**Procedure**—Proceed as directed for *Procedure* in the Assay under *Dimenhydrinate Tablets*. Calculate the quantity, in mg per mL, of dimenhydrinate ( $C_{17}H_{21}NO \cdot C_7H_7ClN_4O_2$ ) in the portion of the Oral Solution taken by the formula:

$$0.05W(R_U / R_S)$$

in which W is the weight, in mg, of USP Dimenhydrinate RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak area ratios of diphenhydramine to the internal standard obtained from the *Assay preparation* and the *Standard preparation*, respectively.

### Dimenhydrinate Tablets

» Dimenhydrinate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of dimenhydrinate ( $C_{17}H_{21}NO \cdot C_7H_7ClN_4O_2$ ).

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Dimenhydrinate RS

**Identification**—The relative retention times of the 8-chlorotheophylline and diphenhydramine peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Dissolution** (711)—

*Medium*: water; 900 mL.

*Apparatus 2*: 50 rpm.

*Time*: 45 minutes.

**Procedure**—Determine the amount of  $C_{17}H_{21}NO \cdot C_7H_7ClN_4O_2$  dissolved by employing UV absorption at the wavelength of maximum absorbance at about 276 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a *Standard solution* having a known concentration of USP Dimenhydrinate RS in the same *Medium*.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_{17}H_{21}NO \cdot C_7H_7ClN_4O_2$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements, the following procedure being used where the test for *Content Uniformity* is required. Transfer 1 Tablet to a 50-mL volumetric flask, add about 5 mL of *Ammonium bicarbonate solution* obtained from the *Assay*, and shake gently to disperse, sonicating, if necessary. Add 20.0 mL of *Internal standard solution* obtained from the *Assay*, shake by mechanical means for 30 minutes, and centrifuge. To 1 mL of the clear supernatant add about 9 mL of *Diluent* obtained from the *Assay*, and mix. Continue as directed for *Procedure* in the *Assay*.

**Content of 8-chlorotheophylline**—

*Ammonium bicarbonate solution*, *Diluent*, *Solution A*, *Solution B*, *Mobile phase*, *Internal standard solution*, and *Chromatographic system*—Prepare as directed in the *Assay*.

**Standard solution**—Prepare as directed for *Standard preparation* in the *Assay*.

**Test solution**—Prepare as directed for *Assay preparation* in the *Assay*.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of 8-chlorotheophylline ( $C_7H_7ClN_4O_2$ ) per Tablet taken by the formula:

$$(214.61/469.96)W(R_U / R_S)$$

in which 214.61 and 469.96 are the molecular weights of 8-chlorotheophylline and dimenhydrinate, respectively; *W* is the weight, in mg, of USP Dimenhydrinate RS in the *Standard solution*; and  $R_U$  and  $R_S$  are peak area ratios of 8-chlorotheophylline to the internal standard obtained from the *Test solution* and the *Standard solution*, respectively. An amount of 8-chlorotheophylline that is between 43.4% and 47.9% of the amount of dimenhydrinate obtained in the *Assay* is found.

**Assay**—

**Ammonium bicarbonate solution**—Dissolve 4 g of ammonium bicarbonate in 250 mL of water.

**Diluent**—Dissolve 4 g of ammonium bicarbonate in 200 mL of water. Add 50 mL of methanol, and mix.

**Solution A**—Dissolve 0.8 g of ammonium bicarbonate in 800 mL of water. Add 200 mL of methanol, filter, and degas.

**Solution B**—Dissolve 0.8 g of ammonium bicarbonate in 150 mL of water. Add 850 mL of methanol, filter, and degas.

**Mobile phase**—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Internal standard solution**—Prepare a solution in methanol containing 2.0 mg of 2-hydroxybenzyl alcohol per mL.

**Standard preparation**—Accurately weigh about 50 mg of USP Dimenhydrinate RS, add about 5 mL of *Ammonium bicarbonate solution* and 20.0 mL of *Internal standard solution*, and mix. To 1 mL of this solution add about 9 mL of *Diluent*, and mix.

**Assay preparation**—Transfer 5 Tablets into a 250-mL volumetric flask, add 25 mL of *Ammonium bicarbonate solution*, and shake gently to disperse, sonicating if necessary. Add 100.0 mL of *Internal standard solution*, shake vigorously for 30 minutes, and centrifuge. To 1 mL of the clear supernatant add about 9 mL of *Diluent*, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 229-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L7. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0	100	0	equilibration
0–7.0	100	0	isocratic
7.0–7.1	100→0	0→100	linear gradient
7.1–15	0	100	isocratic
15–15.1	0→100	100→0	linear gradient
15.1–22.0	100	0	isocratic

Chromatograph the *Standard preparation*, and record the peak areas as directed for *Procedure*: the relative retention times are about 0.3 for 8-chlorotheophylline, 0.5 for the internal standard, and 1.0 for diphenhydramine; the resolution,  $R$ , between 8-chlorotheophylline and the internal standard is not less than 4.5; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of dimenhydrinate ( $C_{17}H_{21}NO \cdot C_7H_7ClN_4O_2$ ) per Tablet taken by the formula:

$$W(R_U / R_S)$$

in which *W* is the weight, in mg, of USP Dimenhydrinate RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak area ratios of diphenhydramine to the internal standard obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dimercaprol

$C_3H_8OS_2$  124.23

1-Propanol, 2,3-dimercapto.

2,3-Dimercapto-1-propanol [59-52-9].

» Dimercaprol contains not less than 97.0 percent and not more than 100.5 percent of  $C_3H_8OS_2$ , and not more than 1.5 percent of 1,2,3-trimercaptopropane ( $C_3H_8S_3$ ).

**Packaging and storage**—Preserve in tight containers, in a cold place.

**Specific gravity** (841): between 1.242 and 1.244.

**Distilling range, Method I** (721): between 66° and 68°, under a pressure of 0.2 mm of mercury.

**Refractive index** (831): between 1.567 and 1.573.

**Limit of 1,2,3-trimercaptopropane and related impurities—**

**Adsorbent**—Use a suitable chromatographic grade of 100-mesh silicic acid.

**Standard buffer solution**—Prepare 100 mL of pH 6.0 Phosphate Buffer (see pH (791)), and dissolve in it 100 mg of sodium bisulfite.

**Acid-washed solvent hexane**—To 100 mL of solvent hexane contained in a separator add 10 mL of sulfuric acid, shake for not less than 12 hours, and allow the layers to separate. Transfer the acid-washed solvent to a distilling flask, and distill slowly, retaining only that portion distilling between 35° and 50°. Use only freshly distilled material.

**Diisopropyl ether**—Place 100 mL of diisopropyl ether in a distilling flask, and distill, retaining only that portion distilling between 68° and 69°. Use only freshly distilled material.

[*Caution—Do not evaporate to the point of near-dryness, since diisopropyl ether tends to form explosive peroxides*]

**Solvent hexane-diisopropyl ether mixture (mobile solvent)**—Mix 50 mL of Diisopropyl ether with 50 mL of Acid-washed solvent hexane.

**Chromatographic tube**—Insert a small plug of glass wool at the juncture of the tube and the stem of a 600- × 13-mm chromatographic tube.

**Chromatographic column**—Mix 20 g of Adsorbent with 20 mL of Standard buffer solution. Make into a slurry by mixing with 100 mL of chloroform. Transfer successive portions of the slurry into the Chromatographic tube, packing firmly and evenly with a close-fitting, ground-glass tamper after each addition. Keep a layer of liquid above the packed column to prevent the formation of air spaces. Wash the column free from chloroform with Solvent hexane-diisopropyl ether mixture, and allow the solvent to fall to the level of the Adsorbent.

**Procedure**—Place about 250 mg of Dimercaprol, accurately weighed and demonstrated to be free from hydrogen sulfide as directed in the Assay, in a 5-mL volumetric flask, add Solvent hexane-diisopropyl ether mixture to volume, and mix. Transfer 2.0 mL of the resulting solution to the prepared Chromatographic column. When the liquid has passed into the column, wash the wall of the tube with a 2-mL portion of Solvent hexane-diisopropyl ether mixture, and allow the washing to fall to the level of the Adsorbent. Fill the Chromatographic tube with solvent, and collect two successive fractions: (A) a 20-mL fraction containing all of the 1,2,3-trimercaptopropane, and (B) a 3-mL fraction that serves as a check on the separation. To each fraction add an equal volume of alcohol, and titrate with 0.1 N iodine VS until a permanent yellow color is produced. Perform a blank titration on 20 mL of the solvent mixture that has been passed through the column prior to introduction of the test specimen, and make any necessary correction. Fraction (B) does not decolorize 1 drop of 0.1 N iodine VS. Each mL of 0.1 N iodine added is equivalent to 4.676 mg of C<sub>3</sub>H<sub>8</sub>S<sub>3</sub>. Not more than 1.5% of 1,2,3-trimercaptopropane (C<sub>3</sub>H<sub>8</sub>S<sub>3</sub>) is found.

**Assay**—Test the Dimercaprol for the presence of hydrogen sulfide by examining the vapor above the assay specimen with moistened lead acetate test paper. If the paper darkens, bubble dry, oxygen-free nitrogen or carbon dioxide through the assay specimen until a fresh strip of test paper gives a negative test. Transfer about 2 mL of hydrogen sulfide-free Dimercaprol to a tared, glass-stoppered, 100-mL volumetric flask, weigh accurately, add methanol to volume, and mix. Pipet 10 mL of the solution into a 50-mL conical flask, and titrate with 0.1 N iodine VS until a permanent

yellow color is produced. Perform a blank titration, and make any necessary correction. Calculate the percentage of C<sub>3</sub>H<sub>8</sub>OS<sub>2</sub> taken by the formula:

$$0.6211V/W - 1.328T$$

in which *V* is the volume, in mL, of 0.1 N iodine used, *W* is the weight, in g, of specimen in the aliquot taken, and *T* is the percentage of C<sub>3</sub>H<sub>8</sub>S<sub>3</sub> found in the determination of the Limit of 1,2,3-trimercaptopropane and related impurities.

## Dimercaprol Injection

» Dimercaprol Injection is a sterile solution of Dimercaprol in a mixture of Benzyl Benzoate and vegetable oil. It contains, in each 100 g, not less than 9.0 g and not more than 11.0 g of dimercaprol (C<sub>3</sub>H<sub>8</sub>OS<sub>2</sub>).

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I or Type III glass.

**USP Reference standards** (11)—

USP Endotoxin RS

**Bacterial endotoxins** (85)—It contains not more than 1 USP Endotoxin Unit per mg of dimercaprol.

**Limit of 1,2,3-trimercaptopropane and related impurities—**

**Adsorbent, Standard buffer solution, Acid-washed solvent hexane, Diisopropyl ether, Solvent hexane-diisopropyl ether mixture, Chromatographic tube, and Chromatographic column**—Prepare as directed in the test for Limit of 1,2,3-trimercaptopropane and related impurities under Dimercaprol.

**Procedure**—Place about 1 g of Injection, accurately weighed and demonstrated to be free from hydrogen sulfide as directed in the Assay under Dimercaprol, in a 5-mL beaker, add 2 mL of Solvent hexane-diisopropyl ether mixture, and mix. Transfer the resulting solution to the prepared Chromatographic column. When the liquid has passed into the column, wash the beaker with two 2-mL portions of Solvent hexane-diisopropyl ether mixture, and allow the washings to fall to the level of the Adsorbent. Proceed as directed for Procedure in the test for Limit of 1,2,3-trimercaptopropane and related impurities under Dimercaprol. The limit of 1,2,3-trimercaptopropane (C<sub>3</sub>H<sub>8</sub>S<sub>3</sub>) is not more than 4.5%, by weight, of the content of dimercaprol.

**Other requirements**—It meets the requirements under Injections (1), except that at times it may be turbid or contain small amounts of flocculent material.

**Assay**—Transfer about 2 mL of Injection to a tared conical flask, and weigh accurately. Add 100 mL of a mixture of 1 volume of chloroform and 3 volumes of methanol, agitate to dissolve the Injection, and titrate with 0.1 N iodine VS to the production of a permanent yellow color. Perform a blank determination, and make any necessary correction. Calculate the percentage of dimercaprol (C<sub>3</sub>H<sub>8</sub>OS<sub>2</sub>) in the portion of Injection taken by the formula:

$$0.6211(V/W - v/w)$$

in which *V* is the volume, in mL, of 0.1 N iodine used; *W* is the weight, in g, of Injection taken; and *v* and *w* are the volume, in mL, of 0.1 N iodine and the weight, in g, of Injection, respectively, used in the test for Limit of 1,2,3-trimercaptopropane and related impurities.

## Dimethyl Sulfoxide

$\text{C}_2\text{H}_6\text{OS}$  78.13  
Methane, sulfinylbis-  
Methyl sulfoxide [67-68-5].

» Dimethyl Sulfoxide contains not less than 99.9 percent of  $\text{C}_2\text{H}_6\text{OS}$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—  
USP Dimethyl Sulfoxide RS

### Identification—

**A:** *Infrared Absorption* (197F), potassium bromide plates being used.

**B:** Add 1.5 mL cautiously and dropwise to 2.5 mL of hydriodic acid in a test tube cooled in ice. Filter the mixture rapidly, and collect the precipitate. Dry the precipitate in vacuum: a deep violet, crystalline solid is obtained, and it is soluble in chloroform, yielding a red solution.

**Specific gravity** (841): between 1.095 and 1.101.

**Refractive index** (831): between 1.4755 and 1.4775.

**Acidity**—Dissolve 50.0 g in 100 mL of water, and add phenolphthalein TS. If the solution remains colorless, titrate with 0.01 N sodium hydroxide until a pink color appears: not more than 5.0 mL of 0.01 N sodium hydroxide is consumed.

**Water, Method I** (921): not more than 0.1%. [NOTE—Weigh and transfer the test specimen in an environment of low humidity to minimize absorption of atmospheric water.]

**Ultraviolet absorbance**—Maintain Dimethyl Sulfoxide in a water bath at a temperature of less than 20° [NOTE—Do not freeze.], and purge with dry nitrogen for 30 minutes. Record the UV absorption spectrum between 270 and 350 nm in a 1-cm cell, using water as the blank: the spectrum is smooth with no absorption maxima; the absorbance at 275 nm is not more than 0.20, and the absorbance ratios,  $A_{285}/A_{275}$  and  $A_{295}/A_{275}$ , at the wavelengths indicated by the subscripts, are not more than 0.65 and 0.45, respectively.

**Limit of nonvolatile residue**—Evaporate about 100.0 g to dryness in a tared, preconditioned dish on a hot plate under a suitable fume hood. Evaporate gently so boiling does not occur. The weight of the residue does not exceed 0.01%.

### Related compounds—

**System suitability solution**—Prepare a solution containing about 0.15 mg of dimethyl sulfone per mL and 0.1 mg of dibenzyl per mL in Dimethyl Sulfoxide.

**Chromatographic system** (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and contains a 0.32-mm  $\times$  15-m column bonded with a 3- $\mu$ m film of phase G2. Initially the column temperature is maintained at 100° for 15 minutes, then is increased at a rate of 10° per minute to a temperature of 170°, and maintained at 170° for 20 minutes. The injection port is maintained at a temperature of about 210°, and the detector block is maintained at a temperature of about 220°. Helium is used as the carrier gas, flowing at a rate of 1.7 mL per minute, and the split ratio is 33:1. [NOTE—The split ratio can be modified in order to optimize performance.] Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between dimethyl sulfone and dibenzyl is not less than 5.0;

and the column efficiency, determined from the dimethyl sulfoxide peak, is not less than 1000 theoretical plates.

**Procedure**—Inject about 1  $\mu$ L of Dimethyl Sulfoxide into the gas chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of total impurities in the portion of Dimethyl Sulfoxide taken by the formula:

$$100(r_U / r_S)$$

in which  $r_U$  is the sum of the areas of all the impurity peaks; and  $r_S$  is the sum of the areas of all the peaks: not more than 0.1% of total impurities is found.

**Assay**—Using the results from the test for *Limit of nonvolatile residue* and the test for *Related compounds*, calculate the percentage of  $\text{C}_2\text{H}_6\text{OS}$  in the portion of Dimethyl Sulfoxide taken by subtracting the percentage of nonvolatile residue and the percentage of total impurities found from 100.0%. [NOTE—A correction for percent water is not applied to the result.]

## Dimethyl Sulfoxide Gel

» Dimethyl Sulfoxide Gel contains not less than 90.0 percent and not more than 110.0 percent of the labeled concentration of  $\text{C}_2\text{H}_6\text{OS}$ .

**Packaging and storage**—Preserve in tight, light-resistant containers.

**Labeling**—Label it to indicate that it is for veterinary use only.

**USP Reference standards** (11)—  
USP Dimethyl Sulfoxide RS

**Identification**—The retention time of the dimethyl sulfoxide peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Minimum fill** (755): meets the requirements.

**pH** (791): between 4.7 and 6.7, determined on a mixture of 5 g of Gel and 5 mL of water.

### Assay—

**Internal standard solution**—Transfer 1.0 mL of dimethylformamide to a 100-mL volumetric flask. Add about 75 mL of methanol, and shake for about 1 minute. Dilute with methanol to volume, and mix.

**Standard preparation**—Transfer about 2 g of USP Dimethyl Sulfoxide RS, accurately weighed, to a 100-mL volumetric flask, add 1.0 mL of dimethylformamide and 75 mL of methanol, and shake for about 1 minute. Dilute with methanol to volume, and mix. This solution contains about 20 mg of USP Dimethyl Sulfoxide RS per mL.

**Assay preparation**—Transfer an accurately weighed quantity of Gel, equivalent to 2 g of dimethyl sulfoxide, to a 100-mL volumetric flask. Add 1.0 mL of dimethylformamide and about 75 mL of methanol. Dilute with methanol to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and a 4-mm  $\times$  1.8-m column packed with 15% liquid phase G39 on support S1A. The column is maintained at about 160° and the injection port and detector block at about 200°. Helium is used as the carrier gas, flowing at a rate of about 30 mL per minute. Chromatograph the *Internal standard solution*, and record the peak responses as directed for *Procedure*: examine the chromatogram to confirm that there are no peaks present that would interfere with the measurement of the dimethylformamide peaks and the dimethyl sulfoxide peaks in subsequent chromatograms.

Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.4 for dimethylformamide and 1.0 for dimethyl sulfoxide; the tailing factor is not more than 2.0; the resolution,  $R_s$ , between the dimethylformamide peak and the dimethyl sulfoxide peak is not less than 4; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 2  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms for not less than 40 minutes, and measure the peak heights for the dimethylformamide and dimethyl sulfoxide peaks. Calculate the percentage (w/w) of  $C_2H_6OS$  in the portion of Gel taken by the formula:

$$10(C / W)(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Dimethyl Sulfoxide RS in the *Standard preparation*;  $W$  is the weight, in g, of Gel taken to prepare the *Assay preparation*; and  $R_U$  and  $R_S$  are the ratios of the dimethyl sulfoxide peak response to the dimethylformamide peak response in the chromatograms obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dimethyl Sulfoxide Irrigation

» Dimethyl Sulfoxide Irrigation is a sterile solution of Dimethyl Sulfoxide in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of  $C_2H_6OS$ .

**Packaging and storage**—Preserve in single-dose containers, and store at controlled room temperature, protected from strong light.

**Labeling**—Label it to indicate prominently that it is not intended for injection.

### USP Reference standards (11)—

USP Dimethyl Sulfoxide RS

USP Endotoxin RS

**Identification**—A portion of the *Assay preparation*, chromatographed as directed in the *Assay*, exhibits a major peak for dimethyl sulfoxide, the retention time of which is identical with that exhibited by the *Standard preparation*.

**Bacterial endotoxins** (85)—It contains not more than 0.5 Endotoxin Unit per mL.

**Sterility** (71): meets the requirements.

**pH** (791): between 5.0 and 7.0, when diluted with water to obtain a solution containing 50 mg of dimethyl sulfoxide per mL.

### Assay—

**Standard preparation**—Dissolve an accurately weighed quantity of USP Dimethyl Sulfoxide RS in acetone, and dilute quantitatively with acetone to obtain a solution having a known concentration of about 80 mg per mL.

**Assay preparation**—Transfer an accurately measured volume of Dimethyl Sulfoxide Irrigation, equivalent to about 2 g of dimethyl sulfoxide, to a 25-mL volumetric flask, dilute with acetone to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—Proceed as directed in the test for *Dimethyl sulfone* under *Dimethyl Sulfoxide*. The relative standard deviation for replicate injections of the *Standard preparation* is not more than 2.0%.

**Procedure**—Introduce equal volumes (about 1.0  $\mu$ L) of the *Standard preparation* and the *Test preparation* into the gas

chromatograph. Measure the peak responses, at corresponding retention times, so obtained, and calculate the quantity, in mg, of  $C_2H_6OS$  in each mL of Dimethyl Sulfoxide Irrigation taken by the formula:

$$25(C / V)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Dimethyl Sulfoxide RS in the *Standard preparation*;  $V$  is the volume, in mL, of Dimethyl Sulfoxide Irrigation taken; and  $r_U$  and  $r_S$  are the peak responses from the *Assay preparation* and the *Standard preparation*, respectively.

## Dimethyl Sulfoxide Topical Solution

» Dimethyl Sulfoxide Topical Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled concentration of  $C_2H_6OS$ .

**Packaging and storage**—Preserve in tight, light-resistant containers.

**Labeling**—Label it to indicate that it is for veterinary use only.

### USP Reference standards (11)—

USP Dimethyl Sulfoxide RS

### Identification—

**A:** The chromatogram of the *Assay preparation*, obtained as directed in the *Assay*, exhibits a major peak for dimethyl sulfoxide, the retention time of which corresponds to that exhibited in the chromatogram of the *Standard preparation*, obtained as directed in the *Assay*.

**B:** To 2 mL of Topical Solution in a test tube add 5 mL of cold hydriodic acid. Filter the mixture rapidly, and collect the precipitate. Dry the precipitate in vacuum: a deep violet, crystalline solid is obtained, and it is soluble in chloroform, yielding a red solution.

**C:** To 0.1 g of solid sodium hydroxide in a test tube add 10 mL of Topical Solution, and heat on a steam bath until the sodium hydroxide has dissolved. Add 10 mL of chloroform, and shake. Filter the chloroform layer through a filter funnel containing about 10 g of anhydrous sodium sulfate. Heat the filtrate on a steam bath to remove the chloroform. Determine the IR spectrum of the liquid residue as directed under *Spectrophotometric Identification Tests* (197F). The spectrum so obtained corresponds to that of a spectrum of USP Dimethyl Sulfoxide RS, similarly prepared.

**Assay**—[NOTE—Use glass equipment to prepare solutions.]

**Internal standard solution**—Transfer 3.0 mL of dimethylformamide to a 250-mL volumetric flask. Add about 200 mL of acetone, and shake for about 1 minute. Dilute with acetone to volume, and mix.

**Standard preparation**—Transfer about 2 g of USP Dimethyl Sulfoxide RS, accurately weighed, to a 250-mL volumetric flask, add 3.0 mL of dimethylformamide and 200 mL of acetone, and sonicate for about 1 minute. Dilute with acetone to volume, and mix to obtain a solution having a known concentration of about 8 mg of USP Dimethyl Sulfoxide RS per mL.

**Assay preparation**—Transfer an accurately measured volume of Topical Solution, equivalent to about 2 g of dimethyl sulfoxide, to a 250-mL volumetric flask, add 3.0 mL of dimethylformamide and about 200 mL of acetone, and sonicate for about 1 minute. Dilute with acetone to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and a 4-mm  $\times$  1.8-m column packed with 10% liquid

phase G16 on support S1A. The column is maintained at about 170°, the injection port at about 200°, and the detector block at about 300°. The carrier gas is helium, flowing at a rate of about 20 mL per minute. Chromatograph two portions of the acetone used to prepare the *Standard preparation*, the *Assay preparation*, and the *Internal standard solution*, and record the peak responses as directed under *Procedure*. Discard the first chromatogram, and examine the second to confirm that there are no peaks present that would interfere with the measurement of the dimethylformamide peaks and the dimethyl sulfoxide peaks in subsequent chromatograms. Chromatograph the *Internal standard solution*, and record the peak responses as directed for *Procedure*: examine the chromatogram to confirm that there are no peaks present that would interfere with the measurement of the dimethylformamide peaks and the dimethyl sulfoxide peaks in subsequent chromatograms. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.2 for acetone, 0.5 for dimethylformamide, and 1.0 for dimethyl sulfoxide; the resolution,  $R$ , between the dimethylformamide peak and the dimethyl sulfoxide peak is not less than 2; the tailing factors for the dimethylformamide peak and the dimethyl sulfoxide peak are not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—[NOTE—Use peak heights where peak responses are indicated.] Separately inject equal volumes (about 2  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms for not less than 20 minutes, and measure the responses for the dimethylformamide and dimethyl sulfoxide peaks. Calculate the percentage (v/v) of  $C_2H_6OS$  in the portion of Topical Solution taken by the formula:

$$(2.5 / 1.096)10(C / V)(R_U / R_S)$$

in which 1.096 is the specific gravity of dimethyl sulfoxide,  $C$  is the concentration, in mg per mL, of USP Dimethyl Sulfoxide RS in the *Standard preparation*;  $V$  is the volume, in mL, of Topical Solution taken to prepare the *Assay preparation*; and  $R_U$  and  $R_S$  are the ratios of the dimethyl sulfoxide peak response to the dimethylformamide peak response in the chromatograms obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dinoprost Tromethamine

$C_{20}H_{34}O_5 \cdot C_4H_{11}NO_3$  475.62  
Prosta-5,13-dien-1-oic acid, 9,11,15-trihydroxy-, (5Z,9 $\alpha$ ,11 $\alpha$ ,13E,15S)-, compd. with 2-amino-2-(hydroxymethyl)-1,3-propanediol (1:1).  
(E,Z)-(1R,2R,3R,5S)-7-[3,5-Dihydroxy-2-[(3S)-(3-hydroxy-1-octenyl)]cyclopentyl]-5-heptenoic acid compound with 2-amino-2-(hydroxymethyl)-1,3-propanediol (1:1).  
Prostaglandin  $F_{2\alpha}$  tromethamine [38562-01-5].

» Dinoprost Tromethamine contains not less than 95.0 percent and not more than 105.0 percent of  $C_{20}H_{34}O_5 \cdot C_4H_{11}NO_3$ , calculated on the dried basis. [Caution—Great care should be taken to pre-

vent inhaling particles of Dinoprost Tromethamine and exposing the skin to it.]

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Dinoprost Tromethamine RS

**Identification**, *Infrared Absorption* (197M).

**Specific rotation** (781S): between +19° and +26°.

*Test solution*: 20 mg per mL, in alcohol.

**Loss on drying** (731)—Dry it in vacuum at room temperature and at a pressure not exceeding 5 mm of mercury for 16 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.5%.

**Chromatographic purity**—[NOTE—Prepare solutions immediately prior to use.]

*Mobile phase*—Proceed as directed in the *Assay*.

*Standard stock solution*—Prepare as directed for *Standard preparation* in the *Assay*.

*Standard solution*—Transfer 1.0 mL of the *Standard stock solution* to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Test solution*—Prepare as directed for the *Assay preparation*.

*Chromatographic system*—Proceed as directed in the *Assay*. Chromatograph the *Test solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between dinoprost tromethamine and any other adjacent peak is not less than 1.0.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Dinoprost Tromethamine taken by the formula:

$$2.5(C/W)F(r_i / r_s)$$

in which  $C$  is the concentration, in  $\mu$ g per mL, of USP Dinoprost Tromethamine RS in the *Standard solution*;  $W$  is the weight, in mg, of Dinoprost Tromethamine taken to prepare the *Test solution*;  $F$  is the relative response factor and is equal to 0.25 for any peak at a relative retention time of about 0.30, 1.7 for any peak at a relative retention time of about 1.15, and 1.0 for any other peak;  $r_i$  is the peak response of each impurity obtained from the *Test solution*; and  $r_s$  is the peak response of dinoprost tromethamine obtained from the *Standard solution*: not more than 2.0% of any impurity having a relative retention time of about 0.94 is found; not more than 1.5% of any impurity having a relative retention time of about 0.84 is found; not more than 0.5% of any other impurity is found; and not more than 2.0% of all other impurities is found.

**Assay**—[NOTE—Prepare solutions immediately prior to use.]

*Mobile phase*—Prepare a filtered and degassed mixture of water, acetonitrile, and phosphoric acid (750:250:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Dinoprost Tromethamine RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 1.0 mg per mL.

*Assay preparation*—Transfer about 25.0 mg of Dinoprost Tromethamine, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 200-nm detector and a 3.9-mm  $\times$  15-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the

*Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 6000 theoretical plates, and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{20}H_{34}O_5 \cdot C_4H_{11}NO_3$  in the portion of Dinoprost Tromethamine taken by the formula:

$$25C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Dinoprost Tromethamine RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dinoprost Tromethamine Injection

» Dinoprost Tromethamine Injection is a sterile solution of Dinoprost Tromethamine in Water for Injection. It may contain a suitable preservative, such as benzyl alcohol. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of dinoprost ( $C_{20}H_{34}O_5$ ).

*Caution*—Extreme care should be exercised when handling dinoprost tromethamine as it is readily absorbed through the skin; accidental spillage on the skin should be washed off immediately with soap and water.

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass.

**Labeling**—Label it to indicate that it is for veterinary use only.

### USP Reference standards (11)—

USP Dinoprost Tromethamine RS

USP Endotoxin RS

**Identification**—The retention time of the derivatized dinoprost peak in the chromatogram of the *Assay preparation* corresponds to that of the derivatized dinoprost peak in the *Standard preparation*, both relative to the internal standard, obtained as directed in the *Assay*.

**Bacterial endotoxins** (85)—It contains not more than 8 USP Endotoxin Units per 1.0 mg of dinoprost.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** (791): between 7.0 and 9.0.

**Other requirements**—It meets the requirements under *Injections* (1).

### Assay—

*Mobile phase*—Prepare a solution consisting of methylene chloride, 1,3-butanediol, and water (496:3.5:0.25).

*Internal standard solution*—Prepare a solution in *Mobile phase* containing about 0.75 mg of guaifenesin per mL.

*Reagent preparations*—

A—Prepare a solution containing about 10 mg of  $\alpha$ -bromo-2'-acetophenone per mL of acetonitrile. Use a freshly prepared solution.

B—Prepare a solution containing 5  $\mu$ L of diisopropylethylamine per mL of acetonitrile. Use a freshly prepared solution.

C—Prepare a citrate buffer solution by dissolving 10.5 g of citric acid monohydrate in about 75 mL of water and adding 5 N sodium hydroxide until a pH of 4.0 is obtained. Dilute with water to 100 mL, and mix.

*Diluent*—Use *Sterile Water for Injection* containing 0.945% of benzyl alcohol.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Dinoprost Tromethamine RS in *Diluent* to obtain a solution having a known concentration of about 0.67 mg of dinoprost tromethamine per mL (*Standard stock preparation*). Transfer 1.0 mL of this solution to a suitable container, and add 1.0 mL of *Reagent C* and 20.0 mL of methylene chloride. Shake and centrifuge. Transfer 5.0 mL of the lower layer into a suitable container, and evaporate with the aid of nitrogen to dryness. Wash the inside of the container with 200  $\mu$ L of *Reagent A*. Swirl to dissolve, add 100  $\mu$ L of *Reagent B*, and mix. Allow the solution to stand for about 1 hour at room temperature, evaporate to dryness, add 4.0 mL of *Internal standard solution*, and mix to obtain a *Standard preparation* having a known concentration of about 0.0419 mg of USP Dinoprost Tromethamine RS per mL.

*Assay preparation*—Dilute and mix an accurately measured volume of Injection with *Diluent* to obtain a solution having a known concentration of about 0.5 mg of dinoprost per mL (*Assay stock preparation*). Proceed as directed for *Standard preparation*, beginning with "Transfer 1.0 mL of this solution."

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  30-cm column that contains packing L3. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between the dinoprost tromethamine and internal standard peaks is not less than 10, and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Inject equal volumes (about 20  $\mu$ L) of the *Assay preparation* and the *Standard preparation* into the chromatograph, record the chromatograms, and measure the peak responses at equivalent retention times. The relative retention times are about 0.4, 0.5, 1.0, and 1.2 for the internal standard, the 15-*R* epimer, dinoprost tromethamine, and the 5,6-*trans* isomer, respectively. Calculate the quantity, in mg, of  $C_{20}H_{34}O_5$  in each mL of the Injection taken by the formula:

$$(354.48/475.62)(DC)(R_U / R_S)$$

in which 354.48 and 475.62 are the molecular weights of dinoprost and dinoprost tromethamine, respectively;  $D$  is the dilution factor used in preparing the *Assay stock preparation*;  $C$  is the concentration, in mg per mL, of USP Dinoprost Tromethamine RS in the *Standard stock preparation*; and  $R_U$  and  $R_S$  are the ratios of the responses for the dinoprost tromethamine and internal standard peaks obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dinoprostone

$C_{20}H_{32}O_5$  352.47  
 Prosta-5,13-dien-1-oic acid, 11,15-dihydroxy-9-oxo-, (5Z, 11 $\alpha$ ,13E,15S)-;  
 (E,Z)-(1R,2R,3R)-7-[3-Hydroxy-2-[(3S)-(3-hydroxy-1-octenyl)]-5-oxocyclopentyl]-5-heptenoic acid;  
 Prostaglandin  $E_2$  [363-24-6].

### DEFINITION

Dinoprostone contains NLT 97.0% and NMT 103.0% of  $C_{20}H_{32}O_5$ .

[NOTE—Prepare all solutions in all tests immediately before use.]

### IDENTIFICATION

- A. INFRARED ABSORPTION** (197K)
- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

**Mobile phase:** Methanol and 0.2% acetic acid (29:21)  
**Standard solution:** 2.5 mg/mL of USP Dinoprostone RS in *Mobile phase*

**Sample solution:** 2.5 mg/mL of Dinoprostone in *Mobile phase*

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.6-mm  $\times$  25-cm; packing L1

**Temperature:** 30°

**Flow rate:** 1 mL/min

**Injection size:** 20  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Resolution:** NLT 1.0 between dinoprostone and any other adjacent peak

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{20}H_{32}O_5$  in the portion of Dinoprostone taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Dinoprostone RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Dinoprostone in the *Sample solution* (mg/mL)

**Acceptance criteria:** 97.0%–103.0%

### IMPURITIES

#### Inorganic Impurities

- RESIDUE ON IGNITION** (281): NMT 0.5%

#### Organic Impurities

##### PROCEDURE

**Mobile phase:** Proceed as directed in the *Assay*.

**Standard stock solution:** Prepare as directed for the *Standard solution* in the *Assay*.

**Standard solution:** Transfer 0.5 mL of the *Standard stock solution* to a 50-mL volumetric flask, and dilute with *Mobile phase* to volume.

**Sample solution:** Prepare as directed in the *Assay*.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.6-mm  $\times$  25-cm; packing L1

**Temperature:** 30°

**Flow rate:** 1 mL/min

**Injection size:** 20  $\mu$ L

#### System suitability

**Samples:** *Standard stock solution* and *Sample solution*

#### Suitability requirements

**Column efficiency:** NLT 6000 theoretical plates, *Standard stock solution*

**Relative standard deviation:** NMT 2.0%, *Standard stock solution*

**Resolution:** NLT 1.0 between dinoprostone and any other adjacent peak, *Sample solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Dinoprostone taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_S$  = peak response of dinoprostone from the *Standard solution*

$C_S$  = concentration of USP Dinoprostone RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Dinoprostone in the *Sample solution* (mg/mL)

$F$  = relative response factor (see *Impurity Table 1*)

**Acceptance criteria:** See *Impurity Table 1*.

**Impurity Table 1**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
15-Oxo-dinoprostone	0.79	5	—*
15-Epi-dinoprostone	0.85	1.1	—*
8-Isodinoprostone	0.90	1.0	—*
5,6-trans-Di-noprostone	1.15	1.0	2.0
(5Z,13E,15S)-15-Hydroxy-9-oxoprost-5, 10, 13-triene-1-oic acid	1.80	5	1.0
(5Z,13E,15S)-15-Hydroxy-9-oxoprost-5, 8(12), 13-trien-1-oic acid	1.90	1.43	1.0
Any individual unspecified impurity	—	1.0	0.10

\* The sum of these three impurities is NMT 1.0%.

### SPECIFIC TESTS

- OPTICAL ROTATION, Specific Rotation** (781S):  $-82.0^\circ$  to  $-90.0^\circ$ , at 20°

**Sample solution:** 5 mg/mL, in alcohol

- **WATER DETERMINATION, Method I (921):** NMT 0.5%

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers.
- **USP REFERENCE STANDARDS (11)**  
USP Dinoprostone RS

## Dioxybenzone

$C_{14}H_{12}O_4$  244.24

Methanone, (2-hydroxy-4-methoxyphenyl)(2-hydroxyphenyl)-

2,2'-Dihydroxy-4-methoxybenzophenone [131-53-3].

» Dioxybenzone contains not less than 97.0 percent and not more than 103.0 percent of  $C_{14}H_{12}O_4$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards (11)**—

USP Dioxybenzone RS

#### Identification—

**A:** Infrared Absorption (197K).

**B:** Ultraviolet Absorption (197U)—

*Solution:* 10  $\mu$ g per mL.

*Medium:* methanol.

Absorptivities at 286 nm, calculated on the dried basis, do not differ by more than 3.0%.

**Congeeing temperature (651):** not lower than 68.0°.

**Loss on drying (731)**—Dry it in vacuum at 40° for 2 hours: it loses not more than 2.0% of its weight.

**Assay**—Dissolve about 100 mg of Dioxybenzone, accurately weighed, in toluene in a 100-mL volumetric flask, dilute with toluene to volume, and mix. Pipet 1 mL of this solution into a second 100-mL volumetric flask, add methanol to volume, and mix. Similarly, prepare a Standard solution of USP Dioxybenzone RS, accurately weighed, having a known concentration of about 10  $\mu$ g per mL. Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 325 nm, with a suitable spectrophotometer, using a 1 in 100 solution of toluene in methanol as the blank. Calculate the quantity, in mg, of  $C_{14}H_{12}O_4$  in the Dioxybenzone taken by the formula:

$$10C(A_U / A_S)$$

in which C is the concentration, in  $\mu$ g per mL, of USP Dioxybenzone RS in the Standard solution, and  $A_U$  and  $A_S$  are the absorbances of the solution of Dioxybenzone and the Standard solution, respectively.

## Dioxybenzone and Oxybenzone Cream

» Dioxybenzone and Oxybenzone Cream is a mixture of approximately equal parts of Dioxybenzone and Oxybenzone in a suitable cream base. It contains, in each 100 g, not less than

2.7 g and not more than 3.3 g each of dioxybenzone ( $C_{14}H_{12}O_4$ ) and oxybenzone ( $C_{14}H_{12}O_3$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards (11)**—

USP Dioxybenzone RS

USP Oxybenzone RS

**Identification, Ultraviolet Absorption (197U)**—

*Solutions:* The solutions from the Cream employed for measurement of absorbance in the Assay.

**Minimum fill (755):** meets the requirements.

#### Assay—

**Standard preparations**—Transfer about 30 mg of USP Dioxybenzone RS, accurately weighed, to a 50-mL volumetric flask, dissolve in methanol, dilute with the same solvent to volume, and mix. Pipet 2 mL of this solution into a 100-mL volumetric flask, add methanol to volume, and mix. Similarly, prepare a *Standard preparation* of USP Oxybenzone RS, accurately weighed, having a known concentration of about 12  $\mu$ g per mL.

**Assay preparation**—Dissolve an accurately weighed portion of Cream, equivalent to about 25 mg each of dioxybenzone and oxybenzone, in methanol in a 100-mL volumetric flask, dilute with methanol to volume, and mix. Pipet 1 mL of this solution into a 15-mL conical test tube, evaporate on a water bath just to dryness, using a gentle stream of air, and dissolve the residue in about 200  $\mu$ L of methanol.

**Procedure**—Prepare sheets of chromatographic paper (Whatman No. 1 or equivalent), each measuring about 23 × 28.5 cm, as follows. Immerse the sheets in a 1 in 20 solution of light mineral oil in solvent hexane, withdraw them immediately, and allow to dry in air. On one sheet mark a starting line about 2.5 cm from the long edge, and apply the entire *Assay preparation* as a uniform streak along the starting line, using a stream of air or an air blower, if necessary, to maintain the width of the streak between 5 mm and 10 mm. Rinse the conical test tube, which contained the *Assay preparation*, with about 100  $\mu$ L of methanol, and apply the rinse to the starting line. Similarly, repeat the rinsing and streaking with two additional portions of methanol, and then allow the paper to dry in air for 5 minutes.

Staple together the short edges of the paper to form a cylinder, and place it in a 12- × 25-cm cylindrical chromatographic chamber containing about 40 mL of a mobile solvent consisting of a mixture of equal volumes of acetone and water. Seal the chamber, and allow the chromatogram to develop for 2 hours.

Remove the paper from the chamber, air-dry, then remove the staples, and view the chromatogram under short-wavelength (254 nm) UV radiation. Mark the two bands representing the separated dioxybenzone and oxybenzone, respectively. [NOTE—Determine the relative position of each benzene on the chromatogram by applying suitable aliquots of each *Standard preparation* to another prepared chromatographic sheet, and developing the chromatogram in a manner similar to that described for the *Assay preparation*.] Cut the marked bands from the sheet, and then, keeping the band segments separate, cut each into several pieces to facilitate extraction. Place the pieces from each band in separate glass-stoppered, 50-mL conical flasks, add 20.0 mL of methanol to each flask, and shake gently for 30 minutes.

To provide the chromatographic blank, treat one of the prepared chromatographic sheets in the same manner as described above, but omit the application of the *Assay preparation*. Cut from the chromatographed paper the areas corresponding to the bands produced by the benzenes from the *Assay preparation*, and in the same manner extract the blank bands for 30 minutes with 20.0 mL of methanol.

Concomitantly determine the absorbance of each of the 4 solutions thus prepared, and of each of the *Standard preparations*, in a 1-cm cell at the wavelength of maximum absorbance at about 325 nm, with a suitable spectrophotometer.

ter, using methanol as the blank. Calculate the quantity, in mg, of dioxybenzone ( $C_{14}H_{12}O_4$ ) in the portion of Cream taken by the formula:

$$2C(A_U - A_B) / A_S$$

in which C is the concentration, in  $\mu\text{g}$  per mL, of USP Dioxybenzone RS in the dioxybenzone *Standard preparation*, and  $A_U$ ,  $A_B$ , and  $A_S$  are the absorbances of the dioxybenzone solution from the *Assay preparation*, the dioxybenzone chromatographic blank solution, and the dioxybenzone *Standard preparation*, respectively. In a similar manner, calculate the quantity, in mg, of oxybenzone ( $C_{14}H_{12}O_3$ ) in the portion of Cream taken, using as  $C$ ,  $A_U$ ,  $A_B$ , and  $A_S$  the respective values pertaining to the oxybenzone determination.

## Diphenhydramine Citrate

$C_{17}H_{21}NO \cdot C_6H_8O_7$  447.48

Ethanamine, 2-(diphenylmethoxy)-*N,N*-dimethyl-, 2-hydroxy-1,2,3-propanetricarboxylate (1:1).  
2-(Diphenylmethoxy)-*N,N*-dimethylethylamine citrate (1:1) [88637-37-0].

» Diphenhydramine Citrate contains not less than 98.0 percent and not more than 100.5 percent of  $C_{17}H_{21}NO \cdot C_6H_8O_7$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—  
USP Diphenhydramine Citrate RS

### Identification—

**A:** *Infrared Absorption* (197K).

**B:** *Ultraviolet Absorption* (197U)—

*Solution:* 700  $\mu\text{g}$  per mL.

*Medium:* water.

**C:** It responds to the test for *Citrate* (191).

**Melting range** (741): between  $146^\circ$  and  $150^\circ$ , but the range between beginning and end of melting does not exceed  $2^\circ$ .

**Loss on drying** (731)—Dry it at  $105^\circ$  for 3 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281)—To about 8 g, accurately weighed, add 5 mL of sulfuric acid, and char. After the substance is thoroughly charred, add 4 mL of nitric acid and a few drops of sulfuric acid, heat gently until fumes are no longer evolved, and ignite at  $800 \pm 25^\circ$  until the carbon is consumed. Place in a muffle furnace at  $550 \pm 50^\circ$  for about 1 hour. Continue the ignition until constant weight is attained: not more than 0.1% remains.

**Assay**—Dissolve about 1.6 g of Diphenhydramine Citrate, accurately weighed, in a mixture of 100 mL of glacial acetic acid and 20 mL of xylene. Add 20 mL of mercuric acetate TS, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 44.75 mg of  $C_{17}H_{21}NO \cdot C_6H_8O_7$ .

## Diphenhydramine Hydrochloride

$C_{17}H_{21}NO \cdot HCl$  291.82  
Ethanamine, 2-(diphenylmethoxy)-*N,N*-dimethyl-, hydrochloride;  
2-(Diphenylmethoxy)-*N,N*-dimethylethylamine hydrochloride [147-24-0].

### DEFINITION

Diphenhydramine Hydrochloride contains NLT 98.0% and NMT 102.0% of diphenhydramine hydrochloride ( $C_{17}H_{21}NO \cdot HCl$ ), calculated on the dried basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **C. IDENTIFICATION TESTS—GENERAL, Chloride** (191)

### ASSAY

#### • PROCEDURE

**Mobile phase:** Acetonitrile, triethylamine, and water (100:1:100). Adjust with glacial acetic acid to a pH of 6.5.

**System suitability solution:** Dissolve 5 mg of benzophenone in 5 mL of acetonitrile, and dilute with water to 100 mL. Transfer 1.0 mL of this solution and 5 mg of diphenhydramine hydrochloride to a 10-mL volumetric flask, and dilute with water to volume.

**Standard solution:** 0.5 mg/mL of USP Diphenhydramine Hydrochloride RS in water

**Sample solution:** 0.5 mg/mL of Diphenhydramine Hydrochloride in water. Filter.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm  $\times$  25-cm; packing L10

**Flow rate:** 1 mL/min

**Injection size:** 10  $\mu\text{L}$

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

#### Suitability requirements

**Resolution:** NLT 2.0 between the benzophenone and diphenhydramine peaks, *System suitability solution*

**Tailing factor:** NMT 2.0, *Standard solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

#### Analysis

**Samples:** *Sample solution* and *Standard solution*  
Calculate the percentage of diphenhydramine hydrochloride ( $C_{17}H_{21}NO \cdot HCl$ ) in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Diphenhydramine Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of diphenhydramine hydrochloride in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0%, on the dried basis

#### IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%

#### SPECIFIC TESTS

- **ACIDITY OR ALKALINITY**

**Sample solution:** 50 mg/mL of Diphenhydramine Hydrochloride in carbon dioxide-free water

**Analysis:** To 10 mL of the *Sample solution*, add 0.15 mL of methyl red TS 2 and 0.25 mL of 0.01 N hydrochloric acid. The solution is pink. Titrate with 0.01 N sodium hydroxide.

**Acceptance criteria:** NMT 0.5 mL of 0.01 N sodium hydroxide is required to change the color of the solution to yellow.

- **LOSS ON DRYING** (731): Dry a sample at 105° for 3 h: it loses NMT 0.5% of its weight.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at room temperature.
- **USP REFERENCE STANDARDS** (11)  
USP Diphenhydramine Hydrochloride RS

### Diphenhydramine Hydrochloride Capsules

» Diphenhydramine Hydrochloride Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{17}H_{21}NO \cdot HCl$ .

**Packaging and storage**—Preserve in tight containers.

#### USP Reference standards (11)—

USP Diphenhydramine Hydrochloride RS

#### Identification—

**A:** The contents of the Capsules meet the requirements under *Identification—Organic Nitrogenous Bases* (181).

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation*, as obtained in the *Assay*.

#### Dissolution, Procedure for a Pooled Sample (711)—

**Medium:** water; 500 mL.

**Apparatus 1:** 100 rpm.

**Time:** 30 minutes.

**Mobile phase and Chromatographic system**—Prepare as directed in the *Assay*.

**Procedure**—Inject a measured volume (about 50  $\mu$ L) of a filtered portion of the solution under test into the chromatograph, record the chromatogram, and measure the response for the major peak. Determine the quantity of  $C_{17}H_{21}NO \cdot HCl$  dissolved in comparison with a *Standard solution* having a known concentration of USP Diphenhydramine Hydrochloride RS in the same medium and similarly chromatographed.

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_{17}H_{21}NO \cdot HCl$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

#### Assay—

**Mobile phase, Standard preparation, System suitability solution, and Chromatographic system**—Prepare as directed in the *Assay* under *Diphenhydramine Hydrochloride*.

**Assay preparation**—Weigh and combine the contents of not fewer than 20 Capsules. Transfer an accurately weighed portion of the combined Capsule contents, equivalent to about 50 mg of diphenhydramine hydrochloride, to a 100-mL volumetric flask. Dissolve in and dilute with water to volume, mix, and filter.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Diphenhydramine Hydrochloride*. Calculate the quantity, in mg, of  $C_{17}H_{21}NO \cdot HCl$  in the portion of Capsule contents taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Diphenhydramine Hydrochloride RS in the *Standard preparation*, and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

### Diphenhydramine Hydrochloride Injection

» Diphenhydramine Hydrochloride Injection is a sterile solution of Diphenhydramine Hydrochloride in Water for Injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{17}H_{21}NO \cdot HCl$ .

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass, protected from light.

#### USP Reference standards (11)—

USP Diphenhydramine Hydrochloride RS

USP Endotoxin RS

#### Identification—

**A:** Dilute a volume of Injection, equivalent to about 50 mg of diphenhydramine hydrochloride, with 0.03 N sulfuric acid to 25 mL, and proceed as directed under *Identification—Organic Nitrogenous Bases* (181), beginning with "Transfer the liquid to a separator": the Injection meets the requirements of the test.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Bacterial endotoxins** (85)—It contains not more than 3.4 USP Endotoxin Units per mg of diphenhydramine hydrochloride.

**pH** (791): between 4.0 and 6.5.

**Other requirements**—It meets the requirements under *Injections* (1).

#### Assay—

**Mobile phase, Standard preparation, System suitability solution, and Chromatographic system**—Prepare as directed in the *Assay* under *Diphenhydramine Hydrochloride*.

**Assay preparation**—Transfer an accurately measured volume of Injection, equivalent to about 50 mg of diphenhydramine hydrochloride, to a 100-mL volumetric flask, dilute with water to volume, and mix.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Diphenhydramine Hydrochloride*. Calculate the quantity, in mg, of  $C_{17}H_{21}NO \cdot HCl$  in each mL of the Injection taken by the formula:

$$100(C / V)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Diphenhydramine Hydrochloride RS in the *Standard preparation*, V is the volume, in mL, of Injection taken, and  $r_U$  and  $r_S$

are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Diphenhydramine Hydrochloride Oral Solution

» Diphenhydramine Hydrochloride Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of diphenhydramine hydrochloride ( $C_{17}H_{21}NO \cdot HCl$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Diphenhydramine Hydrochloride RS

**Identification**—

**A:** Place a portion of Oral Solution, equivalent to 50 mg of diphenhydramine hydrochloride, in a separator, add 0.5 mL of 2 N sulfuric acid, and extract with three 15-mL portions of ether, discarding the extracts. Add 5 mL of water. In a second separator dissolve 50 mg of USP Diphenhydramine Hydrochloride RS in 25 mL of water. Treat each solution as follows. Add 2 mL of 1 N sodium hydroxide, and extract with 75 mL of *n*-heptane. Wash the *n*-heptane extract with 10 mL of water, evaporate the extract to dryness, and dissolve the residue in 4 mL of carbon disulfide. Pass through a dry filter to clarify the solution, if necessary, and proceed as directed under *Identification—Organic Nitrogenous Bases* (181), beginning with "Determine the absorption spectra of the filtered solutions": the Oral Solution meets the requirements of the test.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Alcohol content** (611): between 90.0% and 110.0% of the labeled amount of  $C_2H_5OH$ .

**Assay**—

*Mobile phase, Standard preparation, System suitability solution, and Chromatographic system*—Prepare as directed in the *Assay* under *Diphenhydramine Hydrochloride*.

*Assay preparation*—Transfer an accurately measured volume of Oral Solution, equivalent to about 50 mg of diphenhydramine hydrochloride, to a 100-mL volumetric flask, dilute with water to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Diphenhydramine Hydrochloride*. Calculate the quantity, in mg, of diphenhydramine hydrochloride ( $C_{17}H_{21}NO \cdot HCl$ ) in each mL of the Oral Solution taken by the formula:

$$100(C/V)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Diphenhydramine Hydrochloride RS in the *Standard preparation*; *V* is the volume, in mL, of Oral Solution taken; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Diphenhydramine and Pseudoephedrine Capsules

» Diphenhydramine and Pseudoephedrine Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts

of diphenhydramine hydrochloride ( $C_{17}H_{21}NO \cdot HCl$ ) and pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ).

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Label Capsules to state both the contents of the active moieties and the contents of the salts used in formulating the article.

**USP Reference standards** (11)—

USP Diphenhydramine Hydrochloride RS

USP Pseudoephedrine Hydrochloride RS

**Identification**—

**A:** The retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**B:** *Developing solvent*—Prepare a mixture of acetonitrile, methylene chloride, and *n*-propylamine (56:40:4).

*Standard solution*—Dissolve about 12.5 mg of USP Diphenhydramine Hydrochloride RS and 30 mg of USP Pseudoephedrine Hydrochloride RS in 5.0 mL of water in a 50-mL centrifuge tube.

*Test solution*—Transfer an amount of Capsule contents, equivalent to about 12.5 mg of diphenhydramine hydrochloride and about 30.0 mg of pseudoephedrine hydrochloride, to a 50-mL centrifuge tube. Add 5.0 mL of water, and shake.

*Procedure*—To each centrifuge tube add 5.0 mL of a saturated solution of sodium carbonate and 10 mL of methylene chloride. Insert the stoppers into the tubes and shake for about 1 minute. Centrifuge at about 2000 rpm for about 10 minutes until the layers are well separated. Draw off and discard the top layer. Add 5 g of anhydrous sodium sulfate to the remaining solution, insert the stopper tightly, and shake. Separately apply 30  $\mu$ L ( $3 \times 10 \mu$ L) each of the *Test solution* and the *Standard solution* to a suitable unactivated thin-layer chromatographic plate coated with a 0.25-mm layer of chromatographic silica gel mixture (see *Chromatography* (621)) and allow the spots to dry. Develop the chromatograms in a paper lined chromatographic chamber equilibrated with the *Developing solvent* until the solvent front has moved about three-fourths of the length of the plate. Remove the plate, air-dry, place the plate in an iodine chamber, and allow to develop over several hours: the *R<sub>f</sub>* values of the principal spots obtained from the *Test solution* correspond to those obtained from the *Standard solution*.

**Dissolution, Procedure for a Pooled Sample** (711)—

*Medium:* water, 900 mL.

*Apparatus 1:* 100 rpm.

*Time:* 30 minutes.

*Procedure*—Inject a measured volume (about 50  $\mu$ L) of a filtered portion of the solution under test into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Determine the quantities of  $C_{17}H_{21}NO \cdot HCl$  and of  $C_{10}H_{15}NO \cdot HCl$  dissolved by employing the procedures set forth in the *Assay*, making any necessary modifications.

**Tolerances**—Not less than 75% (*Q*) of the labeled amounts of  $C_{17}H_{21}NO \cdot HCl$  and of  $C_{10}H_{15}NO \cdot HCl$  are dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Related compounds**—

*Mobile phase*—Prepare as directed in the *Assay*.

*Diluting solution*—Prepare a mixture of water, acetonitrile and methanol (64:26:10).

*Standard solution*—Transfer accurately weighed quantities of about 5 mg each of benzhydrol and benzophenone to a 500-mL volumetric flask, dissolve in *Diluting solution*, using heat and sonication if necessary, dilute with *Diluting solution*

to volume, and mix. Dilute 5.0 mL of this solution quantitatively with *Diluting solution* to 25.0 mL, mix, and filter.

**Test solution**—Transfer 10 Capsules to a 500-mL volumetric flask, add about 350 mL of *Diluting solution*, sonicate in warm water at about 40° to effect dissolution, and cool. Dilute with *Diluting solution* to volume, and mix. Dilute 5.0 mL of this solution with *Diluting solution* to 25.0 mL, mix, and filter.

**Resolution solution**—Prepare a solution in *Diluting solution* containing about 2 µg each of benzhydrol and benzophenone, and 100 µg of USP Diphenhydramine Hydrochloride RS, per mL.

**Chromatographic system**—Proceed as directed for *Chromatographic system* under *Assay*. Chromatograph 50 µL of the *Resolution solution*: the resolution,  $R$ , between benzhydrol and diphenhydramine is not less than 1.3 and the resolution,  $R$ , between diphenhydramine and benzophenone is not less than 2.0.

**Procedure**—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution*, and record the areas of the benzhydrol and benzophenone peaks. Calculate the amounts of benzhydrol and benzophenone in the Capsules taken by the formula:

$$C(r_U / r_S)$$

in which  $C$  is the concentration of either benzhydrol or benzophenone, in µg per mL, in the *Standard solution*, and  $r_U$  and  $r_S$  are the areas of the corresponding analyte peaks obtained from the *Test solution* and the *Standard solution*, respectively: the sum of the amounts of benzhydrol and benzophenone does not exceed 2% (w/w) of the diphenhydramine hydrochloride.

#### Assay—

**Aqueous solution**—Dissolve 1.7 g of sodium 1-heptanesulfonate and 0.8 mL of triethylamine in about 800 mL of water, adjust with glacial acetic acid to a pH of  $3.3 \pm 0.05$ , dilute with water to 1 L, mix, and filter.

**Mobile phase**—Prepare a filtered and degassed mixture of *Aqueous solution*, acetonitrile, and methanol (64:26:10). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Transfer about 25 mg of USP Diphenhydramine Hydrochloride RS, accurately weighed, to a 100-mL volumetric flask. Add 25/ mg of USP Pseudoephedrine Hydrochloride RS, accurately weighed,  $f$  being the ratio of the labeled amount, in mg, of pseudoephedrine hydrochloride to the labeled amount, in mg, of diphenhydramine hydrochloride per capsule, dissolve in 0.5% glacial acetic acid, dilute with 0.5% glacial acetic acid to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with 0.5% glacial acetic acid to volume, and mix.

**Assay preparation**—Remove as completely as possible, the contents of not less than 10 Capsules, and weigh accurately. Mix the combined contents, and transfer an accurately weighed portion of the powder, equivalent to about 25 mg of diphenhydramine hydrochloride, to a 100-mL volumetric flask. Dissolve in 0.5% glacial acetic acid, dilute with 0.5% glacial acetic acid to volume, mix, and filter. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with 0.5% glacial acetic acid to volume, and mix.

**Chromatographic system**—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L10. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak areas as directed for *Procedure*: the resolution,  $R$ , between the pseudoephedrine and diphenhydramine peaks is not less than 3.0. For each analyte peak, the tailing factor is not greater than 2.0, and the relative standard deviation for replicate injections is not greater than 2.0%.

**Procedure**—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak areas for the two analytes. The relative retention times are about 1.0 for pseudoephedrine and 3.0 for diphenhydramine. Calculate the quantity, in mg, of diphenhydramine hydrochloride ( $C_{17}H_{21}NO \cdot HCl$ ) in the portion of Capsules taken by formula:

$$C(r_U / r_S)$$

in which  $C$  is the concentration, in µg per mL, of USP Diphenhydramine Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively. Calculate the quantity, in mg, of pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ) in the portion of Capsules taken by the same formula changing the terms to refer to pseudoephedrine hydrochloride.

## Diphenoxylate Hydrochloride

$C_{30}H_{32}N_2O_2 \cdot HCl$  489.05

4-Piperidinecarboxylic acid, 1-(3-cyano-3,3-diphenylpropyl)-4-phenyl-, ethyl ester, monohydrochloride.

Ethyl 1-(3-cyano-3,3-diphenylpropyl)-4-phenylisopropylate monohydrochloride [3810-80-8].

» Diphenoxylate Hydrochloride contains not less than 98.0 percent and not more than 102.0 percent of  $C_{30}H_{32}N_2O_2 \cdot HCl$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—  
USP Diphenoxylate Hydrochloride RS

#### Identification—

**A:** *Infrared Absorption* (197K).

**B:** *Ultraviolet Absorption* (197U)—

*Solution:* 500 µg per mL.

*Medium:* hydrochloric acid in methanol (1 in 1000).

**C:** A saturated solution responds to the tests for *Chloride* (191).

**Melting range** (741): between 220° and 226°.

**Loss on drying** (731)—Dry it at 105° for 2 hours: it loses not more than 0.5% of its weight.

#### Ordinary impurities (466)—

*Test solution:* chloroform.

*Standard solution:* chloroform.

*Eluant:* a mixture of chloroform, cyclohexane, dehydrated alcohol, and formic acid (50:40:10:1).

*Visualization:* 17; then examine the plate immediately under short-wavelength UV light.

**Limits**—The sum of the intensities of all secondary spots obtained from the *Test solution* corresponds to not more than 1.0%.

**Assay**—Dissolve about 300 mg of Diphenoxylate Hydrochloride, accurately weighed, in 75 mL of glacial acetic acid, add 4 mL of mercuric acetate TS, and titrate with 0.1 N

perchloric acid VS, determining the endpoint potentiometrically. Each mL of 0.1 N perchloric acid is equivalent to 48.91 mg of  $C_{30}H_{32}N_2O_2 \cdot HCl$ .

## Diphenoxylate Hydrochloride and Atropine Sulfate Oral Solution

» Diphenoxylate Hydrochloride and Atropine Sulfate Oral Solution contains not less than 93.0 percent and not more than 107.0 percent of the labeled amount of diphenoxylate hydrochloride ( $C_{30}H_{32}N_2O_2 \cdot HCl$ ), and not less than 80.0 percent and not more than 120.0 percent of the labeled amount of atropine sulfate [ $(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4 \cdot H_2O$ ].

**Packaging and storage**—Preserve in tight, light-resistant containers.

### USP Reference standards (11)—

USP Atropine Sulfate RS

USP Diphenoxylate Hydrochloride RS

**Identification**—The retention times of two major peaks in the chromatogram of the *Assay preparation* correspond to the atropine and diphenoxylate peaks in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

### Uniformity of dosage units (905)—

FOR ORAL SOLUTION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements with respect to diphenoxylate hydrochloride.

### Deliverable volume (698)—

FOR ORAL SOLUTION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

**pH** (791): between 3.0 and 4.3, determined in a dilution of the Oral Solution with an equal volume of water.

**Alcohol content** (611): between 13.5% and 16.5% of  $C_2H_5OH$ .

### Assay—

**Solution A**—Transfer 192 mg of sodium 1-pentanesulfonate monohydrate to a suitable container, add 200 mL of water, and sonicate to dissolve. Add 800 mL of water and 1.0 mL of phosphoric acid, and mix.

**Solution B**—Transfer 192 mg of sodium 1-pentanesulfonate monohydrate to a suitable container, add 200 mL of water, and sonicate to dissolve. Add 800 mL of acetonitrile, 1.0 mL of phosphoric acid, and mix.

**Mobile phase**—Prepare a filtered and degassed mixture of *Solution B* and *Solution A* (66:34). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Atropine stock preparation**—Dissolve an accurately weighed quantity of USP Atropine Sulfate RS in dehydrated alcohol, and dilute quantitatively, and stepwise if necessary, with dehydrated alcohol to obtain a solution having a known concentration of about 0.04 mg per mL.

**Standard preparation**—Transfer about 20 mg of USP Diphenoxylate Hydrochloride RS to a 200-mL volumetric flask, add about 100 mL of dehydrated alcohol, and sonicate to dissolve. Accurately add 5.0 mL of *Atropine stock preparation* and 34 mL of water, and mix. Allow the solution to reach room temperature, and then dilute with dehydrated alcohol to volume. This solution contains about 0.1 mg of diphenoxylate hydrochloride and about 0.001 mg of atropine sulfate per mL.

**Assay preparation**—Transfer an accurately measured volume of the Oral Solution, equivalent to about 2.5 mg of diphenoxylate hydrochloride, based on the label claim, to a 25-mL volumetric flask, wash inside of the pipet with small

portions of dehydrated alcohol, add the washings to the flask, dilute with dehydrated alcohol to volume, and mix. Pass a portion of the solution obtained through a 0.45- $\mu$ m PTFE filter, discarding the first few mL, and use the clear filtrate.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm  $\times$  25-cm column that contains 5- $\mu$ m packing L10. The flow rate is about 1.7 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.35 for atropine and 1.0 for diphenoxylate; the resolution,  $R$ , between atropine and diphenoxylate is not less than 5.0; the tailing factor is not more than 1.5 for atropine; and the relative standard deviation for replicate injections is not more than 2.0% for diphenoxylate and not more than 5.0% for atropine. [NOTE—If a significant tailing of the diphenoxylate peak is observed (greater than 2.5), it is recommended to maintain the column temperature at 25°, to stabilize the system.]

**Procedure**—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of diphenoxylate hydrochloride ( $C_{30}H_{32}N_2O_2 \cdot HCl$ ) in the portion of Oral Solution taken by the formula:

$$25C_D (r_U / r_S)$$

in which 25 is the volume, in mL, of the *Assay preparation*;  $C_D$  is the concentration, in mg per mL, of USP Diphenoxylate Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the diphenoxylate peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Calculate the quantity, in mg, of atropine sulfate [ $(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4 \cdot H_2O$ ] in the portion of Oral Solution taken by the formula:

$$(694.83/676.83)(25)C_A (r_U / r_S)$$

in which 694.83 and 676.83 are the molecular weights of atropine sulfate monohydrate and anhydrous atropine sulfate, respectively; 25 is the volume, in mL, of the *Assay preparation*;  $C_A$  is the concentration, in mg per mL, of USP Atropine Sulfate RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the atropine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Diphenoxylate Hydrochloride and Atropine Sulfate Tablets

» Diphenoxylate Hydrochloride and Atropine Sulfate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of diphenoxylate hydrochloride ( $C_{30}H_{32}N_2O_2 \cdot HCl$ ), and not less than 80.0 percent and not more than 120.0 percent of the labeled amount of atropine sulfate [ $(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4 \cdot H_2O$ ].

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

### USP Reference standards (11)—

USP Atropine Sulfate RS

USP Diphenoxylate Hydrochloride RS

**Identification**—The retention times of two major peaks in the chromatogram of the *Assay preparation* correspond to the atropine and diphenoxylate peaks in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Dissolution** <711>—

*Medium:* 0.2 M acetic acid; 500 mL.

*Apparatus 1:* 150 rpm.

*Time:* 45 minutes.

Determine the amount of  $C_{30}H_{32}N_2O_2 \cdot HCl$  dissolved by employing the following method.

*Mobile phase*—Prepare a suitable degassed mixture of acetonitrile and 0.05 M monobasic potassium phosphate (65:35).

*Standard solution*—Dissolve an accurately weighed quantity of USP Diphenoxylate Hydrochloride RS in methanol to obtain a solution having a known concentration of about 250 µg per mL. Pipet 10 mL of this solution into a 500-mL volumetric flask, dilute with *Dissolution Medium* to volume, mix, and filter.

*Chromatographic system* (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 210-nm detector and a 3.9-mm × 30-cm column that contains packing L11. The flow rate is about 1.0 mL per minute. Chromatograph replicate injections of the *Standard solution*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 1.5; and the relative standard deviation is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 50 µL) of the *Standard solution* and of filtered portions of the solution under test into the chromatograph, record the chromatograms, measure the response for the major peak, and determine the amount of  $C_{30}H_{32}N_2O_2 \cdot HCl$  dissolved.

*Tolerances*—Not less than 75% (Q) of the labeled amount of  $C_{30}H_{32}N_2O_2 \cdot HCl$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements for *Content uniformity* with respect to diphenoxylate hydrochloride.

**Assay**—

*Diluent*—Use a mixture of acetonitrile and water (1:1).

*Solution A*—Transfer 192 mg of sodium 1-pentane-sulfonate monohydrate to a suitable container, add 200 mL of water, and sonicate to dissolve. Add 800 mL of water and 1.0 mL of phosphoric acid, and mix.

*Solution B*—Transfer 192 mg of sodium 1-pentane-sulfonate monohydrate to a suitable container, add 200 mL of water, and sonicate to dissolve. Add 800 mL of acetonitrile and 1.0 mL of phosphoric acid, and mix.

*Mobile phase*—Prepare a filtered and degassed mixture of *Solution B* and *Solution A* (66:34). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

*Atropine stock preparation*—Dissolve an accurately weighed quantity of USP Atropine Sulfate RS in *Diluent*, and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.04 mg per mL.

*Standard preparation*—Transfer about 20 mg of USP Diphenoxylate Hydrochloride RS to a 200-mL volumetric flask, add about 100 mL of *Diluent*, and sonicate to dissolve. Accurately add 5.0 mL of *Atropine stock preparation*, and mix. Allow the solution to reach room temperature, and then dilute with *Diluent* to volume. This solution contains about 0.1 mg of diphenoxylate hydrochloride and about 0.001 mg of atropine sulfate per mL.

*Assay preparation*—Transfer an accurately counted number of Tablets, equivalent to about 25 mg of diphenoxylate hydrochloride, based on the label claim, to a 250-mL volumetric flask, add approximately 100 mL of *Diluent*, and shake by mechanical means for at least 15 minutes or until the Tablets are completely disintegrated. Sonicate for an additional 15 minutes, allow the solution to reach room temperature, dilute with *Diluent* to volume, and mix. Pass a portion of the solution obtained through a 0.45-µm PTFE filter, discarding the first few mL, and use the clear filtrate.

*Chromatographic system* (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 220-nm detector

and a 4.6-mm × 25-cm column that contains 5-µm packing L10. The flow rate is about 1.7 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.35 for atropine and 1.0 for diphenoxylate; the resolution, *R*, between atropine and diphenoxylate is not less than 5.0; the tailing factor is not more than 1.5 for atropine; and the relative standard deviation for replicate injections is not more than 2.0% for diphenoxylate and not more than 5.0% for atropine. [NOTE—If a significant tailing of the diphenoxylate peak is observed (greater than 2.5), it is recommended to maintain the column temperature at 25°, to stabilize the system.]

*Procedure*—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of diphenoxylate hydrochloride ( $C_{30}H_{32}N_2O_2 \cdot HCl$ ) in the portion of Tablets taken by the formula:

$$250C_D(r_U / r_S)$$

in which 250 is the volume, in mL, of the *Assay preparation*;  $C_D$  is the concentration, in mg per mL, of USP Diphenoxylate Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the diphenoxylate peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Calculate the quantity, in mg, of atropine sulfate [ $(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4 \cdot H_2O$ ] in the portion of the Tablets taken by the formula:

$$(694.83/676.83)(250)C_A(r_U / r_S)$$

in which 694.83 and 676.83 are the molecular weights of atropine sulfate monohydrate and anhydrous atropine sulfate, respectively; 250 is the volume, in mL, of the *Assay preparation*;  $C_A$  is the concentration, in mg per mL, of USP Atropine Sulfate RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the atropine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dipivefrin Hydrochloride

$C_{19}H_{29}NO_5 \cdot HCl$  387.90

Propanoic acid, 2,2-dimethyl-, 4-[1-hydroxy-2-(methylamino)ethyl]-1,2-phenylene ester, hydrochloride, (±)-.

(±)-3,4-Dihydroxy-α-[(methylamino)methyl]benzyl alcohol 3,4-dipivalate hydrochloride [64019-93-8].

» Dipivefrin Hydrochloride contains not less than 98.5 percent and not more than 101.5 percent of  $C_{19}H_{29}NO_5 \cdot HCl$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** <11>—

USP Dipivefrin Hydrochloride RS

**Identification**—

**A:** *Infrared Absorption* <197K>.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**C:** A solution (1 in 100) meets the requirements of the tests for *Chloride* (191).

**Melting range** (741): between 155° and 165°, but the range between beginning and end of melting does not exceed 2°.

**Loss on drying** (731)—Dry it in a suitable vacuum drying tube over phosphorus pentoxide at 60° for 6 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.3%.

**Heavy metals, Method I** (231): not more than 0.0015%.

**Iron** (241): not more than 5 ppm.

**Standard iron solution**—Use the *Standard Iron Solution* prepared as directed under *Iron* (241).

**Hydroxylamine solution**—Dissolve 5 g of hydroxylamine hydrochloride in 50 mL of water.

**Triazine solution**—Dissolve 125 mg of 2,4,6-tri-(2-pyridyl)-S-triazine in 100 mL of methanol.

**Standard solution**—Into a 50-mL color-comparison tube pipet 1 mL of *Standard iron solution*, add 42.0 mL of water, and mix.

**Test solution**—Into a 50-mL color-comparison tube add 2.0 g of Dipivefrin Hydrochloride, 43.0 mL of water, and mix.

**Procedure**—To each of the tubes containing the *Standard solution* and the *Test solution*, add 5.0 mL of *Hydroxylamine solution*, 2.0 mL of *Triazine solution*, and mix: the color of the solution from the *Test solution* is not darker than that of the solution from the *Standard solution*.

#### Assay—

**Mobile phase**—Prepare a mixture of acetonitrile, 0.014 M sodium dodecyl sulfate, and glacial acetic acid (24:15:1).

**Standard preparation**—Dissolve a suitable quantity of USP Dipivefrin Hydrochloride RS, accurately weighed, in 0.0015 N hydrochloric acid to obtain a solution having a known concentration of about 5 mg per mL.

**Assay preparation**—Dissolve a suitable quantity of Dipivefrin Hydrochloride, accurately weighed, in 0.0015 N hydrochloric acid to obtain a solution having a known concentration of about 5 mg per mL.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm × 30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 500 theoretical plates; the tailing factor for the major peak is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph by means of a suitable microsyringe or sampling valve, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of C<sub>19</sub>H<sub>29</sub>NO<sub>5</sub> · HCl in the portion of Dipivefrin Hydrochloride taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which  $C_S$  is the concentration, in mg per mL, of dipivefrin hydrochloride in the *Standard preparation*;  $C_U$  is the concentration, in mg per mL, of dipivefrin hydrochloride in the *Assay preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dipivefrin Hydrochloride Ophthalmic Solution

» Dipivefrin Hydrochloride Ophthalmic Solution is a sterile, aqueous solution of Dipivefrin Hydrochloride. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of C<sub>19</sub>H<sub>29</sub>NO<sub>5</sub> · HCl. It contains a suitable antimicrobial agent and may contain stabilizers, suitable buffers, and chelating agents.

**Packaging and storage**—Preserve in tight, light-resistant containers.

#### USP Reference standards (11)—

USP Dipivefrin Hydrochloride RS

**Identification**—It meets the requirements for *Identification test B* under *Dipivefrin Hydrochloride*.

**Sterility tests** (71): meets the requirements.

**pH** (791): between 2.5 and 3.5.

#### Assay—

**Mobile phase and Chromatographic system**—Prepare as directed in the *Assay* under *Dipivefrin Hydrochloride*.

**Standard preparation**—Dissolve a suitable quantity of USP Dipivefrin Hydrochloride RS, accurately weighed, in 0.0015 N hydrochloric acid to obtain a solution having a known concentration of about 1 mg per mL.

**Assay preparation**—Transfer an accurately measured volume of Ophthalmic Solution, equivalent to about 25 mg of dipivefrin hydrochloride, to a 25-mL volumetric flask, dilute with 0.0015 N hydrochloric acid to volume, if necessary, and mix.

**Procedure**—Proceed as directed in the *Assay* under *Dipivefrin Hydrochloride*. Calculate the quantity, in mg, of C<sub>19</sub>H<sub>29</sub>NO<sub>5</sub> · HCl in each mL of the Ophthalmic Solution taken by the formula:

$$(25C / V)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Dipivefrin Hydrochloride RS in the *Standard preparation*;  $V$  is the volume, in mL, of Ophthalmic Solution taken; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dipyridamole

C<sub>24</sub>H<sub>40</sub>N<sub>8</sub>O<sub>4</sub> 504.63

Ethanol, 2,2',2'',2'''-[4,8-di-1-piperidinyl]pyrimido[5,4-d]pyrimidine-2,6-diyl)dinitrilo]tetraethanol.

2,2',2'',2'''-[4,8-Dipiperidinopyrimido[5,4-d]pyrimidine-2,6-diyl)dinitrilo]tetraethanol [58-32-2].

» Dipyridamole contains not less than 98.0 percent and not more than 102.0 percent of C<sub>24</sub>H<sub>40</sub>N<sub>8</sub>O<sub>4</sub>, calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers. Store at room temperature.

**USP Reference standards** (11)—

USP Dipyridamole RS

**Identification, Infrared Absorption** (197K).

**Melting range** (741): between 162° and 168°, but the range between beginning and end of melting does not exceed 2°.

**Loss on drying** (731)—Dry it at 105° for 3 hours; it loses not more than 0.2% of its weight.

**Chloride**—Dissolve 500 mg in 5 mL of alcohol and 2 mL of 2 N nitric acid, and add 1 mL of silver nitrate TS: no turbidity or precipitate is produced.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals, Method II** (231): 0.001%.

**Chromatographic purity**—

*Mobile phase and Chromatographic system*—Prepare as directed in the Assay under Dipyridamole Tablets.

*Test preparation A*—Prepare a solution of Dipyridamole in methanol having a known concentration of 1 mg per mL.

*Test preparation B*—Dilute 1.0 mL of Test preparation A with methanol to 100 mL, and mix.

*Procedure*—Inject 10 µL of Test preparation B into the chromatograph by means of a sampling valve, adjusting the operating parameters so that the response of the main peak (retention time about 6.5 minutes) obtained is about 5% full scale. Inject 10 µL of Test preparation A, and run the chromatograph for 10 minutes: the sum of responses of all secondary peaks obtained from Test preparation A is not greater than the response of the main peak obtained from Test preparation B (1.0%).

**Assay**—Transfer about 450 mg of Dipyridamole, accurately weighed, to a 250-mL beaker, and dissolve in 50 mL of glacial acetic acid. Stir for 30 minutes. Add 75 mL of acetone, and stir for an additional 15 minutes. Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically, using a glass electrode and a silver-silver chloride reference electrode system. Perform a blank titration, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 50.46 mg of C<sub>24</sub>H<sub>40</sub>N<sub>8</sub>O<sub>4</sub>.

## Dipyridamole Injection

» Dipyridamole Injection is a sterile solution of Dipyridamole in Water for Injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of dipyridamole (C<sub>24</sub>H<sub>40</sub>N<sub>8</sub>O<sub>4</sub>).

**Packaging and storage**—Preserve in Containers for Injections as described under Injections (1). Protect from light, and avoid freezing.

**USP Reference standards** (11)—

USP Dipyridamole RS

USP Endotoxin RS

**Identification**—

**A: Thin-Layer Chromatographic Identification Test** (201)—

*Test solution*—Use the Injection.

*Standard solution*: 5 mg per mL in a mixture of methanol, water, and 0.1 N hydrochloric acid (5:4:1).

*Developing solvent system*: a mixture of butyl alcohol, water, and glacial acetic acid (34:10:5).

*Procedure*—Proceed as directed in the chapter. Locate the yellow spots on the plate: the R<sub>F</sub> value of the principal spot

obtained from the Test solution corresponds to that of the principal spot obtained from the Standard solution. Spray the plate lightly with a spray reagent prepared as follows. Transfer 1 g of iodine and 3 g of potassium iodide to a 100-mL volumetric flask. Add 10 mL of alcohol to dissolve (heat gently). Add 20 mL of 2 N sulfuric acid, dilute with water to volume, and mix. Store in a dark place. Observe the plate, and locate the brown spots: the R<sub>F</sub> value of the principal spot obtained from the Test solution corresponds to that of the principal spot obtained from the Standard solution.

**B:** The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

**Bacterial endotoxins** (85)—It contains not more than 8.8 USP Endotoxin Units per mg of dipyridamole.

**pH** (791): between 2.2 and 3.2.

**Chromatographic purity**—[NOTE—Protect dipyridamole solutions from exposure to light.]

*Mobile phase and Chromatographic system*—Proceed as directed in the Assay.

*Test solution*—Use the Assay preparation prepared as directed in the Assay.

*Procedure*—Inject a volume (about 10 µL) of the Test solution into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each impurity in the portion of Injection taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the peak response for each impurity; and  $r_s$  is the sum of the responses of all of the peaks: not more than 2.0% of any individual impurity is found; and not more than 4.5% of total impurities is found.

**Other requirements**—It meets the requirements under Injections (1).

**Assay**—[NOTE—Protect dipyridamole solutions from exposure to light.]

*Acetate buffer*—Dissolve a quantity of sodium acetate in water to obtain a concentration of about 6.8 mg per mL. Adjust with acetic acid to a pH of 5.1 ± 0.1.

*Mobile phase*—Prepare a filtered and degassed mixture of methanol and Acetate buffer (65:35). Make adjustments if necessary (see System Suitability under Chromatography (621)).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Dipyridamole RS in Mobile phase, and dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having a known concentration of about 1.0 mg per mL.

*Assay preparation*—Transfer an accurately measured volume of Injection, equivalent to about 25 mg of dipyridamole, to a 25-mL volumetric flask, dilute with Mobile phase to volume, and mix.

*Chromatographic system* (see Chromatography (621))—The liquid chromatograph is equipped with a 276-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the column efficiency is not less than 2000 theoretical plates; the tailing factor is not greater than 1.7; and the relative standard deviation for replicate injections is not greater than 2.0%.

*Procedure*—Separately inject equal volumes (about 10 µL) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quan-

tity, in mg, of dipyridamole ( $C_{24}H_{40}N_8O_4$ ) in the portion of Injection taken by the formula:

$$25C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Dipyridamole RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dipyridamole Oral Suspension

### DEFINITION

Dipyridamole Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of dipyridamole ( $C_{24}H_{40}N_8O_4$ ).

Prepare Dipyridamole Oral Suspension 10 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Dipyridamole	1 g
Vehicle: a 1:1 mixture of Vehicle for Oral Solution (regular or sugar-free), NF, and Vehicle for Oral Suspension, NF, a sufficient quantity to make	100 mL

Place the required number of tablets into a suitable mortar and comminute to a fine powder, or add *Dipyridamole* powder to the mortar. Add 20 mL of *Vehicle*, and mix to a uniform paste. Add *Vehicle* in small portions, and mix well after each addition. Transfer, stepwise and quantitatively, to a graduated or calibrated bottle. Add *Vehicle* in portions to rinse the mortar, add sufficient *Vehicle* to bring to final volume, and mix well.

### ASSAY

#### PROCEDURE

**Solution A:** 1 mg/mL of dibasic sodium phosphate. Adjust with dilute phosphoric acid (1 in 3) to a pH of 4.6.

**Mobile phase:** Methanol and *Solution A* (75:25). Pass through a membrane filter of a 0.5- $\mu$ m pore size, and degas.

**Standard solution:** 100  $\mu$ g/mL of USP Dipyridamole RS in *Mobile phase*

**Sample solution:** Agitate the container of Oral Suspension for 30 min on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at  $-70^\circ$  until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix on a vortex mixer for 30 s. Pipet 1.0 mL of the sample into a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 288 nm

**Column:** 4.6-mm  $\times$  25-cm; 5- $\mu$ m packing L1

**Flow rate:** 1.3 mL/min

**Injection volume:** 20  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

[NOTE—The retention time for dipyridamole is about 7.3 min.]

#### Suitability requirements

**Relative standard deviation:** NMT 2.3% for replicate injections

### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of the labeled amount of dipyridamole ( $C_{24}H_{40}N_8O_4$ ) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of dipyridamole in the *Standard solution* ( $\mu$ g/mL)

$C_U$  = nominal concentration of dipyridamole in the *Sample solution* ( $\mu$ g/mL)

**Acceptance criteria:** 90.0%–110.0%

### SPECIFIC TESTS

• **pH (791):** 3.8–4.8

### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at controlled room temperature, or in a cold place.

• **LABELING:** Label it to state that it is to be well shaken, and to state the *Beyond-Use Date*.

• **BEYOND-USE DATE:** NMT 60 days after the date on which it was compounded

• **USP REFERENCE STANDARDS (11)**  
USP Dipyridamole RS

## Dipyridamole Tablets

» Dipyridamole Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{24}H_{40}N_8O_4$ .

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards (11)**—

USP Dipyridamole RS

**Identification**—Triturate a quantity of finely powdered Tablets, equivalent to about 100 mg of dipyridamole, with 10 mL of 0.1 N hydrochloric acid, and filter, collecting the filtrate in a beaker. Add 0.1 N sodium hydroxide until the solution is basic and a precipitate forms. Heat the mixture on a steam bath for 1 minute, cool, and filter. Dry the residue at  $105^\circ$  for 1 hour: the residue so obtained responds to the *Identification* test under *Dipyridamole*.

**Dissolution (711)**—

*Medium:* 0.1 N hydrochloric acid; 900 mL.

*Apparatus 2:* 50 rpm.

*Time:* 30 minutes.

**Procedure**—Determine the amount of  $C_{24}H_{40}N_8O_4$  dissolved by employing UV absorption at the wavelength of maximum absorbance at about 282 nm on filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a *Standard solution* having a known concentration of USP Dipyridamole RS in the same *Medium*.

**Tolerances**—Not less than 70% (Q) of the labeled amount of  $C_{24}H_{40}N_8O_4$  is dissolved in 30 minutes.

**Uniformity of dosage units (905):** meet the requirements.

**Procedure for content uniformity**—Transfer 1 Tablet to a 100-mL volumetric flask, add 50 mL of 1 N hydrochloric acid, heat in a steam bath for 5 minutes, and shake by mechanical means for 30 minutes. Cool to room temperature, dilute with 1 N hydrochloric acid to volume, and mix. Filter, discarding the first 25 mL of the filtrate. Dilute an accurately

measured portion of the subsequent filtrate with 1 N hydrochloric acid to provide a solution containing about 10 µg of dipyrnidamole per mL. Concomitantly determine the absorbances of this solution and of a solution of USP Dipyrnidamole RS in the same medium having a known concentration of about 10 µg per mL, in 1-cm cells at the wavelength of maximum absorbance at about 282 nm using 1 N hydrochloric acid as the blank. Calculate the quantity, in mg, of  $C_{24}H_{40}N_8O_4$  in the Tablet taken by the formula:

$$(TC / D)(A_U / A_S)$$

in which *T* is the labeled quantity, in mg, of dipyrnidamole in the Tablet; *C* is the concentration, in µg per mL, of USP Dipyrnidamole RS in the *Standard solution*; *D* is the concentration, in µg per mL, of dipyrnidamole in the solution from the Tablet based upon the labeled quantity per Tablet and the extent of dilution; and *A<sub>U</sub>* and *A<sub>S</sub>* are the absorbances of the solution from the Tablet and the *Standard solution*, respectively.

#### Assay—

**Mobile phase**—Dissolve 250 mg of dibasic sodium phosphate in 250 mL of water, and adjust with dilute phosphoric acid (1 in 3) to a pH of 4.6. Add 750 mL of methanol, mix, filter through a 0.5-µm membrane filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Using an accurately weighed quantity of USP Dipyrnidamole RS, prepare a solution in *Mobile phase* having a known concentration of about 15 µg per mL.

**Assay preparation**—Transfer not less than 20 Tablets to a 1000-mL volumetric flask, add 100 mL of water, and sonicate for 15 minutes. Add about 750 mL of methanol, and shake by mechanical means for 30 minutes. Dilute with methanol to volume, mix, and centrifuge. Dilute an accurately measured volume (*V<sub>S</sub>* mL) of the clear supernatant quantitatively with *Mobile phase* to obtain a solution (*V<sub>A</sub>* mL) containing about 15 µg of dipyrnidamole per mL.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 288-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency determined from the analyte peak is not less than 1000 theoretical plates, the tailing factor for the analyte peak is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{24}H_{40}N_8O_4$  in the Tablets taken by the formula:

$$C(V_A / V_S)(r_U / r_S)$$

in which *C* is the concentration, in µg per mL, of USP Dipyrnidamole RS in the *Standard preparation*; *V<sub>A</sub>* is the volume, in mL, of the *Assay preparation*; *V<sub>S</sub>* is the volume, in mL, of supernatant taken for the *Assay preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dirithromycin

$C_{42}H_{78}N_2O_{14}$  835.07

Erythromycin, 9-deoxy-11-deoxy-9,11-[imino[2-(2-methoxyethoxy)ethylidene]oxy]-, 9*S*(*R*)-, (9*S*)-9-Deoxy-11-deoxy-9,11-[imino[(1*R*)-2-(2-methoxyethoxy)ethylidene]oxy]erythromycin [62013-04-1].

» Dirithromycin contains not less than 96.0 percent and not more than 102.0 percent of  $C_{42}H_{78}N_2O_{14}$ , consisting of the 16*R*- and 16*S*-epimers, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** <11>—

USP Dirithromycin RS

**Identification**—

**A: Infrared Absorption** <197K>.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Water**, *Method I* <921>: not more than 1.0%.

**Heavy metals**, *Method II* <231>: 0.002%.

**Limit of dirithromycin 16*S*-epimer**—Using the chromatogram obtained in the test for *Chromatographic purity*, calculate the percentage of dirithromycin 16*S*-epimer in the portion of Dirithromycin taken by the formula:

$$1000(C / W)(r_E / r_S)$$

in which *r<sub>E</sub>* is the response for dirithromycin 16*S*-epimer found in the chromatogram of the *Test solution*; and the other terms are as defined therein: not more than 1.5% of dirithromycin 16*S*-epimer is found.

**Chromatographic purity**—

*Potassium phosphate buffer*, *Mobile phase*, *System suitability solution*, *Solvent*, and *Chromatographic system*—Proceed as directed in the *Assay*.

**Standard solution**—Quantitatively dissolve an accurately weighed quantity of USP Dirithromycin RS in *Solvent* to obtain a solution having a known concentration of about 0.2 mg per mL.

**Test solution**—Transfer about 100 mg of Dirithromycin, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with *Solvent* to volume, and mix.

**Procedure**—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, and record the chromatograms for a period of time that is not less than three times the retention time of dirithromycin (16*R*-epimer). Calculate the percentage of

each impurity found in the portion of Dirithromycin taken by the formula:

$$1000(C / W)(r_i / r_s)$$

in which *C* is the concentration, in mg per mL, of USP Dirithromycin RS in the *Standard solution*; *W* is the quantity, in mg, of Dirithromycin taken to prepare the *Test solution*; *r<sub>i</sub>* is the response for each impurity found in the chromatogram of the *Test solution*; and *r<sub>s</sub>* is the response of the dirithromycin (16*R*-epimer) in the chromatogram of the *Standard solution*: not more than 1.5% of 9-(*S*)-erythromycylamine is found; not more than 1.0% of any other individual impurity is found; and not more than 4.0% of total impurities is found. [NOTE—Do not regard dirithromycin 16*S*-epimer as an impurity.]

#### Assay—

**Potassium phosphate buffer**—Dissolve 1.41 g of monobasic potassium phosphate and 6.91 g of dibasic potassium phosphate in 1 L of water, and pass through a filter having a porosity of 0.5 μm or finer.

**Mobile phase**—Prepare a degassed mixture of acetonitrile, *Potassium phosphate buffer*, and methanol (44:37:19).

**System suitability solution**—Dissolve an accurately weighed quantity of USP Dirithromycin RS in *Mobile phase* to obtain a solution having a concentration of about 2.5 mg per mL. Store this solution at room temperature for about 24 hours. [NOTE—The solution then contains an equilibrated mixture of dirithromycin (16*R*-epimer), dirithromycin 16*S*-epimer, and 9-(*S*)-erythromycylamine. The solution may be used for 1 month when stored at room temperature.]

**Solvent**—Prepare a mixture of acetonitrile and methanol (70:30).

**Standard preparation**—Quantitatively dissolve an accurately weighed quantity of USP Dirithromycin RS in *Solvent* to obtain a solution having a known concentration of about 2 mg per mL.

**Assay preparation**—Transfer about 20 mg of Dirithromycin, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with *Solvent* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 205-nm detector and a 4.6-mm × 25-cm column that contains 5-μm packing L1 and is maintained at a constant temperature of about 40°. The flow rate is about 2 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.7 for 9-(*S*)-erythromycylamine, 1.0 for dirithromycin (16*R*-epimer), and 1.12 for dirithromycin 16*S*-epimer. The resolution, *R<sub>s</sub>*, between dirithromycin (16*R*-epimer) and dirithromycin 16*S*-epimer is not less than 2.0, and between dirithromycin (16*R*-epimer) and 9-(*S*)-erythromycylamine is not less than 5.0, the tailing factor for the dirithromycin (16*R*-epimer) peak is not more than 2.0, and the relative standard deviation of the dirithromycin (16*R*-epimer) peak for replicate injections is not more than 1.0%.

**Procedure**—Separately inject equal volumes (about 10 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas of the major peaks. Calculate the percentage of C<sub>42</sub>H<sub>78</sub>N<sub>2</sub>O<sub>14</sub> in the portion of Dirithromycin taken by the formula:

$$1000(C / W)(r_U / r_s) + P_E$$

in which *C* is the concentration, in mg per mL, of USP Dirithromycin RS in the *Standard preparation*; *W* is the quantity, in mg, of Dirithromycin taken to prepare the *Assay preparation*; *r<sub>U</sub>* and *r<sub>s</sub>* are the area responses for dirithromycin (16*R*-epimer) obtained from the *Assay preparation* and the *Standard preparation*, respectively; and *P<sub>E</sub>* is the percentage of 16*S*-epimer as determined in the test for *Limit of dirithromycin 16S-epimer*.

## Dirithromycin Delayed-Release Tablets

» Dirithromycin Delayed-Release Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of dirithromycin (C<sub>42</sub>H<sub>78</sub>N<sub>2</sub>O<sub>14</sub>), consisting of the 16*R*- and 16*S*-epimers.

**Packaging and storage**—Preserve in tight containers.

#### USP Reference standards <11>—

USP Dirithromycin RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Dissolution** <711>—Proceed as directed for *Procedure* for *Method B* under *Apparatus 1* and *Apparatus 2*, *Delayed-Release Dosage Forms*.

#### ACID STAGE—

**Medium:** 0.1 N hydrochloric acid; 900 mL.

**Apparatus 1:** 10-mesh basket; 100 rpm.

**XanthydroL TS**—[NOTE—Prepare this solution daily.] To about 150 mg of xanthydroL in a 100-mL volumetric flask, add 10 mL of glacial acetic acid, and swirl to dissolve. Dilute with hydrochloric acid to volume, and mix.

**Standard solution**—Quantitatively dissolve an accurately weighed quantity of USP Dirithromycin RS in 0.1 N hydrochloric acid to obtain a solution having a known concentration of about 0.28 mg per mL.

**Procedure**—After 2 hours of operation, remove each Tablet, or the major portion thereof if the Tablet is not intact, from the individual vessel, and subject each Tablet to the test in the *Buffer stage*. Separately add 0.50 mL of acetic anhydride to 0.50 mL of the filtered solution under test and to 0.50 mL of the *Standard solution*, and mix. Add 5.0 mL of glacial acetic acid, allow to stand for 5 minutes, then add 0.50 mL of *XanthydroL TS*, and allow 30 minutes for color development. Determine the amount of C<sub>42</sub>H<sub>78</sub>N<sub>2</sub>O<sub>14</sub>, including the 16*R*- and 16*S*-epimers, dissolved by employing UV absorption at the wavelength of maximum absorbance at about 540 nm.

#### BUFFER STAGE—

**Medium:** pH 6.8 phosphate buffer; 900 mL.

**Procedure**—Proceed as directed for *Acid stage* beginning with "Separately add 0.50 mL of acetic anhydride".

**Tolerances**—Not less than 80% (*Q*) of the labeled amount of C<sub>42</sub>H<sub>78</sub>N<sub>2</sub>O<sub>14</sub>, including the 16*R*- and 16*S*-epimers, is dissolved in 45 minutes.

**Uniformity of dosage units** <905>: meet the requirements.

**Water, Method I** <921>: not more than 5.0%.

#### Chromatographic purity—

**Potassium phosphate buffer, Mobile phase and System suitability solution**—Proceed as directed in the *Assay* under *Dirithromycin*.

**Phosphate buffer**—Dissolve 4.35 g of dibasic potassium phosphate in 1 L of water, adjust with phosphoric acid to a pH of 8.0, and pass through a filter having a 0.5 μm or finer porosity.

**Solvent 1**—Prepare a mixture of acetonitrile and *Phosphate buffer* (60:40).

**Solvent 2**—Prepare a mixture of acetonitrile and *Phosphate buffer* (98:2). [NOTE—The mixture is cloudy.]

**Standard solution**—Quantitatively dissolve an accurately weighed quantity of USP Dirithromycin RS in *Solvent 1* to obtain a solution having a known concentration of about

0.2 mg per mL. [NOTE—Inject the *Standard solution* into the chromatograph immediately after preparation.]

**Test solution**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 745 mg of dirithromycin, to a 50-mL volumetric flask, dissolve in and dilute with *Solvent 2* to volume, and mix. Centrifuge a portion of this solution, transfer 6.0 mL of the clear supernatant to a 10-mL volumetric flask, dilute with *Phosphate buffer* to volume, and mix. [NOTE—Inject the *Test solution* into the chromatograph immediately after preparation.]

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 205-nm detector and a 4.6-mm × 25-cm column that contains 5-μm packing L1 and is maintained at a constant temperature of about 40°. The flow rate is about 2 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.7 for 9-(S)-erythromyclamine, 1.0 for dirithromycin (16R-epimer), and 1.12 for dirithromycin 16S-epimer; the resolution, *R*, between the dirithromycin (16R-epimer) and dirithromycin 16S-epimer is not less than 2.0, and between dirithromycin (16R-epimer) and 9-(S)-erythromyclamine is not less than 5.0; and the tailing factor for the dirithromycin (16R-epimer) peak is not more than 2.0.

**Procedure**—Separately inject equal volumes (about 20 μL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms for a period of time that is not less than three times the retention time of dirithromycin (16R-epimer), and measure the peak areas. Calculate the percentage of each impurity found in the portion of Tablets taken by the formula:

$$50,000(C / 6W)(L / T)(r_i / r_s)$$

in which *C* is the concentration, in mg per mL, of USP Dirithromycin RS in the *Standard solution*; *W* is the quantity, in mg, of Tablet powder taken to prepare the *Test solution*; *L* is the labeled amount, in mg, of dirithromycin in each Tablet; *T* is the average weight, in mg, of each Tablet; *r<sub>i</sub>* is the peak response for each impurity obtained from the *Test solution*; and *r<sub>s</sub>* is the peak response of dirithromycin (16R-epimer) obtained from the *Standard solution*: not more than 1.5% of 9-(S)-erythromyclamine is found; and not more than 5.0% of total impurities is found. [NOTE—Do not regard dirithromycin 16S-epimer as an impurity.]

#### Assay—

*Potassium phosphate buffer*, *Mobile phase*, *System suitability solution*, and *Solvent*—Proceed as directed in the Assay under *Dirithromycin*.

**Standard preparation**—Quantitatively dissolve an accurately weighed quantity of USP Dirithromycin RS in *Solvent* to obtain a solution having a known concentration of about 2.5 mg per mL.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 250 mg of dirithromycin, to a 100-mL volumetric flask, dissolve in and dilute with *Solvent* to volume, and mix. Centrifuge a portion of this solution, and use the clear supernatant as the *Assay preparation*.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 205-nm detector and a 4.6-mm × 25-cm column that contains 5-μm packing L1 and is maintained at a constant temperature of about 40°. The flow rate is about 2 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.7 for 9-(S)-erythromyclamine, 1.0 for dirithromycin (16R-epimer), and 1.12 for dirithromycin 16S-epimer; the resolution, *R*, between the dirithromycin (16R-epimer) and dirithromycin 16S-epimer is not less than 2.0, and between dirithromycin (16R-epimer) and 9-(S)-erythro-

myclamine is not less than 5.0; the tailing factor for the dirithromycin (16R-epimer) peak is not more than 2.0; and the relative standard deviation determined from the dirithromycin (16R-epimer) peak for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of dirithromycin (C<sub>42</sub>H<sub>78</sub>N<sub>2</sub>O<sub>14</sub>), which includes the 16R- and 16S-epimers, in the portion of Tablets taken by the formula:

$$40C(r_U + r_E) / r_S$$

in which *C* is the concentration, in mg per mL, of USP Dirithromycin RS in the *Standard preparation*; *r<sub>U</sub>* and *r<sub>E</sub>* are the peak responses for dirithromycin (16R-epimer) and dirithromycin 16S-epimer, respectively, obtained from the *Assay preparation*; and *r<sub>S</sub>* is the peak response of dirithromycin (16R-epimer) obtained from the *Standard preparation*.

## Disopyramide Phosphate

C<sub>21</sub>H<sub>29</sub>N<sub>3</sub>O · H<sub>3</sub>PO<sub>4</sub> 437.47

2-Pyridineacetamide, α-[2-[bis(1-methylethyl)amino]ethyl]-α-phenyl-, (±)-, phosphate (1:1).

(±)-α-[2-(Diisopropylamino)ethyl]-α-phenyl-2-pyridineacetamide phosphate (1:1) [22059-60-5].

» Disopyramide Phosphate contains not less than 98.0 percent and not more than 102.0 percent of C<sub>21</sub>H<sub>29</sub>N<sub>3</sub>O · H<sub>3</sub>PO<sub>4</sub>, calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

#### USP Reference standards <11>—

USP Disopyramide Phosphate RS

#### Identification—

**A:** *Infrared Absorption* <197M>.

**B:** A solution (1 in 200) meets the requirements of the tests for *Phosphate* <191>.

**pH** <791>: between 4.0 and 5.0 in a solution (1 in 20).

**Loss on drying** <731>—Dry it at 105° for 4 hours: it loses not more than 0.5% of its weight.

**Heavy metals**, *Method II* <231>: 0.002%.

#### Chromatographic purity—

**Standard solutions**—Prepare solutions *A* and *B* of USP Disopyramide Phosphate RS in methanol having concentrations of about 50 and 100 μg per mL, respectively.

**Test solution**—Prepare a solution of Disopyramide Phosphate in methanol having a concentration of about 10 mg per mL.

**Procedure**—Separately apply 10-μL portions of *Standard solutions A* and *B* and the *Test solution* to a suitable thin-layer chromatographic plate (see *Chromatography* <621>), coated with a 0.25-mm layer of chromatographic silica gel. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of toluene, dehydrated alcohol, and ammonium hydroxide (170:28:2) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber,

allow to air-dry, and spray with potassium bismuth iodide TS: the  $R_f$  value of the principal spot obtained from the *Test solution* corresponds to that obtained from *Standard solution B*. Estimate the levels of any additional spots observed in the chromatogram of the *Test solution* by comparison with the principal spots in the chromatograms of *Standard solutions A* and *B*: the sum of the intensities of any additional spots observed is not greater than that obtained from *Standard solution B* (equivalent to 1%).

**Assay**—Dissolve about 160 mg of Disopyramide Phosphate, accurately weighed, in 50 mL of glacial acetic acid, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 21.87 mg of  $C_{21}H_{29}N_3O \cdot H_3PO_4$ .

## Disopyramide Phosphate Capsules

» Disopyramide Phosphate Capsules contain an amount of Disopyramide Phosphate equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of disopyramide ( $C_{21}H_{29}N_3O$ ).

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—  
USP Disopyramide Phosphate RS

**Identification**—Transfer a portion of Capsule contents, equivalent to about 125 mg of disopyramide phosphate, to a 25-mL volumetric flask, add 20 mL of methanol, and shake by mechanical means for 20 minutes. Dilute with methanol to volume, mix, and filter through paper (Whatman No. 2 or equivalent), discarding the first 10 mL of the filtrate. Apply 10  $\mu$ L each of the subsequent filtrate and of a solution of USP Disopyramide Phosphate RS in methanol containing 6.2 mg per mL to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of toluene, alcohol, and ammonium hydroxide (170:28:2) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by viewing under short-wavelength UV light: the  $R_f$  value of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution.

**Dissolution** (711)—

Medium: water; 1000 mL.

Apparatus 2: 50 rpm.

Time: 20 minutes.

**Procedure**—Filter 15 mL of the solution under test, and transfer 10.0 mL of the filtrate to a 25-mL volumetric flask. Dilute with 2 N sulfuric acid to volume, and mix. Determine the amount of disopyramide ( $C_{21}H_{29}N_3O$ ) dissolved from UV absorbances at the wavelength of maximum absorbance at about 268 nm of this solution, using water as the blank, in comparison with a Standard solution having a known concentration of USP Disopyramide Phosphate RS in the same medium.

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_{21}H_{29}N_3O$  is dissolved in 20 minutes.

**Uniformity of dosage units** (905): meet the requirements.

## Assay—

**Methanolic sulfuric acid**—Cautiously add 5.4 mL of sulfuric acid to about 1800 mL of methanol with stirring, dilute with methanol to 2000 mL, and mix.

**Procedure**—Weigh the contents of not fewer than 20 Phosphate Capsules, and calculate the average weight per Capsule. Mix the combined contents of the Capsules, and transfer an accurately weighed portion, equivalent to about 125 mg of disopyramide phosphate, to a glass-stoppered, 125-mL flask. Add 50 mL of *Methanolic sulfuric acid*, and stir for 30 minutes. Filter through a medium-porosity, sintered-glass filter, and rinse thoroughly with *Methanolic sulfuric acid*. Transfer the combined filtrate and rinsings to a 100-mL volumetric flask, dilute with *Methanolic sulfuric acid* to volume, and mix. Dilute an accurately measured portion of this solution quantitatively and stepwise with the same solvent to obtain a solution having a concentration of about 40  $\mu$ g per mL. Dissolve an accurately weighed portion of USP Disopyramide Phosphate RS in *Methanolic sulfuric acid*, and dilute quantitatively and stepwise with the same solvent to obtain a solution having a known concentration of about 40  $\mu$ g per mL. Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 268 nm, with a suitable spectrophotometer, using *Methanolic sulfuric acid* as the blank. Calculate the quantity, in mg, of  $C_{21}H_{29}N_3O$  in the portion of Capsules taken by the formula:

$$3.125(339.48 / 437.47)C(A_U / A_S)$$

in which 339.48 and 437.47 are the molecular weights of disopyramide and disopyramide phosphate, respectively; C is the concentration, in  $\mu$ g per mL, of USP Disopyramide Phosphate RS in the Standard solution; and  $A_U$  and  $A_S$  are the absorbances of the solution from the Capsules and the Standard solution, respectively.

## Disopyramide Phosphate Extended-Release Capsules

» Disopyramide Phosphate Extended-Release Capsules contain an amount of Disopyramide Phosphate equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of disopyramide ( $C_{21}H_{29}N_3O$ ).

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—The labeling indicates the *Dissolution Test* with which the product complies.

**USP Reference standards** (11)—  
USP Disopyramide Phosphate RS

**Identification**—Transfer a portion of Capsule contents, equivalent to about 195 mg of disopyramide phosphate, to a 25-mL volumetric flask, add 20 mL of methanol, and shake by mechanical means for 20 minutes. Dilute with methanol to volume, mix, and filter, discarding the first 10 mL of the filtrate. Apply 20  $\mu$ L each of the subsequent filtrate and of a solution of USP Disopyramide Phosphate RS in methanol containing 7.7 mg per mL to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of toluene, absolute alcohol, and ammonium hydroxide (170:28:2) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by viewing under

short-wavelength UV light: the  $R_f$  value of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution.

#### Dissolution <711>—

TEST 1—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 1*.

*pH 2.5, 0.1 M Phosphate buffer*—Dissolve 272 g of monobasic potassium phosphate in 20 L of water, and adjust with hydrochloric acid to a pH of  $2.50 \pm 0.04$ . [NOTE—Do not adjust back to pH 2.50 with base if too much acid is added. It is imperative that the ionic strength of the buffer be controlled.]

*Medium:* pH 2.5, 0.1 M Phosphate buffer; 1000 mL.

*Apparatus 1:* 100 rpm.

*Times:* 1 hour; 2 hours; 5 hours; 12 hours.

*Procedure*—Filter 10 mL of the solution under test at the required test points. Determine the amount of disopyramide ( $C_{21}H_{29}N_3O$ ) dissolved from UV absorbances at the wavelength of maximum absorbance at about 261 nm of this solution, suitably diluted with *Medium*, if necessary, using *Medium* as the blank, in comparison with a Standard solution having a known concentration of USP Disopyramide Phosphate RS dissolved in *Medium*.

*Tolerances*—The percentage of the labeled amount of disopyramide ( $C_{21}H_{29}N_3O$ ) dissolved is within the range stated at each of the following times.

Time (hours)	Amount dissolved
1	between 5% and 25%
2	between 17% and 43%
5	between 50% and 80%
12	not less than 85%

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

*pH 2.5, 0.1 M Phosphate buffer*, and *Procedure*—Proceed as directed for *Test 1*.

*Medium*—Prepare as directed for *Test 1*; 900 mL.

*Apparatus 2:* 100 rpm.

*Times and Tolerances:*

Time (hours)	Amount dissolved
1	between 5% and 30%
4	between 40% and 65%
8	between 60% and 90%
12	not less than 75%

**Uniformity of dosage units <905>:** meet the requirements.

#### Assay—

*Standard preparation*—Dissolve an accurately weighed quantity of USP Disopyramide Phosphate RS in 0.1 N sulfuric acid, and dilute quantitatively and stepwise with the same solvent to obtain a solution having a known concentration of about 40 µg per mL.

*Assay preparation*—Grind the contents of not fewer than 20 Capsules to a powder fine enough to pass through a 40-mesh screen. Transfer an accurately weighed portion of the powder, equivalent to about 650 mg of disopyramide phosphate, to a 500-mL volumetric flask. Add about 400 mL

of 0.1 N sulfuric acid, and shake for 30 minutes. Dilute with 0.1 N sulfuric acid to volume, mix, and filter. Dilute an accurately measured portion of the filtrate quantitatively and stepwise with 0.1 N sulfuric acid to obtain a solution having a concentration of about 40 µg per mL.

*Procedure*—Concomitantly determine the absorbances of the *Assay preparation* and the *Standard preparation* at the wavelength of maximum absorbance at about 261 nm, with a suitable spectrophotometer, using 0.1 N sulfuric acid as the blank. Calculate the quantity, in mg, of  $C_{21}H_{29}N_3O$  in the portion of Capsules taken by the formula:

$$16.25(339.48 / 437.47)C(A_U / A_S)$$

in which 339.48 and 437.47 are the molecular weights of disopyramide and disopyramide phosphate, respectively; C is the concentration, in µg per mL, of USP Disopyramide Phosphate RS in the *Standard preparation*; and  $A_U$  and  $A_S$  are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

## Disulfiram

$C_{10}H_{20}N_2S_4$  296.54  
Thioperoxydicarbonyl diamide  $[(H_2N)C(S)]_2S_2$ , tetraethyl-;  
Bis(diethylthiocarbamoyl) disulfide [97-77-8].

#### DEFINITION

Disulfiram contains NLT 98.0% and NMT 102.0% of  $C_{10}H_{20}N_2S_4$ .

#### IDENTIFICATION

- A. INFRARED ABSORPTION <197K>**
- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

#### ASSAY

##### PROCEDURE

**Buffer:** 6.8 g/L of monobasic potassium phosphate in water. Adjust with 45% potassium hydroxide solution to a pH of 7.0.

**Mobile phase:** Methanol and *Buffer* (7:3)

**Standard stock solution:** 1 mg/mL of USP Disulfiram RS in alcohol. [NOTE—Discard this solution after 5 days.]

**Standard solution:** 0.02 mg/mL of USP Disulfiram RS from the *Standard stock solution* diluted with *Mobile phase*. [NOTE—Prepare the *Standard solution* fresh daily.]

**Sample stock solution:** Transfer 50 mg of Disulfiram to a 50-mL volumetric flask, add 40 mL of alcohol, sonicate for 5 min to completely dissolve, cool, and dilute with alcohol to volume. [NOTE—Discard this solution after 5 days.]

**Sample solution:** 0.02 mg/mL of Disulfiram from the *Sample stock solution* diluted with *Mobile phase*. [NOTE—Prepare the *Sample solution* fresh daily.]

**Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** UV 250 nm**Column:** 4-mm × 15-cm; 5-μm packing L1**Flow rate:** 1 mL/min**Injection size:** 20 μL**System suitability****Sample:** *Standard solution***Suitability requirements****Column efficiency:** NLT 1800 theoretical plates**Tailing factor:** NMT 2**Relative standard deviation:** NMT 2.0%**Analysis****Samples:** *Standard solution* and *Sample solution*Calculate the percentage of C<sub>10</sub>H<sub>20</sub>N<sub>2</sub>S<sub>4</sub> in the portion of Disulfiram taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 $r_U$  = peak response from the *Sample solution* $r_S$  = peak response from the *Standard solution* $C_S$  = concentration of USP Disulfiram RS in the *Standard solution* (μg/mL) $C_U$  = concentration of Disulfiram in the *Sample solution* (μg/mL)**Acceptance criteria:** 98.0%–102.0%**IMPURITIES****Inorganic Impurities**

- **RESIDUE ON IGNITION** <281>: NMT 0.1%

- **SELENIUM** <291>: 30 ppm

[NOTE— Perform this test only if selenium is a known inorganic process impurity.]

**SPECIFIC TESTS**

- **MELTING RANGE OR TEMPERATURE**, *Class I* <741>: 69°–72°

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **USP REFERENCE STANDARDS** <11>—  
USP Disulfiram RS

**Disulfiram Tablets**

» Disulfiram Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of C<sub>10</sub>H<sub>20</sub>N<sub>2</sub>S<sub>4</sub>.

**Packaging and storage**—Preserve in tight, light-resistant containers.**USP Reference standards** <11>—

USP Disulfiram RS

**Identification**—**A:** *Infrared Absorption* <197K> of a portion of powdered Tablets.**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation*, as obtained in the *Assay*.**Disintegration** <701>: 15 minutes, the use of disks being omitted.**Uniformity of dosage units** <905>: meet the requirements.**Assay**—*Buffer solution A*, *Buffer solution B*, *Mobile phase*, *Standard preparation*, and *Chromatographic system*—Proceed as directed in the *Assay* under *Disulfiram*.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of disulfiram, to a 100-mL volumetric flask, add about 70 mL of alcohol and swirl, sonicate for 5 minutes, and shake by mechanical means for 30 minutes or until dissolved. Dilute with alcohol to volume, mix, and filter. [NOTE—Discard this solution after 5 days.] Quantitatively dilute this solution with *Mobile phase* to obtain the *Assay preparation* having a concentration of about 0.02 mg per mL. [NOTE—Prepare the *Assay preparation* fresh daily.]

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Disulfiram*. Calculate the quantity, in mg, of C<sub>10</sub>H<sub>20</sub>N<sub>2</sub>S<sub>4</sub> in the portion of Tablets taken by the formula:

$$5C(r_U / r_S)$$

in which  $C$  is the concentration, in μg per mL, of USP Disulfiram RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Divalproex Sodium**

(C<sub>16</sub>H<sub>31</sub>NaO<sub>4</sub>)<sub>n</sub>  
 Pentanoic acid, 2-propyl-, sodium salt (2:1);  
 Sodium hydrogen bis(2-propylvalerate) oligomer.

310.41

**DEFINITION**

Divalproex Sodium contains NLT 98.0% and NMT 102.0% of available valproic acid (C<sub>8</sub>H<sub>16</sub>O<sub>2</sub>).

**IDENTIFICATION**

- **A. INFRARED ABSORPTION** <197K>
- **B. IDENTIFICATION TESTS—GENERAL**, *Sodium* <191>  
*Sample:* 100 mg  
*Analysis:* Ignite the *Sample*.  
*Acceptance criteria:* Meets the requirements

**ASSAY**• **PROCEDURE****Solution A:** 3.5 g of monobasic sodium phosphate monohydrate in 900 mL of water. Adjust with phosphoric acid to a pH of 3.5. ## Divalproex Sodium Delayed-Release Capsules

**DEFINITION**

Divalproex Sodium Delayed-Release Capsules contain an amount of divalproex sodium equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of valproic acid (C<sub>8</sub>H<sub>16</sub>O<sub>2</sub>).

**IDENTIFICATION**

- **A. INFRARED ABSORPTION** <197K>
  - Diluent:** Acetonitrile and water (1:1)
  - Standard:** Prepare as directed in <197F> using USP Valproic Acid RS.
  - Sample:** Dissolve the contents of 20 Capsules in 30 mL of *Diluent* in a 50-mL volumetric flask. Sonicate for 30 min to dissolve. Dilute with *Diluent* to volume. Centrifuge the solution at 3000 rpm for about 20 min. Pipet

20 mL of the supernatant into a separatory funnel. Extract with 50 mL of *n*-hexane. Collect the *n*-hexane layer, and evaporate the solvent. Cast 1 mg of the liquid obtained after evaporation to NaCl windows.

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY**• **PROCEDURE****Buffer:** 6.8 g/L of monobasic potassium phosphate. Adjust with phosphoric acid to a pH of 3.0.**Mobile phase:** Acetonitrile and *Buffer* (2:3)**Diluent:** Acetonitrile and water (1:1)**Standard solution:** Transfer a suitable amount of USP Valproic Acid RS to a suitable volumetric flask to obtain a solution having a final concentration of 2.5 mg/mL of valproic acid. Add 40% of the flask volume of *Diluent*. Sonicate for 5 min, and add 20% of the flask volume of 0.1 N hydrochloric acid. Dilute with *Diluent* to volume.**Sample solution:** Transfer an amount of contents (from NLT 20 Capsules) to a suitable volumetric flask to obtain a nominal concentration of 2.5 mg/mL of valproic acid. Dissolve in 20% of the flask volume of 0.1 N hydrochloric acid, and sonicate for 5 min. Add 60% of the flask volume of *Diluent*, and sonicate for an additional 25 min. Dilute with *Diluent* to volume. Centrifuge at 4000 rpm for 10 min, and use the clear supernatant.**Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** UV 215 nm**Column:** 4.6-mm × 15-cm; 5-μm packing L1**Flow rate:** 1.8 mL/min**Injection volume:** 20 μL**System suitability****Sample:** *Standard solution***Suitability requirements****Tailing factor:** NMT 2.0 for valproic acid**Relative standard deviation:** NMT 2.0% for valproic acid**Analysis****Samples:** *Standard solution* and *Sample solution*Calculate the percentage of valproic acid (C<sub>8</sub>H<sub>16</sub>O<sub>2</sub>) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 $r_U$  = peak response from the *Sample solution* $r_S$  = peak response from the *Standard solution* $C_S$  = concentration of USP Valproic Acid RS in the *Standard solution* (mg/mL) $C_U$  = nominal concentration of valproic acid in the *Sample solution* (mg/mL)**Acceptance criteria:** 90.0%–110.0% of valproic acid**PERFORMANCE TESTS****Change to read:**• **DISSOLUTION** <711>**Test 1****Medium:** Phosphate buffer, pH 7.5 (6.8 g/L of monobasic potassium phosphate and 1.64 g/L of sodium hydroxide in water, adjusted with 0.08 N hydrochloric acid to a pH of 7.5); 500 mL, degassed**Apparatus 2:** 50 rpm, with sinkers**Time:** 2, 4, and 6 h**Buffer and Mobile phase:** Prepare as directed in the *Assay*.**Standard stock solution:** 1.6 mg/mL of USP Valproic Acid RS in *Mobile phase***Standard solution:** 0.26 mg/mL of valproic acid from the *Standard stock solution* and *Medium*

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45- $\mu$ m pore size. Replace the volume withdrawn with an equal volume of *Medium* previously heated at  $37.0 \pm 0.5^\circ$ .

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.6-mm  $\times$  15-cm; 5- $\mu$ m packing L1

**Flow rate:** 1.8 mL/min

**Injection volume:** 40  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** NMT 2.0 for valproic acid

**Relative standard deviation:** NMT 2.0% for valproic acid

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of valproic acid ( $C_8H_{16}O_2$ ) dissolved ( $D_i$ ) at each time interval:

$$D_i = (r_U/r_S) \times (C_S/L) \times V \times 100$$

- $r_U$  = peak response from the *Sample solution*
- $r_S$  = peak response from the *Standard solution*
- $C_S$  = concentration of the *Standard solution* (mg/mL)
- $L$  = label claim (mg/Capsule)
- $V$  = volume of *Medium*, 500 mL

Percentage of valproic acid dissolved at 2 h =  $D_1$

Percentage of valproic acid dissolved at 4 h =  $D_2 + [(D_1/V) \times V_S]$

Percentage of valproic acid dissolved at 6 h =  $D_3 + [(D_1/V) \times V_S] + [(D_2/V) \times V_S]$

- $V$  = volume of *Medium*, 500 mL
- $V_S$  = volume withdrawn at each sampling time (mL)

**Tolerances:** NLT 20% (Q) of the labeled amount of valproic acid ( $C_8H_{16}O_2$ ) is dissolved in 2 h; NLT 70% (Q) of the labeled amount of valproic acid ( $C_8H_{16}O_2$ ) is dissolved in 4 h; and NLT 85% (Q) of the labeled amount of valproic acid ( $C_8H_{16}O_2$ ) is dissolved in 6 h.

**Test 2:** If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.

#### Procedure A

**Medium:** 0.05 M phosphate buffer, pH 7.5 (6.8 g/L of monobasic potassium phosphate and 1.64 g/L of sodium hydroxide in water, adjusted with 2 N sodium hydroxide to a pH of 7.5); 500 mL

**Apparatus 2:** 50 rpm, contents of the Capsule

**Time:** 15 min

**Standard solution A:** 0.036 mg/mL of USP Valproic Acid RS in *Medium*. A volume of acetonitrile not exceeding 10% of the total volume may be used to dissolve valproic acid.

**Sample solution A:** Pass a portion of the solution under test through a suitable filter of 0.45- $\mu$ m pore size.

#### Procedure B

**Medium:** 0.05 M phosphate buffer, pH 7.5 (6.8 g/L of monobasic potassium phosphate and 1.64 g/L of sodium hydroxide in water, adjusted with 2 N sodium hydroxide to a pH of 7.5); 900 mL

**Apparatus 2:** 50 rpm, with wire helix sinkers

**Time:** 4 h

**Buffer A:** 0.5 g/L of monohydrate citric acid and 0.4 g/L of dibasic sodium phosphate in water

**Buffer B:** 6.8 g/L of monobasic potassium phosphate and 1.7 g/L of sodium hydroxide in water. Adjust with phosphoric acid to a pH of 7.4.

**Mobile phase:** Acetonitrile, *Buffer A*, and *Buffer B* (30:35:35). Adjust with phosphoric acid to a pH of 3.0.

**Standard solution B:** 0.13 mg/mL of USP Valproic Acid RS in *Medium*. A volume of acetonitrile not exceeding 10% of the total volume may be used to dissolve valproic acid.

**Sample solution B:** Pass a portion of the solution under test through a suitable filter of 0.45- $\mu$ m pore size.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 3.9-mm  $\times$  15-cm; 4- $\mu$ m packing L11

**Flow rate:** 1.2 mL/min

**Injection volume:** 200  $\mu$ L for *Standard solution A* and *Sample solution A*, 50  $\mu$ L for *Standard solution B* and *Sample solution B*

#### System suitability

**Sample:** *Standard solution B*

#### Suitability requirements

**Tailing factor:** NMT 2.0 for valproic acid

**Relative standard deviation:** NMT 2.0% for valproic acid

#### Analysis

**Samples:** *Standard solution A*, *Standard solution B*, *Sample solution A*, and *Sample solution B*

Calculate the percentage of the labeled amount of valproic acid ( $C_8H_{16}O_2$ ) dissolved at each time point:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

- $r_U$  = peak response from *Sample solution A* or *Sample solution B*
- $r_S$  = peak response from *Standard solution A* or *Standard solution B*
- $C_S$  = concentration of *Standard solution A* or *Standard solution B* (mg/mL)
- $L$  = label claim (mg/Capsule)
- $V$  = volume of *Medium*, 500 mL for *Sample solution A* and 900 mL for *Sample solution B*

**Tolerances:** NMT 20% of the labeled amount of valproic acid ( $C_8H_{16}O_2$ ) is dissolved in 15 min (*Sample solution A*); and NLT 80% (Q) of the labeled amount of valproic acid ( $C_8H_{16}O_2$ ) is dissolved in 4 h (*Sample solution B*). The percentage of the labeled amount of valproic acid ( $C_8H_{16}O_2$ ) dissolved at 4 h conforms to *Acceptance Table 1* in *Dissolution* <711>.

**Test 3:** If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 3*.

#### Medium

**Acid stage medium:** 0.08 N hydrochloric acid; 900 mL

**Buffer stage medium:** pH 7.5 phosphate buffer (6.8 g/L of monobasic potassium phosphate and 1.6 g/L of sodium hydroxide in water, prepared as follows. Transfer suitable quantities of monobasic potassium phosphate and sodium hydroxide to a suitable volumetric flask. Dissolve in 83% of the flask volume of water, and adjust with 0.1 N hydrochloric acid, if necessary, to a pH of 7.5. Dilute the resulting solution with water to volume); 900 mL

#### Time

**Acid stage time:** 2 h

**Buffer stage time:** 4 h

#### Apparatus 2: 50 rpm, with sinkers

**Buffer:** • 0.25 g/L of citric acid monohydrate, 0.2 g/L of anhydrous dibasic sodium phosphate, 3.4 g/L of monobasic potassium phosphate, and 0.85 g/L of sodium hydroxide in water. (ERR 1-May-2012)

**Mobile phase:** Acetonitrile and Buffer (45:55), mixed, degassed, and adjusted with phosphoric acid to a pH of 2.5

**Standard solution:** 0.14 mg/mL of USP Valproic Acid RS prepared as follows. Transfer a portion of USP Valproic Acid RS to a suitable volumetric flask. Dissolve in methanol using 5.0% of the final volume. Dilute to final volume with Buffer stage medium, and mix.

**Sample solution**

**Acid stage sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45- $\mu$ m pore size, discarding the first 3 mL of filtrate.

**Buffer stage sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45- $\mu$ m pore size, discarding the first 3 mL of filtrate.

**Chromatographic system**

(See Chromatography <621>, System Suitability.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 3.9-mm  $\times$  15-cm; 4- $\mu$ m packing L11

**Flow rate:** 1 mL/min

**Injection volume:** 50  $\mu$ L

**System suitability**

**Sample:** Standard solution

**Suitability requirements**

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** Standard solution, Acid stage sample solution, and Buffer stage sample solution

Calculate the percentage of the labeled amount of valproic acid ( $C_8H_{16}O_2$ ) dissolved at each timepoint (Q):

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_U$  = peak response from Acid stage sample solution or Buffer stage sample solution

$r_S$  = peak response from the Standard solution

$C_S$  = concentration of the Standard solution (mg/mL)

$L$  = label claim (mg/Capsule)

$V$  = volume of Acid stage medium or Buffer stage medium (900 mL)

**Tolerances:** The requirements for the Acid stage and the Buffer stage must be met.

**Acid stage:** NMT 30% (Q) of the labeled amount of valproic acid ( $C_8H_{16}O_2$ ) is dissolved in 2 h (Acid stage sample solution). The percentage of the labeled amount of valproic acid ( $C_8H_{16}O_2$ ) dissolved at 2 h conforms to Table 1.

**Table 1**

Level	Number Tested	Criteria
A <sub>1</sub>	6	No individual value exceeds Q dissolved.
A <sub>2</sub>	6	Average of the 12 units (A <sub>1</sub> + A <sub>2</sub> ) is not more than Q dissolved; and no individual unit is greater than Q + 15% dissolved.
A <sub>3</sub>	12	Average of the 24 units (A <sub>1</sub> + A <sub>2</sub> + A <sub>3</sub> ) is not more than Q dissolved; and no individual unit is greater than Q + 15% dissolved.

**Buffer stage:** NLT 80% (Q) of the labeled amount of valproic acid ( $C_8H_{16}O_2$ ) is dissolved in 4 h (Buffer stage sample solution). The percentage of the labeled amount of valproic acid ( $C_8H_{16}O_2$ ) dissolved at 4 h conforms to Acceptance Table 2 in Dissolution <711>.

- **UNIFORMITY OF DOSAGE UNITS <905>:** Meet the requirements

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers at controlled room temperature.

- **LABELING:** Divalproex Delayed-Release Capsules may be swallowed whole or may be administered by carefully opening the Capsule and sprinkling the entire contents on a small amount of soft food. This drug/food mixture should be swallowed immediately and not chewed. It should not be stored for future use. When more than one Dissolution test is given, the labeling states the Dissolution test used only if Test 1 is not used.

- **USP REFERENCE STANDARDS <11>**  
USP Valproic Acid RS

## Divalproex Sodium Delayed-Release Tablets

» Divalproex Sodium Delayed-Release Tablets contain an amount of divalproex sodium equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of valproic acid ( $C_8H_{16}O_2$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers, and store at controlled room temperature.

**USP Reference standards <11>**—

USP Valproic Acid RS

**Identification**—The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

**Dissolution <711>**—

ACID STAGE—

**Medium:** 0.08 N hydrochloric acid (prepared by adding 40 mL of hydrochloric acid to 5000 mL of water, adjusting with 2 N hydrochloric acid to a pH of 1.2, and diluting with water to 6000 mL); 900 mL.

**Apparatus 2:** 50 rpm.

**Time:** 1 hour.

**Procedure**—At the end of 1 hour, carefully transfer the Tablet to a dissolution vessel containing the Medium of the Buffer stage. [NOTE—Do not perform an analysis of the Medium in the Acid stage.]

BUFFER STAGE—

**Medium:** pH 7.5 phosphate buffer (prepared by dissolving 40.83 g of monobasic potassium phosphate and 9.84 g of sodium hydroxide in 5000 mL of water, adjusting with 0.08 N hydrochloric acid to a pH of 7.5, and diluting with water to 6000 mL); 900 mL.

**Apparatus 2:** 50 rpm.

**Time:** 1 hour.

Determine the amount of  $C_8H_{16}O_2$  dissolved in the Buffer stage by employing the following method.

**Citrate buffer**—Dissolve 0.5 g of citric acid monohydrate and 0.4 g of dibasic sodium phosphate in 1.0 L of water.

**Potassium phosphate buffer**—Dissolve 6.8 g of monobasic potassium phosphate and 1.7 g of sodium hydroxide in 1.0 L of water. Adjust with phosphoric acid to a pH of 7.4  $\pm$  0.1.

**Mobile phase**—Prepare a mixture of Citrate buffer, Potassium phosphate buffer, and acetonitrile (35:35:30). Adjust with phosphoric acid to a pH of 3.0  $\pm$  0.1, and mix. Filter and degas. Make adjustments if necessary (see System Suitability under Chromatography <621>).

**Standard solution**—Prepare a solution of USP Valproic Acid RS in the Medium used in the Buffer stage, having a known concentration of about 0.12 mg per mL. [NOTE—A volume of acetonitrile not exceeding 10.0% of the total volume may be used to dissolve the USP Valproic Acid RS.]

**Test solution**—If necessary, dilute a portion of each filtered solution under test with the *Medium* used in the *Buffer stage* to obtain a solution having a concentration of about 0.12 mg per mL.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 210-nm detector and a 3.9-mm × 15-cm column that contains 4-μm packing L11. The flow rate is about 1.2 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 1000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 50 μL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of valproic acid (C<sub>8</sub>H<sub>16</sub>O<sub>2</sub>) dissolved by the formula:

$$900CD(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Valproic Acid RS in the *Standard solution*; *D* is the dilution factor used to prepare the *Test solution*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak areas of valproic acid obtained from the *Test solution* and the *Standard solution*, respectively.

**Tolerances**—Not less than 80% (*Q*) of the labeled amount of C<sub>8</sub>H<sub>16</sub>O<sub>2</sub> is dissolved in 1 hour in the *Buffer stage*.

**Uniformity of dosage units** (905): meet the requirements.

#### Assay—

**Citrate buffer**—Dissolve 2.0 g of citric acid monohydrate and 1.6 g of dibasic sodium phosphate in 4.0 L of water.

**Mobile phase**—Prepare a mixture of *Citrate buffer* and acetonitrile (7:3). Adjust with phosphoric acid to a pH of 3.0 ± 0.1, and mix. Filter and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Prepare a solution of USP Valproic Acid RS in *Mobile phase* having a known concentration of about 0.5 mg per mL.

**Assay preparation**—Transfer a number of whole Tablets containing the equivalent of about 2500 mg of valproic acid into a 250-mL volumetric flask. Add 150 mL of *Mobile phase*, and sonicate with frequent swirling for 30 minutes or until the Tablets completely disintegrate. Allow the solution to cool down to room temperature, and then dilute with *Mobile phase* to volume. Transfer 5.0 mL of the resulting solution to a 100-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 210-nm detector and a 3.9-mm × 15-cm column that contains 4-μm packing L11. The flow rate is about 0.9 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 1000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 15 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of valproic acid (C<sub>8</sub>H<sub>16</sub>O<sub>2</sub>) in the portion of Tablets taken by the formula:

$$5000C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Valproic Acid RS in the *Standard preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak areas of valproic acid obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Divalproex Sodium Extended-Release Tablets

### DEFINITION

Divalproex Sodium Extended-Release Tablets contain an amount of divalproex sodium equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of valproic acid (C<sub>8</sub>H<sub>16</sub>O<sub>2</sub>).

### IDENTIFICATION

- A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

**Buffer:** 0.5 g of citric acid monohydrate and 0.4 g of dibasic sodium phosphate in 1 L of water

**Mobile phase:** Methanol and *Buffer* (11:9). Adjust with phosphoric acid to a pH of 5.0.

**Diluent:** *Buffer*, adjusted with phosphoric acid to a pH of 2.0

**Standard stock solution:** 2.5 mg/mL of USP Valproic Acid RS in methanol

**Standard solution:** 1.0 mg/mL of USP Valproic Acid RS from the *Standard stock solution* in *Diluent*

**Sample stock solution:** Transfer an amount of powder (from NLT 20 Tablets) to a suitable volumetric flask to obtain a nominal concentration of 2.5 mg/mL of valproic acid. Dissolve in 50% of the flask volume of methanol by shaking for 1 h. Dilute with methanol to volume, and pass through a suitable filter.

**Sample solution:** 1.0 mg/mL of valproic acid from the filtrate of the *Sample stock solution* in *Diluent*

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 3.9-mm × 15-cm; 4-μm packing L11

**Flow rate:** 0.7 mL/min

**Injection volume:** 20 μL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** NMT 2.0 for valproic acid

**Relative standard deviation:** NMT 2.0% for valproic acid

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of valproic acid (C<sub>8</sub>H<sub>16</sub>O<sub>2</sub>) in the portion of Tablets taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times 100$$

*r<sub>U</sub>* = peak response from the *Sample solution*

*r<sub>S</sub>* = peak response from the *Standard solution*

*C<sub>S</sub>* = concentration of USP Valproic Acid RS in the *Standard solution* (mg/mL)

*C<sub>U</sub>* = nominal concentration of valproic acid in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0% of valproic acid

### PERFORMANCE TESTS

#### Change to read:

#### DISSOLUTION <711>

##### Test 1

**Acid stage medium:** 0.1 N hydrochloric acid; 500 mL

**Buffer stage medium:** 21.6 g of sodium dodecyl sulfate, 6.9 g of sodium dihydrogen phosphate monohydrate, and 0.12 g of sodium hydroxide in 1 L of water.

Adjust with diluted sodium hydroxide or phosphoric acid to a pH of 5.5; 900 mL.

**Apparatus 2:** 100 rpm, with three-prong sinkers only for 250-mg Tablets, if necessary

**Times:** 45 min in the *Acid stage medium*; 3, 9, 12, and 24 h in the *Buffer stage medium* (RB 1-May-2012)

**Analysis:** After 45 min in the *Acid stage medium*, withdraw a sample from the solution, and immediately filter. Replace the *Acid stage medium* with the *Buffer stage medium*, and run the test for the times specified.

**Buffer:** 1.42 g of dibasic sodium phosphate and 0.5 mL of glacial acetic acid in 1 L of water. Adjust with phosphoric acid to a pH of 2.5.

**Mobile phase:** Methanol and *Buffer* (13:7)

**Standard stock solution:** 2.5 mg/mL of USP Valproic Acid RS in methanol

**Standard solution:** 0.15 mg/mL of USP Valproic Acid RS from the *Standard stock solution* in the *Buffer stage medium*. [NOTE—Add 40% of the flask volume of methanol before diluting with *Buffer stage medium* to volume.]

**Sample solutions:** Pass a portion of the solution under test through a suitable filter of 20- $\mu$ m pore size. Use the *Sample solution* from the *Acid stage medium* as is. Dilute the *Sample solution* from the *Buffer stage medium* with methanol by a factor of 2.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 3.9-mm  $\times$  15-cm; 10- $\mu$ m packing L11

**Column temperature:** 30°

**Flow rate:** 1 mL/min

**Injection volume:** 80  $\mu$ L

**Run time:** 6 min

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** NMT 2.5

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution*, *Sample solution* from the *Acid stage medium*, and *Sample solutions* from the *Buffer stage medium*

Calculate the percentage of the labeled amount of valproic acid ( $C_8H_{16}O_2$ ) dissolved in the *Acid stage medium*:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V_A \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Valproic Acid RS in the *Standard solution* (mg/mL)

$L$  = label claim (mg/Tablet)

$V_A$  = volume of the *Acid stage medium*, 500 mL

Calculate the concentration of valproic acid ( $C_8H_{16}O_2$ ) dissolved in the *Buffer stage medium* at the time interval,  $t$ , in mg/mL:

$$C_t = (r_U/r_S) \times (C_S \times D_U)$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Valproic Acid RS in the *Standard solution* (mg/mL)

$D_U$  = dilution factor of the *Sample solution* in the *Buffer stage medium*, 2

Calculate the percentage of the labeled amount of valproic acid ( $C_8H_{16}O_2$ ) in the *Buffer stage medium* at the first time interval:

$$\text{Result} = C_1 \times V_B \times (100/L)$$

$C_1$  = concentration of valproic acid in the *Buffer stage medium* at the first time interval (mg/mL)

$V_B$  = volume of the *Buffer stage medium*, 900 mL

$L$  = label claim (mg/Tablet)

Calculate the percentage of the labeled amount of valproic acid ( $C_8H_{16}O_2$ ) dissolved in the *Buffer stage medium* at the second time interval:

$$\text{Result} = [C_2 \times (V_B - V_S)] + (C_1 \times V_S) \times (100/L)$$

$C_2$  = concentration of valproic acid in the *Buffer stage medium* at the second time interval (mg/mL)

$V_B$  = volume of the *Buffer stage medium*, 900 mL

$V_S$  = volume of the sample taken at each time interval (mL)

$C_1$  = concentration of valproic acid in the *Buffer stage medium* at the first time interval (mg/mL)

$L$  = label claim (mg/Tablet)

Calculate the percentage of the labeled amount of valproic acid ( $C_8H_{16}O_2$ ) dissolved in the *Buffer stage medium* at the  $n^{\text{th}}$  time interval:

$$\text{Result} = C_n \times [V_B - (n - 1) \times V_S] + [(C_1 + C_2 + \dots + C_{n-1}) \times V_S] \times (100/L)$$

$C_n$  = concentration of valproic acid in the *Buffer stage medium* at the  $n^{\text{th}}$  time interval (mg/mL)

$V_B$  = volume of the *Buffer stage medium*, 900 mL

$V_S$  = volume of the sample taken (mL)

$C_1$  = concentration of valproic acid dissolved in the first time interval in the *Buffer stage medium* (mg/mL)

$C_2$  = concentration of valproic acid dissolved in the second time interval in the *Buffer stage medium* (mg/mL)

$C_{n-1}$  = concentration of valproic acid dissolved in the  $(n - 1)^{\text{th}}$  time interval in the *Buffer stage medium* (mg/mL)

$L$  = label claim (mg/Tablet)

#### Tolerances

**Acid stage:** NMT 10% of the labeled amount of valproic acid ( $C_8H_{16}O_2$ ) is dissolved.

**Buffer stage:** See *Table 1*.

**Table 1**

Time (h)	Amount Dissolved (Tablets labeled to contain 500 mg of valproic acid)	Amount Dissolved (Tablets labeled to contain 250 mg of valproic acid)
3	10%–30%	10%–30%
9	35%–55%	35%–60%
12	45%–70%	45%–75%
24	NLT 75%	NLT 75%

The percentage of the labeled amount of valproic acid ( $C_8H_{16}O_2$ ) dissolved at the times specified conform to *Acceptance Table 2* in *Dissolution* <711>.

**Test 2:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

**Acid stage medium:** 0.1 N hydrochloric acid; 500 mL

**Buffer stage concentrate:** 15.53 g/L of monobasic sodium phosphate monohydrate, 5.45 g/L of sodium hydroxide, and 48.65 g of sodium lauryl sulfate per L in water (final pH approximately 11); 400 mL

**Buffer stage medium:** Mix 400 mL of *Buffer stage concentrate* with 500 mL of *Acid stage medium* to a pH of  $5.5 \pm 0.05$ . [NOTE—If necessary, adjust the pH of the *Buffer stage concentrate* with 1 N hydrochloric acid or 1 N sodium hydroxide to assure that the final pH of

the mixture of media is 5.5.] Retain this solution to dilute the solutions prepared later.

**Apparatus 2:** 100 rpm, with wire helix sinkers

**Times:** 45 min in the *Acid stage medium*; 3, 9, 12, and 21 h in the *Buffer stage medium*. • The times in the *Buffer stage medium* include the time in the *Acid stage medium*. • (RB 1-May-2012)

**Procedure:** After 45 min in *Acid stage medium*, stop and lift the paddles from the vessels. Do not perform an analysis of the *Acid stage medium*. Transfer 400 mL of *Buffer stage concentrate* to the vessels containing the *Acid stage medium*, and run the test for the times specified.

**Buffer:** 3.5 g/L of monobasic sodium phosphate monohydrate in water. Adjust with phosphoric acid to a pH of 3.5.

**Mobile phase:** Acetonitrile and *Buffer* (1:1)

**Standard stock solution:** 28 mg/mL of USP Valproic Acid RS in a suitable volumetric flask. Dissolve with 20% of the flask volume of 1 N sodium hydroxide, and dilute with water to volume. Dilute this solution with *Buffer stage medium* to obtain a final concentration of about 2.8 mg/mL.

**Standard solutions:** Prepare a series of dilutions in *Buffer stage medium* from the *Standard stock solution* in the concentrations of 0.028, 0.11, 0.22, 0.50, and 0.70 mg/mL.

**Sample solution:** Withdraw 10 mL of the solution under test, and pass through a suitable filter of 35-µm pore size.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 215 nm

**Column:** 4.6-mm × 15-cm; 5-µm packing L7

**Flow rate:** 1 mL/min

**Injection volume:** 50 µL

#### System suitability

**Samples:** 0.028, 0.11, 0.22, 0.50, and 0.70 mg/mL of the *Standard solutions*

#### Suitability requirements

**Tailing factor:** NMT 2.0, using the 0.50-mg/mL *Standard solution*

**Relative standard deviation:** NMT 2.0%

**Correlation coefficient:** NLT 0.999, using the five concentrations of the *Standard solution*

#### Analysis

**Samples:** *Sample solutions*

From the standard curve, determine the amount of valproic acid ( $C_8H_{16}O_2$ ) dissolved at each time interval using the response of each *Sample solution*.

Calculate the percentage of the labeled amount of valproic acid ( $C_8H_{16}O_2$ ) dissolved in the *Buffer stage medium* at the first time interval:

$$\text{Result} = (C_1 \times V_B) \times (100/L)$$

$C_1$  = concentration of valproic acid in the *Buffer stage medium* at the 3-h time interval (mg/mL)

$V_B$  = volume of the *Buffer stage medium*, 900 mL

$L$  = label claim (mg/Tablet)

Calculate the percentage of the labeled amount of valproic acid ( $C_8H_{16}O_2$ ) dissolved in the *Buffer stage medium* at the  $n^{\text{th}}$  time interval:

$$\text{Result} = C_n \times [V_B - (n - 1) \times V_S] + [(C_1 + C_2 + \dots + C_{n-1}) \times V_B] \times (100/L)$$

$C_n$  = concentration of valproic acid in the *Buffer stage medium* at the  $n^{\text{th}}$  time interval (mg/mL)

$V_B$  = volume of the *Buffer stage medium*, 900 mL

$V_S$  = volume of the sample taken (mL)

$C_1$  = concentration of valproic acid dissolved in the first time interval in the *Buffer stage medium* (mg/mL)

$C_2$  = concentration of valproic acid dissolved in the second time interval in the *Buffer stage medium* (mg/mL)

$C_{n-1}$  = concentration of valproic acid dissolved in the  $(n - 1)^{\text{th}}$  time interval in the *Buffer stage medium* (mg/mL)

$L$  = label claim (mg/Tablet)

**Tolerances:** The percentage of the labeled amount of valproic acid ( $C_8H_{16}O_2$ ) dissolved at the times specified conform to the following acceptance table (*Table 2*).

**Test 3:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

**Acid stage medium:** 0.1 N hydrochloric acid; 250 mL (row 1)

**Buffer stage medium:** pH 6.8 buffer (6.8 g of monobasic potassium phosphate and 0.92 g of sodium hydroxide in 1 L of water. Adjust with phosphoric acid or sodium hydroxide to a pH of  $6.8 \pm 0.05$ ; 250 mL (rows 2–4)

**Apparatus 3:** 30 dips/min, 20-mesh polypropylene screen on top and bottom; 30-s drip time

**Times:** 1 h in acid stage (row 1); 2, 12, and 24 h in buffer stage (rows 2–4). • The times in the *Buffer stage medium* include the time in the *Acid stage medium*. • (RB 1-May-2012)

**Buffer:** 0.25 g of citric acid monohydrate, 0.2 g of anhydrous dibasic sodium phosphate, 3.4 g of monobasic potassium phosphate, and 0.85 g of sodium hydroxide in 1 L of water. Adjust with phosphoric acid to a pH of  $3.0 \pm 0.05$ .

**Mobile phase:** Acetonitrile and *Buffer* (30:70)

**Acid stage standard stock solution:** 1 mg/mL of USP Valproic Acid RS in *Acid stage medium*. Dissolve a suitable amount of USP Valproic Acid RS in a suitable volumetric flask in 10% of the flask volume of methanol to solubilize the valproic acid. Dilute with *Acid stage medium* to volume.

**Buffer stage standard stock solution:** 1 mg/mL of USP Valproic Acid RS in *Buffer stage medium*. Dissolve a suitable amount of USP Valproic Acid RS in a suitable volumetric flask in 10% of the flask volume of methanol to solubilize the valproic acid. Dilute with *Buffer stage medium* to volume.

**Table 2**

		<b>3 h</b>	<b>9 h</b>	<b>12 h</b>	<b>21 h</b>
L1	Individual Tablets	10%–27%	35%–70%	44%–92%	NLT 87%
L2	Average	10%–27%	35%–70%	44%–92%	NLT 87%

L3	Average	10%–27%	35%–70%	44%–92%	NLT 87%
L3	Individual Tablets	NMT 2 Tablets are outside the range of 0%–37% and no individual Tablet is outside the range of 0%–47%	NMT 2 Tablets are outside the range of 25%–80% and no individual Tablet is outside the range of 15%–90%	NMT 2 Tablets are outside the range of 34%–102% and no individual Tablet is outside the range of 24%–112%	NMT 2 Tablets release less than 77% and no individual Tablet releases less than 67%

**Acid stage standard solution:** ( $L/2500$ ) mg/mL of valproic acid from *Acid stage stock solution* in *Acid stage medium*, where  $L$  is the Tablet label claim, in mg

**Buffer stage standard solution:** ( $L/700$ ) mg/mL of valproic acid from *Buffer stage stock solution* in *Buffer stage medium*, where  $L$  is the Tablet label claim, in mg

**Sample solutions:** Centrifuge a portion of the solution under test at about 3000 rpm for about 20 min. Use the supernatant.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 3.9-mm  $\times$  15-cm; 5- $\mu$ m packing L11

**Flow rate:** 2 mL/min

**Injection volume:** 100  $\mu$ L for Tablets labeled to contain 250 mg; 50  $\mu$ L for Tablets labeled to contain 500 mg

#### System suitability

**Samples:** *Acid stage standard solution* and *Buffer stage standard solution*

#### Suitability requirements

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Acid stage standard solution*, *Buffer stage standard solution*, *Acid stage sample solutions*, and *Buffer stage sample solutions*

Calculate the percentage of the labeled amount of valproic acid ( $C_8H_{16}O_2$ ) dissolved at each time point  $Q_i$ :

$$Q_1 = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$$Q_2 = [(r_U/r_S) \times (C_S/L) \times V \times 100] + Q_1$$

$$Q_{12} = [(r_U/r_S) \times (C_S/L) \times V \times 100] + Q_2$$

$$Q_{24} = [(r_U/r_S) \times (C_S/L) \times V \times 100] + Q_{12}$$

$r_U$  = peak response of the *Sample solution* from the *Acid stage* or *Buffer stage* time points

$r_S$  = peak response of the *Acid stage standard solution* or *Buffer stage standard solution*

$C_S$  = concentration of valproic acid in the *Acid stage standard solution* or *Buffer stage standard solution* (mg/mL)

$L$  = label claim (mg/Tablet)

$V$  = volume of the *Acid stage medium* or *Buffer stage medium*, 250 mL

**Tolerances:** See *Table 3*.

**Table 3**

Time (h)	Amount Dissolved (Tablets labeled to contain 500 mg of valproic acid)	Amount Dissolved (Tablets labeled to contain 250 mg of valproic acid)
1	NMT 10%	NMT 10%
2	5%–25%	5%–25%
12	55%–75%	65%–85%
24	NLT 80%	NLT 80%

The percentage of the labeled amount of valproic acid ( $C_8H_{16}O_2$ ) dissolved at the times specified conform to *Acceptance Table 2* in *Dissolution* <711>.

• **Test 4:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4*.

**Acid stage medium:** 0.1 N hydrochloric acid; 500 mL

**Buffer stage stock medium:** 19.0 g/L of trisodium phosphate dodecahydrate in water adjusted with hydrochloric acid to a pH of 5.5

**Buffer stage medium:** 21.6 g/L of sodium lauryl sulfate in *Buffer stage stock medium*; 900 mL

**Apparatus 2:** 100 rpm, with sinkers for 250 mg and 500 mg

**Times:** 45 min in *Acid stage medium*; 3, 9, 12, and 18 h in *Buffer stage medium*. The times in the *Buffer stage medium* include the time in the *Acid stage medium*.

**Buffer:** 1.36 g/L of monobasic potassium phosphate and triethylamine (99.5: 0.5). Adjust with phosphoric acid to a pH of 2.75.

**Solution A:** 1.0 g/L of sodium lauryl sulfate in *Buffer*

**Mobile phase:** Acetonitrile and *Solution A* (50:50), degassed

**Acid stage standard stock solution:** 1 mg/mL of USP Valproic Acid RS prepared as follows. Transfer a suitable amount of USP Valproic Acid RS to a volumetric flask, and dissolve in 20% of the flask volume of acetonitrile to solubilize valproic acid. Dilute with *Acid stage medium* to volume.

**Acid stage standard solution:** ( $L/5000$ ) mg/mL of valproic acid from *Acid stage stock solution* in *Acid stage medium*, where  $L$  is the Tablet label claim, in mg

**Buffer stage standard solution:** ( $L/900$ ) mg/mL of USP Valproic Acid RS, prepared as follows. Transfer a suitable amount of USP Valproic Acid RS to a volumetric flask, and dissolve in ( $L/50$ )% of the flask volume of acetonitrile. Dilute with *Buffer stage medium* to volume.  $L$  is the Tablet label claim, in mg.

**Acid stage sample solution:** Withdraw a 10.0-mL aliquot at each time point, and pass a portion of the solution under test through a suitable filter of 45- $\mu$ m pore size.

**Buffer stage sample solution:** Withdraw a 10.0-mL aliquot at each time point, and pass a portion of the solution under test through a suitable filter of 45- $\mu$ m pore size. Replace the 10.0-mL aliquot withdrawn for analysis with a 10.0-mL aliquot of *Buffer stage medium*.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.6-mm  $\times$  15-cm; 5- $\mu$ m packing L1

**Column temperature:** 30°

**Flow rate:** 1.5 mL/min

**Injection volume:** 50  $\mu$ L

#### System suitability

**Samples:** *Acid stage standard solution* and *Buffer stage standard solution*

#### Suitability requirements

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Acid stage standard solution*, *Buffer stage standard solution*, *Acid stage sample solution*, and *Buffer stage sample solutions*

Calculate the percentage of the labeled amount ( $Q_A$ ) of valproic acid ( $C_8H_{16}O_2$ ) dissolved in the *Acid stage*:

$$\text{Result} = (r_U/r_S) \times (C_S) \times V_A \times (1/L) \times 100$$

$r_U$  = peak response of the *Acid stage sample solution*

$r_S$  = peak response of the *Acid stage standard solution*

$C_S$  = concentration of USP Valproic Acid RS in the *Acid stage standard solution* (mg/mL)

$V_A$  = volume of the *Acid stage medium*, 500 mL

$L$  = label claim (mg/Tablet)

Calculate the concentration ( $C_i$ ) of valproic acid ( $C_8H_{16}O_2$ ) in the sample withdrawn from the vessel at each *Buffer stage* time point ( $i$ ):

$$\text{Result}_i = (r_U/r_S) \times (C_S) \times 100$$

$r_U$  = peak response of the *Buffer stage sample solution*

$r_s$  = peak response of the *Buffer stage standard solution*

$C_s$  = concentration of USP Valproic Acid RS in the *Buffer stage standard solution* (mg/mL)

Calculate the percentage of the labeled amount ( $Q_i$ ) of valproic acid ( $C_8H_{16}O_2$ ) dissolved at each *Buffer stage* time point ( $i$ ):

$$\text{Result}_1 = [C_1 \times V_B \times (1/L) \times 100] + Q_A$$

$$\text{Result}_2 = \{[(C_2 \times V_B) + (C_1 \times V_s)] \times (1/L) \times 100\} + Q_A$$

$$\text{Result}_3 = \{[(C_3 \times V_B) + [(C_2 + C_1) \times V_s]] \times (1/L) \times 100\} + Q_A$$

$$\text{Result}_4 = \{[(C_4 \times V_B) + [(C_3 + C_2 + C_1) \times V_s]] \times (1/L) \times 100\} + Q_A$$

$C_i$  = concentration of valproic acid in the *Buffer stage sample solution* withdrawn at time point  $i$  (mg/mL)

$V_B$  = volume of the *Buffer stage medium*, 900 mL

$L$  = label claim (mg/Tablet)

$V_s$  = volume of the *Buffer stage sample solution* withdrawn from the vessel (mL)

$Q_A$  = percentage of the labeled amount of valproic acid dissolved in the *Acid stage*

Tolerances: See *Table 4*.

**Table 4**

Time Point (i)	Time (h)	Amount Dissolved (Tablets labeled to contain 500 mg of valproic acid)	Amount Dissolved (Tablets labeled to contain 250 mg of valproic acid)
1	3	10%–30%	10%–30%
2	9	40%–70%	35%–60%
3	12	60%–90%	50%–80%
4	18	NLT 85%	NLT 85%

The percentage of the labeled amount of valproic acid ( $C_8H_{16}O_2$ ) dissolved at the times specified conform to *Acceptance Table 2* in *Dissolution* <711>. (RB 1-May-2012)

- **UNIFORMITY OF DOSAGE UNITS** <905>: Meet the requirements

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers at controlled room temperature.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS** <11>  
USP Valproic Acid RS

## Dobutamine Hydrochloride

$C_{18}H_{23}NO_3 \cdot HCl$  337.84

1,2-Benzenediol, 4-[2-[[3-(4-hydroxyphenyl)-1-methylpropyl]amino]ethyl]-, hydrochloride, ( $\pm$ )-  
( $\pm$ )-4-[2-[[3-(*p*-Hydroxyphenyl)-1-methylpropyl]amino]ethyl]-pyrocatechol hydrochloride [49745-95-1].

» Dobutamine Hydrochloride contains not less than 98.0 percent and not more than 102.0 percent of  $C_{18}H_{23}NO_3 \cdot HCl$ , calculated on the anhydrous basis.

**Caution**—Great care should be taken to prevent inhaling particles of Dobutamine Hydrochloride and exposing the skin to it. Protect the eyes.

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

#### USP Reference standards <11>—

USP Dobutamine Hydrochloride RS

**Color of solution**—Transfer 500 mg of Dobutamine Hydrochloride to a 25-mL volumetric flask, dilute with a mixture of methanol and water (1:1) to volume, heating at 30° to 35° to dissolve the sample, if necessary. Immediately cool the solution to room temperature and read the absorbance: the absorbance, determined in a 1-cm cell at 480 nm in a suitable spectrophotometer, water being used as the blank, is not greater than 0.04.

#### Identification—

**A:** *Infrared Absorption* <197K>.

**B:** It responds to the test for dry chlorides in *Chloride* <191>.

**Water, Method I** <921>: not more than 1.0%.

**Residue on ignition** <281>: not more than 0.2%.

**Heavy metals, Method II** <231>: 0.003%.

#### Chromatographic purity—

**Solution A**—Dissolve 2.60 g of sodium 1-octanesulfonate in 1000 mL of water, pipet 3 mL of triethylamine into the solution, and mix. Adjust the solution with phosphoric acid to a pH of 2.5. Filter and degas before use.

**Solution B**—Prepare a filtered and degassed mixture of methanol and acetonitrile (82:18). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Diluting solution**—Prepare a mixture of *Solution A* and *Solution B* (1:1).

**Mobile phase**—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments to either *Solution* if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard solution**—Dissolve an accurately weighed quantity of USP Dobutamine Hydrochloride RS in *Diluting solution* and dilute quantitatively, and stepwise if necessary, with *Diluting solution* to obtain a solution having a known concentration of about 0.05 mg per mL.

**Test solution**—Transfer about 50.0 mg of Dobutamine Hydrochloride, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with *Diluting solution* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm  $\times$  15-cm column that contains packing L1. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0	65	35	equilibration
0–5	65	35	isocratic
5–20	65→20	35→80	linear gradient
20–25	20	80	isocratic
25–26	20→65	80→35	linear gradient
26–30	65	35	re-equilibration

Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the tailing factor is not

more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure all of the peak responses. Calculate the percentage of each impurity in the portion of Dobutamine Hydrochloride taken by the formula:

$$100(C/D)(r_i / r_s)$$

in which *C* is the concentration, in mg per mL, of USP Dobutamine Hydrochloride RS in the *Standard solution*; *D* is the concentration, in mg per mL, of Dobutamine Hydrochloride in the *Test solution*; *r<sub>i</sub>* is the peak response for each impurity found in the *Test solution*; and *r<sub>s</sub>* is the dobutamine response obtained from the *Standard solution*: not more than 0.5% of any individual impurity is found, and not more than 1.0% of total impurities is found.

#### Assay—

**Phosphate buffer**—Transfer about 23 g of monobasic ammonium phosphate to a 2-liter volumetric flask, add 1900 mL of water, and mix. Adjust with phosphoric acid to a pH of 2.2, dilute with water to volume, and mix.

**Mobile phase**—Prepare a filtered and degassed mixture of *Phosphate buffer* and acetonitrile (4:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Dobutamine Hydrochloride RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.5 mg per mL. [NOTE—Prepare fresh daily, and refrigerate until injected.]

**System suitability solution**—Dissolve suitable quantities of 5-(hydroxymethyl)furfural and USP Dobutamine Hydrochloride RS in water to obtain a solution containing about 0.01 and 0.5 mg per mL, respectively.

**Assay preparation**—Transfer about 50 mg of Dobutamine Hydrochloride, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix. [NOTE—Refrigerate until injected, and use within 8 hours.]

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 280-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed under *Procedure*: the relative retention times are 1.0 for dobutamine and not more than 0.62 for 5-(hydroxymethyl)furfural, and the retention time of dobutamine is not more than 5.3 minutes. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{18}H_{23}NO_3 \cdot HCl$  in the portion of Dobutamine Hydrochloride taken by the formula:

$$100C(r_u / r_s)$$

in which *C* is the concentration, in mg per mL, of USP Dobutamine Hydrochloride RS in the *Standard preparation*; and *r<sub>u</sub>* and *r<sub>s</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dobutamine Injection

» Dobutamine Injection is a sterile solution of Dobutamine Hydrochloride in Water for Injection. It contains an amount of Dobutamine Hydrochloride equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of dobutamine ( $C_{18}H_{23}NO_3$ ). It may contain one or more suitable antioxidants, chelating agents, or preservatives.

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I glass.

**Labeling**—Label it to indicate that it is to be diluted to appropriate strength with a suitable parenteral vehicle prior to administration.

#### USP Reference standards <11>—

USP Dobutamine Hydrochloride RS

USP Endotoxin RS

**Identification**—A 10- $\mu$ L volume of it responds to the *Identification* test under *Dobutamine for Injection*.

**Bacterial endotoxins** <85>—It contains not more than 2.08 USP Endotoxin Units per mg of dobutamine.

**pH** <791>: between 2.5 and 5.5.

**Particulate matter** <788>: meets the requirements for small-volume injections.

**Other requirements**—It meets the requirements under *Injections* <1>.

#### Assay—

**Ion-pair solution**—Dissolve 3.38 g of sodium 1-octanesulfonate in 1000 mL of water, pipet 3 mL of triethylamine into the solution, and mix. Adjust the solution with phosphoric acid to a pH of 2.5.

**Mobile phase**—Prepare a filtered and degassed mixture of the ion-pair solution, acetonitrile, and methanol (58:28:14). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>). [NOTE—The ratio of acetonitrile to methanol is critical to the elution order of the *System suitability solution* components.]

**System suitability solution**—Dissolve suitable quantities of 4-(4-hydroxyphenyl)-2-butanone and USP Dobutamine Hydrochloride RS in *Mobile phase* to obtain a solution containing about 0.3 and 0.56 mg per mL, respectively.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Dobutamine Hydrochloride RS in *Mobile phase* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.56 mg per mL (equivalent to about 0.5 mg of dobutamine per mL).

**Assay preparation**—Transfer an accurately measured volume of Injection, equivalent to about 25 mg of dobutamine, to a 50-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm  $\times$  25-cm column that contains 5- $\mu$ m, base-deactivated packing L1. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed under *Procedure*: the relative retention times are about 0.9 for 4-(4-hydroxyphenyl)-2-butanone and 1.0 for dobutamine, the resolution, *R*, between 4-(4-hydroxyphenyl)-2-butanone and dobutamine is not less than 1.5; the tailing factor for dobutamine is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and meas-

ure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{18}H_{23}NO_3$  in the portion of Injection taken by the formula:

$$(301.39 / 337.84)(50C)(r_U / r_S)$$

in which 301.39 is the molecular weight of dobutamine; 337.84 is the molecular weight of dobutamine hydrochloride; C is the concentration, in mg per mL, of USP Dobutamine Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dobutamine for Injection

» Dobutamine for Injection is a sterile mixture of Dobutamine Hydrochloride with suitable diluents. It contains an amount of dobutamine hydrochloride equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of dobutamine ( $C_{18}H_{23}NO_3$ ).

**Caution**—Great care should be taken to prevent inhaling particles of Dobutamine for Injection and exposing the skin to it. Protect the eyes.

**Packaging and storage**—Preserve in Containers for Sterile Solids as described under *Injections* <1>, at controlled room temperature.

**USP Reference standards** <11>—  
USP Dobutamine Hydrochloride RS  
USP Endotoxin RS

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* <1>. Do not use the constituted solution if it is brown or contains a precipitate.

**Identification**—Prepare a solution in methanol, clarified by centrifugation, to contain 10 mg of dobutamine hydrochloride per mL. Apply 10  $\mu$ L of this solution and 10  $\mu$ L of a freshly prepared Standard solution of USP Dobutamine Hydrochloride RS in methanol containing 10 mg per mL to a thin-layer chromatographic plate (see *Chromatography* <621>) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of ethyl acetate, *n*-propyl alcohol, water, and glacial acetic acid (100:40:15:5) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate at room temperature. Observe the plate under short-wavelength UV light: the  $R_f$  value of the principal spot obtained from the solution under test corresponds to that obtained from the Standard solution.

**Bacterial endotoxins** <85>—It contains not more than 5.56 USP Endotoxin Units per mg of dobutamine.

**Uniformity of dosage units** <905>: meets the requirements.

**pH** <791>: between 2.5 and 5.5, the contents of 1 vial being dissolved in 10 mL of water.

**Particulate matter** <788>: meets the requirements for small-volume injections.

**Other requirements**—It meets the requirements under *Injections* <1>.

**Assay**—

*Ion-pair solution, Mobile phase, System suitability solution, Standard preparation, and Chromatographic system*—Proceed as directed in the Assay under *Dobutamine Injection*.

**Assay preparation**—Inject about 10 mL of *Mobile phase* into 1 vial of Dobutamine for Injection, taking care not to let pressure build up in the vial. Shake to dissolve the specimen completely. Transfer the solution to an appropriate volumetric flask, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a concentration of 0.5 mg of dobutamine per mL.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{18}H_{23}NO_3$  in each container of Dobutamine for Injection taken by the formula:

$$(301.39 / 337.84)(10CD)(r_U / r_S)$$

in which 301.39 and 337.84 are the molecular weights of dobutamine and dobutamine hydrochloride, respectively; C is the concentration, in mg per mL, of USP Dobutamine Hydrochloride RS in the *Standard preparation*; D is the dilution factor in the *Assay preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dobutamine in Dextrose Injection

» Dobutamine in Dextrose Injection is a sterile solution of Dobutamine Hydrochloride and Dextrose in Water for Injection. It contains an amount of Dobutamine Hydrochloride equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of dobutamine ( $C_{18}H_{23}NO_3$ ) and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of dextrose ( $C_6H_{12}O_6 \cdot H_2O$ ). It may contain one or more suitable antioxidants or chelating agents.

**Packaging and storage**—Preserve in single-dose containers, preferably of Type II glass, or of a suitable plastic material, and store at room temperature, avoid excessive heat, and protect from freezing.

**Labeling**—The label states the total osmolar concentration in mOsmol per L.

**USP Reference standards** <11>—  
USP Dobutamine Hydrochloride RS  
USP Endotoxin RS

**Identification**—

**A:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the Assay.

**B:** It meets the requirements for the *Identification* test under *Dextrose*.

**Bacterial endotoxins** <85>—It contains not more than 5.56 USP Endotoxin Units per mg of dobutamine.

**pH** <791>: between 2.5 and 5.5.

**Particulate matter** <788>—It meets the requirements for large-volume injections.

**Chromatographic purity**—

*Phosphate buffer, Mobile phase, Standard preparation, System suitability solution, and Chromatographic system*—Proceed as directed in the Assay under *Dobutamine Hydrochloride*.

**Test solution**—Transfer an accurately measured portion of Dobutamine in Dextrose Injection, equivalent to about

44.6 mg of dobutamine to a 100-mL volumetric flask, dilute with water to volume, and mix.

**Procedure**—Inject a volume (about 20  $\mu$ L) of the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity, excluding 5-hydroxymethylfurfural from all calculations, in the portion of Dobutamine in Dextrose Injection taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the peak response for each impurity; and  $r_s$  is the sum of the responses of all of the peaks: not more than 1.0% of any individual impurity is found, and not more than 2.0% of the total impurities is found.

#### Limit of 5-hydroxymethylfurfural—

**Ion-exchange column**—Fill an 8-mm chromatographic tube to a height of about 40 mm with a 100- to 200-mesh, strongly acidic, styrene-divinylbenzene cation-exchange resin. Wash the column with about 30 mL of water, discarding the eluate. [NOTE—Prepare a new column for each *Test solution* and *Blank solution*, and use each column only once.]

**Test solution**—Transfer 2 mL of Injection to the ion-exchange column, and collect the eluate in a 50-mL volumetric flask. Pass 25 mL of water through the column, and collect the eluate in the same volumetric flask. Dilute the eluate with water to volume, and mix. Remove the stopper from the flask, and allow the solution to stand for about 30 minutes in order to oxidize any bisulfite ions present. The solution so obtained is the *Test solution*.

**Blank solution**—Prepare a *Blank solution* in a similar manner to the *Test solution* by passing 27 mL of water through an ion-exchange column, and collecting the eluate in a 50-mL volumetric flask. Dilute with water to volume, and mix.

**Procedure**—Determine the absorbance of the *Test solution* in a 1-cm cell at 284 nm, with a suitable spectrophotometer, after correcting for the *Blank solution*: the absorbance is not more than 0.25.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay for dextrose**—Determine the angular rotation of Injection (see *Optical Rotation* (781)). Calculate the percentage (g per 100 mL) of dextrose ( $C_6H_{12}O_6 \cdot H_2O$ ) in the portion of Injection taken by the formula:

$$(100/52.9)(198.17/180.16)AR$$

in which 100 is the percentage; 52.9 is the midpoint of the specific rotation range for anhydrous dextrose, in degrees; 198.17 and 180.16 are the molecular weights for dextrose monohydrate and anhydrous dextrose, respectively;  $A$  is 100 mm divided by the length of the polarimeter tube, in mm; and  $R$  is the observed rotation, in degrees.

#### Assay for dobutamine—

**Phosphate buffer, Mobile phase, Standard preparation, System suitability solution, and Chromatographic system**—Proceed as directed in the Assay under *Dobutamine Hydrochloride*.

**Assay preparation**—Transfer an amount of Dobutamine in Dextrose Injection, equivalent to about 44.6 mg of dobutamine, accurately weighed, to a 100-mL volumetric flask, dilute with water to volume, and mix. [NOTE—Refrigerate until injected, and use within 8 hours.]

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into

the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of dobutamine ( $C_{18}H_{23}NO_3$ ) in the portion of Dobutamine in Dextrose Injection taken by the formula:

$$(301.39/337.84)100C(r_U / r_S)$$

in which 301.39 and 337.84 are the molecular weights of dobutamine and dobutamine hydrochloride, respectively;  $C$  is the concentration, in mg per mL, of USP Dobutamine Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

### DEFINITION

Docetaxel contains NLT 97.5% and NMT 102.0% of docetaxel ( $C_{43}H_{53}NO_{14}$ ), calculated on the anhydrous and solvent-free basis. [CAUTION—Docetaxel is cytotoxic. Great care should be taken to prevent inhaling particles of Docetaxel and exposing the skin to it.]

### IDENTIFICATION

#### A. INFRARED ABSORPTION (197)

[NOTE—Methods described in *Infrared Absorption* (197K), (197M), or (197S) may be used. Use a solution containing 60 mg/mL of Docetaxel in methylene chloride for (197S).]

#### B. The retention time of the major peak of the Sample solution corresponds to that of the Standard solution, as obtained in the Assay.

**ASSAY**• **PROCEDURE**

Solution A: Water

Solution B: Acetonitrile

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)

USP Endotoxin RS

**Docetaxel Injection****DEFINITION**

Docetaxel Injection is a sterile solution of Docetaxel. It contains NLT 90.0% and NMT 110.0% of the labeled amount of docetaxel (anhydrous) ( $C_{43}H_{53}NO_{14}$ ). It contains polysorbate 80 and/or other suitable solubilizing agents in the infusion vehicle. It may also contain dehydrated alcohol.

**IDENTIFICATION**

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** (201)

**Standard solution:** 0.4 mg/mL of USP Docetaxel RS in methylene chloride containing 1% (v/v) of polysorbate 80

**Sample solution:** 0.4 mg/mL of docetaxel (anhydrous) in methylene chloride from Injection

**Chromatographic system**

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture containing a fluorescent indicator

**Developing solvent system:** Methylene chloride and methanol (23:2)

**TLC tank:** Lined with filter paper

**Analysis:** After removing the plate from the tank, allow to dry in a fume hood, and view under UV light at 254 nm.

**Acceptance criteria:** Meets the requirements

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY**

- **PROCEDURE**

**Solution A:** Water

**Solution B:** Acetonitrile

**Mobile phase:** See *Table 1*.

**Table 1**

Time (min)	Solution A (%)	Solution B (%)
0	72	28
9.0	72	28
39.0	28	72
39.1	0	100
49.0	0	100
49.1	72	28
60	72	28

**Diluent:** Acetonitrile, acetic acid, and water (100:0.1:100)

**System suitability solution:** 1 mg/mL of USP Docetaxel Identification RS in *Diluent*

**Standard solution:** 0.2 mg/mL of USP Docetaxel RS. Transfer USP Docetaxel RS into a suitable volumetric flask, and dissolve in alcohol equivalent to 5% of the final volume. Dilute with *Diluent* to volume.

**Sample solution** (for the Injection labeled as one-vial formulation): Dilute a portion of the Injection with *Diluent* to obtain a solution containing 0.2 mg/mL of docetaxel (anhydrous).

**Sample solution** (for the Injection labeled as two-vial formulation): Transfer the content of the vial containing the Injection concentrate to a suitable volumetric flask. Dissolve in an amount of alcohol equivalent to 5% of

the final volume, and dilute with *Diluent* to volume to obtain a solution having a concentration of 0.2 mg/mL of docetaxel (anhydrous).

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 232 nm

**Column:** 4.6-mm × 15-cm; 3.5-μm packing L1

**Temperatures**

**Refrigerated autosampler:** 10°

**Column:** 45°

**Flow rate:** 1.2 mL/min

**Injection volume:** 20 μL

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

#### Suitability requirements

**Resolution:** NLT 3.5 between 2-debenzoxyl 2-pentenoyl docetaxel and docetaxel, *System suitability solution*

**Relative standard deviation:** NMT 1.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of docetaxel (C<sub>43</sub>H<sub>53</sub>NO<sub>14</sub>) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area from the *Sample solution*

$r_S$  = peak area from the *Standard solution*

$C_S$  = concentration of USP Docetaxel RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of docetaxel (anhydrous) in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

## IMPURITIES

### Change to read:

#### • ORGANIC IMPURITIES

**Mobile phase, Diluent, System suitability solution, Standard solution, Sample solution, and Chromatographic system:** Proceed as directed in the Assay.

**Sensitivity solution:** 0.2 μg/mL of USP Docetaxel RS in *Diluent* from the *Standard solution*

#### System suitability

**Samples:** *System suitability solution*, *Standard solution*, and *Sensitivity solution*

#### Suitability requirements

**Resolution:** NLT 3.5 between 2-debenzoxyl 2-pentenoyl docetaxel and docetaxel, *System suitability solution*

**Signal-to-noise ratio:** NLT 10 for the docetaxel peak, *Sensitivity solution*

**Relative standard deviation:** NMT 1.0%, *Standard solution*

#### Analysis

**Sample:** *Sample solution*

Calculate the percentage of each impurity in the portion of Injection taken:

$$\text{Result} = (r_U/r_T) \times (1/F) \times 100$$

$r_U$  = peak area of each individual impurity from the *Sample solution*

$r_T$  = sum of all of the peak areas from the *Sample solution*

$F$  = relative response factor for each individual impurity (see *Table 2*)

**Acceptance criteria:** See *Table 2*. Disregard any impurity peak less than 0.1% and any peak with a relative retention time less than 0.2 or greater than 1.3.

**Table 2**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)

## SPECIFIC TESTS

• **BACTERIAL ENDOTOXINS TEST (85):** It contains NMT 1.94 USP Endotoxin Units/mg of docetaxel (anhydrous).

• **STERILITY TESTS (71):** It meets the requirements when tested as directed in the *Test for Sterility of the Product to Be Examined, Membrane Filtration*.

• **PARTICULATE MATTER IN INJECTIONS (788):** Meets the requirements for small-volume injections

• **OTHER REQUIREMENTS:** Meets the requirements in *Injections* (1)

## ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in single-dose or multiple-dose containers, preferably of Type I glass. Store at controlled room temperature.

• **LABELING:** Label it to indicate whether it is a one-vial formulation or two-vial formulation (Injection concentrate)

and diluent), and also label it to indicate that it is to be diluted with a suitable parenteral vehicle before intravenous infusion.

• **USP REFERENCE STANDARDS** <11>

USP Docetaxel RS

USP Docetaxel Identification RS

[NOTE—USP Docetaxel Identification RS contains docetaxel and small amounts of 2-debenzoxyl 2-pentenoyl docetaxel, 6-oxodocetaxel, 4-epidocetaxel, and 4-epi-6-oxodocetaxel.]

USP Endotoxin RS

## Docusate Calcium

$C_{40}H_{74}CaO_{14}S_2$  883.22

Butanedioic acid, sulfo-, 1,4-bis(2-ethylhexyl) ester, calcium salt;

1,4-Bis(2-ethylhexyl) sulfosuccinate, calcium salt [128-49-4].

### DEFINITION

Docusate Calcium contains NLT 91.0% and NMT 100.5% of docusate calcium ( $C_{40}H_{74}CaO_{14}S_2$ ), calculated on the anhydrous basis.

### IDENTIFICATION

• **A.**

**Sample:** Place a small piece of Docusate Calcium on a salt plate, add 1 drop of acetone, and promptly cover with another salt plate. Rub the plates together to dissolve the specimen, slide the plates apart, and allow the acetone to evaporate.

**Acceptance criteria:** The IR absorption spectrum of the film exhibits maxima only at the same wavelengths as that of a similar preparation of USP Docusate Calcium RS.

• **B.**

**Sample:** 25 mg

**Analysis:** Dissolve the *Sample* in 2 mL of acetone. Add 2 mL of water, and add 2 drops of sulfuric acid.

**Acceptance criteria:** A white precipitate is formed.

• **C. THIN-LAYER CHROMATOGRAPHY**

**Standard solution:** 10 mg/mL of USP Docusate Calcium RS in isopropyl alcohol

**Sample solution:** 10 mg/mL of Docusate Calcium in isopropyl alcohol

**Chromatographic system**

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

**Mode:** TLC

**Adsorbent:** 0.25-mm layer of chromatographic silica gel

**Application volume:** 10  $\mu$ L. [NOTE—Apply with the aid of a stream of nitrogen.]

**Developing solvent system:** Ethyl acetate, ammonium hydroxide, and alcohol (5:2:2)

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Allow the spots to dry, and develop the chromatogram in the *Developing solvent system* until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Ex-

pose the plate to iodine vapors in a closed chamber for about 30 min, and locate the spots.

**Acceptance criteria:** The  $R_f$  value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution*.

### ASSAY

• **PROCEDURE**

**Solution A:** 2.500 g/L of tetra-*n*-butylammonium iodide in water

**Solution B:** A mixture of 100 g/L of anhydrous sodium sulfate and 10 g/L of sodium carbonate in water

**Sample:** 50 mg

**Analysis:** Dissolve the *Sample* in 50 mL of chloroform in a glass-stoppered, 250-mL conical flask. Add 50 mL of *Solution B* and 500  $\mu$ L of bromophenol blue TS. Titrate with *Solution A* until 1 mL from the endpoint, and shake the stoppered flask vigorously for 2 min. Continue the titration in 2-drop increments, shaking vigorously for 10 s after each addition, and then allow the flask to stand for 10 s. Continue the titration until the chloroform layer just assumes a blue color. Each mL of *Solution A* is equivalent to 2.989 mg of docusate calcium ( $C_{40}H_{74}CaO_{14}S_2$ ).

**Acceptance criteria:** 91.0%–100.5% on the anhydrous basis

### IMPURITIES

• **RESIDUE ON IGNITION** (281): 14.5%–16.5%, calculated on the anhydrous basis

• **HEAVY METALS**, *Method I* (231)

**Sample:** 2.0 g

**Analysis:** Transfer the *Sample* to a platinum crucible, and ignite until free from carbon. Cool, moisten the residue with 1 mL of hydrochloric acid, and evaporate on a steam bath to dryness. Add 2 mL of 1 N acetic acid, digest on a steam bath for 5 min, filter into one of a pair of matched 50-mL, color-comparison tubes, and wash the residue with sufficient water to make 25 mL.

**Acceptance criteria:** NMT 10 ppm

• **LIMIT OF BIS(2-ETHYLHEXYL) MALEATE**

**Mobile phase:** Alcohol and water (78:22), filtered and degassed

**Standard solution:** 80  $\mu$ g/mL of USP Bis(2-ethylhexyl) Maleate RS in alcohol

**Sample solution:** 20 mg/mL of Docusate Calcium in alcohol. [NOTE—If necessary, warm the mixture using the steam bath to achieve a complete dissolution.]

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.6-mm  $\times$  3-cm; 3.5- $\mu$ m packing L1

**Column temperature:** 30°

**Flow rate:** 1 mL/min

**Injection volume:** 3  $\mu$ L

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of bis(2-ethylhexyl) maleate in the portion of Docusate Calcium taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

$r_u$  = peak response of bis(2-ethylhexyl) maleate from the *Sample solution*

$r_s$  = peak response of bis(2-ethylhexyl) maleate from the *Standard solution*

$C_s$  = concentration of USP Bis(2-ethylhexyl) Maleate RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Docusate Calcium in the  
Sample solution (mg/mL)

Acceptance criteria: NMT 0.4%

#### SPECIFIC TESTS

- **WATER DETERMINATION**, Method I (921): NMT 2.0%

- **CLARITY OF SOLUTION**

Sample solution: 25 g in 94 mL of alcohol

Acceptance criteria: The Sample solution does not develop a haze within 24 h when maintained at a temperature of  $25 \pm 1^\circ$ .

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** (11)
  - USP Bis(2-ethylhexyl) Maleate RS
  - $C_{20}H_{36}O_4$  340.51
  - USP Docusate Calcium RS

### Docusate Calcium Capsules

#### DEFINITION

Docusate Calcium Capsules contain NLT 85.0% and NMT 115.0% of the labeled amount of docusate calcium ( $C_{40}H_{74}CaO_{14}S_2$ ).

#### IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL**, Calcium (191)
  - Sample solution: Ash the contents of 1 Capsule, dissolve the residue in 10 mL of dilute hydrochloric acid (1 in 12), and filter.
  - Acceptance criteria: The filtrate meets the requirements.
- **B. THIN-LAYER CHROMATOGRAPHY**
  - Standard solution: 10 mg/mL of USP Docusate Calcium RS in isopropyl alcohol
  - Sample solution: Empty the contents of 1 Capsule into a conical flask, and add isopropyl alcohol to obtain a solution containing 10 mg/mL of docusate calcium.
  - Chromatographic system**  
(See Chromatography (621), Thin-Layer Chromatography.)
  - Mode: TLC
  - Adsorbent: 0.25-mm layer of chromatographic silica gel
  - Application volume: 10  $\mu$ L. [NOTE—Apply with the aid of a stream of nitrogen.]
  - Developing solvent system: Ethyl acetate, ammonium hydroxide, and alcohol (5:2:2)

#### Analysis

Samples: Standard solution and Sample solution

Allow the spots to dry, and develop the chromatogram in the Developing solvent system until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Expose the plate to iodine vapors in a closed chamber for about 30 min, and locate the spots.

Acceptance criteria: The  $R_f$  value of the principal spot of the Sample solution corresponds to that of the Standard solution.

#### ASSAY

- **PROCEDURE**

**Basic fuchsin solution:** Dissolve 100 mg of basic fuchsin, previously recrystallized from alcohol, in 3 mL of methanol in a 100-mL volumetric flask, and dilute with water to volume. Filter before use.

**Standard stock solution:** 5 mg/mL of USP Docusate Calcium RS in isopropyl alcohol

**Standard solution:** Transfer 5 mL of the Standard stock solution to a 500-mL volumetric flask containing 90 mL

of a mixture of water and isopropanol (1:1) with swirling. Dilute with water to volume. The concentration of USP Docusate Calcium RS in this solution is 50  $\mu$ g/mL.

**Sample stock solution:** To 10 Capsules in a 400-mL beaker add 300 mL of hot water. Heat on a steam bath, with occasional stirring, until the Capsules are completely disintegrated. Cool, and transfer with the aid of 100 mL of warm water to a 1000-mL volumetric flask. Rinse the beaker with 100 mL of isopropyl alcohol, add the rinsing to the volumetric flask, and shake to dissolve any previously undissolved particles. Dilute with a mixture of water and isopropyl alcohol (1:1) to volume.

**Sample solution:** Transfer 10.0 mL of the Sample stock solution to a 100-mL volumetric flask, and dilute with water to volume.

#### Instrumental conditions

(See Spectrophotometry and Light-Scattering (851).)

Mode: Vis

Analytical wavelength: 545 nm

Cell: 1 cm

Blank: Chloroform

**Analysis:** Transfer 4.0 mL of the Standard solution to a 125-mL separator. To a second 125-mL separator transfer a volume of the Sample solution, equivalent to 200–240  $\mu$ g of docusate calcium, and add a solution of isopropyl alcohol (1 in 100), if necessary, to bring the volume of the solution in the separator to 4.0 mL. To each separator transfer 20.0 mL of pH 1.2 Hydrochloric Acid Buffer (see Reagents, Indicators, and Solutions—Solutions) and 2.0 mL of Basic fuchsin solution. Add 20 mL of chloroform to each separator, and shake for 1 min. Allow the phases to separate, and transfer the chloroform extracts, through separate pledgets of absorbent cotton, into separate 100-mL volumetric flasks. Extract each of the solutions in the separators in the same manner with additional 20-mL portions of chloroform until no more color is visible in the extract, and pass each extract through the pledget of cotton used for the preceding extract into the flask containing the preceding extract. Dilute the contents of each flask to volume by passing chloroform through the cotton pledgets that had been used to filter the extracts, and mix.

Calculate the percentage of the labeled amount of docusate calcium ( $C_{40}H_{74}CaO_{14}S_2$ ) in the portion of Capsules taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

$A_U$  = absorbance of the Sample solution

$A_S$  = absorbance of the Standard solution

$C_S$  = concentration of anhydrous USP Docusate Calcium RS in the Standard solution ( $\mu$ g/mL)

$C_U$  = nominal concentration of docusate calcium in the Sample solution ( $\mu$ g/mL)

Acceptance criteria: 85.0%–115.0%

#### PERFORMANCE TESTS

- **DISSOLUTION** (711)

Medium: Water; 500 mL

Apparatus 2: 50 rpm

Time: 15 min

**Analysis:** Place 1 Capsule in each vessel, and allow the Capsule to sink to the bottom of the vessel before starting rotation of the blade. Observe the Capsules, and record the time taken for each capsule shell to rupture.

**Tolerances:** The requirements are met if all of the Capsules tested rupture in NMT 15 min. If 1 or 2 of the Capsules rupture in more than 15 min but NMT 30 min, repeat the test on 12 additional Capsules. NMT 2 of the total of 18 Capsules tested rupture in more than 15 min but NMT 30 min.

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements for Content Uniformity for solid-filled capsules and

meet the requirements for *Weight Variation* for solution-filled capsules

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature in a dry place.
- **USP REFERENCE STANDARDS** <11>  
USP Docusate Calcium RS

## Docusate Potassium

$C_{20}H_{37}KO_7S$  460.67  
Butanedioic acid, sulfo-, 1,4-bis(2-ethylhexyl) ester, potassium salt;  
Potassium 1,4-bis(2-ethylhexyl) sulfosuccinate [7491-09-0].

#### DEFINITION

Docusate Potassium contains NLT 95.0% and NMT 100.5% of docusate potassium ( $C_{20}H_{37}KO_7S$ ), calculated on the dried basis.

#### IDENTIFICATION

- **A.**  
**Sample:** Place a small piece of Docusate Potassium on a salt plate, add 1 drop of acetone, and promptly cover with another salt plate. Rub the plates together to dissolve the specimen, slide the plates apart, and allow the acetone to evaporate.  
**Acceptance criteria:** The IR absorption spectrum of the film exhibits maxima only at the same wavelengths as that of a similar preparation of USP Docusate Potassium RS.
- **B. IDENTIFICATION TESTS—GENERAL, Potassium** <191>:  
Meets the requirements of the flame test

#### ASSAY

- **PROCEDURE**  
**Solution A:** 2.500 g/L of tetra-*n*-butylammonium iodide in water  
**Solution B:** A mixture of 100 g/L of anhydrous sodium sulfate and 10 g/L of sodium carbonate in water  
**Sample:** 100 mg  
**Analysis:** Dissolve the *Sample* in 50 mL of chloroform in a glass-stoppered, 250-mL conical flask. Add 50 mL of *Solution B* and 500  $\mu$ L of bromophenol blue TS. Titrate with *Solution A* until 1 mL from the endpoint, and shake the stoppered flask vigorously for 2 min. Continue the titration in 2-drop increments, shaking vigorously for 10 s after each addition, and then allow the flask to stand for 10 s. Continue the titration until the chloroform layer just assumes a blue color. Each mL of *Solution A* is equivalent to 3.118 mg of docusate potassium ( $C_{20}H_{37}KO_7S$ ).  
**Acceptance criteria:** 95.0%–100.5% on the dried basis

#### IMPURITIES

- **RESIDUE ON IGNITION** <281>: 18.0%–20.0%, calculated on the dried basis
- **HEAVY METALS, Method I** <231>  
**Sample:** 2.0 g  
**Analysis:** Transfer the *Sample* to a platinum crucible, and ignite until free from carbon. Cool, moisten the residue with 1 mL of hydrochloric acid, and evaporate on a steam bath to dryness. Add 2 mL of 6 N acetic acid,

digest on a steam bath for 5 min, filter into one of a pair of matched 50-mL, color-comparison tubes, and wash the residue with sufficient water to make 25 mL.

**Acceptance criteria:** NMT 10 ppm

#### • LIMIT OF BIS(2-ETHYLHEXYL) MALEATE

**Mobile phase:** Alcohol and water (78:22), filtered and degassed

**Standard solution:** 80  $\mu$ g/mL of USP Bis(2-ethylhexyl) Maleate RS in alcohol

**Sample solution:** 20 mg/mL of Docusate Potassium in alcohol. [NOTE—If necessary, warm the mixture using the steam bath to achieve a complete dissolution.]

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.6-mm  $\times$  3-cm; 3.5- $\mu$ m packing L1

**Column temperature:** 30°

**Flow rate:** 1 mL/min

**Injection volume:** 3  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of bis(2-ethylhexyl) maleate in the portion of Docusate Potassium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of bis(2-ethylhexyl) maleate from the *Sample solution*

$r_S$  = peak response of bis(2-ethylhexyl) maleate from the *Standard solution*

$C_S$  = concentration of USP Bis(2-ethylhexyl) Maleate RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Docusate Potassium in the *Sample solution* (mg/mL)

**Acceptance criteria:** NMT 0.4%

#### SPECIFIC TESTS

##### • LOSS ON DRYING <731>

**Analysis:** Dry the sample in a glass container at 105° for 4 h.

**Acceptance criteria:** NMT 3.0%

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** <11>  
USP Bis(2-ethylhexyl) Maleate RS  
 $C_{20}H_{36}O_4$  340.51  
USP Docusate Potassium RS

## Docusate Potassium Capsules

#### DEFINITION

Docusate Potassium Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of docusate potassium ( $C_{20}H_{37}KO_7S$ ).

#### IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

#### ASSAY

##### • PROCEDURE

**Diluent:** Transfer 180 mL of water to a 1000-mL volumetric flask, and dilute with methanol to volume.

**Tetrabutylammonium hydroxide solution:** 250 mg/mL of tetrabutylammonium hydroxide in methanol

**Mobile phase:** Mix 180 mL of water, 6.0 mL of glacial acetic acid, and 8.0 mL of *Tetrabutylammonium hydroxide solution* in a 1000-mL volumetric flask, and dilute with methanol to volume. The water concentration may be varied to meet *System suitability* requirements and to provide a suitable elution time (about 5 min) for docusate potassium.

**Standard solution:** 4 mg/mL of USP Docusate Sodium RS, calculated on the anhydrous basis, in *Diluent*

**Sample solution**

**Solid-filled capsules:** Open and empty into a suitable container the contents of a counted number of Capsules, nominally equivalent to 1000 mg of docusate potassium. Place the Capsule shells in the container, and add 250.0 mL of *Diluent*. Shake by mechanical means for 20 min, and clarify a portion of the mixture by centrifuging. Pass a portion of the clear supernatant through a membrane filter of 0.5- $\mu$ m or finer pore size.

**Solution-filled capsules:** Cut open a counted number of Capsules, nominally equivalent to 2.5 g of docusate potassium, and place the shells and contents in a suitable container. Add 25 mL of methanol, agitate for NLT 2 min, and decant the liquid into a 200-mL volumetric flask. Repeat the addition of methanol, agitation, and decanting NLT four times. Dilute with methanol to volume. Pipet 8 mL of this solution into a 25-mL volumetric flask, add 4.5 mL of water, and dilute with methanol to volume.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** Refractive index

**Column:** 4.6-mm  $\times$  25-cm; packing L1

**Flow rate:** 1.8 mL/min

**Injection volume:** 100  $\mu$ L

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Relative standard deviation:** NMT 3.0% for five replicate injections

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of docusate potassium ( $C_{20}H_{37}KO_7S$ ) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of anhydrous USP Docusate Sodium RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of docusate potassium in the *Sample solution* (mg/mL)

$M_{r1}$  = molecular weight of docusate potassium, 460.67

$M_{r2}$  = molecular weight of docusate sodium, 444.56

**Acceptance criteria:** 90.0%–110.0%

**PERFORMANCE TESTS**

• **DISSOLUTION** <711>

**Medium:** Water; 500 mL

**Apparatus 2:** 50 rpm

**Time:** 15 min

**Analysis:** Place 1 Capsule in each vessel, and allow the Capsule to sink to the bottom of the vessel before starting rotation of the blade. Observe the Capsules, and record the time taken for each Capsule shell to rupture.

**Tolerances:** The requirements are met if all of the Capsules tested rupture in NMT 15 min. If 1 or 2 of the Capsules rupture in more than 15 min but NMT 30 min, repeat the test on 12 additional Capsules. NMT 2 of the total of 18 Capsules tested rupture in more than 15 min but NMT 30 min.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.

• **USP REFERENCE STANDARDS** <11>

USP Docusate Potassium RS

USP Docusate Sodium RS

## Docusate Sodium

$C_{20}H_{37}NaO_7S$  444.56

Butanedioic acid, sulfo-, 1,4-bis(2-ethylhexyl) ester, sodium salt;

Sodium 1,4-bis(2-ethylhexyl) sulfosuccinate [577-11-7].

**DEFINITION**

Docusate Sodium contains NLT 99.0% and NMT 100.5% of  $C_{20}H_{37}NaO_7S$ , calculated on the anhydrous basis.

**IDENTIFICATION**

• **PROCEDURE**

**Sample:** Place a small piece of Docusate Sodium on a salt plate, add one drop of acetone, and promptly cover with another salt plate. Rub the plates together to dissolve the specimen, slide the plates apart, and allow the acetone to evaporate.

**Acceptance criteria:** The IR absorption spectrum of the film exhibits maxima only at the same wavelengths as that of a similar preparation of USP Docusate Sodium RS.

**ASSAY**

• **PROCEDURE**

**Solution A:** 2.5 g/L of tetra-*n*-butylammonium iodide in water

**Solution B:** A mixture of 100 g/L of anhydrous sodium sulfate and 10 g/L of sodium carbonate in water

**Sample:** 50 mg

**Analysis:** Dissolve the *Sample* in 50 mL of chloroform in a glass-stoppered, 250-mL conical flask. Add 50 mL of *Solution B* and 500  $\mu$ L of bromophenol blue TS. Titrate with *Solution A* until 1 mL from the endpoint, and shake the stoppered flask vigorously for 2 min. Continue the titration in two-drop increments, shaking vigorously for 10 s after each addition, and then allow the flask to stand 10 s. Continue the titration until the chloroform layer just assumes a blue color. Each mL of *Solution A* is equivalent to 3.009 mg of  $C_{20}H_{37}NaO_7S$ .

**Acceptance criteria:** 99.0%–100.5% on the anhydrous basis

**IMPURITIES**

**Inorganic Impurities**

- **RESIDUE ON IGNITION** <281>: Between 15.5% and 16.5%, calculated on the anhydrous basis

**Procedure:** Transfer about 1 g, accurately weighed, to a tared crucible, ignite until thoroughly charred, and cool. Moisten the ash with 1 mL of sulfuric acid, and complete the ignition by heating at  $800 \pm 25^\circ$  for 15-min periods to constant weight.

- **HEAVY METALS** <231>

**Sample:** 2.0 g

**Analysis:** Transfer the *Sample* to a platinum crucible, and ignite until free from carbon. Cool, moisten the residue with 1 mL of hydrochloric acid, and evaporate on a steam bath to dryness. Add 2 mL of 6 N acetic acid, digest on a steam bath for 5 min, filter into one of a pair of matched 50-mL, color-comparison tubes,

and wash the residue with sufficient water to make 25 mL.

Acceptance criteria: NMT 10 ppm

USP Docusate Sodium RS

**Docusate Sodium Syrup****DEFINITION**

Docusate Sodium Syrup contains NLT 90.0% and NMT 110.0% of the labeled amount of docusate sodium ( $C_{20}H_{37}NaO_7S$ ).

**IDENTIFICATION**• **A. THIN-LAYER CHROMATOGRAPHY**

**Standard solution:** 2 mg/mL of USP Docusate Sodium RS in isopropyl alcohol

**Sample solution:** Dilute a volume of Syrup, equivalent to about 10 mg of docusate sodium, with isopropyl alcohol to obtain a preparation containing about 2 mg/mL, and mix. Use the upper layer of this preparation.

**Chromatographic system**

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

**Mode:** TLC

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture

**Application volume:** 50 µL. [NOTE—Apply with the aid of a stream of nitrogen.]

**Developing solvent system:** Ethyl acetate, alcohol, water, and ammonium hydroxide (25:10:20:1). [NOTE—This is a two-phase system.]

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Allow the spots to dry, and develop the chromatogram in the *Developing solvent system*, until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Expose the plate to iodine vapors in a closed chamber for about 30 min, and locate the spots.

**Acceptance criteria:** The *Sample solution* produces a spot at the same  $R_f$  value and of approximately the same size as that obtained from the *Standard solution*.

**ASSAY**• **PROCEDURE**

**Standard stock solution:** 1.0 mg/mL of USP Docusate Sodium RS, first dissolved in alcohol using about 2.5% of the final volume, and then diluted with water to volume. This solution contains 1 mg/mL of USP Docusate Sodium RS.

**Standard solution:** 10 µg/mL in water from the *Standard stock solution*

**Sample solution:** Transfer an accurately measured volume of Syrup, equivalent to about 100 mg of docusate sodium, to a 1000-mL volumetric flask, allowing the pipet to drain for 15 min. Dilute with water to volume, and mix. Transfer 10.0 mL of the solution to a 100-mL volumetric flask, dilute with water to volume, and mix.

**Instrumental conditions**

(See *Spectrophotometry and Light-Scattering* <851>.)

**Mode:** Vis

**Analytical wavelength:** 650 nm

**Cell:** 1 cm

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Transfer 20.0 mL each of the *Standard solution* and the *Sample solution* to two individual separators. Place

20 mL of water in a third separator (*Blank solution*). To each separator add 5 drops of hydrochloric acid, mix by swirling, add 1.0 mL of methylene blue solution (1 in 1000), and mix by swirling. To each separator add 20.0 mL of chloroform, and shake vigorously for 5 min. Wash each chloroform solution, in clean separators, with 20 mL of water, shaking vigorously for 60 s. Discard the washings, and filter each chloroform solution through a layer of 3 g of anhydrous granular sodium sulfate, supported on glass wool, into a 100-mL volumetric flask, washing each separator with two 10-mL portions of chloroform, and filtering the washings into each flask. Dilute each flask with chloroform to volume. Concomitantly determine the absorbances of the *Standard solution* and the *Sample solution*, using the *Blank solution* to set the instrument. Calculate the percentage of the labeled amount of docusate sodium ( $C_{20}H_{37}NaO_7S$ ) in the portion of Syrup taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

$A_U$  = absorbance of the *Sample solution*  
 $A_S$  = absorbance of the *Standard solution*  
 $C_S$  = concentration of USP Docusate Sodium RS in the *Standard solution* ( $\mu\text{g/mL}$ )  
 $C_U$  = nominal concentration of docusate sodium in the *Sample solution* ( $\mu\text{g/mL}$ )  
**Acceptance criteria:** 90.0%–110.0%

#### SPECIFIC TESTS

- **PH** (791): 5.5–6.5

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **USP REFERENCE STANDARDS** (11)  
USP Docusate Sodium RS

### Docusate Sodium Tablets

#### DEFINITION

Docusate Sodium Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of docusate sodium ( $C_{20}H_{37}NaO_7S$ ).

#### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)  
**Sample:** Finely divide a suitable number of Tablets, extract with solvent hexane, filter, and evaporate the solvent hexane extract on a steam bath. Use the dry residue.  
**Acceptance criteria:** Meet the requirements

#### ASSAY

- **PROCEDURE**  
**Mobile phase:** Acetonitrile and 7 mM ammonium acetate (1:1)  
**Standard solution:** Dissolve the USP Docusate Sodium RS in alcohol, and dilute with water to obtain a solution containing 1.0 mg/mL of USP Docusate Sodium RS.  
**Methylparaben solution:** 0.15 mg/mL of methylparaben in water  
**System suitability solution:** Mix 0.1 mL of *Methylparaben solution* and 10 mL of *Standard solution*.  
**Sample solution:** Transfer 10 Tablets to a 1-L volumetric flask, add 200 mL of alcohol and 300 mL of water, and shake by mechanical means for NLT 90 min to completely disintegrate the Tablets. Dilute with water to volume, and filter, discarding the first 3 mL of the filtrate.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC  
**Detector:** UV 210 nm  
**Column:** 4.6-mm  $\times$  10-cm; packing L1  
**Column temperature:** 40°  
**Flow rate:** 1 mL/min  
**Injection volume:** 40  $\mu\text{L}$

#### System suitability

**Samples:** *Standard solution* and *System suitability solution*  
 [NOTE—The relative retention times for methylparaben and docusate are about 0.74 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 2.0 between methylparaben and docusate, *System suitability solution*  
**Tailing factor:** NMT 2.5, *Standard solution*  
**Relative standard deviation:** NMT 1.8%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
 Calculate the percentage of the labeled amount of docusate sodium ( $C_{20}H_{37}NaO_7S$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*  
 $r_S$  = peak response from the *Standard solution*  
 $C_S$  = concentration of USP Docusate Sodium RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of docusate sodium in the *Sample solution* (mg/mL)  
**Acceptance criteria:** 90.0%–110.0%

#### PERFORMANCE TESTS

- **DISINTEGRATION** (701)  
**Medium:** Proceed as directed in the chapter, except substitute simulated gastric fluid TS for water in the test for *Uncoated Tablets*.  
**Time:** 1 h  
**Acceptance criteria:** Meet the requirements
- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** (11)  
USP Docusate Sodium RS

### Dofetilide

$C_{19}H_{27}N_3O_5S_2$  441.56  
 Methanesulfonamide, N-[4-[2-[methyl[2-[4-[(methylsulfonyl)amino]phenoxy]ethyl]amino]ethyl]phenyl]-;  
 $\beta$ -[(p-Methanesulfonamidophenethyl)methylamino]methanesulfono-p-phenetidine [115256-11-6].

#### DEFINITION

Dofetilide contains NLT 97.0% and NMT 103.0% of  $C_{19}H_{27}N_3O_5S_2$ , calculated on the anhydrous, solvent-free basis.

**IDENTIFICATION**

- **A. INFRARED ABSORPTION** <197K>
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY**• **PROCEDURE**

**Potassium hydroxide solution:** 0.56 g/mL of potassium hydroxide

**Buffer:** 1.36 g of monobasic potassium phosphate and 5 mg of ascorbic acid in 1 L of water. Adjust with *Potassium hydroxide solution* to a pH of 7.0.

**Mobile phase:** Acetonitrile and *Buffer* (1:3)

**System suitability solution:** 25 µg/mL of USP Dofetilide RS and 0.5 µg/mL of USP Dofetilide Related Compound A RS in *Mobile phase*

**Standard solution:** 25 µg/mL of USP Dofetilide RS in *Mobile phase*

**Sample solution:** 25 µg/mL of Dofetilide in *Mobile phase*

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 230 nm

**Column:** 3.9-mm × 15-cm; 4-µm packing L7

**Temperature:** 30°

**Flow rate:** 1 mL/min

**Injection size:** 50 µL

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

**Suitability requirements**

**Resolution:** NLT 8.0 between dofetilide and dofetilide related compound A, *System suitability solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of C<sub>19</sub>H<sub>27</sub>N<sub>3</sub>O<sub>5</sub>S<sub>2</sub> in the portion of Dofetilide taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of dofetilide from the *Sample solution*

$r_S$  = peak response of dofetilide from the *Standard solution*

$C_S$  = concentration of dofetilide in the *Standard solution* (µg/mL)

$C_U$  = concentration of Dofetilide in the *Sample solution* (µg/mL)

**Acceptance criteria:** 97.0%–103.0% on the anhydrous and solvent-free basis

**IMPURITIES****Inorganic Impurities**

- **RESIDUE ON IGNITION** <281>: NMT 0.1%
- **HEAVY METALS, Method II** <231>: NMT 20 ppm

**Organic Impurities**• **PROCEDURE**

**Buffer:** 0.78 g/L of ammonium acetate. Adjust with glacial acetic acid to a pH of 5.0 ± 0.1.

**Diluent:** Acetonitrile and *Buffer* (3:22)

**Solution A:** *Buffer*

**Solution B:** Methanol

**Mobile phase:** See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	88	12
5	88	12
25	70	30
30	70	30

**System suitability solution:** 1.25 µg/mL each of USP Dofetilide RS and USP Dofetilide Related Compound A RS in *Diluent*

**Standard solution:** 1.25 µg/mL of USP Dofetilide RS in *Diluent*

**Diluted standard solution:** 0.125 µg/mL of USP Dofetilide RS in *Diluent* from the *Standard solution*

**Sample solution:** 0.25 mg/mL of Dofetilide in *Diluent*

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 230 nm

**Column:** 3.9-mm × 15-cm; 5-µm packing L1

**Temperature:** 30°

**Flow rate:** 1 mL/min

**Injection size:** 50 µL

**System suitability**

**Samples:** *System suitability solution* and *Diluted standard solution*

**System suitability requirements**

**Resolution:** NLT 5.0 between dofetilide and dofetilide related compound A, *System suitability solution*

**Column efficiency:** NLT 35,000 theoretical plates for the dofetilide peak, *System suitability solution*

**Tailing factor:** NMT 1.5 for the dofetilide peak, *System suitability solution*

**Relative standard deviation:** NMT 10.0%, *Diluted standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Dofetilide taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response for each impurity from the *Sample solution*

$r_S$  = peak response of dofetilide from the *Standard solution*

$C_S$  = concentration of USP Dofetilide RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Dofetilide in the *Sample solution* (mg/mL)

$F$  = relative response factor (see *Impurity Table 1*)

**Acceptance criteria**

**Individual impurities:** See *Impurity Table 1*.

**Total impurities:** See *Impurity Table 1*.

**Impurity Table 1**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Dofetilide related compound A <sup>a</sup>	0.9	1.04	0.5
Dofetilide	1.0	—	—
Any other individual unspecified impurity	—	1.00 <sup>b</sup>	0.1
Total impurities	—	—	0.5

<sup>a</sup> N-[4-(2-(2-[4-(Methanesulfonamido)phenoxy]ethylamino)ethyl)phenyl]methanesulfonamide.

<sup>b</sup> Unless otherwise determined.

## Dolasetron Mesylate

$C_{19}H_{20}N_2O_3 \cdot CH_4O_3S \cdot H_2O$  438.49  
 1*H*-Indole-3-carboxylic acid, octahydro-3-oxo-2,6-methano-2*H*-quinolizin-8-yl ester, (2 $\alpha$ ,6 $\alpha$ ,8 $\alpha$ ,9 $\alpha\beta$ )-, monomethanesulfonate monohydrate;  
 Indole-3-carboxylic acid, ester with (8*r*)-hexahydro-8-hydroxy-2,6-methano-2*H*-quinolizin-3(4*H*)-one, monomethanesulfonate monohydrate [115956-13-3].

### DEFINITION

Dolasetron Mesylate contains NLT 98.0% and NMT 102.0% of  $C_{19}H_{20}N_2O_3 \cdot CH_4O_3S \cdot H_2O$ , calculated on the as-is basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION** <197K>
- **B. PROCEDURE**

**Sample solution:** 1 mg/mL

**Analysis:** Transfer 5–10 mg of 5,5'-methylenedisalicylic acid to a clean crucible, and heat in an oven at 150° for 5 min. Remove from the oven, and add 10 drops of the *Sample solution*. Return to the oven, and evaporate to dryness.

**Acceptance criteria:** A red or pink color (presence of methanesulfonic acid) develops in the white residue.

### ASSAY

#### • PROCEDURE

**Mobile phase:** Acetonitrile, water, and 1 M ammonium formate (450:440:110), adding 0.19 mL of triethylamine to the acetonitrile portion

**Standard solution:** 0.04 mg/mL and 0.004 mg/mL respectively of USP Dolasetron Mesylate RS and indole-3-carboxylic acid in *Mobile phase*

**Sample solution:** 0.04 mg/mL of Dolasetron Mesylate in *Mobile phase*

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 285 nm

**Column:** 4.6-mm  $\times$  15-cm; packing L1

**Flow rate:** 1 mL/min

**Injection size:** 20  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Resolution:** NLT 4 between indole-3-carboxylic acid and dolasetron mesylate

**Tailing factor:** NMT 1.8

**Relative standard deviation:** NMT 1.5% for replicate injections

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{19}H_{20}N_2O_3 \cdot CH_4O_3S \cdot H_2O$  in the Dolasetron Mesylate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response from the *Sample solution*
- $r_S$  = peak response from the *Standard solution*
- $C_S$  = concentration of USP Dolasetron Mesylate RS in the *Standard solution* (mg/mL)
- $C_U$  = concentration of Dolasetron Mesylate in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the as-is basis

### IMPURITIES

#### Organic Impurities

##### • PROCEDURE

**0.01 M Dibasic ammonium phosphate solution:** 1.32 g/L of dibasic ammonium phosphate. Adjust with 2.0 M phosphoric acid to a pH of 7.0.

**Diluent:** Acetonitrile and water (1:4)

**Solution A:** Acetonitrile and 0.01 M *Dibasic ammonium phosphate solution* (53:1000), filtered and degassed

**Solution B:** Acetonitrile and 0.01 M *Dibasic ammonium phosphate solution* (795:295), filtered and degassed

**Mobile phase:** See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	100	0
28	0	100
38	0	100
40	100	0
50	100	0

**System suitability solution:** 0.004 mg/mL and 0.03 mg/mL, respectively, of indole and USP Dolasetron Mesylate RS in *Diluent*

**Standard solution A:** 0.03 mg/mL of USP Dolasetron Mesylate RS in *Diluent*

**Standard solution B:** 6 mg/mL and 0.0072 mg/mL, respectively, of USP Dolasetron Mesylate RS and USP Dolasetron Mesylate Related Compound A RS in *Diluent*

**Sample solution:** 6 mg/mL of Dolasetron Mesylate in *Diluent*

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.6-mm  $\times$  25-cm; packing L7

**Flow rate:** 1.5 mL/min

**Injection size:** 100  $\mu$ L

#### System suitability

##### Suitability requirements

**Resolution:** NLT 1.5 between the first eluting peak, indole, and the second eluting peak, dolasetron mesylate from the *System suitability solution*. [NOTE— If the dolasetron mesylate peak is found to elute before the indole peak, condition the column as follows: fill up the column with *Solution A*, plug the column, and place the column in a convection oven at 105° for about 16 h. Retest the column.]

**Relative standard deviation:** NMT 5.0% for replicate injections of *Standard solution A*

#### Analysis

**Samples:** *Standard solution A*, *Standard solution B*, and *Sample solution*

Calculate the percentage of dolasetron mesylate related compound A in the Dolasetron Mesylate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$r_U$  = peak response of dolasetron mesylate related compound A from the *Sample solution*

$r_S$  = peak response of dolasetron mesylate related compound A from the *Standard solution B*

$C_S$  = concentration of USP Dolasetron Mesylate Related Compound A RS in the *Standard solution B* (mg/mL)

$C_U$  = concentration of Dolasetron Mesylate in the *Sample solution* (mg/mL)

$M_{r1}$  = molecular weight of dolasetron mesylate related compound A base, 181.2

$M_{r2}$  = molecular weight of dolasetron mesylate related compound A hydrochloride, 217.8

Calculate the percentage of each impurity (other than dolasetron mesylate related compound A) in the portion of Dolasetron Mesylate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_S$  = peak response of dolasetron mesylate from the *Standard solution A*

$C_S$  = concentration of USP Dolasetron Mesylate RS in the *Standard solution A* (mg/mL)

$C_U$  = concentration of Dolasetron Mesylate in the *Sample solution* (mg/mL)

#### Acceptance criteria

**Individual impurities:** NMT 0.1%

**Total impurities:** NMT 0.3%

[NOTE—The reporting level for impurities is 0.05%.]

#### SPECIFIC TESTS

- **WATER DETERMINATION, Method Ia (921):** Between 3.5% and 4.7%

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light.
- **USP REFERENCE STANDARDS (11)**
  - USP Dolasetron Mesylate RS
  - USP Dolasetron Mesylate Related Compound A RS
  - Hexahydro-8-hydroxy-2,6-methano-2H-quinolizin-3 (4H)-one, hydrochloride.

### Dolasetron Mesylate Injection

» Dolasetron Mesylate Injection is a sterile solution, suitable for intravenous administration, containing Dolasetron Mesylate in a buffer solution. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of dolasetron mesylate ( $C_{19}H_{20}N_2O_3 \cdot CH_4O_3S \cdot H_2O$ ).

**Packaging and storage**—Preserve in a single-dose container, protected from light. Store at controlled room temperature.

**Labeling**—Label it to indicate that it may be diluted with a suitable parenteral vehicle prior to intravenous infusion.

#### USP Reference standards (11)—

USP Dolasetron Mesylate RS

USP Endotoxin RS

#### Identification, Infrared Absorption (197K)—

**Test specimen**—Transfer a portion of Injection, equivalent to about 100 mg of dolasetron mesylate, to a 150-mL beaker. Add about 20 mL of water and 10 mL of a sodium hydroxide solution (1 in 10). Mix, and allow to stand at room temperature for 30 minutes. Pass through a filtering crucible with fritted disk having a medium porosity, using about 100 mL of water to aid in the transfer. Dry the precipitate in a vacuum oven at 105° for 4 hours. Prepare a 1.5% mixture of the dried powder with potassium bromide.

**Bacterial endotoxins (85)**—It contains not more than 2.7 USP Endotoxin Units per mg of dolasetron mesylate.

**pH (791):** between 3.2 and 3.8.

**Particulate matter (788):** meets the requirements for small-volume injections.

**Other requirements**—It meets the requirements under *Injections* (1).

#### Assay—

**Mobile phase**—Proceed as directed in the *Assay* under *Dolasetron Mesylate*.

**System suitability preparation**—Dissolve accurately weighed quantities of USP Dolasetron Mesylate RS and indole-3-carboxylic acid in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having known concentrations of about 0.1 mg per mL and 0.02 mg per mL, respectively.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Dolasetron Mesylate RS in *Mobile phase* to obtain a solution having a known concentration of about 0.1 mg per mL.

**Assay preparation**—Using a “to contain” pipet, transfer 2.5 mL of Injection to a 50-mL volumetric flask. Rinse the pipet with several portions of *Mobile phase*, and collect the rinses in the same flask. Dilute with *Mobile phase* to volume, and mix. Pipet 5.0 mL of this solution into a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—Prepare as directed in the *Assay* under *Dolasetron Mesylate*. Chromatograph the *System suitability preparation*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between indole-3-carboxylic acid and dolasetron mesylate is not less than 4; and the tailing factor for the dolasetron mesylate peak is not more than 1.8. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 1.5%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of dolasetron mesylate ( $C_{19}H_{20}N_2O_3 \cdot CH_4O_3S \cdot H_2O$ ) in each mL of Injection taken by the formula:

$$200C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Dolasetron Mesylate RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

### Dolasetron Mesylate Oral Solution

#### DEFINITION

Dolasetron Mesylate Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of dolasetron mesylate ( $C_{19}H_{20}N_2O_3 \cdot CH_4O_3S$ ).

Prepare Dolasetron Mesylate Oral Solution 10 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Dolasetron Mesylate powder	1 g
Vehicle for Oral Solution (regular or sugar-free), <i>NF</i> , a sufficient quantity to make	100 mL

Add *Dolasetron Mesylate powder* and 15 mL of *Vehicle* to a mortar, and mix. Add the *Vehicle* in small portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough *Vehicle* to bring to final volume, and mix.

**ASSAY****• PROCEDURE**

**Solution A:** 0.05 M ammonium acetate adjusted with diluted ammonium hydroxide to a pH of 7.5

**Mobile phase:** Acetonitrile and *Solution A* (24:76). Filter, and degas.

**Diluent:** Acetonitrile and water (24:76)

**Standard stock solution:** 500 µg/mL of USP Dolasetron Mesylate RS in *Diluent*

**Standard solution:** 10 µg/mL of USP Dolasetron Mesylate RS from *Standard stock solution* in *Mobile phase*

**Sample solution:** 10 µg/mL of dolasetron mesylate prepared from Oral Solution and *Diluent*. Shake each sample thoroughly by hand for 15 s, centrifuge at 1000 rpm for 2 min, and use the supernatant.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 280 nm

**Column:** 4.6-mm × 15-cm; 3-µm packing L10

**Column temperature:** 30°

**Flow rate:** 0.8 mL/min

**Injection volume:** 5 µL

**System suitability**

**Sample:** *Standard solution*

[NOTE—The retention time for dolasetron mesylate is about 6.9 min.]

**Suitability requirements**

**Relative standard deviation:** NMT 1.4% for replicate injections

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of dolasetron mesylate ( $C_{19}H_{20}N_2O_3 \cdot CH_4O_3S$ ) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of dolasetron mesylate in the *Standard solution* (µg/mL)

$C_U$  = nominal concentration of dolasetron mesylate in the *Sample solution* (µg/mL)

**Acceptance criteria:** 90.0%–110.0%

**SPECIFIC TESTS**

**• pH <791>:** 3.6–4.6

**ADDITIONAL REQUIREMENTS**

**• PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at controlled room temperature, or in a cold place.

**• LABELING:** Label it to state the *Beyond-Use Date*.

**• BEYOND-USE DATE:** NMT 90 days after the date on which it was compounded

**• USP REFERENCE STANDARDS <11>**

USP Dolasetron Mesylate RS

**Dolasetron Mesylate Oral Suspension****DEFINITION**

Dolasetron Mesylate Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of dolasetron mesylate ( $C_{19}H_{20}N_2O_3 \cdot CH_4O_3S$ ).

Prepare Dolasetron Mesylate Oral Suspension 10 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* <795>).

Dolasetron Mesylate	1 g
Vehicle: a 1:1 mixture of Vehicle for Oral Solution (regular or sugar-free), NF, and Vehicle for Oral Suspension, NF, a sufficient quantity to make	100 mL

If using tablets, place the required number in a suitable mortar, and comminute to a fine powder, or add *Dolasetron Mesylate powder* to the mortar. Add 20 mL of *Vehicle*, and mix to a uniform paste. Add the *Vehicle* in small portions, and mix well after each addition. Transfer, stepwise and quantitatively, to a calibrated bottle. Add the *Vehicle* in portions to rinse the mortar, add sufficient *Vehicle* to bring to final volume, and mix well.

**ASSAY****• PROCEDURE**

**Solution A:** 0.05 M ammonium acetate adjusted with diluted ammonium hydroxide to a pH of 7.5

**Mobile phase:** Acetonitrile and *Solution A* (24:76). Filter and degas.

**Diluent:** Acetonitrile and water (24:76)

**Standard stock solution:** 500 µg/mL of USP Dolasetron Mesylate RS in *Diluent*

**Standard solution:** 10 µg/mL of USP Dolasetron Mesylate RS prepared from the *Standard stock solution* in *Mobile phase*

**Sample solution:** 10 µg/mL of dolasetron mesylate prepared from Oral Suspension and *Diluent*. Shake each sample thoroughly by hand for 15 s, centrifuge at 1000 rpm for 2 min, and use the supernatant.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**USP Reference standards** <11>—  
USP Dolasetron Mesylate RS

**Identification, Infrared Absorption** <197K>—

*Test specimen*—Transfer a quantity of powdered Tablets, equivalent to about 200 mg of dolasetron mesylate, to a capped tube. Add 10 mL of acetonitrile, and shake for about 5 minutes. Allow to settle, filter, and collect the filtrate in a glass vial. Evaporate the solvent at 85°. Add an additional 5 mL of acetonitrile to the vial, and evaporate at 85°. Then evaporate to dryness in a vacuum oven at 80°. Mix about 2 mg of the crystals obtained with about 300 mg of potassium bromide.

**Dissolution** <711>—

*Medium:* 0.1 N hydrochloric acid; 900 mL.

*Apparatus 2:* 50 rpm.

*Time:* 30 minutes.

*Procedure*—Determine the amount of  $C_{19}H_{20}N_2O_3 \cdot CH_4O_3S \cdot H_2O$  dissolved by employing UV absorption at the wavelength of maximum absorbance at about 284 nm on filtered portions of the solution under test, suitably diluted with *Medium*, in comparison with a Standard solution having a known concentration of USP Dolasetron Mesylate RS in the same *Medium*.

*Tolerances*—Not less than 80% (Q) of the labeled amount of  $C_{19}H_{20}N_2O_3 \cdot CH_4O_3S \cdot H_2O$  is dissolved in 30 minutes.

**Uniformity of dosage units** <905>: meet the requirements.

**Assay**—

*Mobile phase*—Proceed as directed in the Assay under *Dolasetron Mesylate*.

*System suitability preparation*—Dissolve accurately weighed quantities of USP Dolasetron Mesylate RS and indole-3-carboxylic acid in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having known concentrations of about 0.1 mg and 0.05 mg per mL, respectively.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Dolasetron Mesylate RS in *Mobile phase* to obtain a solution having a known concentration of about 0.1 mg per mL.

*Assay preparation*—Transfer 10 Tablets to a 500-mL volumetric flask, add about 400 mL of *Mobile phase*, and stir vigorously with a magnetic stirrer for at least 40 minutes to dissolve. Dilute with *Mobile phase* to volume, mix, and allow the insoluble excipients to settle. Quantitatively dilute a portion of the supernatant with *Mobile phase* to obtain a solution having a concentration of about 0.1 mg of dolasetron mesylate per mL.

*Chromatographic system* (see *Chromatography* <621>)—Prepare as directed in the Assay under *Dolasetron Mesylate*. Chromatograph the *System suitability preparation*, and re-

cord the peak responses as directed for *Procedure*: the resolution, *R*, between indole-3-carboxylic acid and dolasetron mesylate is not less than 4; and the tailing factor for the dolasetron mesylate peak is not more than 1.8. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 1.5%.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of dolasetron mesylate ( $C_{19}H_{20}N_2O_3 \cdot CH_4O_3S \cdot H_2O$ ) in each Tablet taken by the formula:

$$(TC/D)(r_U / r_S)$$

in which *T* is the labeled quantity, in mg, of dolasetron mesylate in the Tablet; *C* is the concentration, in mg per mL, of USP Dolasetron Mesylate RS in the *Standard preparation*; *D* is the concentration, in mg per mL, of dolasetron mesylate in the *Assay preparation*, based on the labeled quantity per Tablet and the extent of dilution; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Donepezil Hydrochloride

$C_{24}H_{29}NO_3 \cdot HCl$  415.95  
(±)-2-[(1-Benzyl-4-piperidyl)methyl]-5,6-dimethoxy-1-indanone hydrochloride [120011-70-3].

### DEFINITION

Donepezil Hydrochloride contains NLT 98.0% and NMT 102.0% of  $C_{24}H_{29}NO_3 \cdot HCl$ , calculated on the anhydrous basis.

### IDENTIFICATION

#### • A. INFRARED ABSORPTION <197K>

[NOTE—If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the USP Donepezil Hydrochloride RS separately in dichloromethane, evaporate to dryness, and record new spectra using the residues.]

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

#### • C. IDENTIFICATION TESTS—GENERAL, Chloride <191>

**Sample solution:** 10 mg/mL

**Acceptance criteria:** Meets the requirements

### ASSAY

#### • PROCEDURE

**Buffer:** 3.9 g/L of sodium 1-decane sulfonate in water  
**Mobile phase:** Acetonitrile and *Buffer* (35:65). Adjust with perchloric acid to a pH of 1.8.

**System suitability solution:** 0.4 mg/mL of USP Donepezil Hydrochloride RS and 0.016 mg/mL of USP Donepezil Related Compound A RS prepared as follows. Dissolve suitable quantities of USP Donepezil Hydrochloride RS and USP Donepezil Related Compound A RS using 40% of the flask volume of methanol, and dilute with water to volume.

**Standard solution:** 0.4 mg/mL of USP Donepezil Hydrochloride RS in *Mobile phase*

**Sample solution:** 0.4 mg/mL of Donepezil Hydrochloride in *Mobile phase*

**Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** UV 271 nm**Column:** 4.6-mm × 15-cm; 5-μm packing L1**Column temperature:** 35°**Flow rate:** 1.4 mL/min**Injection size:** 20 μL**System suitability****Samples:** *System suitability solution* and *Standard solution*[NOTE—Refer to *Table 1* under *Organic Impurities, Procedure 1* for the relative retention times.]**Suitability requirements****Resolution:** NLT 1.5 between donepezil related compound A and donepezil, *System suitability solution***Relative standard deviation:** NMT 2.0%, *Standard solution***Analysis****Samples:** *Standard solution* and *Sample solution*Calculate the percentage of donepezil hydrochloride (C<sub>24</sub>H<sub>29</sub>NO<sub>3</sub> · HCl) in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 $r_U$  = peak response of donepezil hydrochloride from the *Sample solution* $r_S$  = peak response of donepezil hydrochloride from the *Standard solution* $C_S$  = concentration of USP Donepezil Hydrochloride RS in the *Standard solution* (mg/mL) $C_U$  = concentration of Donepezil Hydrochloride in the *Sample solution* (mg/mL)**Acceptance criteria:** 98.0%–102.0% on the anhydrous basis**IMPURITIES**

- **HEAVY METALS**, *Method II* <231>: NMT 20 ppm

## Donepezil Hydrochloride Tablets

### DEFINITION

Donepezil Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of donepezil hydrochloride ( $C_{24}H_{29}NO_3 \cdot HCl$ ).

### IDENTIFICATION

- **A. ULTRAVIOLET ABSORPTION (197U)**  
 Wavelength range: 220–360 nm  
 Sample solution: Crush a suitable number of Tablets, and transfer an amount of powder, equivalent to 10 mg of donepezil hydrochloride, to a 100-mL volumetric flask. Add 80 mL of 0.1 N hydrochloric acid, and sonicate for 5 min. Cool the solution to room temperature, and dilute with 0.1 N hydrochloric acid to volume. Transfer a portion of this solution to a centrifuge tube, and centrifuge for 15 min. Transfer 5 mL of the clear

supernatant to a 25-mL volumetric flask, and dilute with 0.1 N hydrochloric acid to volume.

**Analysis:** Using a 1-cm cell, record the UV spectrum of the *Sample solution*.

**Acceptance criteria:** The solution exhibits absorption maxima at 230, 271, and 315 nm.

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

**Diluent:** Methanol and 0.1 N hydrochloric acid (3:1)

**Mobile phase:** Dissolve 2.5 g of sodium decanesulfonate in 650 mL of water, and add 1.0 mL of perchloric acid and 350 mL of acetonitrile. If necessary, adjust with an additional 0.5 mL of perchloric acid to a pH of about 1.8.

**System suitability solution:** 0.2 mg/mL of USP

Donepezil Hydrochloride RS and 0.008 mg/mL of USP Donepezil Related Compound A RS. [NOTE—Dissolve in 40% of the flask volume of methanol, swirl, and dilute with water to volume.]

**Standard solution:** 0.4 mg/mL of USP Donepezil Hydrochloride RS in *Diluent*. [NOTE—Dissolve in 60% of the flask volume of *Diluent*, swirl, and dilute with *Diluent* to volume.]

**Sample solution:** Nominally, 0.4 mg/mL of donepezil hydrochloride prepared as follows. Dissolve a suitable number of Tablets in 75% of the flask volume of *Diluent*, and sonicate in an ultrasonic bath for 20 min. Swirl the mixture for 30 s, allow to cool to room temperature, and dilute with *Diluent* to volume. [NOTE—If necessary, add a magnetic stirring bar to the flask, and mix for 10 min on the magnetic stirrer, to aid in dissolution.] Allow a few min for the solids to settle. Pass through a suitable filter, discarding the first 2–3 mL of the filtrate.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 271 nm

**Column:** 4.6-mm  $\times$  15-cm; 5- $\mu$ m packing L1

**Column temperature:** 35°

**Flow rate:** 1.4 mL/min

**Injection size:** 20  $\mu$ L

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for donepezil related compound A and donepezil are about 0.92 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 1.5 between donepezil related compound A and donepezil, *System suitability solution*

**Tailing factor:** NMT 1.5 for the donepezil peak, *System suitability solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of donepezil hydrochloride ( $C_{24}H_{29}NO_3 \cdot HCl$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of donepezil hydrochloride from the *Sample solution*

$r_S$  = peak response of donepezil hydrochloride from the *Standard solution*

$C_S$  = concentration of USP Donepezil Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of donepezil hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

## PERFORMANCE TESTS

### • DISSOLUTION <711>

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm

Time: 30 min

Determine the amount of donepezil hydrochloride ( $C_{24}H_{29}NO_3 \cdot HCl$ ) dissolved, by using one of the following methods.

### Chromatographic method

Diluent: Methanol and 0.1 N hydrochloric acid (3:1)

Mobile phase: Acetonitrile, water, and perchloric acid (350:650:1)

Standard stock solution: 1.1 mg/mL of USP Donepezil Hydrochloride RS in *Diluent*. Dilute this solution with *Medium* to obtain a final concentration of 0.11 mg/mL.

Standard solution: Dilute the *Standard stock solution* with *Medium* to obtain a final concentration of ( $L/1000$ ) mg/mL, where  $L$  is the label claim in mg/Tablet.

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45- $\mu$ m pore size, discarding the first few mL of the filtrate.

### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 271 nm

Column: 4.6-mm  $\times$  15-cm; 5- $\mu$ m packing L1

Column temperature: 35°

Flow rate: 1.0 mL/min

Injection size: 50  $\mu$ L

### System suitability

Sample: *Standard solution*

### Suitability requirements

Tailing factor: NMT 1.5

Column efficiency: NLT 5000 theoretical plates

Relative standard deviation: NMT 2.0%

### Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of donepezil hydrochloride ( $C_{24}H_{29}NO_3 \cdot HCl$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$L$  = label claim (mg/Tablet)

$V$  = volume of *Medium*, 900 mL

### Spectrometric method

Standard stock solution: 0.11 mg/mL of USP Donepezil Hydrochloride RS in water

Standard solution: Dilute the *Standard stock solution* with *Medium* to obtain a final concentration of ( $L/900$ ) mg/mL, where  $L$  is the label claim in mg/Tablet.

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45- $\mu$ m pore size.

### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

Mode: UV

Analytical wavelength: 230 nm

Blank: *Medium*

Calculate the percentage of the labeled amount of donepezil hydrochloride ( $C_{24}H_{29}NO_3 \cdot HCl$ ) dissolved:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times V \times 100$$

$A_U$  = absorbance of the *Sample solution*

$A_U$  = absorbance of the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$L$  = label claim (mg/Tablet)

$V$  = volume of *Medium*, 900 mL

Tolerances: NLT 80% (Q) of the labeled amount of donepezil hydrochloride is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** <905>: Meet the requirements

## IMPURITIES

### • ORGANIC IMPURITIES, PROCEDURE 1

[NOTE—On the basis of the synthetic route, perform either *Procedure 1* or *Procedure 2*. *Procedure 2* is recommended if any of the impurities included in *Table 3* are potential degradation products.]

Diluent, Mobile phase, System suitability solution, Sample solution, and Chromatographic system: Proceed as directed in the *Assay*.

Standard solution: 0.8  $\mu$ g/mL of USP Donepezil Hydrochloride RS in *Diluent*

### System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for donepezil related compound A and donepezil are about 0.92 and 1.0, respectively.]

### Suitability requirements

Resolution: NLT 1.5 between donepezil related compound A and donepezil, *System suitability solution*

Relative standard deviation: NMT 8.0%, *Standard solution*

### Analysis

Samples: *Standard solution* and *Sample solution*

[NOTE—Identify the impurities using the relative retention times given in *Table 1*.]

Calculate the percentage of any individual impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response of each individual impurity from the *Sample solution*

$r_S$  = peak response of donepezil hydrochloride from the *Standard solution*

$C_S$  = concentration of USP Donepezil Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of donepezil hydrochloride in the *Sample solution* (mg/mL)

$F$  = relative response factor (see *Table 1*)

Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Desbenzyl donepezil <sup>a</sup>	0.33	1.0	0.5
Donepezil open ring <sup>b</sup>	0.70	0.6	0.5
Donepezil hydrochloride	1.0	—	—
Donepezil N-oxide <sup>c</sup>	1.2	1.0	0.5
Any individual unspecified degradation product	—	—	0.2

<sup>a</sup> 5,6-Dimethoxy-2-(piperidin-4-ylmethyl)indan-1-one.

<sup>b</sup> 2-(3-(1-Benzylpiperidin-4-yl)-2-oxopropyl)-4,5-dimethoxybenzoic acid.

<sup>c</sup> 2-[(1-Benzylpiperidin-4-yl)methyl]-5,6-dimethoxyindan-1-one N-oxide.

### • ORGANIC IMPURITIES, PROCEDURE 2

Diluent: Acetonitrile and water (25:75)

Solution A: Add 1 mL of phosphoric acid in 1 L of water. Adjust with triethylamine to a pH of 6.5. Pass through a filter of 0.45- $\mu$ m or finer pore size.

**Solution B:** Acetonitrile  
**Mobile phase:** See Table 2.

**Table 2**

Time (min)	Solution A (%)	Solution B (%)
0	75	25
10	40	60
40	40	60
41	75	25
50	75	25

**Standard solution:** 0.01 mg/mL of USP Donepezil Hydrochloride RS in *Diluent*. Sonication may be used to aid the dissolution.

**Sample solution:** Nominally 1.0 mg/mL of donepezil hydrochloride in *Diluent*. Sonication may be used to aid the dissolution.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 286 nm

**Column:** 4.6-mm × 25-cm; 5-μm packing L1

**Column temperature:** 50°

**Flow rate:** 1.5 mL/min

**Injection size:** 20 μL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 1.5

**Relative standard deviation:** NMT 2.0%, for five replicate injections

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each specified impurity or any individual degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response of each individual impurity from the *Sample solution*

$r_S$  = peak response of donepezil hydrochloride from the *Standard solution*

$C_S$  = concentration of USP Donepezil Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of donepezil hydrochloride in the *Sample solution* (mg/mL)

$F$  = relative response factor for the corresponding impurity peak from Table 3

**Acceptance criteria:** See Table 3.

**Table 3**

Name	Relative Retention Time*	Relative Response Factor	Acceptance Criteria, NMT (%)
Desbenzyl donepezil <sup>a</sup>	0.23	1.5	0.15
Donepezil pyridine analog (DPMI) <sup>b</sup>	0.49	1.9	0.15

## Donepezil Hydrochloride Orally Disintegrating Tablets

**DEFINITION**

Donepezil Hydrochloride Orally Disintegrating Tablets contains NLT 93.0% and NMT 107.0% of the labeled amount of donepezil hydrochloride (C<sub>24</sub>H<sub>29</sub>NO<sub>3</sub> · HCl).

**IDENTIFICATION**• **A. ULTRAVIOLET ABSORPTION** <197U>

**Sample solution:** Crush a suitable number of Tablets, and transfer an amount of powder, equivalent to 10 mg of donepezil hydrochloride, to a 100-mL volumetric flask. Add 80 mL of 0.1 N hydrochloric acid, and sonicate for 5 min. Cool to room temperature, and dilute with 0.1 N hydrochloric acid to volume. Transfer a portion to a centrifuge tube, and centrifuge for 15 min. Transfer 5 mL of the clear supernatant to a 25-mL volumetric flask, and dilute with 0.1 N hydrochloric acid to volume.

**Analysis**

**Wavelength range:** 220–360 nm

**Acceptance criteria:** 230, 271, and 315 nm

• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY**• **PROCEDURE**

**Diluent:** Methanol and 0.1 N hydrochloric acid (3:1)

**Mobile phase:** Dissolve 2.5 g of sodium decanesulfonate in 650 mL of water, and add 1.0 mL of perchloric acid and 350 mL of acetonitrile. If necessary, adjust with an additional 0.5 mL of perchloric acid to a pH of about 1.8.

**System suitability solution:** 0.4 mg/mL of USP Donepezil Hydrochloride RS and 0.016 mg/mL of USP Donepezil Related Compound A RS, prepared by dissolving in 40% of the flask volume of methanol and diluting with water to volume.

**Standard solution:** 0.4 mg/mL of USP Donepezil Hydrochloride RS in *Diluent*

**Sample solution:** 0.4 mg/mL of donepezil hydrochloride in *Diluent*, prepared by transferring a suitable number of Tablets to an appropriate volumetric flask containing 10 mL of 0.1 N hydrochloric acid. Shake to disintegrate the Tablets. Add 60% of the flask volume of *Diluent*, sonicate for 10 min, allow to cool to room temperature, and dilute with *Diluent* to volume.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 271 nm

**Column:** 4.6-mm × 15-cm; 5-μm packing L1

**Column temperature:** 35°

**Flow rate:** 1.4 mL/min

**Injection size:** 20 μL

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times of donepezil related compound A and donepezil are about 0.92 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 1.5 between donepezil related compound A and donepezil, *System suitability solution*

**Tailing factor:** NMT 1.5 for donepezil, *System suitability solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of  $C_{24}H_{29}NO_3 \cdot HCl$  in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of donepezil hydrochloride from the *Sample solution*

$r_S$  = peak response of donepezil hydrochloride from the *Standard solution*

$C_S$  = concentration of USP Donepezil Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of donepezil hydrochloride in the *Sample solution* (mg/mL)

**Acceptance criteria:** 93.0%–107.0%

#### PERFORMANCE TESTS

##### • DISINTEGRATION <701>

**Time:** NMT 60 s

##### • DISSOLUTION <711>

**Medium:** 0.1 N hydrochloric acid; 900 mL

**Apparatus 2:** 50 rpm

**Time:** 30 min

**Diluent:** Methanol and 0.1 N hydrochloric acid (3:1)

**Mobile phase:** Acetonitrile, perchloric acid, and water (350:1:650)

**Standard stock solution:** 1.1 mg/mL of USP Donepezil Hydrochloride RS in *Diluent*. Dilute with *Medium* to obtain a concentration of 0.11 mg/mL.

**Standard solution:** Dilute the *Standard stock solution* with *Medium* to obtain a concentration of L/1000 mg/mL, where L is the Tablet label claim in mg.

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45-μm pore size.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 271 nm

**Column:** 4.6-mm × 15-cm; 5-μm packing L1

**Column temperature:** 35°

**Flow rate:** 1 mL/min

**Injection size:** 50 μL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Column efficiency:** NLT 5000 theoretical plates

**Tailing factor:** NMT 1.5

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{24}H_{29}NO_3 \cdot HCl$  dissolved.

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

L = label claim (mg/Tablet)

V = volume of *Medium*, 900 mL

**Tolerances:** NLT 80% (Q) of the labeled amount of  $C_{24}H_{29}NO_3 \cdot HCl$  is dissolved.

- **UNIFORMITY OF DOSAGE UNITS <905>:** Meet the requirements

#### IMPURITIES

##### Organic Impurities

##### • PROCEDURE

**Mobile phase, System suitability solution, Sample solution, and Chromatographic system:** Proceed as directed in the *Assay*.

**Standard solution:** 0.8 μg/mL of USP Donepezil Hydrochloride RS in *Diluent*

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times of donepezil related compound A and donepezil are about 0.92 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 1.5 between donepezil related compound A and donepezil, *System suitability solution*

**Relative standard deviation:** NMT 8.0%, *Standard solution*

#### Analysis

**Samples:** *Sample solution* and *Standard solution*.

[NOTE—Identify the impurities, using the relative retention times given in *Impurity Table 1*.]

Calculate the percentage of any individual impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response of any individual impurity from the *Sample solution*

$r_S$  = peak response of donepezil hydrochloride from the *Standard solution*

$C_S$  = concentration of USP Donepezil Hydrochloride RS in the *Standard solution* (mg/mL)

- $C_U$  = nominal concentration of donepezil hydrochloride in the *Sample solution* (mg/mL)  
 $F$  = relative response factor of each related compound, as listed in *Impurity Table 1*

**Acceptance criteria**

**Individual impurities:** See *Impurity Table 1*.

**Impurity Table 1**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Desbenzyl donepezil <sup>a</sup>	0.35	1.0	0.5
Donepezil open ring <sup>b</sup>	0.70	0.6	0.5
Donepezil hydrochloride	1.0	—	—
Donepezil <i>N</i> -oxide <sup>c</sup>	1.2	1.0	0.5
Individual unspecified degradation impurity	—	—	0.2
Total impurities	—	—	1.0

<sup>a</sup> 5,6-Dimethoxy-2-(piperidin-4-ylmethyl)indan-1-one.

<sup>b</sup> 2-(3-(1-Benzylpiperidin-4-yl)-2-oxopropyl)-4,5-dimethoxybenzoic acid.

<sup>c</sup> 2-[(1-Benzylpiperidin-4-yl)methyl]-5,6-dimethoxyindan-1-one *N*-oxide.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at controlled room temperature.
- **USP REFERENCE STANDARDS (11)**  
 USP Donepezil Hydrochloride RS  
 USP Donepezil Related Compound A RS  
 (*E*)-2-[(1-Benzylpiperidin-4-yl)methylene]-5,6-dimethoxyindan-1-one.  
 $C_{24}H_{27}NO_3$  377.48

## Dopamine Hydrochloride

$C_8H_{11}NO_2 \cdot HCl$  189.64

1,2-Benzenediol, 4-(2-aminoethyl)-, hydrochloride.

4-(2-Aminoethyl)pyrocatechol hydrochloride [62-31-7].

» Dopamine Hydrochloride contains not less than 98.0 percent and not more than 102.0 percent of  $C_8H_{11}NO_2 \cdot HCl$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers. Store at room temperature.

**USP Reference standards (11)**—

USP Dopamine Hydrochloride RS

**Clarity and color of solution**—A solution of 400 mg in 10 mL of sodium bisulfite solution (1 in 1000) is clear and colorless or practically colorless.

**Identification**—

**A:** *Infrared Absorption* (197K).

**B:** *Ultraviolet Absorption* (197U)—

*Solution:* 40 µg per mL.

*Medium:* sodium bisulfite in water (1 in 1000).

**C:** It responds to the tests for *Chloride* (191).

**pH** (791): between 3.0 and 5.5, in a solution (1 in 25).

**Loss on drying** (731)—Dry it at 105° for 2 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals, Method I** (231)—Dissolve 1 g in 25 mL of water: the limit is 0.002%.

**Sulfate** (221)—Dissolve 500 mg in 40 mL of water: any turbidity produced is not more than that produced in a solution containing 0.10 mL of 0.020 N sulfuric acid.

**Readily carbonizable substances** (271)—Dissolve 100 mg in 5 mL of sulfuric acid: the solution has no more color than *Matching Fluid A*.

**Chromatographic purity**—

**Standard solution and Standard dilutions**—Prepare a solution of USP Dopamine Hydrochloride RS in methanol to contain 30 mg per mL (*Standard solution*). Prepare a series of dilutions of the *Standard solution* in methanol to contain 0.6 mg, 0.3 mg, and 0.15 mg per mL (*Standard dilutions*), corresponding to 2.0%, 1.0%, and 0.5% of impurities, respectively.

**Test solution**—Transfer 150 mg of Dopamine Hydrochloride to a 5-mL volumetric flask, dilute with methanol to volume, and mix.

**Procedure**—In a suitable chromatographic chamber arranged for thin-layer chromatography (see *Chromatography* (621)), place a solvent system consisting of 13 volumes of chloroform, 9 volumes of methanol, and 4 volumes of dilute glacial acetic acid (3 in 10). Line the chamber with filter paper, and allow to equilibrate. Apply 10-µL portions of the *Standard solution*, the *Standard dilutions*, and the *Test solution* to a 20- × 20-cm chromatographic plate coated with a 0.25-mm layer of chromatographic silica gel mixture. Develop the chromatogram until the solvent front has moved about 15 cm. Remove the plate from the developing chamber, allow to dry at room temperature for several minutes, and spray evenly with a freshly prepared mixture containing equal volumes of ferric chloride solution (1 in 10) and potassium ferricyanide solution (1 in 20). [Dopamine and its related impurities appear as blue spots under visible light.] The *Test solution* exhibits its principal spot at an  $R_f$  value corresponding to that of the *Standard solution* and not more than three secondary spots. Estimate the concentration of any secondary spots exhibited by the *Test solution* by comparison with the *Standard dilutions*: the sum of the impurities is not greater than 1.0%.

**Assay**—Dissolve about 75 mg of Dopamine Hydrochloride, accurately weighed, in 5 mL of formic acid, add 25 mL of acetic anhydride, and mix. Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 18.96 mg of  $C_8H_{11}NO_2 \cdot HCl$ .

## Dopamine Hydrochloride Injection

» Dopamine Hydrochloride Injection is a sterile solution of Dopamine Hydrochloride in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of  $C_8H_{11}NO_2 \cdot HCl$ . It may contain a suitable antioxidant.

**NOTE**—Do not use the Injection if it is darker than slightly yellow or discolored in any other way.

**Packaging and storage**—Preserve in single-dose containers of Type I glass.

**Labeling**—Label it to indicate that the Injection is to be diluted with a suitable parenteral vehicle prior to intravenous infusion.

**USP Reference standards** (11)—

USP Dopamine Hydrochloride RS

USP Endotoxin RS

**Identification**—Transfer a volume of Injection to a suitable container, and dilute if necessary, with dilute methanol (1 in 5) to obtain a test solution having a known concentration of 1.6 mg per mL. Prepare a Standard solution of USP Dopamine Hydrochloride RS in dilute methanol (1 in 5) having the same concentration as the test solution. The test solution so obtained responds to the *Thin-layer Chromatographic Identification Test* (201), a mixture of *n*-butyl alcohol, glacial acetic acid, and water (4:1:1) being used as the developing solvent and 5  $\mu$ L each of the test solution and Standard solution being applied to the thin-layer chromatographic plate.

**Bacterial endotoxins** (85)—It contains not more than 16.67 USP Endotoxin Units per mg of dopamine hydrochloride.

**pH** (791): between 2.5 and 5.0.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—

**Mobile phase**—Prepare a filtered and degassed mixture of 0.005 M sodium 1-octanesulfonate in 1% glacial acetic acid and acetonitrile (87:13). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve a suitable quantity of USP Dopamine Hydrochloride RS, accurately weighed, in *Mobile phase* to obtain a solution having a concentration of about 1.6 mg per mL. Pipet 10 mL of this solution into a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix to obtain a *Standard preparation* having a known concentration of about 0.16 mg of dopamine hydrochloride per mL.

**System suitability solution**—Prepare a solution of benzoic acid in methanol containing about 20 mg per mL. Dilute 1 volume of this solution with 3 volumes of the *Mobile phase* to obtain a solution having a final concentration of about 5 mg per mL. Transfer 10.0 mL of this solution and 10.0 mL of a Standard solution containing 1.6 mg of USP Dopamine Hydrochloride RS per mL to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Assay preparation**—Transfer an accurately measured volume of Injection, equivalent to about 16 mg of dopamine hydrochloride, to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4-mm  $\times$  30-cm column packed with packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed under *Procedure*: the resolution, *R*, between benzoic acid and dopamine hydrochloride is not less than 4.0. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the relative standard deviation for replicate injections is not more than 3.0%.

**Procedure**—Separately inject equal volumes (about 40  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_8H_{11}NO_2 \cdot HCl$  in each mL of the Injection taken by the formula:

$$(100C / V)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Dopamine Hydrochloride RS in the *Standard preparation*; *V* is the volume, in mL, of Injection taken; and *r<sub>U</sub>* and *r<sub>S</sub>* are the responses of dopamine hydrochloride obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dopamine Hydrochloride and Dextrose Injection

» Dopamine Hydrochloride and Dextrose Injection is a sterile solution of Dopamine Hydrochloride and Dextrose in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of dopamine hydrochloride ( $C_8H_{11}NO_2 \cdot HCl$ ) and of dextrose ( $C_6H_{12}O_6 \cdot H_2O$ ).

NOTE—Do not use the Injection if it is darker than slightly yellow or discolored in any other way.

**Packaging and storage**—Preserve in single-dose glass or plastic containers. Glass containers are preferably of Type I or Type II glass.

**Labeling**—The label states the total osmolar concentration in mOsmol per L. Where the contents are less than 100 mL, or where the label states that the Injection is not for direct injection but is to be diluted before use, the label alternatively may state the total osmolar concentration in mOsmol per mL.

**USP Reference standards** (11)—

USP Dopamine Hydrochloride RS

USP Endotoxin RS

**Identification**—

A: It responds to the *Identification* test under *Dextrose*.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for dopamine hydrochloride*.

**Bacterial endotoxins** (85)—It contains not more than 16.67 USP Endotoxin Units per mg of dopamine hydrochloride.

**pH** (791): between 2.5 and 4.5.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Limit of 5-hydroxymethylfurfural and related substances**—

**Diluting solution**—Prepare a solution containing approximately 0.022 N sodium hydroxide in water.

**Cation-exchange column**—Proceed as directed under *Column Partition Chromatography* (see *Chromatography* (621)), using a chromatographic tube capable of providing a 0.8-cm  $\times$  4-cm bed volume (or about 2 mL) of 100- to 200-mesh, strongly acidic, styrene-divinylbenzene cation-exchange resin. Condition the column by washing with about 30 mL of water, discarding the eluate.

**Procedure**—Pass a volume of Injection containing about 100 mg of hydrous dextrose through the resin bed in the *Cation-exchange column*, allowing the specimen to flow down the wall of the column so as not to disturb the resin bed, and collect the eluate in a 50-mL volumetric flask. Wash the column with 25 mL of water, and collect the eluate in the same 50-mL volumetric flask. Dilute the eluate with *Diluting solution* to volume, and mix to obtain the test solution. In a similar manner, prepare a blank by passing 27 mL of water through a freshly conditioned *Cation-exchange column*, collecting the eluate in a 50-mL volumetric flask, diluting with *Diluting solution* to volume, and mixing. Determine the absorbance of the test solution against the blank in a 1-cm cell at 284 nm, with a suitable spectrophotometer: the absorbance is not more than 0.25.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay for dopamine hydrochloride**—Proceed with Injection as directed in the *Assay* under *Dopamine Hydrochloride Injection*.

**Assay for dextrose**—Transfer an accurately measured volume of Injection, containing 2 to 5 g of dextrose, to a 100-mL volumetric flask. Add 0.2 mL of 6 N ammonium hydroxide, dilute with water to volume, and mix. Determine the angular rotation in a suitable polarimeter tube (see *Optical Rotation* <781>). Calculate the percentage (g per 100 mL) of dextrose ( $C_6H_{12}O_6 \cdot H_2O$ ) in the portion of Injection taken by the formula:

$$(100/52.9)(198.17/180.16)AR$$

in which 100 is the percentage; 52.9 is the midpoint of the specific rotation range for anhydrous dextrose, in degrees; 198.17 and 180.16 are the molecular weights for dextrose monohydrate and anhydrous dextrose, respectively;  $A$  is 100 mm divided by the length of the polarimeter tube, in mm; and  $R$  is the observed rotation, in degrees.

## Dorzolamide Hydrochloride

$C_{10}H_{16}N_2O_4S_3 \cdot HCl$  360.90

4*H*-Thieno[2,3-*b*]thiopyran-2-sulfonamide, 4-(ethylamino)-5,6-dihydro-6-methyl-, 7,7-dioxide, monohydrochloride, (4*S*-trans)-.

(4*S*,6*S*)-4-(Ethylamino)-5,6-dihydro-6-methyl-4*H*-thieno[2,3-*b*]thiopyran-2-sulfonamide 7,7-dioxide, monohydrochloride [130693-82-2].

» Dorzolamide Hydrochloride contains not less than 99.0 percent and not more than 101.0 percent of  $C_{10}H_{16}N_2O_4S_3 \cdot HCl$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in well-closed containers, protected from light, and store at 15° to 30°.

### USP Reference standards <11>—

USP Dorzolamide Hydrochloride RS

USP Dorzolamide Hydrochloride Related Compound A RS (4*R*,6*R*)-4-(Ethylamino)-5,6-dihydro-6-methyl-4*H*-thieno[2,3-*b*]thiopyran-2-sulfonamide-7,7-dioxide, monohydrochloride.

$C_{10}H_{16}N_2O_4S_3 \cdot HCl$  360.91

### Identification—

**A:** Infrared Absorption <197M>.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**C:** It meets the requirements for *Chloride* <191>.

**Water**, *Method I* <921>: not more than 0.5%, using 0.4 g.

**Residue on ignition** (281): not more than 0.1%, an ignition temperature of 600° being used.

**Heavy metals**, *Method II* <231>: 0.001%.

### Limit of dorzolamide hydrochloride related compound A—

**Mobile phase**—Prepare a filtered and degassed mixture of *tert*-butyl methyl ether, chromatographic *n*-heptane, acetonitrile, and water (63:35:2:0.2). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**System suitability solution**—Transfer about 18 mg of USP Dorzolamide Hydrochloride RS and 2 mg of USP Dorzolamide Hydrochloride Related Compound A RS, each accu-

rately weighed, to a 15-mL centrifuge tube, dissolve in 4 mL of 0.5 N ammonium hydroxide, add 4 mL of ethyl acetate, and mix. Separate the ethyl acetate layer, and transfer to a 15-mL centrifuge tube. Add 4 mL of ethyl acetate to the aqueous layer, mix, separate the ethyl acetate layer, and combine it with the first extract. Evaporate the combined organic layers to dryness on a water bath maintained at 50° under a stream of nitrogen. Dissolve the residue in 3 mL of acetonitrile, add 3 drops of (*S*)-(-)- $\alpha$ -methylbenzyl isocyanate [NOTE—Discard the reagent if it is colored.], and allow to react for 5 minutes on a water bath maintained at 50°. Evaporate the mixture to dryness on a water bath maintained at 50° under a stream of nitrogen. Dissolve the residue in 10 mL of a mixture of *tert*-butyl methyl ether, glacial acetic acid, and acetonitrile (87:10:3).

**Test solution**—Transfer about 20 mg of Dorzolamide Hydrochloride, accurately weighed, to a 15-mL centrifuge tube, and proceed as directed for *System suitability solution* beginning with “dissolve in 4 mL”.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L3. The flow rate is about 2 mL per minute. Chromatograph the *System suitability solution*, and record the peak areas as directed for *Procedure*: the relative retention times are about 1.0 for dorzolamide and 1.5 for dorzolamide hydrochloride related compound A; the resolution,  $R$ , between dorzolamide and dorzolamide hydrochloride related compound A is not less than 4.0; the column efficiency for the dorzolamide hydrochloride peak is not less than 4000 theoretical plates; the tailing factor is not more than 1.4.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *System suitability solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of dorzolamide hydrochloride related compound A in the portion of Dorzolamide Hydrochloride taken by the formula:

$$100r_1 / (r_1 + r_5)$$

in which  $r_1$  is the peak area of dorzolamide hydrochloride related compound A obtained from the *Test solution*; and  $r_5$  is the peak area of dorzolamide hydrochloride obtained from the *Test solution*: not more than 0.5% is found.

### Chromatographic purity—

**Phosphate buffer**, *Solution A*, *Solution B*, *Mobile phase*, and *Chromatographic system*—Proceed as directed in the *Assay*.

**Test solution**—Use the *Assay preparation*.

**Procedure**—Inject a volume (about 10  $\mu$ L) of the *Test solution* into the chromatograph, record the chromatogram, and measure all of the peak areas. Calculate the percentage of each impurity in the portion of Dorzolamide Hydrochloride taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the peak area of each individual impurity obtained from the *Test solution*; and  $r_s$  is the sum of all the peak areas obtained from the *Test solution*: not more than 0.1% of any individual impurity is found; and not more than 0.5% of total impurities is found.

### Assay—

**Phosphate buffer**—Dissolve 3.7 g of monobasic potassium phosphate in 1000 mL of water.

**Solution A**—Prepare a filtered and degassed mixture of *Phosphate buffer* and acetonitrile (94:6.5).

**Solution B**—Use acetonitrile.

**Mobile phase**—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Dissolve suitable quantities of USP Dorzolamide Hydrochloride RS in *Solution A* to obtain a solution having a known concentration of about 0.6 mg per mL.

**Assay preparation**—Transfer about 60 mg of Dorzolamide Hydrochloride, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Solution A* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. The column temperature is maintained at 35°. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–15	100	0	isocratic
15–30	100→50	0→50	linear gradient
30–37	50→100	50→0	linear gradient
37–44	100	0	isocratic

Chromatograph the *Standard preparation*, and record the peak areas as directed for *Procedure*: the column efficiency is not less than 6500 theoretical plates; the tailing factor is not less than 0.6 and not more than 1.2; and the relative standard deviation for replicate injections is not more than 1.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of C<sub>10</sub>H<sub>16</sub>N<sub>2</sub>O<sub>4</sub>S<sub>3</sub> · HCl in the portion of Dorzolamide Hydrochloride taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Dorzolamide Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Doxapram Hydrochloride

C<sub>24</sub>H<sub>30</sub>N<sub>2</sub>O<sub>2</sub> · HCl · H<sub>2</sub>O 432.98  
 2-Pyrrolidinone, 1-ethyl-4-[2-(4-morpholinyl)ethyl]-3,3-diphenyl-, monohydrochloride, monohydrate, (±)-  
 (±)-1-Ethyl-4-(2-morpholinoethyl)-3,3-diphenyl-2-pyrrolidinone monohydrochloride monohydrate  
 [7081-53-0].  
 Anhydrous 414.98 [113-07-5].

» Doxapram Hydrochloride, dried at 105° for 2 hours, contains not less than 98.0 percent and not more than 100.5 percent of C<sub>24</sub>H<sub>30</sub>N<sub>2</sub>O<sub>2</sub> · HCl.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** <11>—

USP Doxapram Hydrochloride RS

### Identification—

**A: Infrared Absorption** <197K>.

**B: Ultraviolet Absorption** <197U>—

*Solution*: 400 µg per mL.

*Medium*: water.

Absorptivities at 258 nm, calculated on the dried basis, do not differ by more than 3.0%.

**pH** <791>: between 3.5 and 5.0, in a solution (1 in 100).

**Loss on drying** <731>—Dry it at 105° for 2 hours: it loses between 3.0% and 4.5% of its weight.

**Residue on ignition** <281>: not more than 0.3%.

**Heavy metals, Method II** <231>: 0.002%.

### Chromatographic purity—

**Dragendorff reagent**—Dissolve 17 g of bismuth subnitrate and 200 g of tartaric acid in 800 mL of water (*Solution A*). Dissolve 160 g of potassium iodide in 400 mL of water (*Solution B*). Mix *Solution A* and *Solution B*. To 25 mL of this stock solution add 50 g of tartaric acid and 250 mL of water, and mix.

**Test preparation**—Dissolve 57 mg of Doxapram Hydrochloride in 0.5 mL of 0.1 N sodium hydroxide, add 1.0 mL of chloroform, and shake.

**Standard preparation A**—Dissolve 57 mg of USP Doxapram Hydrochloride RS in 0.5 mL of 0.1 N sodium hydroxide, add 1.0 mL of chloroform, and shake.

**Standard preparation B**—Dissolve 11.4 mg of USP Doxapram Hydrochloride RS in 0.5 mL of 0.1 N sodium hydroxide, add 100 mL of chloroform, and shake.

**Procedure**—Apply 10-µL portions of the chloroform solutions obtained from the *Test preparation* and the *Standard preparations* to a suitable thin-layer chromatographic plate (see *Chromatography* <621>) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a chromatographic chamber lined with paper and equilibrated with a solvent system consisting of a mixture of isopropyl alcohol and 1 N ammonium hydroxide (4:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Spray the plate with *Dragendorff reagent* in order to visualize the spots: the  $R_f$  value of the principal spot obtained from the *Test preparation* corresponds to that obtained from *Standard preparation A*, and no spot, other than the principal spot, in the chromatogram of the *Test preparation* is larger or more intense than the principal spot obtained from *Standard preparation B* (0.2%).

**Assay**—Dissolve about 800 mg of Doxapram Hydrochloride, previously dried and accurately weighed, in 50 mL of glacial acetic acid, add 1 drop of crystal violet TS and 10 mL of mercuric acetate TS, and titrate with 0.1 N perchloric acid VS to a blue-green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 41.50 mg of C<sub>24</sub>H<sub>30</sub>N<sub>2</sub>O<sub>2</sub> · HCl.

## Doxapram Hydrochloride Injection

» Doxapram Hydrochloride Injection is a sterile solution of Doxapram Hydrochloride in Water for Injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of C<sub>24</sub>H<sub>30</sub>N<sub>2</sub>O<sub>2</sub> · HCl · H<sub>2</sub>O.

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass.

**USP Reference standards** (11)—

USP Doxapram Hydrochloride RS

USP Endotoxin RS

**Identification**—

**A:** The chromatogram obtained from the *Assay preparation* in the *Assay* exhibits a major peak for doxapram, the retention time of which corresponds to that of the doxapram peak in the chromatogram of the *Standard preparation*.

**B:** Transfer a volume of Injection, equivalent to about 50 mg of doxapram hydrochloride hydrate, to a separator containing 5 mL of water. Add 1 mL of a saturated solution of sodium chloride to the separator, insert the stopper, and mix. Add 5 mL of 2.5 N sodium hydroxide, and extract with three 15-mL portions of chloroform. Pass each extract through a pledget of glass wool, combine the filtrates in a 50-mL volumetric flask, dilute with chloroform to volume, and mix. Evaporate to dryness about 5 mL of this solution. Dissolve the residue in 0.01 N sulfuric acid, dilute with the same solvent to 100 mL, and mix: the UV absorption spectrum of the solution so obtained exhibits maxima and minima at the same wavelengths as a solution similarly prepared, about 50 mg of USP Doxapram Hydrochloride RS, instead of Doxapram Hydrochloride Injection, being used.

**Bacterial endotoxins** (85)—It contains not more than 3.3 USP Endotoxin Units per mg of doxapram hydrochloride.

**pH** (791): between 3.5 and 5.0.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—

**Mobile phase**—Dissolve 2.8 g of monobasic potassium phosphate in 1 L of water, adjust with 50% phosphoric acid or 1 N potassium hydroxide to a pH of  $3.0 \pm 0.1$ , and filter through a 0.5- $\mu$ m or finer porosity filter. Prepare a suitable mixture of this solution and acetonitrile (65:35). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Internal standard solution**—Prepare a solution of diphenhydramine hydrochloride in water containing about 1.5 mg per mL.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Doxapram Hydrochloride RS in water to obtain a solution having a known concentration of about 2 mg per mL. Transfer 5.0 mL of this solution and 5.0 mL of *Internal standard solution* to a 50-mL volumetric flask, dilute with water to volume, and mix.

**Assay preparation**—Transfer an accurately measured volume of Injection, equivalent to about 100 mg of doxapram hydrochloride monohydrate, to a 50-mL volumetric flask, dilute with water to volume, and mix. Transfer 5.0 mL of this solution and 5.0 mL of *Internal standard solution* to a 50-mL volumetric flask, dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 225-nm detector and a 4.6-mm  $\times$  15-cm column containing 5- $\mu$ m packing L10, and is maintained at 40°. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the responses as directed under *Procedure*: the relative retention times are about 1.0 for doxapram and 1.2 for diphenhydramine, the resolution, *R*, between the doxapram and diphenhydramine peaks is not less than 3.0; the tailing factor for the peaks is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 5  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of doxapram hydrochloride hydrate

( $C_{24}H_{30}N_2O_2 \cdot HCl \cdot H_2O$ ) in each mL of the Injection taken by the formula:

$$(432.98 / 414.98)(500C / V)(R_U / R_S)$$

in which 432.98 and 414.98 are the molecular weights of doxapram hydrochloride monohydrate and anhydrous doxapram hydrochloride, respectively, *C* is the concentration, in mg per mL, of USP Doxapram Hydrochloride RS in the *Standard preparation*, *V* is the volume, in mL, of Injection taken to prepare the *Assay preparation*, and *R<sub>U</sub>* and *R<sub>S</sub>* are the ratios of the peak responses of doxapram and diphenhydramine obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Doxazosin Mesylate**

$C_{23}H_{25}N_5O_5 \cdot CH_4O_3S$  547.58

Piperazine, 1-(4-amino-6,7-dimethoxy-2-quinazolinyl)-4-[(2,3-dihydro-1,4-benzodioxin-2-yl)carbonyl]-, monomethanesulfonate.

1-(4-Amino-6,7-dimethoxy-2-quinazolinyl)-4-(1,4-benzodioxan-2-ylcarbonyl)piperazine monomethanesulfonate [77883-43-3].

» Doxazosin Mesylate contains not less than 98.0 percent and not more than 102.0 percent of  $C_{23}H_{25}N_5O_5 \cdot CH_4O_3S$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers, and store below 30°.

**USP Reference standards** (11)—

 $C_{24}H_{28}N_8O_4 \cdot 2HCl$  565.45**Identification**—

**A:** *Infrared Absorption* (197K).

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the

chromatogram of the *Standard preparation*, as obtained in the Assay.

**Loss on drying** (731)—Dry it in vacuum at 105° for 4 hours: it loses not more than 2.0% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals, Method II** (231): 20 µg per g.

**Related compounds—**

*Solvent A, Solvent D, Mobile phase, System suitability solution, and Chromatographic system*—Proceed as directed in the Assay.

*Solvent B*—Use acetonitrile.

*Solvent C*—Use water.

*Mobile phase*—Use variable mixtures of *Solvent A, Solvent B, and Solvent C* as directed for *Chromatographic system* in the Assay. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard solution*—Dissolve accurately weighed quantities of USP Doxazosin Mesylate RS, USP Doxazosin Related Compound A RS, USP Doxazosin Related Compound B RS, USP Doxazosin Related Compound C RS, USP Doxazosin Related Compound D RS, USP Doxazosin Related Compound E RS, USP Doxazosin Related Compound F RS, USP Terazosin Related Compound A RS, and USP Terazosin Related Compound C RS in approximately 2 mL of *Solvent D*; and dilute quantitatively, and stepwise if necessary, with *Solvent C* and *Solvent D* to obtain a solution having a known concentration of 0.0015 mg per mL of each of the Reference Standards. The final ratio of *Solvent C* to *Solvent D* is maintained at 9:1. Sonicate briefly to dissolve completely.

*Test solution*—Dissolve an accurately weighed quantity of Doxazosin Mesylate in approximately 2 mL of *Solvent D*, and dilute with *Solvent C* and *Solvent D* to obtain a solution having a known concentration of 0.6 mg per mL. The final ratio of *Solvent C* to *Solvent D* is maintained at 9:1. Sonicate briefly to dissolve completely.

*Procedure*—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for all the peaks. Calculate the percentage of each impurity in the portion of Doxazosin Mesylate taken by the formula:

$$100(C_S / C_T)(r_i / r_s)$$

in which  $C_S$  is the concentration, in mg per mL, of each Reference Standard in the *Standard solution*;  $C_T$  is the concentration, in mg per mL, of Doxazosin Mesylate in the *Test solution*;  $r_i$  is the peak response for each individual impurity obtained from the *Test solution*; and  $r_s$  is the peak response for each individual impurity obtained from the *Standard solution*: not more than 0.3% of terazosin related compound A is found; not more than 0.25% of any other identified individual impurity is found; not more than 0.10% of any other unidentified impurity is found; and not more than 1.0% of total impurities is found. Calculate the percentages of doxazosin related compound G and doxazosin related compound H [NOTE—The doxazosin related compound G is the mesylate salt and has the same retention time as that of the terazosin related compound A. The doxazosin related compound H is the mesylate salt and has the same retention time as that of the doxazosin related compound C.] in the portion of Doxazosin Mesylate taken by the formula:

$$(100/F)(C_S / C_T)(r_i / r_s)$$

in which the response factor,  $F$ , is 0.735 for doxazosin related compound G and 0.769 for doxazosin related compound H;  $C_S$  is the concentration, in mg per mL, of USP Doxazosin Mesylate RS in the *Standard solution*;  $C_T$  is the concentration, in mg per mL, of Doxazosin Mesylate in the *Test solution*;  $r_i$  is the peak response of doxazosin related compound G or doxazosin related compound H in the *Test*

*solution*; and  $r_s$  is the peak response of USP Doxazosin Mesylate RS in the *Standard solution*.

**Assay—**

*Solvent A*—Dissolve 5 g of phosphoric acid (84%–86%) in 100 mL of water.

*Solvent B*—Use acetonitrile.

*Solvent C*—Use water.

*Solvent D*—Prepare a mixture of 100 mL of *Solvent B* and 2 g of phosphoric acid (84%–86%).

*Mobile phase*—Use variable mixtures of degassed *Solvent A, Solvent B, and Solvent C*, as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*System suitability solution*—Dissolve accurately weighed quantities of USP Doxazosin Related Compound A RS and USP Doxazosin Related Compound B RS in approximately 2.5 mL of *Solvent D*. Further dilute this solution quantitatively, and stepwise if necessary, with *Solvent C* and *Solvent D* to obtain a final solution having a known concentration of 12 µg per mL of each of the related compounds. The final ratio of *Solvent C* to *Solvent D* is maintained at 9:1. Sonicate briefly to dissolve completely.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Doxazosin Mesylate RS in approximately 2 mL of *Solvent D*, and dilute with *Solvent C* and *Solvent D* to obtain a solution having a known concentration of 0.6 mg per mL. The final ratio of *Solvent C* to *Solvent D* is maintained at 9:1. Sonicate briefly to dissolve completely.

*Assay preparation*—Dissolve an accurately weighed quantity of Doxazosin Mesylate in approximately 2 mL of *Solvent D*, and dilute with *Solvent C* and *Solvent D* to obtain a solution having a concentration of 0.6 mg per mL, based on the labeled quantity of doxazosin mesylate. The final ratio of *Solvent C* to *Solvent D* is maintained at 9:1. Sonicate briefly to dissolve completely.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 210-nm detector and a 4-mm × 25-cm column that contains 5-µm packing L7. The flow rate is about 0.8 mL per minute, and the column temperature is maintained at 35°. The chromatograph is programmed as follows.

Time (min)	Solvent			Elution
	A (%)	Solvent B (%)	Solvent C (%)	
0–10	20	10→22	70→58	linear gradient
10–35	20	22→50	58→30	linear gradient
35–40	20	50	30	equilibration

[NOTE—Between sample injections, the system is re-equilibrated for at least 7 minutes, or until a stable baseline is obtained, representing the starting composition.]

Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between doxazosin related compound A and doxazosin related compound B is not less than 4.

*Procedure*—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the doxazosin mesylate peaks. Calculate the percentage of  $C_{23}H_{25}N_5O_5 \cdot CH_4O_3S$  in the portion of Doxazosin Mesylate taken by the formula:

$$100(C_S / C_T) (r_u / r_s)$$

in which  $C_S$  is the concentration, in mg per mL, of USP Doxazosin Mesylate RS in the *Standard preparation*;  $C_T$  is the concentration, in mg per mL, of Doxazosin Mesylate in the *Assay preparation*; and  $r_u$  and  $r_s$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Doxazosin Tablets

» Doxazosin Tablets contain an amount of doxazosin mesylate equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of doxazosin ( $C_{23}H_{25}N_5O_5$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Doxazosin Mesylate RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Dissolution** (711)—

*Medium*: 0.01 N hydrochloric acid; 900 mL.

*Apparatus 2*: 50 rpm.

*Time*: 30 minutes.

**Procedure**—Determine the amount of doxazosin mesylate ( $C_{23}H_{25}N_5O_5 \cdot CH_4SO_3$ ) dissolved by employing UV absorption at the wavelength of maximum absorbance at about 246 nm on filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Doxazosin Mesylate RS in the same *Medium*.

**Tolerances**—Not less than 70%(Q) of the labeled amount of  $C_{23}H_{25}N_5O_5 \cdot CH_4SO_3$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—

**Buffer solution**—Transfer 3.4 g of monobasic potassium phosphate into a 1-L flask, and add 800 mL of water and 4.0 mL of triethylamine to dissolve. Adjust with phosphoric acid to a pH of 4.5, and dilute with water to volume.

**Mobile phase**—Prepare a filtered and degassed mixture of methanol and *Buffer solution* (11 : 9). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Diluent**: A mixture of methanol and 0.1 N hydrochloric acid (9 : 1).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Doxazosin Mesylate RS in *Diluent*, and dilute quantitatively and stepwise if necessary, with *Diluent* to obtain a solution having a final concentration of about 49 µg per mL.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 245-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute, and the column temperature is maintained at 40°. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the capacity factor,  $k'$ , for doxazosin is not less than 2.0; the column efficiency is not less than 1000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Assay preparation**—Transfer 10 Tablets, whole or ground, into a 250-mL volumetric flask, add 10 mL of water, and sonicate until the Tablets are disintegrated. Add 150 mL of *Diluent*, sonicate for 30 minutes, dilute with *Diluent* to volume, and mix. Quantitatively dilute a portion of the supernatant with *Diluent* to obtain a solution having a concentration of about 0.04 mg of doxazosin per mL.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the doxazosin peaks. Calculate the

quantity, in mg, of doxazosin ( $C_{23}H_{25}N_5O_5$ ) in the portion of Tablets taken by the formula:

$$(451.48/547.58)CD(r_U / r_S)$$

in which 451.48 and 547.58 are the molecular weights of doxazosin and doxazosin mesylate, respectively; C is the concentration, in mg per mL, of USP Doxazosin Mesylate RS in the *Standard preparation*; D is the dilution volume, in mL, considering the initial 250-mL flask and any subsequent dilution used to prepare the *Assay preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Doxepin Hydrochloride

$C_{19}H_{21}NO \cdot HCl$  315.84

1-Propanamine, 3-dibenz[*b,e*]oxepin-11(6*H*)ylidene-*N,N*-dimethyl-, hydrochloride.

*N,N*-Dimethyldibenz[*b,e*]oxepin- $\Delta^{11(6H),7}$ -propylamine hydrochloride [1229-29-4; 4698-39-9((*E*)-isomer); 25127-31-5((*Z*)-isomer)].

» Doxepin Hydrochloride, an (*E*) and (*Z*) geometric isomer mixture, contains the equivalent of not less than 98.0 percent and not more than 102.0 percent of doxepin hydrochloride ( $C_{19}H_{21}NO \cdot HCl$ ), calculated on the dried basis. It contains not less than 13.6 percent and not more than 18.1 percent of the (*Z*)-isomer, and not less than 81.4 percent and not more than 88.2 percent of the (*E*)-isomer.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Doxepin Hydrochloride RS

USP Doxepin Related Compound A RS

Dibenzo[*b,e*]oxepin-11(6*H*)-one.

$C_{14}H_{10}O_2$  210.23

USP Doxepin Related Compound B RS

11(*RS*)-(3-(Dimethylamino)propyl)-6,11-dihydrodibenzo[*b,e*]oxepin-11-ol.

$C_{19}H_{23}NO_2$  297.39

USP Doxepin Related Compound C RS

(*E,Z*)-3-(Dibenzo[*b,e*]oxepin-11(6*H*)-ylidene)-*N*-methylpropan-1-amine.

$C_{18}H_{19}NO \cdot HCl$  301.81

**Identification**—

**A**: *Infrared Absorption* (197K).

**B**: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**C**: A solution (1 in 100) in a mixture of water and alcohol (1:1) meets the requirements of the test for *Chloride* (191) in amine hydrochlorides.

**Loss on drying** (731)—Dry it in vacuum at 60° for 3 hours; it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.2%.

**Heavy metals**, Method II (231): 0.002%.

**Related compounds—**

*Diluted phosphoric acid*—Prepare a mixture of water and phosphoric acid (10:1), and mix well.

*Buffer*—Dissolve 1.42 g of dibasic sodium phosphate in 1 L of water, adjust with *Diluted phosphoric acid* to a pH of 7.7, and mix.

*Mobile phase*—Prepare a filtered and degassed mixture of methanol, *Buffer*, and acetonitrile (50:30:20). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Diluent*—Prepare a mixture of *Mobile phase* and 2 N sodium hydroxide (1000:2).

*Standard solution*—Dissolve accurately weighed quantities of USP Doxepin Hydrochloride RS, USP Doxepin Related Compound A RS, USP Doxepin Related Compound B RS, and USP Doxepin Related Compound C RS in *Diluent* to obtain a solution having a known concentration of about 0.001 mg of doxepin hydrochloride, doxepin related compound A, and doxepin related compound B each per mL, and 0.002 mg per mL of doxepin related compound C. [NOTE—Sonication for about 1 minute may be used to aid the initial dissolution of the compounds.]

*Test solution*—Dissolve an accurately weighed quantity of Doxepin Hydrochloride in *Diluent* to obtain a final solution having a known concentration of about 1 mg per mL.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm × 25-cm column that contains 5-μm packing L1. The flow rate is about 1 mL per minute. The column temperature is maintained at 30°. Chromatograph about 20 μL of the *Standard solution*, and record the peak areas as directed for *Procedure*: the resolution, *R*, between doxepin related compound A and doxepin related compound C is not less than 1.5; the resolution between doxepin related compound C and doxepin related compound B is not less than 1.5; and the signal-to-noise ratio for all the peaks is not less than 10. [NOTE—Use the approximate relative retention times given in *Table 1* for the purpose of peak identification. The doxepin related compound C peak will be the largest peak in the *Standard solution* chromatogram.]

**Table 1**

Name	Relative Retention Time (RRT)	Limit (%)
Doxepin related compound A	0.48	0.10
Doxepin related compound C	0.55	0.20
Doxepin related compound B	0.63	0.10
Doxepin hydrochloride	1.0	—
Unknown impurity	—	0.10 each

*Procedure*—Inject a volume (about 20 μL) of the *Test solution* into the chromatograph, record the chromatogram for up to 2.2 times the retention time of doxepin, and measure the peak responses. Calculate the percentage of each individual doxepin related compound in the portion of Doxepin Hydrochloride taken by the formula:

$$100(r_U / r_S)(C_S / C_T)$$

in which  $r_U$  is the individual peak response for each doxepin related compound obtained from the *Test solution*;  $r_S$  is the response of the corresponding peak in the *Standard solution*;  $C_S$  is the concentration, in mg per mL, of each doxepin related compound in the *Standard solution*; and  $C_T$  is the concentration, in mg per mL, of Doxepin Hydrochloride in

the *Test solution*. The related substance limits are listed in *Table 1*. [NOTE—Discard any peak with a relative retention time less than 0.25. This method is not intended to resolve the *E*- and *Z*-isomers of doxepin hydrochloride. Minor variations in the mobile phase composition could result in a shoulder in the trailing edge of doxepin. In cases where there may be separation, both the *E*- and *Z*-isomers should be used in the appropriate calculations.] Use the response of the doxepin peak obtained from the *Standard solution* and the concentration of doxepin hydrochloride in the *Standard solution* to calculate the percentage of unknown individual impurities.

**Assay—**

*Mobile phase*—Prepare a mixture of 0.2 M monobasic sodium phosphate buffer and methanol (7:3), adjust with 2 N phosphoric acid to a pH of 2.5, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Doxepin Hydrochloride RS in *Mobile phase*, and dilute quantitatively and stepwise with *Mobile phase* to obtain a solution having a known concentration of about 100 μg per mL.

*Assay preparation*—Transfer about 50 mg of Doxepin Hydrochloride, accurately weighed, to a 100-mL volumetric flask. Add about 70 mL of *Mobile phase*, and sonicate to dissolve. Dilute with *Mobile phase* to volume, and mix. Pipet 10.0 mL of this solution into a 50-mL volumetric flask, and dilute with *Mobile phase* to volume.

*Chromatographic system*—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm × 12.5-cm column, heated to 50°, that contains packing L7. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the resolution between the (*E*)- and (*Z*)-isomers is not less than 1.5, the tailing factor for each analyte peak is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 20 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{19}H_{21}NO \cdot HCl$  in the portion of Doxepin Hydrochloride taken by the formula:

$$0.5C[(r_{U(Z)} + r_{U(E)}) / (r_{S(Z)} + r_{S(E)})]$$

in which  $C$  is the concentration, in μg per mL, of USP Doxepin Hydrochloride RS in the *Standard preparation*, and  $r_{U(Z)}$  and  $r_{U(E)}$  are the respective peak responses of the (*Z*)- and (*E*)-isomers obtained from the *Assay preparation*, and  $r_{S(Z)}$  and  $r_{S(E)}$  are the respective peak responses of the (*Z*)- and (*E*)-isomers obtained from the *Standard preparation*. Calculate the percentage of the (*Z*)-isomer in the *Assay preparation* taken by the formula:

$$(r_{U(Z)} / r_{S(Z)})(W_S / W_T)(P_Z)$$

in which  $W_S$  is the weight, in mg, of USP Doxepin Hydrochloride RS in the *Standard preparation*,  $W_T$  is the weight, in mg, in the portion of Doxepin Hydrochloride taken, and  $P_Z$  is the labeled percentage of (*Z*)-isomer in USP Doxepin Hydrochloride RS. Similarly calculate the percentage of (*E*)-isomer in the *Assay preparation* taken by the formula:

$$(r_{U(E)} / r_{S(E)})(W_S / W_T)(P_E)$$

in which  $P_E$  is the labeled percentage of (*E*)-isomer in USP Doxepin Hydrochloride RS.

## Doxepin Hydrochloride Capsules

» Doxepin Hydrochloride Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of doxepin ( $C_{19}H_{21}NO$ ).

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Doxepin Hydrochloride RS

**Identification**—The retention times of the major peaks for (E)- and (Z)-isomers in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Dissolution** (711)—

*Medium*: water; 900 mL.

*Apparatus 1*: 50 rpm.

*Time*: 30 minutes.

**Procedure**—Determine the amount of  $C_{19}H_{21}NO$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 292 nm on filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a *Standard solution* having a known concentration of USP Doxepin Hydrochloride RS in the same *Medium*.

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_{19}H_{21}NO$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements, the following procedure being used where the test for *Content Uniformity* is required.

**Diluting solution**—Prepare a mixture containing 500 mL of methanol and 500 mL of 0.05 M monobasic sodium phosphate, and filter. Adjust with 2 N sodium hydroxide to a pH of 6.7.

**Standard preparation**—Transfer 20 mg of USP Doxepin Hydrochloride RS, accurately weighed, to a 200-mL volumetric flask, dissolve in and dilute with *Diluting solution* to volume, and filter.

**Test preparation**—Transfer the contents of 1 Capsule into an appropriate volumetric flask, add *Diluting solution* to about 80% of the volume of the flask, and shake the flask by mechanical means for about 30 minutes. Dilute with *Diluting solution* to volume. Make further dilutions, if necessary, to obtain a solution having a known concentration of 0.1 mg per mL of doxepin hydrochloride. Individually test 9 more Capsules using the above procedure.

**Procedure**—Determine the amount of active ingredient in each unit of the *Test preparation* from UV absorbances at the wavelength of maximum absorbance at about 292 nm using 0.5-cm cells in comparison with the *Standard preparation*.

**Water, Method I** (921): not more than 9.0%, determined on the contents of 1 Capsule.

**Assay**—

**Mobile phase, Standard preparation, and Chromatographic system**—Proceed as directed in the *Assay* under *Doxepin Hydrochloride*.

**Assay preparation**—Remove, as completely as possible, the contents of not fewer than 20 Capsules. Weigh the contents and determine the average weight per Capsule. Mix the combined contents, and transfer an accurately weighed quantity of the powder, equivalent to about 50 mg of doxepin hydrochloride, to a 100-mL volumetric flask. Add about 70 mL of *Mobile phase*, and shake by mechanical means for 30 minutes. Dilute with *Mobile phase* to volume, mix, and filter. Pipet 10.0 mL of this solution into a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Doxepin Hydrochloride*. Calculate the quantity, in mg, of  $C_{19}H_{21}NO \cdot HCl$  in the portion of Capsules taken by the formula:

$$0.5C[(r_{U(Z)} + r_{U(E)}) / (r_{S(Z)} + r_{S(E)})]$$

in which the terms are as defined therein.

## Doxepin Hydrochloride Oral Solution

» Doxepin Hydrochloride Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of doxepin ( $C_{19}H_{21}NO$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

**Labeling**—Label it to indicate that each dose is to be diluted with water or other suitable fluid to approximately 120 mL, just prior to administration.

**USP Reference standards** (11)—

USP Doxepin Hydrochloride RS

**Identification**—

**Mobile phase**—Add 0.2 mL of diethylamine to a solution containing 250 mL of chloroform and 750 mL of acetonitrile in a vacuum flask. Prior to use, degas the contents of the flask by stirring vigorously with a magnetic stirrer, while applying vacuum, for 10 minutes.

**Procedure**—Transfer 5.0 mL of the Oral Solution to a 60-mL separator, add 1 mL of sodium hydroxide solution (1 in 25), 1 g of sodium chloride, and 5.0 mL of ethyl acetate, and shake the mixture vigorously for 1 minute. Allow the phases to separate, transfer 1.0 mL of the clear upper phase to a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Transfer about 22 mg of USP Doxepin Hydrochloride RS to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Inject 4-μL portions of both solutions into a high-pressure liquid chromatograph (see *Chromatography* (621)) fitted with a 50-cm × 2-mm column packed with silica microspheres and equipped with an UV detector capable of monitoring absorption at 254 nm and a suitable recorder. Adjust the operating parameters to obtain a flow rate of about 24 mL per hour. The chromatogram of the test solution exhibits two peaks having retention times that are identical with those obtained with the *Standard solution*.

**Uniformity of dosage units** (905)—

FOR ORAL SOLUTION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** (698)—

FOR ORAL SOLUTION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

**pH** (791): between 4.0 and 7.0, the test specimen being allowed to remain in contact with the electrodes for 15 minutes prior to the measurement.

**Assay**—Transfer an accurately measured volume of Oral Solution, equivalent to 100 mg of doxepin, to a 100-mL volumetric flask, dilute with dilute hydrochloric acid (1 in 120) to volume, and mix. Dilute 4.0 mL of this solution with the same solvent to 50.0 mL. Transfer 15.0 mL of the resulting solution to a 125-mL separator, and extract with two 20-mL portions of ether. Dilute 10.0 mL of the extracted aqueous phase with dilute hydrochloric acid (1 in 120) to 25.0 mL. Prepare a *Standard solution* from a suitable quantity of USP Doxepin Hydrochloride RS, by quantitative and stepwise dilution with dilute hydrochloric acid (1 in 120) to obtain a solution having a known concentration of about 1.1 mg per

mL. Take a 4-mL aliquot of the Standard solution through the above-described procedure, beginning with "Dilute 4.0 mL of this solution." Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 292 nm, with a suitable spectrophotometer, using dilute hydrochloric acid (1 in 120) as the blank. Calculate the quantity, in mg, of doxepin ( $C_{19}H_{21}NO$ ) in each mL of the Oral Solution taken by the formula:

$$0.885(0.1 C/V)(A_U / A_S)$$

in which 0.885 is the ratio of the molecular weight of doxepin to that of doxepin hydrochloride;  $C$  is the concentration, in  $\mu\text{g}$  per mL, of USP Doxepin Hydrochloride RS in the Standard solution;  $V$  is the volume, in mL, of Oral Solution taken; and  $A_U$  and  $A_S$  are the absorbances of the solution from the Oral Solution and the Standard solution, respectively.

## Doxorubicin Hydrochloride

$C_{27}H_{29}NO_{11} \cdot HCl$  579.98

5,12-Naphthacenedione, 10-[(3-amino-2,3,6-trideoxy- $\alpha$ -L-lyxo-hexopyranosyl)oxy]-7,8,9,10-tetrahydro-6,8,11-trihydroxy-8-(hydroxylacetyl)-1-methoxy-, hydrochloride (8*S*-*cis*)-, (8*S*,10*S*)-10-[3-Amino-2,3,6-trideoxy- $\alpha$ -L-lyxo-hexopyranosyl)-oxy-8-glycoloyl]-7,8,9,10-tetrahydro-6,8,11-trihydroxy-1-methoxy-5,12-naphthacenedione hydrochloride [25316-40-9].

» Doxorubicin Hydrochloride contains not less than 98.0 percent and not more than 102.0 percent of  $C_{27}H_{29}NO_{11} \cdot HCl$ , calculated on the anhydrous, solvent-free basis.

**Caution**—Great care should be taken to prevent inhaling particles of doxorubicin hydrochloride and exposing the skin to it.

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature, except where it is labeled as amorphous, in which case it should be stored in the freezer.

**Labeling**—The amorphous form is so labeled.

### USP Reference standards (11)—

USP Doxorubicin Hydrochloride RS

**Identification**—The retention time of the doxorubicin peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

**Crystallinity** (695): meets the requirements, except that where it is labeled as amorphous, most of the particles do not exhibit birefringence and extinction positions.

**pH** (791): between 4.0 and 5.5, in a solution containing 5 mg per mL.

**Water, Method I** (921): not more than 4.0%.

**Chromatographic purity**—Proceed as directed in the Assay, except to use, instead of the Assay preparation, a test

solution prepared by dissolving Doxorubicin Hydrochloride in Mobile phase to obtain a solution containing about 0.5 mg per mL. From the chromatogram of the test solution, calculate the percentage of impurities taken by the formula:

$$100S/(S + r)$$

in which  $S$  is the sum of the responses of the minor component peaks; and  $r$  is the response of the major doxorubicin peak: the total of any impurities detected is not more than 2.0%.

**Limit of solvent residues** (as acetone and alcohol)—

**Standard solution**—Transfer to a 100-mL volumetric flask about 200 mg of acetone, 300 mg of dehydrated alcohol, and 1000 mg of dioxane, each accurately weighed, and mix. Dilute with water to volume, and mix. Transfer 5.0 mL of the resulting solution to a 50-mL volumetric flask, dilute with water to volume, and mix. This solution contains about 0.2 mg of acetone, 0.3 mg of  $C_2H_5OH$ , and 1 mg of dioxane per mL.

**Solvent**—Transfer about 100 mg of dioxane, accurately weighed, to a 100-mL volumetric flask, dilute with water to volume, and mix.

**Test solution**—Dissolve about 200 mg of Doxorubicin Hydrochloride in 3.0 mL (3.0 g) of Solvent.

**Chromatographic system** (see Chromatography (621))—The gas chromatograph is equipped with a flame-ionization detector and a 4-mm  $\times$  2-m column packed with 8% to 10% liquid phase G16 and 2% potassium hydroxide on 100- to 120-mesh support S1A. The column temperature is maintained at about 60°, and helium is used as the carrier gas. Adjust the column temperature and carrier gas flow rate so that dioxane elutes in about 6 minutes. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.2 for acetone, 0.5 for alcohol, and 1.0 for dioxane; the resolution,  $R$ , between adjacent peaks is not less than 2.0; the tailing factor for the alcohol peak is not more than 1.5; and the relative standard deviations of the ratios of the peak responses of the acetone and dioxane peaks and of the alcohol and dioxane peaks for replicate injections is not more than 4.0%.

**Procedure**—Separately inject equal volumes (about 1  $\mu\text{L}$ ) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage, by weight, of acetone ( $CH_3COCH_3$ ) and alcohol ( $C_2H_5OH$ ), respectively, in the portion of Doxorubicin Hydrochloride taken by the same formula:

$$100(C_A / C_D)(D_U / W_U)(R_U / R_S)$$

in which  $C_A$  is the concentration, in mg per mL, of acetone or alcohol in the Standard solution;  $C_D$  is the concentration, in mg per mL, of dioxane in the Standard solution;  $D_U$  is the total quantity, in mg, of dioxane in the Test solution;  $W_U$  is the quantity, in mg, of Doxorubicin Hydrochloride taken to prepare the Test solution; and  $R_U$  and  $R_S$  are the area ratios of the analyte peak (acetone or alcohol) to the dioxane peak obtained from the Test solution and the Standard solution, respectively: not more than 0.5% of acetone is found; and the total of acetone and alcohol is not greater than 2.5%. Use the combined percentage of acetone and alcohol obtained to calculate the result obtained as directed in the Assay on the solvent-free basis.

### Assay—

**Mobile phase**—Prepare a suitable mixture of water, acetonitrile, methanol, and phosphoric acid (540:290:170:2). Dissolve 1 g of sodium lauryl sulfate in 1000 mL of this solution, adjust with 2 N sodium hydroxide to a pH of  $3.6 \pm 0.1$ , and degas. Make adjustments if necessary (see System Suitability under Chromatography (621)).

**Resolution solution**—Dissolve about 10 mg of Doxorubicin Hydrochloride in 5 mL of water, add 5 mL of phosphoric acid, and allow to stand for about 30 minutes. Adjust with 2 N sodium hydroxide (about 37 mL) to a pH of  $2.6 \pm 0.1$ , add 15 mL of acetonitrile and 10 mL of methanol, mix, and filter. [NOTE—Portions of this solution may be frozen until needed, then thawed, and mixed before use.]

**Standard preparation**—Dissolve an accurately weighed quantity of USP Doxorubicin Hydrochloride RS in *Mobile phase* to obtain a solution having a known concentration of about 0.1 mg per mL.

**Assay preparation**—Transfer about 20 mg of Doxorubicin Hydrochloride, accurately weighed, to a 200-mL volumetric flask, add *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L13. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor for the doxorubicin peak is not less than 0.7 and not more than 1.2; the column efficiency, determined from the doxorubicin peak, is not less than 2250 theoretical plates; and the relative standard deviation for replicate injections is not more than 1.0%. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.6 for doxorubicinone and 1.0 for doxorubicin; and the resolution,  $R$ , between doxorubicinone and doxorubicin is not less than 5.5.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{27}H_{29}NO_{11} \cdot HCl$  in the Doxorubicin Hydrochloride taken by the formula:

$$0.2CP(r_U / r_S)$$

in which  $C$  is the concentration, in mg, of USP Doxorubicin Hydrochloride RS in each mL of the *Standard preparation*;  $P$  is the content, in  $\mu$ g per mg, of  $C_{27}H_{29}NO_{11} \cdot HCl$  in the USP Doxorubicin Hydrochloride RS; and  $r_U$  and  $r_S$  are the responses of the doxorubicin peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Doxorubicin Hydrochloride Injection

» Doxorubicin Hydrochloride Injection is a sterile solution of Doxorubicin Hydrochloride in Sterile Water for Injection made isoosmotic with Sodium Chloride, Dextrose, or other suitable added substances. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of  $C_{27}H_{29}NO_{11} \cdot HCl$ .

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I glass, protected from light. Store in a refrigerator. Injection may be packaged in multiple-dose containers not exceeding 100 mL in volume.

**USP Reference standards** <11>—  
USP Doxorubicin Hydrochloride RS  
USP Endotoxin RS

**Identification**—When chromatographed as directed in the *Assay*, the *Assay preparation* exhibits a major peak for doxorubicin, the retention time of which corresponds to that exhibited by the *Standard preparation*.

**Bacterial endotoxins** <85>—Use a test solution prepared by diluting Doxorubicin Hydrochloride Injection with Sterile Water for Injection to obtain a concentration of 1.1 mg of doxorubicin hydrochloride per mL: the specimen under test contains not more than 2.2 USP Endotoxin Units per mg of doxorubicin hydrochloride.

**Sterility** <71>—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*, the entire contents of all the containers being collected aseptically.

**pH** <791>: between 2.5 and 4.5.

**Other requirements**—It meets the requirements under *Injections* <1>.

**Assay**—

*Mobile phase*, *Resolution solution*, *Standard preparation*, and *Chromatographic system*—Proceed as directed in the *Assay* under *Doxorubicin Hydrochloride*.

**Assay preparation**—Dilute an accurately measured volume of Injection, equivalent to not less than 2 mg of doxorubicin hydrochloride, quantitatively with *Mobile phase* to obtain a solution containing about 0.1 mg of doxorubicin hydrochloride per mL, and mix.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Doxorubicin Hydrochloride*. Calculate the quantity, in mg, of  $C_{27}H_{29}NO_{11} \cdot HCl$  in each mL of the Injection taken by the formula:

$$(CP / 1000)(L / D)(r_U / r_S)$$

in which  $L$  is the labeled quantity, in mg per mL, of doxorubicin hydrochloride in the Doxorubicin Hydrochloride Injection taken,  $D$  is the concentration, in mg per mL, of doxorubicin hydrochloride in the *Assay preparation*, on the basis of the labeled quantity in the volume of Injection taken and the extent of dilution, and the other terms are as defined therein.

## Doxorubicin Hydrochloride for Injection

» Doxorubicin Hydrochloride for Injection is a sterile mixture of Doxorubicin Hydrochloride and Lactose. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of  $C_{27}H_{29}NO_{11} \cdot HCl$ .

**Caution**—Great care should be taken to prevent inhaling particles of Doxorubicin Hydrochloride and exposing the skin to it.

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* <1>, except that multiple-dose containers may provide for the withdrawal of not more than 100 mL when constituted as directed in the labeling.

**USP Reference standards** <11>—  
USP Doxorubicin Hydrochloride RS  
USP Endotoxin RS

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* <1>.

**Bacterial endotoxins** <85>—Use a solution of Doxorubicin Hydrochloride for Injection containing 1.1 mg of doxorubicin hydrochloride per mL: the specimen under test contains not more than 2.2 USP Endotoxin Units per mg of doxorubicin hydrochloride.

**Sterility** <71>—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*, the entire contents of all the con-

tainers being collected aseptically with the aid of 200 mL of Fluid A before filtering.

**pH** (791): between 4.5 and 6.5, in the solution constituted as directed in the labeling, except that water is used as the diluent.

**Water, Method I** (921): not more than 4.0%, the *Test Preparation* being prepared as directed for a hygroscopic specimen.

**Other requirements**—It responds to the *Identification* test under *Doxorubicin Hydrochloride*, and meets the requirements for *Uniformity of Dosage Units* (905) and *Labeling* under *Injections* (1).

#### Assay—

*Mobile phase, Resolution solution, Standard preparation, and Chromatographic system*—Proceed as directed in the Assay under *Doxorubicin Hydrochloride*.

*Assay preparation*—Dilute the contents of 1 container quantitatively with *Mobile phase* to obtain a solution containing about 0.1 mg of doxorubicin hydrochloride per mL.

*Procedure*—Proceed as directed for *Procedure* in the Assay under *Doxorubicin Hydrochloride*. Calculate the quantity, in mg, of  $C_{27}H_{29}NO_{11} \cdot HCl$  in the container of Doxorubicin Hydrochloride for Injection taken by the formula:

$$(CP / 1000)(L / D)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Doxorubicin Hydrochloride RS in the *Standard preparation*, *P* is the content, in µg per mg, of  $C_{27}H_{29}NO_{11} \cdot HCl$  in the USP Doxorubicin Hydrochloride RS, *L* is the labeled quantity of doxorubicin hydrochloride in the container, *D* is the concentration, in mg per mL, of doxorubicin hydrochloride in the *Assay preparation* on the basis of the labeled quantity in the container and the extent of dilution, and *r<sub>U</sub>* and *r<sub>S</sub>* are the responses of the doxorubicin peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Doxycycline

$C_{22}H_{24}N_2O_8 \cdot H_2O$  462.45

2-Naphthacenecarboxamide, 4-(dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,5,10,12,12a-pentahydroxy-6-methyl-1,11-dioxo-, [4S-(4α,4aα,5α,5aα,6α,12α)]-, monohydrate.

4-(Dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,5,10,12,12a-pentahydroxy-6-methyl-1,11-de monohydrate [17086-28-1].

Anhydrous 444.44 [564-25-0].

» Doxycycline has a potency equivalent to not less than 880 µg and not more than 980 µg of  $C_{22}H_{24}N_2O_8$  per mg.

**Packaging and storage**—Preserve in tight, light-resistant containers.

#### USP Reference standards (11)—

USP Doxycycline Hyclate RS

USP Methacycline Hydrochloride RS

**Identification**—Dissolve a suitable quantity in methanol to obtain a *Test Solution* containing 1 mg of doxycycline per mL, and proceed as directed for *Method II* under *Identification*—*Tetracyclines* (193).

**Crystallinity** (695): meets the requirements.

**pH** (791): between 5.0 and 6.5, in an aqueous suspension containing 10 mg per mL.

**Water, Method I** (921): between 3.6% and 4.6%.

#### Related compounds—

*Mobile phase and Diluent*—Prepare as directed in the Assay under *Doxycycline Hyclate*.

*System suitability solution*—Prepare as directed for the *Resolution solution* in the Assay under *Doxycycline Hyclate*.

*Methacycline standard stock solution, Standard solution 1, Standard solution 2, and Chromatographic system*—Prepare as directed for the *Related compounds* test under *Doxycycline Hyclate*.

*Test solution*—Use the *Assay preparation*, prepared as directed in the Assay.

*Procedure*—Proceed as directed for the *Related compounds* test under *Doxycycline Hyclate*. Calculate the percentage of methacycline in the portion of Doxycycline taken by the formula:

$$5000(C_M / W)(r_U / r_M)$$

in which *C<sub>M</sub>* is the concentration, in mg per mL, of USP Methacycline Hydrochloride RS in *Standard solution 2*; *W* is the weight, in mg, of Doxycycline taken to prepare the *Test solution*; and *r<sub>U</sub>* and *r<sub>M</sub>* are the methacycline peak responses obtained from the *Test solution* and *Standard solution 2*, respectively. Not more than 2% of methacycline is found. Calculate the percentage of each related compound, other than methacycline, in the portion of Doxycycline taken by the formula:

$$5000(C_S / W)(r_i / r_S)$$

in which *C<sub>S</sub>* is the concentration, in mg per mL, of USP Doxycycline Hyclate RS in *Standard solution 2*; *W* is the weight, in mg, of Doxycycline taken to prepare the *Test solution*; *r<sub>i</sub>* is the peak response for each impurity obtained from the *Test solution*; and *r<sub>S</sub>* is the doxycycline peak response obtained from *Standard solution 2*. Not more than 0.5% of any impurity eluting before methacycline is found; not more than 2% of 6-epidoxycycline is found; and not more than 0.5% of any impurity eluting after the main doxycycline peak is found.

#### Assay—

*Mobile phase, Diluent, Resolution solution, Standard preparation, and Chromatographic system*—Prepare as directed in the Assay under *Doxycycline Hyclate*.

**NOTE**—Throughout the following sections, protect the *Standard preparation* and the *Assay preparation* from light.

*Assay preparation*—Transfer about 55 mg of Doxycycline, accurately weighed, to a 50-mL volumetric flask, add 12 mL of 0.1 N hydrochloric acid, swirl to dissolve, dilute with *Diluent* to volume, and mix. Filter through a filter of 0.5 µm or finer porosity.

*Procedure*—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in µg, of doxycycline ( $C_{22}H_{24}N_2O_8$ ) in each mg of the Doxycycline taken by the formula:

$$50(CP / W)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Doxycycline Hyclate RS in the *Standard preparation*, *P* is the potency, in µg of doxycycline per mg, of USP Doxycycline Hyclate RS, *W* is the weight, in mg, of Doxycycline taken to prepare the *Assay preparation*, and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Doxycycline Capsules

» Doxycycline Capsules contain not less than 90.0 percent and not more than 120.0 percent of the labeled amount of doxycycline ( $C_{22}H_{24}N_2O_8$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Doxycycline Hyclate RS

**Identification**—

A: Shake a suitable quantity of Capsule contents with methanol to obtain a solution containing 1 mg of doxycycline per mL, and filter. Using the filtrate as the *Test solution*, proceed as directed for *Method II* under *Identification—Tetracyclines* (193).

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation* as obtained in the *Assay*.

**Dissolution** (711)—

*Medium*: 0.01 N hydrochloric acid; 900 mL.

*Apparatus 2*: 75 rpm.

*Time*: 60 minutes.

*Procedure*—Determine the amount of  $C_{22}H_{24}N_2O_8$  dissolved by employing UV absorption at the wavelength of maximum absorbance at about 268 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a *Standard solution* having a known concentration of USP Doxycycline Hyclate RS in the same *Medium*.

*Tolerances*—Not less than 85% (Q) of the labeled amount of  $C_{22}H_{24}N_2O_8$  is dissolved in 60 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Water, Method I** (921): not more than 5.5%.

**Assay**—

*Mobile phase, Diluent, Resolution solution, Standard preparation, and Chromatographic system*—Proceed as directed in the *Assay* under *Doxycycline Hyclate*.

NOTE—Throughout the following sections, protect the *Standard preparation*, the *Assay preparation*, and the stock solutions used in their preparation, from light.

*Assay preparation*—Remove, as completely as possible, the contents of not less than 20 Capsules, and weigh accurately. Mix the combined contents, and transfer an accurately weighed portion of the powder, equivalent to about 100 mg of doxycycline, to a 100-mL volumetric flask. Add 20 mL of 0.1 N hydrochloric acid, sonicate for 5 minutes, shake for 15 minutes, dilute with *Diluent* to volume, and mix. Filter a portion of this solution through a filter of 0.5  $\mu$ m or finer porosity, and use the filtrate as the *Assay preparation*.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of doxycycline ( $C_{22}H_{24}N_2O_8$ ) in the portion of Capsules taken by the formula:

$$0.1 CP(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Doxycycline Hyclate RS in the *Standard preparation*, P is the designated potency, in  $\mu$ g of doxycycline per mg, of USP Doxycycline Hyclate RS, and  $r_U$  and  $r_S$  are the doxycycline peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Doxycycline for Injection

» Doxycycline for Injection contains an amount of Doxycycline Hyclate equivalent to not less than 90.0 percent and not more than 120.0 percent of the labeled amount of doxycycline ( $C_{22}H_{24}N_2O_8$ ).

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* (1), protected from light.

**USP Reference standards** (11)—

USP Doxycycline Hyclate RS

USP Endotoxin RS

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* (1).

**Identification**—Dissolve a suitable quantity in methanol to obtain a solution containing the equivalent of 1 mg of doxycycline per mL, and filter. Using the filtrate as the *Test solution*, proceed as directed for *Method II* under *Identification—Tetracyclines* (193).

**Bacterial endotoxins** (85)—It contains not more than 1.14 USP Endotoxin Units per mg of doxycycline.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined, Fluid D* being used instead of *Fluid A*.

**pH** (791): between 1.8 and 3.3, in the solution constituted as directed in the labeling.

**Loss on drying** (731)—Dry about 100 mg, accurately weighed, in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: the article containing added substances loses not more than 2.0% of its weight; the article containing no added substances loses not more than 4.0% of its weight.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Assay**—

*Mobile phase, Diluent, Resolution solution, Standard preparation, and Chromatographic system*—Proceed as directed in the *Assay* under *Doxycycline Hyclate*.

*Assay preparation 1* (where it is represented as being in a single-dose container)—Constitute Doxycycline for Injection as directed in the labeling. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and dilute quantitatively with *Diluent* to obtain a solution containing the equivalent of about 1000  $\mu$ g of doxycycline per mL.

*Assay preparation 2* (where the label states the quantity of doxycycline equivalent in a given volume of constituted solution)—Constitute Doxycycline for Injection as directed in the labeling. Dilute an accurately measured volume of the constituted solution quantitatively with *Diluent* to obtain a solution containing the equivalent of about 1000  $\mu$ g of doxycycline per mL.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Doxycycline Hyclate*. Calculate the quantity, in mg, of doxycycline ( $C_{22}H_{24}N_2O_8$ ) withdrawn from the container, or in the portion of constituted solution taken by the formula:

$$(L / D)(CP)(r_U / r_S)$$

in which L is the labeled quantity, in mg, of doxycycline in the container, or in the volume of constituted solution taken, D is the concentration, in  $\mu$ g of doxycycline per mL, of *Assay preparation 1* or *Assay preparation 2*, based on the labeled quantity in the container or in the portion of constituted solution taken, respectively, and the extent of dilution, and the other terms are as defined therein.

## Doxycycline for Oral Suspension

» Doxycycline for Oral Suspension contains the equivalent of not less than 90.0 percent and not more than 125.0 percent of the labeled amount of  $C_{22}H_{24}N_2O_8$  when constituted as directed. It contains one or more suitable buffers, colors, diluents, flavors, and preservatives.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—  
USP Doxycycline Hyclate RS

**Identification**—To a quantity of Doxycycline for Oral Suspension (powder), equivalent to about 50 mg of doxycycline, add 50 mL of methanol, shake, and allow to settle. Using the clear supernatant as the *Test Solution*, proceed as directed for *Method II* under *Identification—Tetracyclines* (193).

**Uniformity of dosage units** (905)—

FOR SOLID PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** (698): meets the requirements.

**pH** (791): between 5.0 and 6.5, in the suspension constituted as directed in the labeling.

**Water, Method I** (921): not more than 3.0%.

**Assay**—

*Mobile phase, Diluent, Resolution solution, Standard preparation, and Chromatographic system*—Proceed as directed in the Assay under *Doxycycline Hyclate*.

*Assay preparation*—Constitute Doxycycline for Oral Suspension as directed in the labeling. Transfer an accurately measured portion of the constituted suspension, freshly mixed and free from air bubbles, equivalent to about 100 mg of doxycycline, to a 100-mL volumetric flask, add 50 mL of 0.1 N hydrochloric acid, and shake by mechanical means for about 15 minutes. Dilute with *Diluent* to volume, and mix. Filter through filter paper, discarding the first 10 mL of the filtrate, then filter through a filter of 0.5- $\mu$ m or finer porosity.

*Procedure*—Proceed as directed for *Procedure* in the Assay under *Doxycycline Hyclate*. Calculate the quantity, in mg of doxycycline ( $C_{22}H_{24}N_2O_8$ ), in each mL of the constituted suspension taken by the formula:

$$0.1(CP / V)(r_U / r_S)$$

in which *V* is the volume, in mL, of the constituted suspension taken to prepare the *Assay preparation*, and the other terms are as defined therein.

**Add the following:**

## ▲Doxycycline Tablets

### DEFINITION

Doxycycline Tablets contain NLT 90.0% and NMT 120.0% of the labeled amount of doxycycline ( $C_{22}H_{24}N_2O_8$ ).

### IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

### ASSAY

#### • PROCEDURE

**Buffer:** A solution containing 3.2 g/L of monobasic potassium phosphate, 0.87 g/L of sodium hydroxide, 0.59 g/L of tetrabutylammonium hydrogen sulfate, and 0.47 g/L of disodium edetate

**Mobile phase:** To 850 mL of *Buffer* add 60 g of tertiary butyl alcohol, and dilute with water to 1000 mL. Adjust with 1 N sodium hydroxide to a pH of 8.0.

**Diluent A:** 0.1 N hydrochloric acid

**Diluent B:** 0.01 N hydrochloric acid

**System suitability solution:** 1.2 mg/mL of USP Doxycycline Hyclate RS and 1 mg/mL of USP Doxycycline Related Compound A RS in a mixture of *Diluent A* and *Diluent B* (20:80), prepared as follows. Dissolve first in *Diluent A* using 20% of the final volume, and then dilute with *Diluent B* to volume. Sonicate as necessary to dissolve.

**Standard solution:** 1.2 mg/mL of USP Doxycycline Hyclate RS in a mixture of *Diluent A* and *Diluent B* (20:80), prepared as follows. Dissolve first in *Diluent A* using 20% of the final volume, and then dilute with *Diluent B* to volume. Sonicate as necessary to dissolve. Protect this solution from light using low-actinic glassware.

**Sample solution:** 1 mg/mL of doxycycline in *Diluent* from NLT 20 Tablets, finely crushed, in a mixture of *Diluent A* and *Diluent B* (20:80) prepared as follows. Suspend a suitable portion of crushed Tablets in *Diluent A* using 20% of the final volume, sonicate as necessary, and dilute with *Diluent B* to volume. Pass through a suitable filter. Protect this solution from light using low-actinic glassware.

### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 270 nm

**Column:** 4.6-mm  $\times$  25-cm; 5- $\mu$ m packing L21

**Column temperature:** 60°

**Flow rate:** 1.5 mL/min

**Injection volume:** 20  $\mu$ L

### System suitability

**Samples:** *System suitability solution* and *Standard solution*

The relative retention times for doxycycline related compound A and doxycycline are about 0.7 and 1.0, respectively.

### Suitability requirements

**Resolution:** NLT 1.5 between doxycycline related compound A and doxycycline, *System suitability solution*

**Tailing factor:** NMT 2.0 for the doxycycline peak, *Standard solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of the labeled amount of doxycycline ( $C_{22}H_{24}N_2O_8$ ) in the portion of Doxycycline Tablets taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times P \times F \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Doxycycline Hyclate RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of doxycycline in the *Sample solution* (mg/mL)

$P$  = potency of doxycycline in USP Doxycycline Hyclate RS ( $\mu\text{g}/\text{mg}$ )

$F$  = conversion factor, 0.001  $\text{mg}/\mu\text{g}$

Acceptance criteria: 90.0%–120.0%

## PERFORMANCE TESTS

### DISSOLUTION (711)

Medium: 0.01 N hydrochloric acid; 900 mL

Apparatus 2: 75 rpm

Time: 60 min

Standard solution: 0.01  $\text{mg}/\text{mL}$  of doxycycline from USP Doxycycline Hyclate RS in Medium

Sample solution: Pass a portion of the solution under test through a suitable filter. Dilute a portion of the filtrate with Medium to a concentration that is similar to that of the Standard solution.

### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: UV

Analytical wavelength: 268 nm

Cell: 1 cm

Blank: Medium

### Analysis

Samples: Standard solution and Sample solution

Determine the percentage of the labeled amount of doxycycline ( $\text{C}_{22}\text{H}_{24}\text{N}_2\text{O}_8$ ) dissolved:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times V \times P \times 100$$

$A_U$  = absorbance of the Sample solution

$A_S$  = absorbance of the Standard solution

$C_S$  = concentration of USP Doxycycline Hyclate RS in the Standard solution ( $\text{mg}/\text{mL}$ )

$L$  = label claim ( $\text{mg}/\text{Tablet}$ )

$V$  = volume of Medium, 900 mL

$P$  = potency of doxycycline in USP Doxycycline Hyclate RS ( $\mu\text{g}/\text{mg}$ )

Tolerances: NLT 85% (Q) of the labeled amount of doxycycline ( $\text{C}_{22}\text{H}_{24}\text{N}_2\text{O}_8$ ) is dissolved.

### UNIFORMITY OF DOSAGE UNITS (905): Meet the requirements

## IMPURITIES

### ORGANIC IMPURITIES

Diluent A, Diluent B, Mobile phase, System suitability solution, Standard solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the Assay.

### Analysis

Sample: Sample solution

Calculate the percentage of each impurity in the portion of Doxycycline Tablets taken:

$$\text{Result} = (r_U/r_S) \times (1/F) \times 100$$

$r_U$  = peak response of each impurity from the Sample solution

$r_S$  = peak response of doxycycline from the Sample solution

$F$  = relative response factor as listed in Table 1

Acceptance criteria: See Table 1.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Oxytetracycline <sup>a</sup>	0.3	—	—
4-Epidoxycycline <sup>b</sup>	0.4	0.8	1.5
Methacycline <sup>a,c</sup>	0.6	—	—
Doxycycline related compound A (6-epidoxycycline) <sup>a,d</sup>	0.7	—	—
Doxycycline	1.0	—	—
Any individual unspecified impurity	—	1.0	0.3
Total impurities	—	—	2.5

<sup>a</sup> These are synthetic process impurities, which are controlled in the drug substance. They are listed here for reference only and are not to be reported. Total impurities does not include these peaks.

<sup>b</sup> (4*R*,4*aR*,5*S*,5*aR*,6*R*,12*aS*)-4-(Dimethylamino)-1,4,4*a*,5,5*a*,6,11,12*a*-octahydro-3,5,10,12,12*a*-pentahydroxy-6-methyl-1,11-dioxo-2-naphthacenecarboxamide.

<sup>c</sup> (4*S*,4*aR*,5*S*,5*aR*,12*aS*)-4-(Dimethylamino)-1,4,4*a*,5,5*a*,6,11,12*a*-octahydro-3,5,10,12,12*a*-pentahydroxy-6-methylene-1,11-dioxo-2-naphthacenecarboxamide.

<sup>d</sup> (4*S*,4*aR*,5*S*,5*aR*,6*S*,12*aS*)-4-(Dimethylamino)-1,4,4*a*,5,5*a*,6,11,12*a*-octahydro-3,5,10,12,12*a*-pentahydroxy-6-methyl-1,11-dioxo-2-naphthacenecarboxamide.

## ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at controlled room temperature.

### USP REFERENCE STANDARDS (11)

USP Doxycycline Hyclate RS

USP Doxycycline Related Compound A RS

(4*S*,4*aR*,5*S*,5*aR*,6*S*,12*aS*)-4-(Dimethylamino)-1,4,4*a*,5,5*a*,6,11,12*a*-octahydro-3,5,10,12,12*a*-pentahydroxy-6-methyl-1,11-dioxo-2-naphthacenecarboxamide.

$\text{C}_{22}\text{H}_{24}\text{N}_2\text{O}_8$  444.43▲<sup>USP36</sup>

## Doxycycline Calcium Oral Suspension

» Doxycycline Calcium Oral Suspension is prepared from Doxycycline Hyclate, and contains one or more suitable buffers, colors, diluents, flavors, and preservatives. It contains the equivalent of not less than 90.0 percent and not more than 125.0 percent of the labeled amount of doxycycline ( $\text{C}_{22}\text{H}_{24}\text{N}_2\text{O}_8$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

### USP Reference standards (11)—

USP Doxycycline Hyclate RS

**Identification**—To an accurately measured volume of Oral Suspension, equivalent to about 50 mg of doxycycline, add 50 mL of methanol, shake, and allow to settle. Using the clear supernatant as the Test Solution, proceed as directed for Method II under Identification—Tetracyclines (193).

### Uniformity of dosage units (905)—

FOR SUSPENSION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** (698): meets the requirements.

**pH** (791): between 6.5 and 8.0.

**Assay—**

*Mobile phase, Resolution solution, Standard preparation, and Chromatographic system*—Proceed as directed in the Assay under Doxycycline Hyclate.

*Edetate diluent*—Transfer 5.2 g of edetate disodium to a 500-mL volumetric flask, add about 400 mL of *Mobile phase*, sonicate for about 10 minutes or until dissolved, dilute with *Mobile phase* to volume, and mix.

*Assay preparation*—Constitute Oral Suspension as directed in the labeling. Transfer an accurately measured portion of the constituted oral suspension, freshly mixed and free from air bubbles, equivalent to about 100 mg of doxycycline, to a 100-mL volumetric flask, add 50 mL of *Edetate diluent*, sonicate for 15 minutes, and then shake by mechanical means for about 15 minutes. Dilute with *Edetate diluent* to volume, and mix. Pass through filter paper, discarding the first 10 mL of the filtrate, then pass through a filter having a 0.5- $\mu$ m or finer porosity.

*Procedure*—Proceed as directed for *Procedure* in the Assay under Doxycycline Hyclate. Calculate the quantity, in mg, of doxycycline ( $C_{22}H_{24}N_2O_8$ ) in each mL of the Oral Suspension taken by the formula:

$$0.1(CP / V)(r_U / r_S)$$

in which  $V$  is the volume, in mL, of Oral Suspension taken to prepare the *Assay preparation*; and the other terms are as defined therein.

## Doxycycline Hyclate

( $C_{22}H_{24}N_2O_8 \cdot HCl$ )<sub>2</sub> ·  $C_2H_6O \cdot H_2O$  1025.87

2-Naphthacenecarboxamide, 4-(dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,5,10,12,12a-pentahydroxy-6-methyl-1,11-dioxo-, monohydrochloride, compd. with ethanol (2:1), monohydrate, [4S-(4 $\alpha$ ,4a $\alpha$ ,5 $\alpha$ ,5a $\alpha$ ,6 $\alpha$ ,12 $\alpha$ )]-.  
4-(Dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,5,10,12,12a-pentahydroxy-6-methyl-1,11-dioxo-2-naphthacenecarboxamide monohydrochloride, compound with ethyl alcohol (2:1), monohydrate [24390-14-5].

» Doxycycline Hyclate has a potency equivalent to not less than 800  $\mu$ g and not more than 920  $\mu$ g of doxycycline ( $C_{22}H_{24}N_2O_8$ ) per mg.

**Packaging and storage**—Preserve in tight containers, protected from light.

**Labeling**—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

**USP Reference standards** (11)—

USP Doxycycline Hyclate RS

USP Endotoxin RS

USP Methacycline Hydrochloride RS

**Identification, Infrared Absorption** (197K)

**Crystallinity** (695): meets the requirements.

**pH** (791): between 2.0 and 3.0, in a solution containing 10 mg of doxycycline per mL.

**Water, Method I** (921): between 1.4% and 2.8%.

**Related compounds—**

*Mobile phase and Diluent*—Prepare as directed in the Assay.

*System suitability solution*—Prepare as directed for *Resolution solution* in the Assay.

*Methacycline standard stock solution*—Dissolve an accurately weighed quantity of USP Methacycline Hydrochloride RS in *Diluent*, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 1.2 mg per mL.

*Standard solution 1*—Prepare as directed for the *Standard preparation* in the Assay.

*Standard solution 2*—Transfer 2.0 mL of *Standard solution 1* and 2.0 mL of the *Methacycline standard stock solution* to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix. This solution contains about 0.024 mg each of USP Doxycycline Hyclate RS and USP Methacycline Hydrochloride RS per mL.

*Test solution*—Use the *Assay preparation*, prepared as directed in the Assay.

*Chromatographic system* (see *Chromatography* (621))—Prepare as directed in the Assay. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.4 for 4-epidoxycycline (the main degradation product), 0.6 for methacycline, 0.7 for 6-epidoxycycline, and 1.0 for doxycycline; the resolution,  $R$ , between 4-epidoxycycline and doxycycline is not less than 3.0; and the tailing factor is not more than 2.0. Chromatograph *Standard solution 1*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of *Standard solution 2* and the *Test solution* into the chromatograph, record the chromatograms for a period of time that is 1.7 times the retention time of doxycycline, and measure the peak areas. Calculate the percentage of methacycline in the portion of Doxycycline Hyclate taken by the formula:

$$10,000(C_M / W)(r_U / r_M)$$

in which  $C_M$  is the concentration, in mg per mL, of USP Methacycline Hydrochloride RS in *Standard solution 2*;  $W$  is the weight, in mg, of Doxycycline Hyclate taken to prepare the *Test solution*; and  $r_U$  and  $r_M$  are the methacycline peak responses obtained from the *Test solution* and *Standard solution 2*, respectively. Not more than 2% of methacycline is found. Calculate the percentage of each related compound, other than methacycline, in the portion of Doxycycline Hyclate taken by the formula:

$$10,000(C_S / W)(r_i / r_S)$$

in which  $C_S$  is the concentration, in mg per mL, of USP Doxycycline Hyclate RS in *Standard solution 2*;  $W$  is the weight, in mg, of Doxycycline Hyclate taken to prepare the *Test solution*;  $r_i$  is the peak response for each impurity obtained from the *Test solution*; and  $r_S$  is the doxycycline peak response obtained from *Standard solution 2*. Not more than 0.5% of any impurity eluting before methacycline is found; not more than 2% of 6-epidoxycycline is found; and not more than 0.5% of any impurity eluting after the main doxycycline peak is found.

**Other requirements**—Where the label states that Doxycycline Hyclate is sterile, it meets the requirements for *Sterility* and *Bacterial endotoxins* under Doxycycline for Injection. Where the label states that Doxycycline Hyclate must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under Doxycycline for Injection.

**Assay—**

*Mobile phase*—Transfer 2.72 g of monobasic potassium phosphate, 0.74 g of sodium hydroxide, 0.50 g of tetrabutylammonium hydrogen sulfate, and 0.40 g of edetate disodium to a 1000-mL volumetric flask. Add about 850 mL of

water, and stir to dissolve. Add 60 g of tertiary butyl alcohol with the aid of water, dilute with water to volume, and adjust with 1 N sodium hydroxide to a pH of  $8.0 \pm 0.1$ . Pass this solution through a filter having a porosity of 0.5  $\mu\text{m}$  or finer, and degas before using. Make any necessary adjustments (see *System Suitability* under *Chromatography* (621)). Decreasing the proportion of tertiary butyl alcohol results in a longer retention time of doxycycline and improved separation of doxycycline from the related compounds.

**Diluent**—Use 0.01 N hydrochloric acid.

**Resolution solution**—Prepare a solution of USP Doxycycline Hyclate RS in *Diluent* containing about 6 mg of doxycycline per mL. Transfer 5 mL of this solution to a 25-mL volumetric flask, heat on a steam bath for 60 minutes, and evaporate to dryness on a hot plate, taking care not to char the residue. Dissolve the residue in 0.01 N hydrochloric acid, dilute with *Diluent* to volume, and mix. Pass a portion of this solution through a filter having a porosity of 0.5  $\mu\text{m}$  or finer, and use the filtrate as the *Resolution solution*. This solution contains a mixture of 4-epidoxycycline, 6-epidoxycycline, and doxycycline. When stored in a refrigerator, this solution may be used for 14 days. [NOTE—Throughout the following sections, protect the *Standard preparation* and the *Assay preparation* from light.]

**Standard preparation**—Transfer about 12 mg of USP Doxycycline Hyclate RS, accurately weighed, to a 10-mL volumetric flask, add about 6 mL of *Diluent*, sonicate for about 5 minutes or until dissolved, dilute with *Diluent* to volume, and mix.

**Assay preparation**—Transfer about 120 mg of Doxycycline Hyclate, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix. Pass through a membrane filter having a porosity of 0.5  $\mu\text{m}$  or finer.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 270 nm detector, and a 4.6-mm  $\times$  25-cm column that contains packing L21 and is maintained at  $60 \pm 1^\circ$ . The flow rate is about 1 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.4 for 4-epidoxycycline (the main degradation product), 0.7 for 6-epidoxycycline, and 1.0 for doxycycline, the resolution, *R*, between the 4-epidoxycycline peak and the doxycycline peak is not less than 3.0, and the tailing factor for the doxycycline peak is not more than 2.0. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu\text{L}$ ) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms for a period of time that is 1.7 times the retention time of doxycycline, and measure the responses for the major peaks. Calculate the potency, in  $\mu\text{g}$  of doxycycline ( $\text{C}_{22}\text{H}_{24}\text{N}_2\text{O}_8$ ) per mg, of the Doxycycline Hyclate taken by the formula:

$$100(\text{CP} / W)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Doxycycline Hyclate RS in the *Standard preparation*; *P* is the designated potency, in  $\mu\text{g}$  of doxycycline ( $\text{C}_{22}\text{H}_{24}\text{N}_2\text{O}_8$ ) per mg, of USP Doxycycline Hyclate RS; *W* is the quantity, in mg, of Doxycycline Hyclate taken to prepare the *Assay preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Doxycycline Hyclate Capsules

» Doxycycline Hyclate Capsules contain the equivalent of not less than 90.0 percent and not more than 120.0 percent of the labeled amount of doxycycline ( $\text{C}_{22}\text{H}_{24}\text{N}_2\text{O}_8$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Doxycycline Hyclate RS

**Identification**—Shake a suitable quantity of Capsule contents with methanol to obtain a solution containing the equivalent of 1 mg of doxycycline per mL, and filter. Using the filtrate as the *Test Solution*, proceed as directed for *Method II* under *Identification—Tetracyclines* (193).

**Dissolution** (711)—

*Medium*: water; 900 mL.

*Apparatus 2*: 75 rpm, the distance between the blade and the inside bottom of the flask being maintained at  $4.5 \pm 0.5$  cm during the test.

*Time*: 30 minutes.

**Procedure**—Determine the amount of  $\text{C}_{22}\text{H}_{24}\text{N}_2\text{O}_8$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 276 nm of filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Doxycycline Hyclate RS in the same medium.

**Tolerances**—Not less than 80% (*Q*) of the labeled amount of  $\text{C}_{22}\text{H}_{24}\text{N}_2\text{O}_8$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Water, Method I** (921): not more than 8.5%.

**Assay**—

*Mobile phase*, *Diluent*, *Resolution solution*, *Standard preparation*, and *Chromatographic system*—Proceed as directed in the *Assay* under *Doxycycline Hyclate*.

**Assay preparation**—Remove, as completely as possible, the contents of not less than 20 Capsules, and weigh accurately. Mix the combined contents, and transfer an accurately weighed portion of the powder, equivalent to about 100 mg of doxycycline, to a 100-mL volumetric flask, add about 75 mL of *Diluent*, sonicate for 5 minutes, shake for 15 minutes, dilute with *Diluent* to volume, and mix. Filter through a membrane filter of 0.5  $\mu\text{m}$  or finer porosity.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Doxycycline Hyclate*. Calculate the quantity, in mg, of doxycycline ( $\text{C}_{22}\text{H}_{24}\text{N}_2\text{O}_8$ ) in the portion of Capsules taken by the formula:

$$0.1 \text{CP}(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Doxycycline Hyclate RS in the *Standard preparation*, *P* is the designated potency, in  $\mu\text{g}$  of doxycycline per mg, of USP Doxycycline Hyclate RS, and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Doxycycline Hyclate Delayed-Release Capsules

» Doxycycline Hyclate Delayed-Release Capsules contain the equivalent of not less than 90.0 percent and not more than 120.0 percent of the labeled amount of doxycycline ( $C_{22}H_{24}N_2O_8$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

**Labeling**—The label indicates that the contents of the Capsules are enteric-coated.

**USP Reference standards** (11)—  
USP Doxycycline Hyclate RS

**Identification**—Shake a suitable quantity of finely powdered Capsule contents with methanol to obtain a solution containing the equivalent of 1 mg of doxycycline per mL, and filter. Using the filtrate as the *Test Solution*, proceed as directed for *Method II* under *Identification—Tetracyclines* (193).

**Dissolution** (711)—Proceed as directed for *Procedure* for *Method B* under *Apparatus 1* and *Apparatus 2*, *Delayed-Release Dosage Forms*.

ACID STAGE—[NOTE—Conduct the test by transferring the contents of each Capsule to the individual basket units of the apparatus.]

Medium: 0.06 N hydrochloric acid; 900 mL.

Apparatus 1: 50 rpm.

Time: 20 minutes.

Diluting solvent: 0.1 N hydrochloric acid.

*Procedure*—Determine the amount of  $C_{22}H_{24}N_2O_8$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 345 nm on filtered portions of the solution under test, suitably diluted with *Diluting solvent*, in comparison with a Standard solution having a known concentration of about 0.01 mg of USP Doxycycline Hyclate RS per mL in *Diluting solvent*.

*Tolerances*—*Level 1* (6 Capsules tested): No individual value exceeds 50% dissolved. *Level 2* (6 Capsules tested): Not more than 2 individual values of 12 tested are greater than 50% dissolved.

BUFFER STAGE—[NOTE—Conduct this stage of testing on separate specimens, selecting Capsules that were not previously subjected to *Acid stage* testing and transferring the contents of each Capsule to the individual basket units of the apparatus.]

Medium: pH 5.5 neutralized phthalate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*); 1000 mL.

Apparatus 1: 50 rpm.

Time: 30 minutes.

Diluting solvent: 0.1 N hydrochloric acid.

*Procedure*—Determine the amount of  $C_{22}H_{24}N_2O_8$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 345 nm on filtered portions of the solution under test, suitably diluted with *Diluting solvent*, in comparison with a Standard solution having a known concentration of about 0.01 mg of USP Doxycycline Hyclate RS per mL in *Diluting solvent*.

*Tolerances*—Not less than 85% (Q) of the labeled amount of  $C_{22}H_{24}N_2O_8$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Water, Method I** (921): not more than 5.0%.

### Assay—

*Mobile phase*, *Diluent*, *Resolution solution*, *Standard preparation*, and *Chromatographic system*—Proceed as directed in the *Assay* under *Doxycycline Hyclate*.

*Assay preparation*—Remove, as completely as possible, the contents of not fewer than 20 Capsules, and weigh accurately. Mix the combined contents, and transfer an accurately weighed portion of the powder, equivalent to about 100 mg of doxycycline, to a 100-mL volumetric flask, add about 75 mL of *Diluent*, sonicate for 5 minutes, shake for 15 minutes, dilute with *Diluent* to volume, and mix. Pass through a membrane filter having a 0.5- $\mu$ m or finer porosity.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Doxycycline Hyclate*. Calculate the quantity, in mg, of doxycycline ( $C_{22}H_{24}N_2O_8$ ) in the portion of Capsules taken by the formula:

$$0.1 CP(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Doxycycline Hyclate RS in the *Standard preparation*; P is the designated potency, in  $\mu$ g of doxycycline per mg, of USP Doxycycline Hyclate RS; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Doxycycline Hyclate Delayed-Release Tablets

### DEFINITION

Doxycycline Hyclate Delayed-Release Tablets contain an amount of Doxycycline Hyclate equivalent to NLT 90.0% and NMT 120.0% of the labeled amount of doxycycline ( $C_{22}H_{24}N_2O_8$ ).

### IDENTIFICATION

A. The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### Change to read:

#### • PROCEDURE

**Mobile phase:** Transfer 0.77 g of ammonium acetate, 0.75 g of sodium hydroxide, 0.50 g of tetrabutylammonium hydrogen sulfate, and 0.40 g of edetate disodium to a 1000-mL volumetric flask. Add 850 mL of water, and dissolve. Add 70 g of tertiary butyl alcohol with the aid of water, dilute with water to volume, and adjust with acetic acid or ammonium hydroxide to a pH of  $9.00 \pm 0.05$ .

**Standard solution:** 1.16 mg/mL of doxycycline hyclate in methanol and water (1:9). Transfer USP Doxycycline Hyclate RS to a suitable volumetric flask, and add methanol to 10% of the final volume. Sonicate for 5 min or until dissolved. Dilute with water to volume. Protect the *Standard solution* from light. • Calculate the concentration,  $C_s$ , in mg/mL of doxycycline, using the designated potency, in  $\mu$ g/mg of doxycycline in USP Doxycycline Hyclate RS. • (RB 1-Jun-2012)

**Sample solution:** Equivalent to 1 mg/mL of doxycycline in a mixture of methanol and water (1:9) from NLT 10 Tablets, crushed. Prepare the solution as follows. Weigh and crush NMT 2 Tablets at a time in a suitable mortar. Transfer a weighed portion of the powder to a suitable volumetric flask, add methanol to 10% of the final vol-

ume, and sonicate. Dilute with water to volume, sonicating as necessary. Pass through a suitable filter. Protect the *Sample solution* from light.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 270 nm

**Column:** 4.6-mm × 25-cm; packing L21

**Column temperature:** 52 ± 2°

**Flow rate:** 1 mL/min

**Injection volume:** 15 µL

**Run time:** 1.7 times the retention time of the doxycycline peak

#### System suitability

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0% from six replicate injections

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of doxycycline (C<sub>22</sub>H<sub>24</sub>N<sub>2</sub>O<sub>8</sub>) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of doxycycline in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of doxycycline in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–120.0%

### PERFORMANCE TESTS

#### Change to read:

#### • DISSOLUTION <711>

**Test 1:** Proceed as directed for *Apparatus 1* and *Apparatus 2*, *Delayed-Release Dosage Forms*, *Method B*, *Procedure* <711>.

#### Acid stage

**Medium:** 0.06 N hydrochloric acid; 900 mL, degassed with helium

**Apparatus 1:** 50 rpm

**Time:** 20 min

**Standard solution:** 0.128 mg/mL of USP Doxycycline Hyclate RS in *Medium*. Calculate the concentration,  $C_S$ , in mg/mL of doxycycline, using the designated potency, in µg/mg of doxycycline in USP Doxycycline Hyclate RS. [NOTE—Sonicate if necessary to dissolve.]

**Sample solution:** Pass portions of the solution under test through a suitable PVDF filter of 0.45-µm pore size.

**Detector:** UV 346 nm

**Cell:** 0.1-cm quartz

**Blank:** *Medium*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of doxycycline (C<sub>22</sub>H<sub>24</sub>N<sub>2</sub>O<sub>8</sub>) dissolved:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times V \times 100$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of doxycycline in the *Standard solution* (mg/mL)

$L$  = label claim (mg/Tablet)

$V$  = volume of *Medium*, 900 mL

#### Tolerances

**Level 1 (6 Tablets tested):** No individual value is more than 30% of the labeled amount of doxycycline (C<sub>22</sub>H<sub>24</sub>N<sub>2</sub>O<sub>8</sub>) dissolved in 20 min.

**Level 2 (6 Tablets tested):** NMT 2 individual values of the 12 tested are greater than 30% of the labeled amount of doxycycline (C<sub>22</sub>H<sub>24</sub>N<sub>2</sub>O<sub>8</sub>) in 20 min.

#### Buffer stage

Conduct this stage of testing on separate Tablets, selecting those that were not previously subjected to the *Acid stage* testing.

**Medium:** pH 5.5 neutralized phthalate buffer (see *Reagents, Indicators, and Solutions—Buffer Solutions*); 900 mL, degassed

**Apparatus 1:** 50 rpm

**Time:** 30 min

**Standard solution:** 0.128 mg/mL of USP Doxycycline Hyclate RS in *Medium*. Calculate the concentration,  $C_S$ , in mg/mL of doxycycline, using the designated potency, in µg/mg of doxycycline in USP Doxycycline Hyclate RS. [NOTE—Sonicate if necessary to dissolve.]

**Sample solution:** Pass portions of the solution under test through a suitable PVDF filter of 0.45-µm pore size.

**Analysis:** Determine the percentage of doxycycline (C<sub>22</sub>H<sub>24</sub>N<sub>2</sub>O<sub>8</sub>) dissolved by the procedure described for the *Acid stage*.

**Tolerances:** NLT 85% (Q) of the labeled amount of doxycycline (C<sub>22</sub>H<sub>24</sub>N<sub>2</sub>O<sub>8</sub>) is dissolved.

**Test 2:** If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*. Proceed as directed for *Apparatus 1* and *Apparatus 2*, *Delayed-Release Dosage Forms*, *Method B*, *Procedure* <711>.

#### Acid stage

**Medium, Apparatus 1, Time, Blank, and Analysis:** Proceed as directed for *Acid stage* in *Test 1*.

**Standard solution:** (L/900) mg/mL of USP Doxycycline Hyclate RS in *Medium*. Calculate the concentration,  $C_S$ , in mg/mL of doxycycline, using the designated potency, in µg/mg of doxycycline in USP Doxycycline Hyclate RS. Sonicate if necessary to dissolve.

**Sample solution:** Pass portions of the solution under test through a suitable filter.

**Detector:** UV 345 nm

**Cell:** See *Table 1*.

Table 1

Tablet Strength (mg/Tablet)	Cell Size (cm)
75	0.5
100	0.5
150	0.2

#### Tolerances

**Level 1 (6 Tablets tested):** No individual value is more than 50% of the labeled amount of doxycycline (C<sub>22</sub>H<sub>24</sub>N<sub>2</sub>O<sub>8</sub>) dissolved in 20 min.

**Level 2 (6 Tablets tested):** NMT 2 individual values of the 12 tested are greater than 50% of the labeled amount of doxycycline (C<sub>22</sub>H<sub>24</sub>N<sub>2</sub>O<sub>8</sub>) in 20 min.

#### Buffer stage

Conduct this stage of testing on separate Tablets, selecting those that were not previously subjected to the *Acid stage* testing.

**Medium:** pH 5.5 neutralized phthalate buffer (see *Reagents, Indicators, and Solutions—Buffer Solutions*); 1000 mL, degassed

**Apparatus 1 and Analysis:** Proceed as directed for *Buffer stage* in *Test 1*.

**Time:** 45 min

**Standard solution:** (L/1000) mg/mL of USP Doxycycline Hyclate RS in *Medium*. Calculate the concentration,  $C_s$ , in mg/mL of doxycycline, using the designated potency, in  $\mu\text{g}/\text{mg}$  of doxycycline in USP Doxycycline Hyclate RS. Sonicate if necessary to dissolve.

**Sample solution:** Pass portions of the solution under test through a suitable filter.

**Detector and Cell:** Proceed as directed for *Acid stage* in *Test 2*.

**Tolerances:** NLT 70% (Q) of the labeled amount of doxycycline ( $\text{C}_{22}\text{H}_{24}\text{N}_2\text{O}_8$ ) is dissolved.

**Test 3:** If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 3*. Proceed as directed for *Apparatus 1 and Apparatus 2, Delayed-Release Dosage Forms, Method B, Procedure (711)*.

#### Acid stage

**Apparatus 1 and Time** • (RB 1-Jun-2012): Proceed as directed for *Acid stage* in *Test 1*.

**Medium:** 0.06 N hydrochloric acid; 900 mL

**Standard solution:** • Prepare the solutions as directed in *Table 2* from USP Doxycycline Hyclate RS in *Medium*. Calculate the concentration,  $C_s$ , in mg/mL of doxycycline, using the designated potency, in  $\mu\text{g}/\text{mg}$  of doxycycline in USP Doxycycline Hyclate RS.

**Table 2**

Tablet Strength (mg/Tablet)	Concentration of Doxycycline (mg/mL)
75	0.1
100	0.1
150	0.17

• (RB 1-Jun-2012)

**Sample solution:** Pass portions of the solution under test through a suitable filter.

**Detector:** UV 345 nm

**Cell:** 0.2 cm

• **Blank:** *Medium*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of the labeled amount of doxycycline ( $\text{C}_{22}\text{H}_{24}\text{N}_2\text{O}_8$ ) dissolved:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times V \times 100$$

$A_U$  = absorbance of the *Sample solution*  
 $A_S$  = absorbance of the *Standard solution*  
 $C_S$  = concentration of doxycycline in the *Standard solution* (mg/mL)  
 $L$  = label claim (mg/Tablet)  
 $V$  = volume of *Medium*, 900 mL • (RB 1-Jun-2012)

**Tolerances:** See *Table 3*.

• **Table 3**

Level	Number of Tablets Tested	Tolerances	
		Tablets Labeled to Contain 75 or 100 mg of Doxycycline	Tablets Labeled to Contain 150 mg of Doxycycline
$A_1$	6	No individual value exceeds 50% at 20 min.	No individual value exceeds 30% at 20 min.
$A_2$	6	Average of 12 units ( $A_1 + A_2$ ) is NMT 50% at 20 min, and no individual unit is greater than 65% dissolved.	Average of 12 units ( $A_1 + A_2$ ) is NMT 30% at 20 min, and no individual unit is greater than 45% dissolved.
$A_3$	12	Average of 24 units ( $A_1 + A_2 + A_3$ ) is NMT 50% at 20 min, and no individual unit is greater than 65% dissolved.	Average of 24 units ( $A_1 + A_2 + A_3$ ) is NMT 30% at 20 min, and no individual unit is greater than 45% dissolved.

• (RB 1-Jun-2012)

#### Buffer stage

Conduct this stage of testing on separate Tablets, selecting those that were not previously subjected to the *Acid stage* testing.

**Medium:** pH 5.5 neutralized phthalate buffer (see *Reagents, Indicators, and Solutions—Buffer Solutions*); 1000 mL

**Apparatus 1:** 50 rpm

**Time:** 60 min

**Standard solution:** • Prepare the solutions as directed in *Table 4* from USP Doxycycline Hyclate RS in *Medium*. Calculate the concentration,  $C_s$ , in mg/mL of doxycycline, using the designated potency, in  $\mu\text{g}/\text{mg}$  of doxycycline in USP Doxycycline Hyclate RS.

**Table 4**

Tablet Strength (mg/Tablet)	Concentration of Doxycycline (mg/mL)
75	0.1
100	0.1
150	0.15

• (RB 1-Jun-2012)

**Sample solution:** Pass portions of the solution under test through a suitable filter.

**Detector:** UV 345 nm

**Cell:** 0.2 cm

**Blank:** *Medium*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of the labeled amount of doxycycline ( $\text{C}_{22}\text{H}_{24}\text{N}_2\text{O}_8$ ) dissolved:

**Tolerances:** NLT 75% (Q) of the labeled amount of doxycycline ( $C_{22}H_{24}N_2O_8$ ) is dissolved. • (RB 1-Jun-2012)

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

**IMPURITIES****Change to read:**• **ORGANIC IMPURITIES**

**Mobile phase, Sample solution, and Chromatographic system:** Proceed as directed in the *Assay*.

**Standard stock solution:** 1.16 mg/mL of doxycycline hyclate in methanol and water (1:9). Transfer USP Doxycycline Hyclate RS to a suitable volumetric flask, and add methanol to 10% of the final volume. Sonicate for 5 min or until dissolved. Dilute with water to volume. Protect the solution from light. • Calculate the concentration, in mg/mL of doxycycline, using the designated potency, in  $\mu\text{g}/\text{mg}$  of doxycycline in USP Doxycycline Hyclate RS. • (RB 1-Jun-2012)

**Standard solution:** 0.02 mg/mL of doxycycline from the *Standard stock solution*. Protect the solution from light.

**Sensitivity solution:** 1  $\mu\text{g}/\text{mL}$  of doxycycline from the *Standard solution*. Protect the solution from light.

**System suitability stock solution:** 0.04 mg/mL each of USP Oxytetracycline Hydrochloride RS, USP Methacycline Hydrochloride RS, and USP Doxycycline Related Compound A RS. Protect the solution from light.

**System suitability solution:** Transfer 5 mL of the *Standard stock solution* into a 25-mL volumetric flask. Heat on a steam bath for 60 min, and gently evaporate to dryness on a hot plate (partial degradation of doxycycline to 4-epidoxycycline). Add 3 mL of the *System suitability stock solution* to the flask, and dilute with water to volume. Pass through a suitable filter. Protect the solution from light.

**System suitability**

**Samples:** *Standard solution*, *Sensitivity solution*, and *System suitability solution*

**Suitability requirements**

**Signal-to-noise ratio:** NLT 10 for doxycycline, *Sensitivity solution*

**Resolution:** NLT 1.5 between doxycycline and 6-epidoxycycline, *System suitability solution*

**Tailing factor:** NMT 2.0, *Standard solution*

**Relative standard deviation:** NMT 5.0%, *Standard solution*

**Analysis**

**Samples:** *Sample solution* and *Standard solution*  
 Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*  
 $r_S$  = peak response of doxycycline from the *Standard solution*  
 $C_S$  = concentration of doxycycline in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of doxycycline in the *Sample solution* (mg/mL)  
 $F$  = relative response factor (see *Table 6*)  
**Acceptance criteria:** See *Table 6*.

**Table 6**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Oxytetracycline	0.3	1.0	0.5
4-Epidoxycycline <sup>a</sup>	0.4	1.0	1.0
Methacycline	0.6	1.0	2.0
6-Epidoxycycline (doxycycline related compound A) <sup>b</sup>	0.7	0.86	2.0
Doxycycline	1.0	—	—

<sup>a</sup> (4*R*,4*aR*,5*S*,5*aR*,6*R*,12*aS*)-4-(Dimethylamino)-1,4,4*a*,5,5*a*,6,11,12*a*-octahydro-3,5,10,12,12*a*-pentahydroxy-6-methyl-1,11-dioxo-2-naphthacene-carboxamide monohydrate.

<sup>b</sup> (4*S*,4*aR*,5*S*,5*aR*,6*S*,12*aS*)-4-(Dimethylamino)-1,4,4*a*,5,5*a*,6,11,12*a*-octahydro-3,5,10,12,12*a*-pentahydroxy-6-methyl-1,11-dioxo-2-naphthacene-carboxamide monohydrate.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at controlled room temperature.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS** (11)

## Doxycycline Hyclate Tablets

**DEFINITION**

Doxycycline Hyclate Tablets contain the equivalent of NLT 90.0% and NMT 120.0% of the labeled amount of doxycycline (C<sub>22</sub>H<sub>24</sub>N<sub>2</sub>O<sub>8</sub>).

**IDENTIFICATION**• **PROCEDURE**

**Sample solution:** Shake a suitable quantity of finely ground Tablets with methanol to obtain a solution containing the equivalent of 1 mg/mL of doxycycline, and filter. Use the filtrate as the *Sample solution*.

**Analysis:** Proceed as directed under *Identification—Tetracyclines* (193), *Method II*.

**ASSAY**• **PROCEDURE**

**Mobile phase:** Transfer 2.72 g of monobasic potassium phosphate, 0.74 g of sodium hydroxide, 0.50 g of tetrabutylammonium hydrogen sulfate, and 0.40 g of edetate disodium to a 1000-mL volumetric flask. Add 850 mL of water, and stir to dissolve. Add 60 g of tertiary butyl alcohol with the aid of water, dilute with water to volume, and adjust with 1 N sodium hydroxide to a pH of 8.0 ± 0.1. Decreasing the proportion of tertiary butyl alcohol results in a longer retention time of doxycycline and improved separation of doxycycline from the related compounds.

**Diluent:** 0.01 N hydrochloric acid

[NOTE—Throughout the following sections, protect the *Standard solution* and the *Sample solution* from light.]

**Standard solution:** 1.2 mg/mL of USP Doxycycline Hyclate RS in Diluent. [NOTE—Sonicate as necessary to dissolve.]

**System suitability solution:** Prepare 6 mg/mL of doxycycline from USP Doxycycline Hyclate RS in *Diluent*. Transfer 5 mL of this solution to a 25-mL volumetric flask, heat on a steam bath for 60 min, and evaporate to dryness on a hot plate, taking care not to char the residue. Dissolve the residue in 0.01 N hydrochloric acid, dilute with *Diluent* to volume, and filter. This solution contains a mixture of 4-epidoxycycline, 6-epidoxycycline, and doxycycline. When stored in a refrigerator, this solution may be used for 14 days.

**Sample solution:** Transfer an equivalent to 100 mg of doxycycline, from finely powdered Tablets (NLT 20), to a 100-mL volumetric flask, add 75 mL of *Diluent*, sonicate for 5 min, shake for 15 min, dilute with *Diluent* to volume, and mix. Pass through a suitable filter.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 270 nm

**Column:** 4.6-mm × 25-cm; packing L21

**Column temperature:** 60 ± 1°

**Flow rate:** 1 mL/min

**Injection size:** 20 µL

**System suitability**

**Samples:** *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for 4-epidoxycycline (the main degradation product), 6-epidoxycycline, and doxycycline are about 0.4, 0.7, and 1.0, respectively, *System suitability solution*.]

**Suitability requirements**

**Resolution:** NLT 3.0 between the 4-epidoxycycline peak and the doxycycline peak, *System suitability solution*

**Tailing factor:** NMT 2.0, *System suitability solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution* is dissolved.

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Record the chromatograms for a period of time that is 1.7 times the retention time of doxycycline.

Calculate the percentage of C<sub>22</sub>H<sub>24</sub>N<sub>2</sub>O<sub>8</sub> in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (P/1000) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Doxycycline Hyclate RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of doxycycline in the *Sample solution* (mg/mL)

$P$  = potency of doxycycline, converted from µg/mg to mg/mg

**Acceptance criteria:** 90.0%–120.0%

**PERFORMANCE TESTS**

- **DISSOLUTION** (711) [NOTE—Use low-actinic glassware to prepare the solutions.]

**Test 1**

**Medium:** Water; 900 mL

**Apparatus 2:** 75 rpm, the distance between the blade and the inside bottom of the flask being maintained at 4.5 ± 0.5 cm during the test

**Time:** 90 min

**Standard solution:** USP Doxycycline Hyclate RS in *Medium*

**Sample solution:** Dilute with *Medium*, if necessary, to a concentration that is similar to the *Standard solution*.

**Spectrometric conditions**(See *Spectrophotometry and Light-Scattering* <851>.)**Mode:** UV-Vis**Analytical wavelength:** 276 nm**Tolerances:** NLT 85% (Q) of the labeled amount of  $C_{22}H_{24}N_2O_8$  is dissolved.**Test 2:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.**Medium:** Water; 900 mL**Apparatus 2:** 50 rpm, the distance between the blade and the inside bottom of the vessel being maintained at  $4.5 \pm 0.5$  cm during the test**Time:** 30 min**Standard solution:** 22 µg/mL of doxycycline in *Medium*, prepared using USP Doxycycline Hyclate RS**Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size.**Spectrometric conditions**(See *Spectrophotometry and Light-Scattering* <851>.)**Mode:** UV-Vis**Analytical wavelength:** 276 nm**Cell:** 0.5 cm**Blank:** *Medium*

Calculate the percentage of doxycycline dissolved in the portion of Tablets taken:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times V \times 100$$

 $A_U$  = absorbance of the *Sample solution* $A_S$  = absorbance of the *Standard solution* $C_S$  = concentration of doxycycline in the *Standard solution* (mg/mL) $L$  = Tablet label claim (mg) $V$  = volume of *Medium*, 900 mL**Tolerances:** NLT 85% (Q) of the labeled amount of doxycycline is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

**SPECIFIC TESTS**

- **WATER DETERMINATION**, *Method I* (921): NMT 5.0%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS** (11)  
USP Doxycycline Hyclate RS

---

**Doxylamine Succinate**

---

 $C_{17}H_{22}N_2O \cdot C_4H_6O_4$  388.46Ethanamine, *N,N*-dimethyl-2-[1-phenyl-

1-(2-pyridinyl)ethoxy]-, butanedioate (1:1).

2-[α-[2-(Dimethylamino)ethoxy]-α-methylbenzyl]pyridine succinate (1:1) [562-10-7].

» Doxylamine Succinate contains not less than 98.0 percent and not more than 101.0 percent of  $C_{17}H_{22}N_2O \cdot C_4H_6O_4$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

**USP Reference standards** (11)—

USP Doxylamine Succinate RS

**Identification**—**A:** *Ultraviolet absorption* (197U)—*Solution:* 20 µg per mL.*Medium:* 0.1 N hydrochloric acid.

Absorptivities at 262 nm, calculated on the dried basis, do not differ by more than 3.0%.

**B:** It meets the requirements under *Identification—Organic Nitrogenous Bases* (181).

**C:** Dissolve about 500 mg in 5 mL of water, and add a slight excess of 6 N ammonium hydroxide. Extract the liberated doxylamine with several portions of ether, discard the ether extracts, and evaporate the aqueous solution on a steam bath to dryness. Add 2 mL of 3 N hydrochloric acid, and again evaporate on the steam bath to dryness. Cool, add about 10 mL of ether, allow to stand for a few minutes, and decant the clear supernatant. Evaporate the ether solution to dryness, and dry the residue at 105° for 30 minutes; the succinic acid so obtained melts between 184° and 188°, the procedure for *Class I* being used (see *Melting Range or Temperature* (741)).

**Melting range**, *Class I* (741): between 103° and 108°, but the range between beginning and end of melting does not exceed 3°.

**Loss on drying** (731)—Dry it in vacuum over phosphorus pentoxide for 5 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Volatile related compounds**—Dissolve 650 mg in 20 mL of 0.1 N hydrochloric acid in a separator. Render the solution alkaline with 2.5 N sodium hydroxide, and immediately extract with four 25-mL portions of ether, filtering each extract through an ether-saturated pledget of cotton. Evaporate the combined ether extracts on a water bath with the aid of a current of air to dryness at a temperature not exceeding 50°, and dissolve the residue in 5 mL of alcohol. Inject about 1 µL of this solution into a suitable gas chromatograph (see *Chromatography* (621)) equipped with a flame-ionization detector. Under typical conditions, the instrument contains a 2-m × 4-mm glass column containing 5% packing G16 and 5% packing G12 on 60- to 80-mesh S1A. The column is maintained at about 212°, the injection port and detector block are maintained at about 250°, and dry helium is used as the carrier gas. The total relative area of all extraneous peaks (except that of the solvent peak) does not exceed 2.0%, and the relative area of any individual extraneous peak does not exceed 1.0%.

**Assay**—Dissolve about 500 mg of Doxylamine Succinate, accurately weighed, in 80 mL of glacial acetic acid. Add crystal violet TS, and titrate with 0.1 N perchloric acid VS to an emerald-green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 19.42 mg of  $C_{17}H_{22}N_2O \cdot C_4H_6O_4$ .

---

**Doxylamine Succinate Oral Solution**

---

» Doxylamine Succinate Oral Solution contains not less than 92.0 percent and not more than 108.0 percent of the labeled amount of doxylamine succinate ( $C_{17}H_{22}N_2O \cdot C_4H_6O_4$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Doxylamine Succinate RS

**Identification**—Use a volume of Oral Solution equivalent to about 50 mg of doxylamine succinate, and proceed as directed under *Identification—Organic Nitrogenous Bases* (181), beginning with “Transfer the liquid to a separator.” The Oral Solution meets the requirements of the test.

**Assay**—Proceed with Oral Solution as directed under *Salts of Organic Nitrogenous Bases* (501), determining the absorbance at the wavelength of maximum absorbance at about 262 nm. Calculate the quantity, in mg, of doxylamine succinate ( $C_{17}H_{22}N_2O \cdot C_4H_6O_4$ ) in each mL of the Oral Solution taken by the formula:

$$(0.05C / V)(A_U / A_S)$$

in which  $C$  is the concentration, in  $\mu\text{g}$  per mL, of USP Doxylamine Succinate RS in the *Standard Preparation*; and  $V$  is the volume, in mL, of Oral Solution taken.

## Doxylamine Succinate Tablets

» Doxylamine Succinate Tablets contain not less than 92.0 percent and not more than 108.0 percent of the labeled amount of  $C_{17}H_{22}N_2O \cdot C_4H_6O_4$ .

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

### USP Reference standards (11)—

USP Doxylamine Succinate RS

**Identification**—Tablets meet the requirements under *Identification—Organic Nitrogenous Bases* (181).

### Dissolution (711)—

*Medium:* 0.01 N hydrochloric acid; 900 mL.

*Apparatus 2:* 50 rpm.

*Time:* 30 minutes.

**Procedure**—Determine the amount of  $C_{17}H_{22}N_2O \cdot C_4H_6O_4$  dissolved by employing UV absorption at the wavelength of maximum absorbance at about 262 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, in comparison with a Standard solution having a known concentration of USP Doxylamine Succinate RS in the same *Medium*.

**Tolerances**—Not less than 80% ( $Q$ ) of the labeled amount of  $C_{17}H_{22}N_2O \cdot C_4H_6O_4$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Procedure for content uniformity**—Transfer 1 finely powdered Tablet to a 100-mL volumetric flask containing 65 mL of 0.1 N hydrochloric acid. Shake frequently during a 10-minute period, dilute with 0.1 N hydrochloric acid to volume, and mix. Allow the insoluble material to settle, and filter, discarding the first 20 mL of the filtrate. Dilute a portion of the subsequent filtrate quantitatively and stepwise, if necessary, with 0.1 N hydrochloric acid to provide a solution containing approximately 25  $\mu\text{g}$  of doxylamine succinate per mL. Concomitantly determine the absorbances of this solution and of a Standard solution of USP Doxylamine Succinate RS in the same medium having a known concentration of about 25  $\mu\text{g}$  per mL in 1-cm cells at the wavelength of maximum absorbance at about 262 nm, with a suitable spectrophotometer, using 0.1 N hydrochloric acid as the blank. Calculate the quantity, in mg, of  $C_{17}H_{22}N_2O \cdot C_4H_6O_4$  in the Tablet taken by the formula:

$$(TC / D)(A_U / A_S)$$

in which  $T$  is the labeled quantity, in mg, of doxylamine succinate in the Tablet,  $C$  is the concentration, in  $\mu\text{g}$  per

mL, of USP Doxylamine Succinate RS in the Standard solution,  $D$  is the concentration, in  $\mu\text{g}$  per mL, of doxylamine succinate in the solution from the Tablet, based on the labeled quantity per Tablet and the extent of dilution, and  $A_U$  and  $A_S$  are the absorbances of the solution from the Tablet and the Standard solution, respectively.

### Assay—

**Mobile phase**—Transfer 340 mg of monobasic potassium phosphate, 150 mg of triethylamine hydrochloride, and 150 mg of sodium lauryl sulfate to a 100-mL volumetric flask, add 63 mL of water, and mix. Dilute with acetonitrile to volume, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Doxylamine Succinate RS in 0.1 M hydrochloric acid, and dilute quantitatively, and stepwise if necessary, with 0.1 M hydrochloric acid to obtain a solution having a known concentration of about 0.25 mg per mL.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an amount of powder, equivalent to about 25 mg of doxylamine succinate, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with 0.1 M hydrochloric acid to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 262-nm detector and a 4.6-mm  $\times$  15-cm column that contains packing L7. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 2.5; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu\text{L}$ ) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of doxylamine succinate ( $C_{17}H_{22}N_2O \cdot C_4H_6O_4$ ) in the portion of Tablets taken by the formula:

$$100C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Doxylamine Succinate RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dronabinol

$C_{21}H_{30}O_2$  314.46

6*H*-Dibenzo[*b,d*]pyran-1-ol, 6*a*,7,8,10*a*-tetrahydro-6,6,

9-trimethyl-3-pentyl-, (6*aR-trans*)-.

(6*aR*,10*aR*)-6*a*,7,8,10*a*-Tetrahydro-6,6,9-trimethyl-3-pentyl-6*H*-dibenzo[*b,d*]pyran-1-ol [1972-08-3].

» Dronabinol is  $\Delta^9$ -tetrahydrocannabinol. It contains not less than 95.0 percent of  $C_{21}H_{30}O_2$ .

**Packaging and storage**—Preserve in tight, light-resistant glass containers in inert atmosphere. Store as per labeling instructions.

**USP Reference standards** (11)—USP  $\Delta^9$ -Tetrahydrocannabinol RSUSP *exo*-Tetrahydrocannabinol RS(6aR, 10aR)-6,6-Dimethyl-9-methylene-3-pentyl-6a,7,8,9,10,10a-hexahydro-6H-benzo[c]chromen-1-ol  
C<sub>21</sub>H<sub>30</sub>O<sub>2</sub> 314.46**Identification**—

**A:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**B:** *Visualizing agent*—Transfer about 100 mg of Fast Blue B salt to a suitable flask containing about 100 mL of methanol, stir for about 5 minutes, and allow to settle. Decant the clear liquid into the sprayer reservoir. [NOTE—Prepare fresh daily.]

*Identification solution*—Use the *Standard preparation*, prepared as directed in the *Assay*.

*Test solution*—Use the *Assay preparation*.

*Procedure*—Apply separately 10  $\mu$ L each of the *Identification solution* and the *Test solution* to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel. Allow the spots to dry, and develop the plate in a chromatographic chamber that has been equilibrated (for about 2 minutes) with vapors from a solvent mixture of *n*-hexane and methylene chloride (1:1) until the solvent front has moved about 10 cm. Remove the plate from the developing chamber, quickly mark the solvent front, and allow the plate to dry at room temperature for about 5 minutes. Spray the plate with the *Visualizing agent* until it is uniformly damp (not saturated). Heat the plate at about 80° until the spots are developed: the color and *R<sub>F</sub>* value of the spots from the *Test solution* correspond to those obtained from the *Identification solution*.

**Related compounds**—[NOTE—Minimize exposure to air and light for the *Standard solution* and the *Test solution*. Analyze all samples within 24 hours.]

*Mobile phase*, *System suitability solution*, and *Standard preparation*—Proceed as directed in the *Assay*.

*Standard solution*—Dilute an accurately measured volume of the *Standard preparation* quantitatively, and stepwise if necessary, with dehydrated alcohol to obtain a solution having a known concentration of about 0.004 mg per mL.

*Sensitivity solution*—Quantitatively dilute an accurately measured volume of the *Standard solution* with dehydrated alcohol to obtain a solution having a concentration of about 0.2  $\mu$ g per mL.

*Test solution*—Use the *Assay preparation*.

*Chromatographic system*—Proceed as directed in the *Assay*. In addition, chromatograph the *Sensitivity solution*, and calculate the signal-to-noise ratio, *S/N*, by the formula:

$$(2H)/h$$

in which *H* is the measured height of the peak, and *h* is the amplitude of the average measured baseline noise; the signal-to-noise ratio is not less than 10.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for all of the peaks.

**Table 1**

Name	Relative Retention Time	Relative Response Factor	Limit (%)
Cannabinol	0.78	2.7	1.5
$\Delta^9$ -Tetrahydrocannabinol	1.00	1.0	—
<i>Exo</i> -tetrahydrocannabinol <sup>1</sup>	1.07	0.92	0.5
$\Delta^8$ -Tetrahydrocannabinol	1.18	0.90	2.0
Any other individual impurity	—	1.0	1.0

<sup>1</sup>(6aR, 10aR)-6,6-Dimethyl-9-methylene-3-pentyl-6a,7,8,9,10,10a-hexahydro-6H-benzo[c]chromen-1-ol.

Calculate the percentage of each impurity in the portion of Dronabinol taken by the formula:

$$100(1/F)(CV/W)(r_U / r_S)$$

in which *F* is the relative response factor for each impurity (see *Table 1*); *C* is the concentration, in mg per mL, of  $\Delta^9$ -tetrahydrocannabinol in the *Standard solution*; *V* is the volume, in mL, of the *Test solution*; *W* is the weight, in mg, of Dronabinol taken to prepare the *Test solution*; *r<sub>U</sub>* is the peak area response of each impurity in the *Test solution*; and *r<sub>S</sub>* is the peak area response of  $\Delta^9$ -tetrahydrocannabinol in the *Standard solution*. In addition to not exceeding the limits in *Table 1*, not more than 5.0% of total impurities is found.

**Assay**—[NOTE—Minimize exposure to air and light for the *Standard preparation* and the *Assay preparation*. Analyze all samples within 24 hours.]

*Mobile phase*—Prepare a filtered and degassed mixture of methanol, water, tetrahydrofuran, and acetonitrile (45:25:20:10), making adjustments, if necessary (see *System Suitability* under *Chromatography* (621)).

*System suitability solution*—Transfer accurately measured volumes of USP  $\Delta^9$ -Tetrahydrocannabinol RS and USP *Exo*-tetrahydrocannabinol RS to a suitable volumetric flask, and dilute with dehydrated alcohol to prepare a solution that contains about 200  $\mu$ g of  $\Delta^9$ -tetrahydrocannabinol and about 10  $\mu$ g of *exo*-tetrahydrocannabinol per mL.

*Standard preparation*—Quantitatively dilute an accurately measured volume of USP  $\Delta^9$ -Tetrahydrocannabinol RS with dehydrated alcohol to obtain a solution having a known concentration of about 0.2 mg per mL.

*Assay preparation*—Transfer about 20 mg of Dronabinol, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with dehydrated alcohol to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 228-nm detector and a 4.6-mm  $\times$  15-cm analytical column that contains 4- $\mu$ m packing L1. The flow rate is about 1 mL per minute. The column temperature is maintained at 20°. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between  $\Delta^9$ -tetrahydrocannabinol and *exo*-tetrahydrocannabinol is not less than 1.5; and the tailing factor of  $\Delta^9$ -tetrahydrocannabinol is not more than 2.0. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for all of the peaks. Calculate the quan-

tity, in mg, of  $C_{21}H_{30}O_2$  in the portion of Dronabinol taken by the formula:

$$CV(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of  $\Delta^9$ -tetrahydrocannabinol in the *Standard preparation*;  $V$  is the volume, in mL, of the *Assay preparation*; and  $r_U$  and  $r_S$  are the  $\Delta^9$ -tetrahydrocannabinol peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dronabinol Capsules

### DEFINITION

Dronabinol Capsules contain dronabinol in Sesame Oil. Dronabinol Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of dronabinol ( $C_{21}H_{30}O_2$ ).

### IDENTIFICATION

- The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

**Mobile phase:** Methanol, tetrahydrofuran, and water (71:5:24)

**System suitability stock solution:** 1.0 mg/mL of  $\Delta^8$ -tetrahydrocannabinol in methanol

**System suitability solution:** 0.5 mg/mL of USP  $\Delta^9$ -Tetrahydrocannabinol RS and 0.5 mg/mL of  $\Delta^8$ -tetrahydrocannabinol. Mix equal volumes of USP  $\Delta^9$ -Tetrahydrocannabinol RS and *System suitability stock solution*.

**Standard solution:** 0.2 mg/mL of USP  $\Delta^9$ -Tetrahydrocannabinol RS in dehydrated alcohol

**Sample solution:** Equivalent to 0.2 mg/mL of dronabinol, from Capsule contents (NLT 20) in dehydrated alcohol

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 228 nm

**Column:** 4.6-mm  $\times$  15-cm; 3- $\mu$ m packing L1

**Guard column:** 4.6-mm  $\times$  30-mm; 5- $\mu$ m packing L1

**Flow rate:** 1 mL/min

**Injection size:** 20  $\mu$ L

#### System suitability

**Samples:** *System suitability solution* and *Standard solution* [NOTE—The relative retention times for  $\Delta^9$ -tetrahydrocannabinol and  $\Delta^8$ -tetrahydrocannabinol are about 1.0 and 1.14, respectively.]

#### Suitability requirements

**Resolution:** NLT 2.0 between dronabinol and  $\Delta^8$ -tetrahydrocannabinol, *System suitability solution*

**Tailing factor:** NMT 2.0 of  $\Delta^9$ -tetrahydrocannabinol, *System suitability solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of  $C_{21}H_{30}O_2$  in the portion of Capsules taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times 100$$

$r_U$  = peak response of dronabinol from the *Sample solution*

$r_S$  = peak response of dronabinol from the *Standard solution*

$C_S$  = concentration of USP  $\Delta^9$ -Tetrahydrocannabinol RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of dronabinol in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

### PERFORMANCE TESTS

#### DISSOLUTION <711>

**Medium:** Water; 500 mL

**Apparatus 2:** 50 rpm

**Time:** 15 min

**Analysis:** Place 1 Capsule in each vessel, and allow the Capsule to sink to the bottom of the vessel before starting rotation of the blade. Observe the Capsules, and record the time taken for each Capsule shell to rupture.

**Tolerances:** The requirements are met if all of the Capsules tested rupture in NMT 15 min. If 1 or 2 of the Capsules rupture in NLT 15 but NMT 30 min, repeat the test on 12 additional Capsules. NMT 2 of the total of 18 Capsules tested rupture in NLT 15 min but NMT 30 min.

- UNIFORMITY OF DOSAGE UNITS <905>:** Meet the requirements

### ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers, in a cool place.

#### USP REFERENCE STANDARDS <11>

USP  $\Delta^9$ -Tetrahydrocannabinol RS

## Droperidol

$C_{22}H_{22}FN_3O_2$  379.43

2H-Benzimidazol-2-one, 1-[1-[4-(4-fluorophenyl)-4-oxobutyl]-1,2,3,6-tetrahydro-4-pyridinyl]-1,3-dihydro-1H-benzimidazol-2-one [548-73-2].

» Droperidol, dried in vacuum at 70° for 4 hours, contains not less than 98.0 percent and not more than 102.0 percent of  $C_{22}H_{22}FN_3O_2$ .

**Packaging and storage**—Preserve in tight, light-resistant containers, under nitrogen, in a cool place.

#### USP Reference standards <11>

USP Droperidol RS

#### Identification—

**A:** *Infrared Absorption* <197K>.

**B:** *Ultraviolet Absorption* <197U>—

*Solution:* 15  $\mu$ g per mL.

*Medium:* 0.1 N hydrochloric acid in isopropyl alcohol (1 in 10).

**Loss on drying** <731>—Dry it in vacuum at 70° for 4 hours; it loses not more than 5.0% of its weight.

**Residue on ignition** <281>: not more than 0.2%.

**Heavy metals, Method II** <231>: 0.002%.

**Limit of 4,4'-bis[1,2,3,6-tetrahydro-4-(2-oxo-1-benzimidazol-1-yl)pyridyl]butyrophene**—Dissolve about 30.0 mg of the sample in 70 mL of isopropyl alcohol in a 100-mL volumetric flask. Add 10.0 mL of 0.1 N hydrochloric acid, dilute with isopropyl alcohol to volume, and mix. The absorptivity of the solution in 1-cm cells at the wavelength of maximum absorbance at about 330 nm, with a suitable spectrophotometer, using a 1 in 10 solution of

0.1 N hydrochloric acid in isopropyl alcohol as the blank, is not more than 0.7 (equivalent to limit of 1.5%).

**Assay**—Dissolve about 240 mg of Droperidol, previously dried and accurately weighed, in 50 mL of glacial acetic acid, add *p*-naphtholbenzein TS, and titrate with 0.1 N perchloric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 37.94 mg of  $C_{22}H_{22}FN_3O_2$ .

## Droperidol Injection

» Droperidol Injection is a sterile solution of Droperidol in Water for Injection, prepared with the aid of Lactic Acid. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{22}H_{22}FN_3O_2$ , as the lactate.

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I glass, protected from light.

**USP Reference standards** (11)—

USP Droperidol RS

USP Endotoxin RS

**Identification**—

**A:** Dissolve about 25 mg of USP Droperidol RS in 10 mL of water containing 0.3 mL of 50% acetic acid in a separator to obtain a solution containing about 2.5 mg per mL. Transfer a volume of Injection, equivalent to about 25 mg of droperidol, to a second separator. Separately add 2 mL of ammonia TS to each separator, and mix. Extract each solution with two 10-mL portions of chloroform, collecting the chloroform extracts from the solutions in separate 50-mL beakers. Apply separately 20  $\mu$ L of the test solution and the Standard solution to a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel. Allow the spots to dry, and develop the chromatogram in a chamber with an unequilibrated solvent system consisting of a mixture of ethyl acetate, chloroform, methanol, and acetate buffer (0.2 M sodium acetate adjusted with 50% acetic acid to a pH of 4.7) (54:23:18:5) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by lightly spraying with dinitrophenylhydrazine TS, then examine under short-wavelength UV light: the  $R_f$  value of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation* as obtained in the *Assay*.

**Bacterial endotoxins** (85)—It contains not more than 35.7 USP Endotoxin Units per mg of droperidol.

**pH** (791): between 3.0 and 3.8.

**Chromatographic purity**—

*Mobile phase*, *System suitability preparation*, *Standard stock preparation*, *Standard preparation*, and *Chromatographic system*—Proceed as directed in the *Assay*.

*Test preparation*—Use the *Assay preparation*.

*Procedure*—Inject a volume (about 100  $\mu$ L) of the *Test preparation* into the chromatograph, record the chromato-

gram of twice the retention time of droperidol, and measure the peak responses. Calculate the percentage of each impurity in the portion of Droperidol taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the peak response for each impurity, and  $r_s$  is the sum of the responses of all the peaks: the sum of all impurities is not more than 2.0%.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—

*Borate buffer*—Dissolve 31 g of boric acid in about 800 mL of water. Slowly add sodium hydroxide solution (1 in 5) in small quantities until all of the boric acid is dissolved and the pH is constant at 7.0. Quantitatively transfer the solution to a glass-stoppered, 1000-mL volumetric flask, dilute with water to volume, and mix.

*Mobile phase*—Prepare a filtered and degassed mixture of methanol, water, and *Borate buffer* (700:280:20). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard stock preparation*—Dissolve an accurately weighed quantity of USP Droperidol RS in methanol to obtain a solution having a known concentration of about 1 mg per mL.

*Standard preparation*—Transfer 5.0 mL of *Standard stock preparation* to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*System suitability preparation*—Prepare a solution of 4'-fluoroacetophenone in methanol containing about 1 mg per mL. Transfer 5.0 mL of this solution and 5.0 mL of *Standard stock preparation* to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Assay preparation*—Transfer an accurately measured volume of Injection, equivalent to about 5 mg of droperidol, to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm  $\times$  25-cm column that contains 10- $\mu$ m packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability preparation* and the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between 4'-fluoroacetophenone and droperidol is not less than 5.0; the tailing factor for the analyte peak is not more than 2.0; and the relative standard deviation for replicate injections of the *Standard preparation* is not more than 1.5%.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of droperidol ( $C_{22}H_{22}FN_3O_2$ ) in each mL of the Injection taken by the formula:

$$100(C / V)(r_u / r_s)$$

in which  $C$  is the concentration, in mg per mL, of USP Droperidol RS in the *Standard preparation*;  $V$  is the volume, in mL, of Injection taken; and  $r_u$  and  $r_s$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Drospirenone

$C_{24}H_{30}O_3$  366.49  
(6R,7R,8R,9S,10R,13S,14S,15S,16S,17S)-1,3',4',6,6a,7,8,9,10,11,12,13,14,15,15a,16-Hexadecahydro-10,13-dimethylspiro-[17H-dicyclopropa[6,7:15,16]cyclopenta[a]phenanthrene-17,2'(5'H)-furan]-3,5'(2H)-dione; 17-Hydroxy-6 $\beta$ ,7 $\beta$ :15 $\beta$ ,16 $\beta$ -dimethylene-3-oxo-17  $\alpha$ -pregn-4-ene-21-carboxylic acid,  $\gamma$ -lactone [67392-87-4].

### DEFINITION

Drospirenone contains NLT 98.0% and NMT 102.0% of  $C_{24}H_{30}O_3$ , calculated on the anhydrous and solvent-free basis.

### IDENTIFICATION

- A. INFRARED ABSORPTION** <197M>
- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### Change to read:

- PROCEDURE**  
Solution A: Water  
Solution B: Acetonitrile  
Mobile phase: See *Table 1*.

Table 1

## SPECIFIC TESTS

- OPTICAL ROTATION, Specific Rotation (781S)**  
Sample solution: 10 mg/mL in methanol  
Acceptance criteria:  $-187^{\circ}$  to  $-193^{\circ}$  at  $20^{\circ}$  on the anhydrous and solvent-free basis
- MELTING RANGE OR TEMPERATURE, Class 1 (741):**  
 $198^{\circ}$ – $203^{\circ}$ . [NOTE—Dry over silica gel for NLT 24 h before testing.]
- WATER DETERMINATION, Method I (921):** NMT 0.2%

## ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- USP REFERENCE STANDARDS (11)**  
USP Drospirenone RS  
USP Drospirenone Related Compound A RS  
17-Hydroxy-6 $\beta$ ,7 $\beta$ :15 $\beta$ ,16 $\beta$ -dimethylene-3-oxo-17 $\beta$ -pregn-4-ene-21-carboxylic acid,  $\gamma$ -lactone.  
 $C_{24}H_{30}O_3$  366.49

## Drospirenone and Ethinyl Estradiol Tablets

### DEFINITION

Drospirenone and Ethinyl Estradiol Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of drospirenone ( $C_{24}H_{30}O_3$ ) and NLT 90.0% and NMT 110.0% of the labeled amount of ethinyl estradiol ( $C_{20}H_{24}O_2$ ).

### IDENTIFICATION

- A.** The retention times of the drospirenone and ethinyl estradiol peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

**Solution A:** Dissolve 132 g of dibasic ammonium phosphate in 0.8 L of water, adjust with phosphoric acid to a pH of 6.8, and dilute to 1 L.

**Solution B:** *Solution A* and water (1:24)

**Mobile phase:** Acetonitrile and *Solution B* (1:1). Adjust with phosphoric acid to a pH of 6.8.

**Standard solution:** ( $L/25$ ) mg/mL of USP Drospirenone RS and of USP Ethinyl Estradiol RS in *Mobile phase*, where  $L$  is the Tablet label claim, in mg/Tablet, of each compound

**Sample solution:** Transfer 10 Tablets to a 250-mL volumetric flask, add 230 mL of *Mobile phase*, and sonicate with intermittent shaking for NLT 10 min, or until the Tablets are completely dispersed. Equilibrate to room temperature. Dilute with *Mobile phase* to volume, and centrifuge the sample until a clear supernatant is obtained. Use the supernatant.

### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector 1:** UV 270 nm for drospirenone

**Detector 2:** Fluorescence, excitation wavelength at 285 nm, emission wavelength at 315 nm for ethinyl estradiol. [NOTE—*Detector 1* and *Detector 2* are connected in series.]

**Column:** 4.0-mm  $\times$  12.5-cm; 3- $\mu$ m packing L1

**Column temperature:**  $25 \pm 3^{\circ}$

**Flow rate:** 1.2 mL/min

**Injection size:** 20  $\mu$ L

### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** Between 0.8 and 1.8 for both drospirenone and ethinyl estradiol

**Relative standard deviation:** NMT 2.0% for both drospirenone and ethinyl estradiol

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of drospirenone ( $C_{24}H_{30}O_3$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of drospirenone from the *Sample solution*

$r_S$  = peak response of drospirenone from the *Standard solution*

$C_S$  = concentration of USP Drospirenone RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of drospirenone in the *Sample solution* (mg/mL)

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of ethinyl estradiol ( $C_{20}H_{24}O_2$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of ethinyl estradiol from the *Sample solution*

$r_S$  = peak response of ethinyl estradiol from the *Standard solution*

$C_S$  = concentration of USP Ethinyl Estradiol RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of ethinyl estradiol in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0% of ethinyl estradiol; 90.0%–110.0% of drospirenone

### PERFORMANCE TESTS

#### DISSOLUTION (711)

**Test 1:** For drug products labeled to contain 3 mg of drospirenone and 0.03 mg of ethinyl estradiol, or 3 mg of drospirenone and 0.02 mg of ethinyl estradiol

**Medium:** Water; 900 mL

**Apparatus 2:** 50 rpm

**Time:** 30 min

**Standard solution:** ( $L/900$ ) mg/mL of USP Drospirenone RS and USP Ethinyl Estradiol RS in *Medium*, where  $L$  is the Tablet label claim of each compound. A volume of methanol not exceeding 2% of the final

total volume of solution may be used to aid in dissolving these compounds.

**Sample solution:** Pass a portion of the solution under test through a suitable cellulose filter of 0.45- $\mu$ m pore size, discarding the first 10 mL.

**Mobile phase:** Acetonitrile and water (40:60)

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 270 nm (for drospirenone), in series with a fluorescence detector (for ethinyl estradiol), with excitation at 210 nm and detection at 315 nm, or with excitation at 281 nm and detection at 305 nm

**Column:** 4.6-mm  $\times$  6-cm; 3- $\mu$ m packing L1

**Column temperature:** 22°

**Flow rate:** 1 mL/min

**Injection size:** 100  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Column efficiency:** NLT 2000 for both drospirenone and ethinyl estradiol

**Tailing factor:** Between 0.8 and 1.5 for both drospirenone and ethinyl estradiol

**Relative standard deviation:** NMT 3% for both drospirenone and ethinyl estradiol

**Samples:** *Standard solution* and *Sample solution*

[NOTE—In *Medium*, drospirenone is partially converted into 17-epidrospirenone, which has a relative retention time of approximately 1.2 relative to drospirenone. The amount of drospirenone dissolved is calculated from the sum of drospirenone and 17-epidrospirenone.]

Calculate the percentage of drospirenone and ethinyl estradiol dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$L$  = label claim (mg/Tablet)

$V$  = volume of *Medium*, 900 mL

**Tolerances:** NLT 85% (Q) of the labeled amount of drospirenone and NLT 75% (Q) of the labeled amount of ethinyl estradiol is dissolved.

**Test 2:** For drug products labeled to contain 3 mg of drospirenone and 0.02 mg of ethinyl estradiol. If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

**Medium:** Water; 900 mL

**Apparatus 2:** 50 rpm

**Time:** 30 min

**Standard solution:** ( $L/900$ ) mg/mL of USP Drospirenone RS and of USP Ethinyl Estradiol RS in *Medium*, where  $L$  is the Tablet label claim of each compound.

**Sample solution:** Centrifuge a portion of the solution under test at 3500 rpm for 15 min, and use the supernatant.

**Mobile phase:** Acetonitrile, methanol, and water (40:5:55)

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 260 nm (for drospirenone), in series with a fluorescence detector (for ethinyl estradiol), with excitation at 280 nm and detection at 310 nm

**Column:** 4.6-mm  $\times$  10-cm; 3- $\mu$ m packing L1

**Temperature**

**Column:** 30°

**Autosampler:** 5°

**Flow rate:** 1 mL/min

**Injection size:** 200  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** NMT 2 for both drospirenone and ethinyl estradiol

**Relative standard deviation:** NMT 3% for both drospirenone and ethinyl estradiol

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of drospirenone and ethinyl estradiol dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$L$  = label claim (mg/Tablet)

$V$  = volume of *Medium*, 900 mL

**Tolerances:** NLT 80% (Q) of the labeled amount of drospirenone and NLT 85% (Q) of the labeled amount of ethinyl estradiol is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

#### IMPURITIES

##### • ORGANIC IMPURITIES

**Solution A:** Acetonitrile, methanol, and water (26:19:55)

**Solution B:** Acetonitrile, methanol, and water (76:19:5)

**Mobile phase:** See *Table 1*.

**Table 1**

Time (min)	Flow (mL/min)	Solution A (%)	Solution B (%)
0	0.5	90	10
40	0.5	90	10
53	0.5	0	100
59	1.0	0	100
60	0.5	90	10
70	0.5	90	10

**System suitability stock solution:** ( $L_1 \times 18/100$ )  $\mu$ g/mL of USP Drospirenone RS in *Solution A*, where  $L_1$  is the label claim ( $\mu$ g/Tablet) of drospirenone

**System suitability solution:** Transfer 1.0 mL of the *System suitability stock solution* into a 10-mL volumetric flask, add 1.0 mL of 0.1 N HCl, and heat for 30 min in a 40° water bath. Immediately add 1 mL of 0.1 N NaOH and allow to reach room temperature. Dilute with *Solution A* to volume to obtain a solution containing drospirenone and 17-epidrospirenone. [NOTE—NaOH must be added immediately after heating for the reaction to proceed properly. The drospirenone to 17-epidrospirenone ratio must be between 3:1 and 7:1.]

**Standard solution:** ( $L_1 \times 15/1000$ )  $\mu$ g/mL of USP Drospirenone RS, ( $L_2 \times 30/1000$ )  $\mu$ g/mL of USP Ethinyl Estradiol RS, and ( $L_2 \times 30/1000$ )  $\mu$ g/mL of USP Ethinyl Estradiol Related Compound B RS in *Solution A*, where  $L_1$  and  $L_2$  are the label claim ( $\mu$ g/Tablet) of drospirenone and ethinyl estradiol, respectively

**Sensitivity solution:** ( $L_1 \times 15/10,000$ )  $\mu$ g/mL of USP Drospirenone RS, ( $L_2 \times 30/10,000$ )  $\mu$ g/mL of USP Ethinyl Estradiol RS, and ( $L_2 \times 30/10,000$ )  $\mu$ g/mL of USP Ethinyl Estradiol Related Compound B RS in *Solution A*, where  $L_1$  and  $L_2$  are the label claim ( $\mu$ g/Tablet) of dro-

spirenone and ethinyl estradiol, respectively, prepared from the *Standard solution*

**Sample solution:** Transfer 15 Tablets to a 10-mL glass-stoppered test tube, and add 5.0 mL of *Solution A*. Shake vigorously, sonicate for NLT 5 min, and place in an ice bath for NLT 10 min. Centrifuge the sample at least until an almost clear supernatant is obtained. Filter the supernatant, and use the filtrate.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector 1:** UV 222 nm

**Detector 2:** Fluorescence, excitation wavelength at 215 nm, emission wavelength at 315 nm. Monitor the signal at 344 nm between 37 and 42 min. [NOTE—*Detector 1* and *Detector 2* are connected in series. Use the response at 344 nm to quantify ethinyl estradiol related compound B.]

**Column:** 3.0-mm × 30-cm; 3-μm packing L1 followed, in series, by a 4.6-mm × 10-cm; chromolith packing L1

**Column temperature:** 40°

**Flow rate:** See *Table 1*.

**Injection size:** 20 μL

#### System suitability

**Samples:** *Standard solution*, *Sensitivity solution*, and *System suitability solution*

#### Suitability requirements

**Tailing Factor:** Between 0.8 and 1.5 for both drospirenone and ethinyl estradiol, *Standard solution*

**Resolution:** NLT 2.0 between drospirenone and

17-epidrospirenone, *System suitability solution*

**Relative standard deviation:** NMT 5.0% for both drospirenone and ethinyl estradiol, *Standard solution*

**Signal-to-noise ratio:** NLT 10 for drospirenone and ethinyl estradiol related compound B and NLT 7.0 for ethinyl estradiol, *Sensitivity solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Identify the ethinyl estradiol degradation products using the relative retention times given in *Table 2*. Calculate the percentage of each ethinyl estradiol degradation product and unspecified degradation products in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response of each ethinyl estradiol degradation product from the *Sample solution*

$r_S$  = peak response of ethinyl estradiol from the *Standard solution*

$C_S$  = concentration of USP Ethinyl Estradiol RS in the *Standard solution* (μg/mL)

$C_U$  = nominal concentration of ethinyl estradiol in the *Sample solution* (μg/mL)

$F$  = relative response factor for each degradation product (see *Table 2*)

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of ethinyl estradiol related compound B in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of ethinyl estradiol related compound B from the *Sample solution*

$r_S$  = peak response of ethinyl estradiol related compound B from the *Standard solution*

$C_S$  = concentration of USP Ethinyl Estradiol Related Compound B RS in the *Standard solution* (μg/mL)

$C_U$  = nominal concentration of ethinyl estradiol in the *Sample solution* (μg/mL)

**Samples:** *Standard solution* and *Sample solution*

Identify the drospirenone degradation products using the relative retention times given in *Table 3*. Calculate the percentage of each drospirenone degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response of each drospirenone degradation product from the *Sample solution*

$r_S$  = peak response of drospirenone from the *Standard solution*

$C_S$  = concentration of USP Drospirenone RS in the *Standard solution* (μg/mL)

$C_U$  = nominal concentration of drospirenone in the *Sample solution* (μg/mL)

$F$  = relative response factor for each degradation product (see *Table 3*)

#### Acceptance criteria

[NOTE—Report only degradation products greater than 0.1%.]

**Individual degradation products:** See *Table 2* for ethinyl estradiol and *Table 3* for drospirenone.

**Total degradation products:** NMT 3.5%

**Table 2**

Name	Detection Mode	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%) <sup>a</sup>	Acceptance Criteria, NMT (%) <sup>b</sup>
6α-Hydroxy ethinyl estradiol <sup>c</sup>	Fl (215 nm/315 nm) <sup>g</sup>	0.25	0.73	0.3	0.3

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS** (11)
  - USP Drospirenone RS
  - USP Ethinyl Estradiol RS
  - USP Ethinyl Estradiol Related Compound B RS
  - 19-Nor-17α-pregna-1,3,5(10),9(11)-tetraen-20-yne-3,17-diol.
  - C<sub>20</sub>H<sub>22</sub>O<sub>2</sub> 294.39

## Duloxetine Hydrochloride

C<sub>18</sub>H<sub>19</sub>NOS · HCl 333.88  
 2-Thiophenepropylamine, *N*-methyl-γ-(1-naphthalenyloxy)-, hydrochloride, (*S*)-;  
 (+)-(*S*)-*N*-Methyl-γ-(1-naphthyloxy)-2-thiophenepropylamine hydrochloride [136434-34-9].

## DEFINITION

Duloxetine Hydrochloride contains NLT 97.0% and NMT 102.0% of C<sub>18</sub>H<sub>19</sub>NOS · HCl, calculated on the dried basis.

## IDENTIFICATION

### Change to read:

- **A. INFRARED ABSORPTION** (197K) • (ERR 1-Jul-2012)
- **B.** The retention time of the major peak in the *Sample solution* corresponds to that of the duloxetine *S*-isomer from the *System suitability solution* in the test for *Limit of Duloxetine Related Compound A*.

### Change to read:

- **C. IDENTIFICATION TESTS—GENERAL, Chloride** (191)
  - **Sample solution:** 5 mg/mL in methanol
  - **Acceptance criteria:** Meets the requirements • (ERR 1-Jul-2012)

## ASSAY

### PROCEDURE

Protect solutions of duloxetine from light.  
**Buffer:** 2.9 g/L of phosphoric acid in water. Adjust with sodium hydroxide solution to a pH of 2.5. To each L of this solution add 10.3 g of sodium 1-hexanesulfonate monohydrate, and dissolve.

**Mobile phase:** Acetonitrile, *n*-propanol, and *Buffer* (13:17:70)

**Diluent:** Acetonitrile and water (25:75)

**System suitability solution:** 0.2 mg/mL of USP Duloxetine Hydrochloride RS in *Mobile phase*. Heat the solution to at least 40° for a minimum of 1 h. [NOTE—The resulting solution contains duloxetine impurity B, duloxetine impurity C, duloxetine impurity D, duloxetine impurity E, and duloxetine related compound F.]

**Standard solution:** 0.1 mg/mL of USP Duloxetine Hydrochloride RS in *Diluent*

**Sample solution:** 0.1 mg/mL of Duloxetine Hydrochloride in *Diluent*

### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 230 nm

**Column:** 4.6-mm × 15-cm; 3.5-μm packing L7

**Column temperature:** 40 ± 3°

**Flow rate:** 1 mL/min

**Injection size:** 10 μL

**Run time:** 2 times the retention time of duloxetine

### System suitability

**Sample:** *System suitability solution*

[NOTE—See *Table 1* for relative retention times.]

### Suitability requirements

**Resolution:** NLT 1.5 between duloxetine and duloxetine related compound F peaks

**Tailing factor:** NMT 1.5 for the duloxetine peak

**Relative standard deviation:** NMT 1.0% for the duloxetine peak

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of duloxetine hydrochloride (C<sub>18</sub>H<sub>19</sub>NOS · HCl) in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Duloxetine Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Duloxetine Hydrochloride in the *Sample solution* (mg/mL)

**Acceptance criteria:** 97.0%–102.0% on the dried basis

## IMPURITIES

• **HEAVY METALS, Method II** (231): NMT 10 ppm

• **RESIDUE ON IGNITION** (281): NMT 0.2%

### ORGANIC IMPURITIES

Protect solutions of duloxetine from light.

**Buffer, Mobile phase, Diluent, and System suitability solution:** Proceed as directed in the *Assay*.

**Sensitivity solution:** 0.2 μg/mL of USP Duloxetine Hydrochloride RS in *Diluent*

**Sample solution:** 0.2 mg/mL of Duloxetine Hydrochloride in *Diluent*

**Chromatographic system:** Proceed as directed in the Assay

**Run time:** 2.4 times the retention time of duloxetine

**System suitability**

**Samples:** *System suitability solution* and *Sensitivity solution*

[NOTE—See *Table 1* for relative retention times.]

**Suitability requirements**

**Resolution:** NLT 1.5 between duloxetine impurity C and duloxetine impurity D; NLT 1.5 between duloxetine and duloxetine related compound F, *System suitability solution*

**Tailing factor:** NMT 1.5 for the duloxetine peak, *System suitability solution*

**Relative standard deviation:** NMT 1.0% for the duloxetine peak, *System suitability solution*

**Signal-to-noise ratio:** NLT 20 for the duloxetine peak, *Sensitivity solution*

**Analysis**

**Sample:** *Sample solution*

Calculate the percentage of any individual impurity in the portion of Duloxetine Hydrochloride taken:

$$\text{Result} = (r_U/r_T) \times (1/F) \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_T$  = sum of the responses of all the peaks from the *Sample solution*

$F$  = relative response factor (see *Table 1*)

**Acceptance criteria:** See *Table 1*.

**Table 1**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria NMT (%)
Duloxetine impurity B <sup>a,g</sup>	0.15	0.36	—
Duloxetine impurity C <sup>b,g</sup>	0.43	1.0	—

**• LIMIT OF DULOXETINE RELATED COMPOUND A**

**Mobile phase:** Hexane and isopropyl alcohol (83:17). To 1 L of this mixture add 2 mL of diethylamine.

**System suitability solution:** 0.1 mg/mL each of USP Duloxetine Hydrochloride RS and USP Duloxetine Related Compound A RS in *Mobile phase*. Sonication may be used to aid in dissolution.

**Sensitivity solution:** 0.1 µg/mL of USP Duloxetine Hydrochloride RS in *Mobile phase*

**Sample solution:** 0.1 mg/mL of Duloxetine Hydrochloride in *Mobile phase*. Sonication may be used to aid in dissolution.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 230 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L40

**Column temperature:** 40°

**Flow rate:** 1 mL/min

**Injection size:** 10 µL

**Run time:** 2 times the retention time of duloxetine

**System suitability**

**Samples:** *Sensitivity solution* and *System suitability solution*

[NOTE—The relative retention times for duloxetine and duloxetine related compound A are 1.0 and 1.3, respectively.]

**Suitability requirements**

**Resolution:** NLT 3.5 between duloxetine and duloxetine related compound A, *System suitability solution*

**Tailing:** Between 0.8 and 1.5 each for duloxetine and duloxetine related compound A peaks, *System suitability solution*

**Relative standard deviation:** NMT 5.0% for the duloxetine peak, *System suitability solution*

**Signal-to-noise ratio:** NLT 3, *Sensitivity solution*

**Analysis**

**Sample:** *Sample solution*

Calculate the percentage of duloxetine related compound A in the portion of Duloxetine Hydrochloride taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response for duloxetine related compound A from the *Sample solution*

$r_T$  = sum of the responses of duloxetine and duloxetine related compound A peaks from the *Sample solution*

**Acceptance criteria:** NMT 0.5%

**SPECIFIC TESTS**

- LOSS ON DRYING** <731>: Dry at 105° for 3 h: it loses NMT 0.5% of its weight.

**ADDITIONAL REQUIREMENTS**

- PACKAGING AND STORAGE:** Protect from light. Store at room temperature.
- USP REFERENCE STANDARDS** <11>
  - USP Duloxetine Hydrochloride RS
  - USP Duloxetine Related Compound A RS
  - (R)-N-Methyl-3-(naphthalen-1-yloxy)-3-(thiophen-2-yl)propan-1-amine hydrochloride.
  - C<sub>18</sub>H<sub>19</sub>NOS · HCl 333.88

## Duloxetine Delayed-Release Capsules

**DEFINITION**

Duloxetine Delayed-Release Capsules contain an amount of Duloxetine Hydrochloride equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of duloxetine (C<sub>18</sub>H<sub>19</sub>NOS).

**IDENTIFICATION**

- A. INFRARED ABSORPTION** <197S>

**Spectral range:** 1650 cm<sup>-1</sup> to 900 cm<sup>-1</sup>

**Standard:** 1 mg/mL of USP Duloxetine Hydrochloride RS in methylene chloride. Shake the contents, and sonicate for 1 min. Transfer 15 mL of filtrate into a separatory funnel, and add 15 mL of pH 7.5 phosphate buffer. Collect the organic layer, and evaporate to dryness. Redis-

solve the residue with a few drops of methylene chloride, and transfer to a KBr or NaCl plate. Allow it to dry.

**Sample:** 1 mg/mL of duloxetine, from the contents of NLT 10 Capsules in methylene chloride. Proceed as directed for the *Standard*.

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

## ASSAY

### PROCEDURE

Protect solutions of duloxetine from light.

**Buffer A:** 3.4 g/L of monobasic potassium phosphate in water. To 1 L of this solution add 15 mL of triethylamine, and adjust with phosphoric acid to a pH of 5.5.

**Buffer B:** 0.2 g/L of monobasic ammonium phosphate and 4.5 g/L of dibasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 8.0.

**Mobile phase:** Methanol, tetrahydrofuran, and *Buffer A* (323:90:587)

**Diluent:** Methanol and *Buffer B* (50:50)

**System suitability solution:** 0.1 mg/mL USP Duloxetine Hydrochloride RS, 0.05 mg/mL of 1-naphthol, 0.01 mg/mL of USP Duloxetine Related Compound F RS, and 0.025 mg/mL of USP Duloxetine Related Compound H RS, in *Diluent*. [NOTE—Add 1 mL of methanol before diluting to volume to assist with dissolving contents. Duloxetine related compound H is used for peak identification purposes in this solution.]

**Standard solution:** 0.1 mg/mL of USP Duloxetine Hydrochloride RS in *Diluent*

**Sample solution:** Nominally 0.1 mg/mL of duloxetine from the contents of NLT 5 Capsules, in *Diluent*

### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

[NOTE—It is recommended to preheat the *Mobile phase* to 45°.]

**Mode:** LC

**Detector:** UV 230 nm

**Column:** 4.6-mm × 7.5-cm; 3- or 3.5-μm packing L7

**Column temperature:** 45°

**Flow rate:** 1.5 mL/min

**Injection size:** 10 μL

**Run time:** 6 times the retention time of duloxetine

### System suitability

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—See *Table 1* under *Organic Impurities* for relative retention times.]

### Suitability requirements

**Resolution:** NLT 1.6 between duloxetine and duloxetine related compound F; NLT 2 between 1-naphthol and duloxetine related compound H, *System suitability solution*

**Relative standard deviation:** NMT 1.5%, *Standard solution*

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of duloxetine (C<sub>18</sub>H<sub>19</sub>NO<sub>3</sub>) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Duloxetine Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of duloxetine in the *Sample solution* (mg/mL)

$M_{r1}$  = molecular weight of duloxetine free base, 297.42

$M_{r2}$  = molecular weight of duloxetine hydrochloride, 333.88

**Acceptance criteria:** 90.0%–110.0%

## PERFORMANCE TESTS

### DISSOLUTION <711>

**Acid stage medium:** 0.1 N hydrochloric acid; 1000 mL  
**Time:** 2 h

**Buffer stage medium:** pH 6.8 phosphate buffer; 1000 mL

**Time:** 60 min for Capsules containing 20% w/w pellets; 90 min for Capsules containing 32% w/w pellets

**Apparatus 1:** 100 rpm

**Buffer A and Mobile phase:** Proceed as directed in the *Assay*.

**Standard stock solution:** 0.28 mg/mL of USP Duloxetine Hydrochloride RS in *Buffer stage medium*. Use a small amount of methanol, not exceeding 2% of the final volume, to dissolve duloxetine.

**Acid stage standard solution:** 2.3 μg/mL of duloxetine hydrochloride, from the *Standard stock solution* diluted with *Buffer stage medium*

**Buffer stage standard solution:** 23 μg/mL of duloxetine hydrochloride, from the *Standard stock solution* diluted with *Buffer stage medium*

**Sample solution:** After 2 h in the *Acid stage medium*, pass a portion of the solution under test through a suitable filter. Transfer the basket containing the pellets to the vessel containing the *Buffer stage medium*. After the appropriate time in the *Buffer stage medium*, pass a portion of the solution under test through a suitable filter.

### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 230 nm

**Column:** 4.6-mm × 7.5-cm; 3-μm packing L7

**Column temperature:** 45°

**Flow rate:** 1.5 mL/min

**Injection size:** 10 μL

### System suitability

**Sample:** *Acid stage standard solution*

### Suitability requirements

**Tailing factor:** NMT 1.5

**Relative standard deviation:** NMT 2.0%

### Analysis

**Samples:** *Acid stage standard solution*, *Buffer stage standard solution*, and *Sample solution*

Calculate the percentage of duloxetine released in the *Acid stage medium* ( $P_A$ ):

$$P_A =$$

$$\{(r_U/r_S) + [(r_{2U}/r_S) \times 1/F]\} \times C_S/L \times V \times (M_{r1}/M_{r2}) \times 100$$

$r_U$  = peak response of duloxetine from the *Sample solution*

$r_S$  = peak response of duloxetine from the *Acid stage standard solution*

$r_{2U}$  = peak response for 1-naphthol from the *Sample solution*

$F$  = relative response factor for 1-naphthol, 0.49  
 $C_S$  = concentration of duloxetine hydrochloride in the *Acid stage standard solution* (mg/mL)

$L$  = label claim (mg/Capsule)

$V$  = volume of *Medium*, 1000 mL

$M_{r1}$  = molecular weight of duloxetine free base, 297.42

$M_{r2}$  = molecular weight of duloxetine hydrochloride, 333.88

Calculate the percentage of duloxetine released in the *Buffer stage medium*:

$$\text{Result} = [(r_U/r_S) \times C_S/L \times V \times (M_{r1}/M_{r2}) \times 100] + P_A$$

- $r_U$  = peak response of duloxetine from the *Sample solution*  
 $r_S$  = peak response of duloxetine from the *Buffer stage standard solution*  
 $C_S$  = concentration of duloxetine hydrochloride in the *Buffer stage standard solution* (mg/mL)  
 $L$  = label claim (mg/Capsule)  
 $V$  = volume of *Medium*, 1000 mL  
 $M_{r1}$  = molecular weight of duloxetine free base, 297.42  
 $M_{r2}$  = molecular weight of duloxetine hydrochloride, 333.88  
 $P_A$  = percentage of duloxetine released in the *Acid stage medium*

**Tolerances**

**Acid stage:** No individual unit releases more than 10% of the labeled amount of duloxetine in 2 h.

**Buffer stage**

**For Capsules containing 20% w/w pellets:** NLT 75% (Q) of the labeled amount of duloxetine is dissolved in 60 min.

**For Capsules labeled to contain 32% w/w pellets:** NLT 75% (Q) of the labeled amount of duloxetine is dissolved in 90 min.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

**IMPURITIES**• **ORGANIC IMPURITIES**

Protect solutions of duloxetine from light.

**Buffer A, Buffer B, Mobile phase, Diluent, System suitability solution, Standard solution, Sample solution, Chromatographic system, and System suitability:** Proceed as directed in the *Assay*.

**Analysis**

**Sample:** *Sample solution*

Calculate the percentage of each impurity in the portion of Capsules taken:

$$\text{Result} = (r_U/r_T) \times 100$$

- $r_U$  = peak response of each impurity from *Sample solution*  
 $r_T$  = sum of the responses of all the peaks from *Sample solution*

**Acceptance criteria:** See *Table 1*.

**Table 1**

Name	Relative Retention Time	Acceptance Criteria NMT (%)
Duloxetine	1.0	—
Duloxetine related compound F <sup>a,d</sup>	1.1	—
1-Naphthol <sup>b,d</sup>	1.5	—
Duloxetine related compound H <sup>c</sup>	2.2	0.2
Any individual unspecified degradation product	—	0.2
Total impurities	—	0.4

<sup>a</sup> (S)-N-Methyl-3-(naphthalen-1-yloxy)-3-(thiophen-2-yl)propan-1-amine hydrochloride.

<sup>b</sup> Naphthalen-1-ol.

<sup>c</sup> (S)-4-{Methyl[3-(naphthalen-1-yloxy)-3-(thiophen-2-yl)propyl]amino}-4-oxobutanoic acid.

<sup>d</sup> For system suitability purposes only.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store at controlled room temperature.

• **USP REFERENCE STANDARDS (11):**

USP Duloxetine Hydrochloride RS

USP Duloxetine Related Compound F RS

(S)-N-Methyl-3-(naphthalen-1-yloxy)-3-(thiophen-3-yl)propan-1-amine hydrochloride.

C<sub>18</sub>H<sub>19</sub>NOS · HCl 333.88

USP Duloxetine Related Compound H RS

(S)-4-{Methyl[3-(naphthalen-1-yloxy)-3-(thiophen-2-yl)propyl]amino}-4-oxobutanoic acid.

C<sub>22</sub>H<sub>23</sub>NO<sub>4</sub>S 397.49

**Absorbable Dusting Powder**

» Absorbable Dusting Powder is an absorbable powder prepared by processing cornstarch and intended for use as a lubricant for surgical gloves. It contains not more than 2.0 percent of magnesium oxide.

**Packaging and storage—**Preserve in well-closed containers. It may be preserved in sealed paper packets.

**Identification—**A 1 in 10 suspension is colored purplish blue to deep blue by iodine TS.

**Stability to autoclaving—**Transfer about 2 g to a suitable paper packet, and seal or close the packet with a double fold. Wrap the paper packet in muslin, transfer to an autoclave, heat to 121° for 30 minutes, and cool: the powder is not caked, and any lumps are easily crushed between the fingers.

**Sedimentation—**Boil 100 mL of a 1 in 10 suspension in water for 20 minutes. Cool, transfer to a 100-mL graduated cylinder, dilute with water to volume, and allow to stand undisturbed for 24 hours: the volume occupied by the settled Powder is between 45 mL and 75 mL.

**pH (791):** between 10.0 and 10.8, in a 1 in 10 suspension.

**Loss on drying (731)—**Dry about 2 g, accurately weighed, at 105° to constant weight: it loses not more than 12% of its weight.

**Residue on ignition (281)—**Heat about 1 g, accurately weighed, in a covered platinum crucible until most of the carbon is burned away, but do not ignite the sample. Remove the cover, and ignite to constant weight: not more than 3.0% of residue remains.

**Heavy metals, Method II (231):** 0.001%.

**Assay for magnesium oxide—**Weigh accurately about 2.5 g, and transfer to a beaker. Add 25 mL of water and 2 mL of 3 N hydrochloric acid, and stir the mixture for 5 minutes. Add 5 mL of hydroxylamine hydrochloride solution (1 in 10), 15 mL of ammonia-ammonium chloride TS, 5 mL of potassium cyanide solution (1 in 10), and 5 drops of eriochrome black TS, mix, and titrate with 0.05 M edetate disodium VS until the solution becomes distinctly blue in color. Each mL of 0.05 M edetate disodium is equivalent to 2.015 mg of MgO.

## Dyclonine Hydrochloride

$C_{18}H_{27}NO_2 \cdot HCl$  325.87

1-Propanone, 1-(4-butoxyphenyl)-3-(1-piperidinyl)-hydrochloride.

4'-Butoxy-3-piperidinopropiophenone hydrochloride [536-43-6].

» Dyclonine Hydrochloride contains not less than 98.0 percent and not more than 102.0 percent of  $C_{18}H_{27}NO_2 \cdot HCl$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Dyclonine Hydrochloride RS

**Identification**—

**A:** *Infrared Absorption* (197M).

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**C:** Add 2 mL of silver nitrate TS to 10 mL of Dyclonine Hydrochloride solution (1 in 100): a white precipitate is formed. Add 2 mL of nitric acid, centrifuge, and discard the supernatant. Wash the precipitate twice by adding 10 mL of 2 N nitric acid, centrifuging, and discarding the supernatant: the precipitate so obtained is soluble in 6 N ammonium hydroxide.

**Melting range** (741): between 173° and 178°.

**pH** (791): between 4.0 and 7.0, in a solution (1 in 100).

**Loss on drying** (731)—Dry it at 105° for 1 hour: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.2%.

**Assay**—

*Mobile phase, Standard preparation, and Chromatographic system*—Proceed as directed in the *Assay* under *Dyclonine Hydrochloride Gel*.

*Assay preparation*—Transfer about 50 mg of Dyclonine Hydrochloride, accurately weighed, to a 500-mL volumetric flask, dissolve in 0.001 N phosphoric acid, dilute with 0.001 N phosphoric acid to volume, and mix.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{18}H_{27}NO_2 \cdot HCl$  in the portion of Dyclonine Hydrochloride taken by the formula:

$$500C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Dyclonine Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dyclonine Hydrochloride Gel

» Dyclonine Hydrochloride Gel contains not less than 90.0 percent and not more than 110.0 per-

cent of the labeled amount of  $C_{18}H_{27}NO_2 \cdot HCl$ . It may contain suitable stabilizers and antimicrobial agents.

**Packaging and storage**—Preserve in collapsible, opaque plastic tubes or in tight, light-resistant glass containers. [NOTE—Do not use aluminum or tin tubes.]

**USP Reference standards** (11)—

USP Dyclonine Hydrochloride RS

**Identification**—Shake a portion of Gel, equivalent to about 400 mg of dyclonine hydrochloride, with 25 mL of chloroform, and allow the layers to separate. Remove the chloroform layer, evaporate on a steam bath to dryness, and dry the residue at 105° for 1 hour: the dyclonine hydrochloride so obtained responds to the *Identification* tests under *Dyclonine Hydrochloride*.

**pH** (791): between 2.0 and 4.0.

**Assay**—

*Mobile phase*—Dissolve 0.20 g of monobasic potassium phosphate and 0.45 mL of *n*-heptylamine in about 350 mL of water. Adjust with phosphoric acid to a pH of 3.0, dilute with water to 400 mL, add 600 mL of acetonitrile, and mix.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Dyclonine Hydrochloride RS in 0.001 N phosphoric acid to obtain a solution having a known concentration of about 0.1 mg per mL.

*Assay preparation*—Transfer an accurately measured portion of Gel, equivalent to about 5.0 mg of dyclonine hydrochloride, to a 50-mL volumetric flask. Add 10 mL of 0.001 N phosphoric acid, and sonicate to dissolve the gel. Dilute with 0.001 N phosphoric acid to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm  $\times$  25-cm column that contains 5- $\mu$ m diameter packing L13. The flow rate is about 1.2 mL per minute. Adjust the flow rate, if necessary, so that the retention time of dyclonine hydrochloride is not less than 5 minutes. Chromatograph five replicate injections of the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 2.0 and the relative standard deviation is not more than 3.0%.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of dyclonine hydrochloride ( $C_{18}H_{27}NO_2 \cdot HCl$ ) in the portion of Gel taken by the formula:

$$50C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Dyclonine Hydrochloride RS in the *Standard preparation*, and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dyclonine Hydrochloride Topical Solution

» Dyclonine Hydrochloride Topical Solution is a sterile, aqueous solution of Dyclonine Hydrochloride. It contains not less than 92.0 percent and not more than 108.0 percent of the labeled amount of  $C_{18}H_{27}NO_2 \cdot HCl$ . It may contain suitable stabilizers and antimicrobial agents.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—  
USP Dyclonine Hydrochloride RS

**Identification**—To a volume of Topical Solution, equivalent to about 300 mg of dyclonine hydrochloride, add 15 mL of chloroform, shake, and allow the layers to separate. Remove a portion of the chloroform solution, evaporate on a steam bath to dryness, and dry the residue at 105° for 1 hour: the dyclonine hydrochloride so obtained responds to the *Identification* tests under *Dyclonine Hydrochloride*.

**Sterility** (71): meets the requirements.

**pH** (791): between 3.0 and 5.0.

**Assay**—

*Mobile phase, Standard preparation, and Chromatographic system*—Proceed as directed in the *Assay* under *Dyclonine Hydrochloride Gel*.

*Assay preparation*—Transfer an accurately measured volume of Topical Solution, equivalent to about 50 mg of dyclonine hydrochloride, to a 500-mL volumetric flask. Dilute with water to volume, and mix.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{18}H_{27}NO_2 \cdot HCl$  in each mL of the Topical Solution taken by the formula:

$$500(C/V)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Dyclonine Hydrochloride RS in the *Standard preparation*, V is the volume, in mL, of the Topical Solution taken, and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dydrogesterone

$C_{21}H_{28}O_2$  312.45  
Pregna-4,6-diene-3,20-dione, (9 $\beta$ ,10 $\alpha$ )-.  
9 $\beta$ ,10 $\alpha$ -Pregna-4,6-diene-3,20-dione [152-62-5].

» Dydrogesterone contains not less than 98.0 percent and not more than 102.0 percent of  $C_{21}H_{28}O_2$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—  
USP Dydrogesterone RS

**Identification**—

**A:** *Infrared Absorption* (197K).

**B:** *Ultraviolet Absorption* (197U)—

*Solution:* 6  $\mu$ g per mL.

*Medium:* methanol.

Absorptivities at 285 nm, calculated on the dried basis, do not differ by more than 2.5%.

**Melting range** (741): between 167° and 171°.

**Specific rotation** (781S): between –442° and –462°.

*Test solution:* 10 mg per mL, in trichloroethane.

**Loss on drying** (731)—Dry it in vacuum at 50° for 1 hour: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals, Method II** (231): 0.002%.

**Chromatographic purity**—

*Mobile phase, System suitability preparation, and Chromatographic system*—Prepare as directed in the *Assay*.

*Test solution*—Prepare a solution of Dydrogesterone in *Mobile phase* having a concentration of about 0.1 mg per mL.

*Procedure*—Inject about 20  $\mu$ L of the *Test solution* into the chromatograph, record the chromatograms for not less than 20 minutes, and measure the peak area responses. The sum of the areas of the secondary peaks, is not more than 2.0% of the total peak area.

**Assay**—

*Mobile phase*—Prepare a filtered and degassed mixture of water, alcohol, and acetonitrile (530:260:210). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Dydrogesterone RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.1 mg per mL.

*Assay preparation*—Transfer about 100 mg of Dydrogesterone, accurately weighed, to a 100-mL volumetric flask, add *Mobile phase* to volume, and mix. Transfer 10.0 mL of the resulting solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*System suitability preparation*—Transfer 10 mg of dydrogesterone to a 100-mL volumetric flask, add 30 mL of alcohol, and mix to dissolve the solid. Add 1 mL of 0.2 N sodium hydroxide, and heat the mixture at 85° for 10 minutes. Cool to room temperature, neutralize with 1 mL of 0.2 N hydrochloric acid, add 20 mL of acetonitrile, dilute with water to volume, and mix. This solution contains dydrogesterone and 17  $\alpha$ -dydrogesterone.

*Chromatographic system*—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm  $\times$  15-cm column that contains 3- $\mu$ m packing L1 and is maintained at 40°. The flow rate is about 1 mL per minute. Chromatograph 20  $\mu$ L of the *System suitability preparation*, and record the peak responses as directed under *Procedure*: the resolution between the dydrogesterone and 17  $\alpha$ -dydrogesterone is not less than 5, and the relative standard deviation of dydrogesterone peak responses from replicate injections is not more than 1.5%. The relative retention times are about 1.0 for dydrogesterone and about 1.3 for 17  $\alpha$ -dydrogesterone.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{21}H_{28}O_2$  in the portion of Dydrogesterone taken by the formula:

$$1000C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Dydrogesterone RS in the *Standard preparation*, and  $r_U$  and  $r_S$  are the peak responses for dydrogesterone obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dydrogesterone Tablets

» Dydrogesterone Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{21}H_{28}O_2$ .

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Dydrogesterone RS

**Identification**—Extract a quantity of the powdered Tablets, containing about 60 mg of Dydrogesterone, with 20 mL of methanol, filter, and evaporate to dryness: the residue so obtained responds to *Identification* test A under *Dydrogesterone*.

**Dissolution** (711)—

*Medium*: 0.3% sodium lauryl sulfate; 500 mL.

*Apparatus 2*: 100 rpm.

*Time*: 60 minutes.

**Procedure**—Determine the amount of  $C_{21}H_{28}O_2$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 295 nm of filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Dydrogesterone RS in the same medium.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_{21}H_{28}O_2$  is dissolved in 60 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—

*Mobile phase, Standard preparation, System suitability preparation, and Chromatographic system*—Proceed as directed in the *Assay* under *Dydrogesterone*.

**Assay preparation**—Weigh and finely powder not less than 20 Tablets. Transfer a portion of the powder, equivalent to about 20 mg of Dydrogesterone, to a 200-mL volumetric flask, add about 100 mL of *Mobile phase*, and sonicate for 10 minutes. Cool to room temperature, dilute with *Mobile phase* to volume, and mix.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and determine the peak responses by area measurement. Calculate the quantity, in mg, of  $C_{21}H_{28}O_2$  in the portion of Tablets taken by the formula:

$$200C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Dydrogesterone RS in the *Standard preparation*, and  $r_U$  and  $r_S$  are the Dydrogesterone peak area responses from the *Assay preparation* and the *Standard preparation*, respectively.

( $\pm$ )-7-(2,3-Dihydroxypropyl)theophylline [479-18-5].

» Dyphylline contains not less than 98.0 percent and not more than 102.0 percent of  $C_{10}H_{14}N_4O_4$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Dyphylline RS

**Identification**—

**A: Infrared Absorption** (197K).

**B: Ultraviolet Absorption** (197U)—

*Solution*: 10  $\mu$ g per mL.

*Medium*: water.

**Melting range** (741): between 160° and 164°.

**pH** (791): between 5.0 and 7.5, in a solution (1 in 100).

**Loss on drying** (731)—Dry about 1 g, accurately weighed, at 105° for 3 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.15%.

**Chloride** (221): A 1.0-g portion shows no more chloride than corresponds to 0.50 mL of 0.020 N hydrochloric acid (0.035%).

**Sulfate** (221): A 1.0-g portion shows no more sulfate than corresponds to 0.10 mL of 0.020 N sulfuric acid (0.010%).

**Heavy metals, Method I** (231): 0.002%.

**Limit of theophylline**—Dissolve 2.0 g in 10 mL of hot water. Cool, add 10 drops of bromothymol blue TS and 5.0 mL of silver nitrate TS, and mix. Not more than 0.50 mL of 0.10 N sodium hydroxide is required to change the color of the solution to blue (0.5%).

**Related compounds**—Dissolve about 200 mg in a mixture of 30 volumes of methanol and 20 volumes of water in a 10-mL volumetric flask, dilute with the same mixture to volume, and mix (*Test solution*). Dilute 1 mL of the *Test solution* with methanol to 100 mL (*Diluted test solution*). Separately apply 10  $\mu$ L of each solution to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of binder-free chromatographic silica gel mixture. Develop the plate in a suitable chamber containing a mixture of chloroform, dehydrated alcohol, and ammonium hydroxide (90:10:1) until the solvent front has moved about 15 cm. Remove the plate, air-dry at room temperature, and examine under short-wavelength UV light: no spot in the chromatogram of the *Test solution* other than the principal spot is larger or more intense than the principal spot from the *Diluted test solution* (1.0%).

**Assay**—Dissolve about 200 mg of Dyphylline, accurately weighed, in 2 mL of formic acid, and carefully add, with stirring, 50 mL of acetic anhydride. Add 0.2 mL of Sudan IV TS, and titrate with 0.1 N perchloric acid VS to a deep violet endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 25.42 mg of  $C_{10}H_{14}N_4O_4$ .

## Dyphylline

$C_{10}H_{14}N_4O_4$  254.24

1*H*-Purine-2,6-dione, 7-(2,3-dihydroxypropyl)-3,7-dihydro-1,3-dimethyl-, ( $\pm$ )-.

## Dyphylline Injection

» Dyphylline Injection contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{10}H_{14}N_4O_4$ .

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I glass, protected from light. To avoid precipitation, store at a temperature of not below 15°, but avoid excessive heat.

**USP Reference standards** (11)—

USP Dyphylline RS

USP Endotoxin RS

**Labeling**—Label it to indicate that the Injection is not to be used if crystals have separated.**Identification**—**A:** Dilute about 5 mL with 20 mL of water, and add 1.0 mL of 2 N sodium hydroxide and 2 drops of potassium permanganate TS: a green color is produced.**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation* obtained as directed in the *Assay*.**C:** Transfer a portion of Injection, equivalent to about 100 mg of dyphylline, to a 200-mL volumetric flask, dilute with water to volume, and mix. Transfer 2 mL to a 100-mL volumetric flask, dilute with water to volume, and mix: the UV absorption spectrum of the solution exhibits maxima and minima at the same wavelengths as that of a solution of USP Dyphylline RS containing 10 µg per mL, concomitantly measured.**Bacterial endotoxins** (85)—It contains not more than 0.7 USP Endotoxin Unit per mg of dyphylline.**pH** (791): between 5.0 and 8.0.**Other requirements**—It meets the requirements under *Injections* (1).**Assay**—*Mobile phase, Standard preparation, and Chromatographic system*—Prepare as directed in the *Assay* under *Dyphylline Tablets*.*Assay preparation*—Transfer an accurately measured volume of Injection, equivalent to about 100 mg of dyphylline, to a 500-mL volumetric flask, add water to volume, and mix.*Procedure*—Proceed as directed in the *Assay* under *Dyphylline Tablets*. Calculate the quantity, in mg, of  $C_{10}H_{14}N_4O_4$  in each mL of the Injection taken by the formula:

$$(0.5C / V)(r_U / r_S)$$

in which *V* is the volume, in mL, of Injection taken, and the other terms are as defined therein.

---

**Dyphylline Oral Solution**

---

» Dyphylline Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of dyphylline ( $C_{10}H_{14}N_4O_4$ ).**Packaging and storage**—Preserve in tight containers.**USP Reference standards** (11)—

USP Dyphylline RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.**Alcohol content**—*Standard preparation*—Pipet 5 mL of dehydrated alcohol and 5 mL of acetone into a 200-mL volumetric flask containing 50 mL of water, add water to volume, and mix. Pipet 10 mL of this solution into a 200-mL volumetric flask, add water to volume, and mix.*Test preparation*—Transfer an accurately measured volume of Oral Solution, equivalent to about 5 mL of alcohol, to a 200-mL volumetric flask containing about 30 mL of water. Pipet 5 mL of acetone into the flask, add water to volume,

and mix. Pipet 10 mL of this solution into a 200-mL volumetric flask, add water to volume, and mix.

*Chromatographic system*—The gas chromatograph is equipped with a flame-ionization detector and contains a 75-cm × 4-mm column packed with 20% phase G20 on support S1AB, conditioned as directed (see *Chromatography* (621)). The column is maintained at a temperature of about 85°, and the injection port and detector block are maintained at about 175° and 225°, respectively. Nitrogen is used as the carrier gas at a flow rate of about 18 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution, *R*, is not less than 2.0; the tailing factor of the alcohol peak is not greater than 1.5; and the relative standard deviation for replicate injections is not more than 2.0% in the ratio of the peak of alcohol to the peak of acetone.*Procedure*—Separately inject equal volumes (about 4 µL) of the *Test preparation* and the *Standard preparation*, in duplicate, into the gas chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of alcohol in the specimen taken by the formula:

$$(500 / V)(R_U / R_S)$$

in which *V* is the volume, in mL, of Oral Solution taken, and *R<sub>U</sub>* and *R<sub>S</sub>* are the peak response ratios of alcohol to that of acetone obtained from the *Assay preparation* and the *Standard preparation*, respectively: the alcohol content, obtained as the average of the calculated results, is between 90.0% and 110.0% of the labeled amount of  $C_2H_5OH$ .**Assay**—*Mobile phase and Chromatographic system*—Prepare as directed in the *Assay* under *Dyphylline Tablets*.*Standard preparation*—Dissolve an accurately weighed quantity of USP Dyphylline RS in *Mobile phase* to obtain a solution having a known concentration of about 500 µg per mL.*Assay preparation*—Transfer an accurately measured volume of Oral Solution, equivalent to about 100 mg of dyphylline, to a 200-mL volumetric flask, add *Mobile phase* to volume, and mix.*Procedure*—Separately inject equal volumes (about 10 µL), of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of dyphylline ( $C_{10}H_{14}N_4O_4$ ) in the volume of Oral Solution taken by the formula:

$$0.2C(r_U / r_S)$$

in which *C* is the concentration, in µg per mL, of USP Dyphylline RS in the *Standard preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the dyphylline peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

---

**Dyphylline Tablets**

---

» Dyphylline Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{10}H_{14}N_4O_4$ .**Packaging and storage**—Preserve in tight containers.**USP Reference standards** (11)—

USP Dyphylline RS

**Identification**—**A:** To a solution of 5 Tablets in 20 mL of water add 1 mL of 2 N sodium hydroxide and 2 drops of potassium permanganate TS: a green color is produced.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation*, as obtained in the *Assay*.

**C:** Weigh a portion of finely powdered Tablets, equivalent to about 100 mg of dyphylline, and transfer to a 200-mL volumetric flask. Add about 100 mL of water, shake by mechanical means for about 15 minutes, dilute with water to volume, and mix. Filter, and transfer 2 mL of the filtrate to a 100-mL volumetric flask, dilute with water to volume, and mix: the UV absorption spectrum of the solution exhibits maxima and minima at the same wavelengths as that of a solution of USP Dyphylline RS containing 10 µg per mL, concomitantly measured.

#### **Dissolution** <711>—

*Medium:* water; 900 mL.

*Apparatus 1:* 100 rpm.

*Time:* 45 minutes.

*Procedure*—Determine the amount of  $C_{10}H_{14}N_4O_4$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 273 nm of filtered portions of the solution under test, suitably diluted with water, in comparison with a Standard solution having a known concentration of USP Dyphylline RS in the same medium.

*Tolerances*—Not less than 75% (Q) of the labeled amount of  $C_{10}H_{14}N_4O_4$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

#### **Assay**—

*Mobile phase*—Dissolve 1.4 g of monobasic potassium phosphate in 1350 mL of water in a 2-liter volumetric flask, add methanol to volume, and mix. Filter through a 0.5-µm porosity membrane filter. [NOTE—The composition may be varied to meet system suitability requirements.]

*Standard preparation*—Dissolve an accurately weighed quantity of USP Dyphylline RS in water to obtain a solution having a known concentration of about 200 µg per mL.

*Assay preparation*—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of dyphylline, to a 500-mL volumetric flask, add 200 mL of water, insert the stopper, and shake by mechanical means for 10 minutes. Add water to volume, and mix. Just prior to injection, filter about 5 mL through a 1.2-µm porosity membrane filter.

*Chromatographic system* (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm × 30-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph five replicate injections of the *Standard preparation*, and record the peak responses as directed under *Procedure*: the relative standard deviation is not more than 2.0%. The tailing factor is not more than 2.0.

*Procedure*—Inject separately equal volumes, accurately measured (about 10 µL), of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of  $C_{10}H_{14}N_4O_4$  in the portion of Tablets taken by the formula:

$$0.5C(r_U / r_S)$$

in which C is the concentration, in µg per mL, of USP Dyphylline RS in the *Standard preparation*, and  $r_U$  and  $r_S$  are the dyphylline peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## **Dyphylline and Guaifenesin Oral Solution**

» Dyphylline and Guaifenesin Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of dyphylline ( $C_{10}H_{14}N_4O_4$ ) and guaifenesin ( $C_{10}H_{14}O_4$ ).

**Packaging and storage**—Preserve in tight containers.

#### **USP Reference standards** <11>—

USP Dyphylline RS

USP Guaifenesin RS

#### **Identification**—

**A:** To an amount of the Oral Solution equivalent to about 100 mg of dyphylline, add water to make 20 mL, mix, and add 2.0 mL of 2 N sodium hydroxide and 2 drops of potassium permanganate TS: a green color is produced.

**B:** Transfer a volume of Oral Solution, equivalent to about 100 mg of guaifenesin, to a 60-mL separator, add 10 mL of chloroform, shake for 30 seconds, and allow the layers to separate. Decant the lower (chloroform) layer through chloroform-washed cotton into a small beaker. Evaporate 1 mL of the extract, on a watch glass, on a steam bath to dryness. To the residue add 1 drop of formaldehyde TS and a few drops of sulfuric acid: a deep cherry-red to purple color is produced.

**C:** The retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**pH** <791>: between 5.0 and 7.0.

#### **Alcohol content**—

*Standard preparation, Test preparation, Chromatographic system, and Procedure*—Proceed as directed in *Alcohol content* under *Dyphylline Oral Solution*: the alcohol content is between 90.0% and 110.0% of the labeled amount of  $C_2H_5OH$ .

#### **Assay**—

*Mobile phase*—Prepare a suitable filtered and degassed mixture of 0.01 M monobasic potassium phosphate and methanol (79:21). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

*Standard preparation*—Dissolve accurately weighed quantities of USP Dyphylline RS and USP Guaifenesin RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having known concentrations of about 0.1 mg of guaifenesin and about 0.1 µg of dyphylline per mL,  $f$  being the ratio of the labeled amount of dyphylline to that of guaifenesin.

*Resolution solution*—Prepare a solution in *Mobile phase* containing in each mL about 0.1 mg each of dyphylline and guaifenesin and about 0.01 mg of guaiacol.

*Assay preparation*—Transfer an accurately measured volume of Oral Solution, equivalent to about 100 mg of guaifenesin, to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Chromatographic system* (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 230-nm detector, a guard column that contains packing L1, and a 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between the guaiacol and guaifenesin peaks is not less than 1.8, and the resolution,  $R$ , between the guaiacol and dyphylline peaks is not less than 9.0. The relative retention times are about 0.25 for dyphylline

line, 0.7 for guaiacol, and 1.0 for guaifenesin. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0% for both dyphylline and guaifenesin.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantities, in mg, of dyphylline ( $C_{10}H_{14}N_4O_4$ ) and guaifenesin ( $C_{10}H_{14}O_4$ ) in each mL of the Oral Solution taken by the formula:

$$1000C/V(r_U / r_S)$$

in which C is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard preparation*, V is the volume, in mL, of Oral Solution taken; and  $r_U$  and  $r_S$  are the peak responses of the corresponding analyte obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dyphylline and Guaifenesin Tablets

» Dyphylline and Guaifenesin Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of dyphylline ( $C_{10}H_{14}N_4O_4$ ) and guaifenesin ( $C_{10}H_{14}O_4$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Dyphylline RS

USP Guaifenesin RS

**Identification**—

**A:** Triturate a quantity of finely powdered Tablets, equivalent to about 100 mg of dyphylline, with 20 mL of water, and transfer to a test tube. Add 2.0 mL of 2 N sodium hydroxide and 2 drops of potassium permanganate TS: a green color is produced.

**B:** Triturate a quantity of finely powdered Tablets, equivalent to about 100 mg of guaifenesin, with 10 mL of chloroform, filter, and on a watch glass evaporate 1 mL of the filtrate, on a steam bath, to dryness. To the residue add 1

drop of formaldehyde TS and a few drops of sulfuric acid: a deep cherry-red to purple color is produced.

**C:** The retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Dissolution**, *Procedure for a Pooled Sample* (711)—

*Medium:* water; 900 mL.

*Apparatus 1:* 100 rpm.

*Time:* 45 minutes.

*Procedure*—Determine the amounts of dyphylline ( $C_{10}H_{14}N_4O_4$ ) and guaifenesin ( $C_{10}H_{14}O_4$ ) dissolved, using the procedure set forth in the *Assay*, making any necessary modifications.

*Tolerances*—Not less than 75% (Q) of the labeled amounts of  $C_{10}H_{14}N_4O_4$  and  $C_{10}H_{14}O_4$  are dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—

*Mobile phase*, *Resolution solution*, and *Standard preparation*—Prepare as directed in the *Assay* under *Dyphylline and Guaifenesin Oral Solution*.

*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of guaifenesin, to a 100-mL volumetric flask, add about 80 mL of *Mobile phase*, sonicate for 30 minutes, and shake by mechanical means for an additional 30 minutes. Dilute with *Mobile phase* to volume, mix, and pass through a membrane filter having a 0.45- $\mu$ m or finer porosity, discarding the first 10 mL of the filtrate. Transfer 5.0 mL of the clear filtrate to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Chromatographic system*—Prepare as directed in the *Assay* under *Dyphylline and Guaifenesin Oral Solution*, except omit the use of the guard column.

*Procedure*—Proceed as directed in the *Assay* under *Dyphylline and Guaifenesin Oral Solution*. Calculate the quantities, in mg, of dyphylline ( $C_{10}H_{14}N_4O_4$ ) and guaifenesin ( $C_{10}H_{14}O_4$ ) in the portion of Tablets taken by the formula:

$$1000C(r_U / r_S)$$

in which the terms are as defined therein.

## Ecamsule Solution

$C_{28}H_{34}O_8S_2$  562.69

Bicyclo[2.2.1]heptane-1-methanesulfonic acid, 3,3'-(1,4-phenylenedimethylidyne)bis[7,7-dimethyl-2-oxo]-, (±)-(3*E*,3'*E*)-3,3'-(*p*-Phenylenedimethylidyne)bis[2-oxo-10-bornanesulfonic acid] [92761-26-7].

» Ecamsule Solution is an aqueous solution of  $C_{28}H_{34}O_8S_2$ . It contains not less than 30.0 percent and not more than 34.0 percent, by weight, of ecamsule ( $C_{28}H_{34}O_8S_2$ ).

**Packaging and storage**—Preserve in tight containers. Protect from light, and store at room temperature.

### USP Reference standards (11)—

USP Ecamsule Solution RS

USP Ecamsule Related Compound A RS  
1,4-Phenylenedimethanol.

$C_8H_{10}O_2$  138.16

USP Ecamsule Related Compound B RS  
4-(Hydroxymethyl)benzoic acid.

$C_8H_8O_3$  152.15

USP Ecamsule Related Compound C RS  
Terephthalic acid.

$C_8H_6O_4$  166.13

USP Ecamsule Related Compound D RS  
((1*SR*,4*RS*)-7,7-Dimethyl-2-oxobicyclo[2.2.1]heptan-1-yl)methanesulfonic acid.

$C_{10}H_{16}O_4S$  232.30

USP Ecamsule Related Compound E RS  
Sodium ((1*SR*,4*SR*,*E*)-3-(4-(hydroxymethyl)benzylidene)-7,7-dimethyl-2-oxobicyclo[2.2.1]heptan-1-yl)methanesulfonate.

$C_{18}H_{21}NaO_5S$  372.41

USP Ecamsule Related Compound F RS  
4-((*E*)-((1*SR*,4*SR*)-7,7-Dimethyl-3-oxo-4-(sulfomethyl)bicyclo[2.2.1]heptan-2-ylidene)methyl)benzoic acid.

$C_{18}H_{20}O_6S$  364.41

USP Ecamsule Related Compound G RS  
4-((*E*)-((1*SR*,4*SR*)-7,7-Dimethyl-3-oxo-4-(sulfomethyl)bicyclo[2.2.1]heptan-2-ylidene)methyl)benzaldehyde, sodium salt.

$C_{18}H_{19}NaO_5S$  370.40

USP Ecamsule Triethanolamine RS  
Bicyclo[2.2.1]heptane-1-methanesulfonic acid, 3,3'-(1,4-phenylenedimethylidyne)bis[7,7-dimethyl-2-oxo]-, di-triethanolamine salt (1:2).

$C_{28}H_{34}O_8S_2 \cdot (C_6H_{15}NO_3)_2$  861.07

**Labeling**—The label states that this article is not intended for direct administration to humans or animals.

### Identification—

**A: Infrared Absorption** (197A)—Place a drop of Ecamsule Solution on a diamond sampling surface and dry it with a stream of warm air. The IR absorption spectrum conforms to that of USP Ecamsule Solution RS, similarly obtained.

**B: Ultraviolet Absorption** (197U)—

**Solution**—Transfer 0.25 g of Ecamsule Solution to a 100-mL volumetric flask, and dilute with water to volume. Further dilute 2 mL of this solution with water to 100 mL.

The Solution exhibits absorption maximum between 342 and 346 nm.

**Limit of chloride**—Dissolve about 10 g of Ecamsule Solution, accurately weighed, in 70 mL of water. Titrate this solution with 0.01 N silver nitrate, determine the endpoint potentiometrically (see *Titrimetry* (541)), and calculate the percentage of chloride in the portion of  $C_{28}H_{34}O_8S_2$  taken by the formula:

$$100(35.5)(VN/W)(100/A)$$

in which 35.5 is the atomic weight, in g per mole, of chloride; *V* is the volume, in mL, of silver nitrate used for titration; *N* is the concentration, in normality, of silver nitrate; *W* is the weight, in mg, of Ecamsule Solution taken for determination; and *A* is the assay, in percent, of Ecamsule Solution: not more than 0.3% of chloride is found.

### Limit of sodium—

**Diluent**—Transfer 5 mL of nitric acid in a 1000-mL volumetric flask containing about 500 mL of water, and dilute with water to volume.

**Test solution**—Transfer about 1 g of Ecamsule Solution, accurately weighed, to a 100-mL volumetric flask, and dilute with Diluent to volume.

**Standard solutions**—Dilute quantitatively, and stepwise if necessary, a commercially available sodium atomic absorption standard solution containing 1000 µg of sodium per mL with Diluent to obtain solutions having known concentrations of 1, 5, 10, and 20 µg per mL, respectively.

**Procedure** (see *Spectrophotometry and Light Scattering* (851))—Concomitantly determine the absorbances of the Standard solutions and the Test solution at the sodium emission line of 330 nm or 589 nm with a suitable atomic absorption spectrophotometer equipped with a sodium lamp and an air-acetylene flame, using Diluent as the blank. Determine the concentration of sodium, in µg per mL, in the Test solution using the calibration graph. Calculate the percentage of sodium in the portion of  $C_{28}H_{34}O_8S_2$  taken by the formula:

$$100 \times 10^{-6}(CV/W)(100/A)$$

in which *C* is the concentration, in µg per mL, of sodium in the Test solution, the multiplier of  $10^{-6}$  is for conversion of µg per mL to g per mL; *V* is the volume, in mL, of Test solution; *W* is the weight, in g, of Ecamsule Solution taken for determination; and *A* is the assay, in percent, of Ecamsule Solution: not more than 0.3% of sodium is found.

### Related compounds—

**Test for related compounds A to F—**

**Solvent A**—Prepare a mixture of acetonitrile and 85% phosphoric acid (1000:1).

**Solvent B**—Prepare a mixture of water and 85% phosphoric acid (1000:1).

**Standard solution**—Dissolve an accurately weighed quantity of USP Ecamsule Related Compound A RS, USP Ecamsule Related Compound B RS, USP Ecamsule Related Compound C RS, USP Ecamsule Related Compound D RS, USP Ecamsule Related Compound E RS, and USP Ecamsule Related Compound F RS in water, sonicating if necessary, to obtain a solution having known concentrations as found in Table 1.

**Test solution**—Transfer about 100 mg, accurately weighed, of Ecamsule Solution to a 50-mL volumetric flask, and dilute with water to volume.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with either a programmable variable wavelength detector or two separate detectors capable of monitoring at 200 nm and 300 nm and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–25	20	80	isocratic
25–27	20→80	80→20	linear gradient
27–47	80	20	isocratic
47–50	80→20	20→80	linear gradient
50–65	20	80	equilibration

Chromatograph the *Standard solution*, and record the peak areas as directed for *Procedure*: the relative standard deviations of the ecamsule related compound peaks for replicate injections are not more than 10.0%; and the resolution,  $R$ , between all adjacent peak pairs of ecamsule related compounds is not less than 1.5 measured at 200 nm.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, allow the chromatogram to run for about 20 minutes for the *Standard solution* and 60 minutes for the *Test solution*, record the chromatograms at 200 nm from 0 to 8 minutes and at 300 nm after 8 minutes, and measure the peak areas. Calculate the percentage of ecamsule related compounds A, B, C, D, and F in the portion of  $C_{28}H_{34}O_8S_2$  taken by the formula:

$$100[100C_S / (C_U \times A)](r_U / r_S)$$

in which  $C_S$  is the concentration, in mg per mL, of the ecamsule related compound in the *Standard solution*;  $C_U$  is the concentration, in mg per mL, of the *Test solution*;  $A$  is the assay, in percent, obtained from the *Assay*; and  $r_U$  and  $r_S$  are the peak areas of the ecamsule related compound obtained from the *Test solution* and *Standard solution*, respectively. Calculate the percentage of ecamsule related compound E in the portion of  $C_{28}H_{34}O_8S_2$  taken by the formula:

$$100(350.43/372.41)[100C_S / (C_U \times A)](r_U / r_S)$$

in which 350.43 and 372.41 are the molecular weights of ecamsule related compound E (free acid) and USP Ecamsule Related Compound E RS (sodium salt), respectively;  $C_S$  is the concentration, in mg per mL, of ecamsule related compound E in the *Standard solution*;  $C_U$  is the concentration, in mg per mL, of the *Test solution*;  $A$  is the assay, in percent, obtained from the *Assay*; and  $r_U$  and  $r_S$  are the peak areas of the ecamsule related compound E obtained from the *Test solution* and *Standard solution*, respectively. The limits are given in Table 1.

*Test for related compound G, Ecamsule exo-2-hydroxyecamsule, Ecamsule endo-2-hydroxyecamsule, and unspecified impurities*—

*Mobile phase*—Proceed as directed in the *Assay*.

*Standard solution 1*—Dissolve an accurately weighed quantity of USP Ecamsule Related Compound G RS in water to obtain a solution having a known concentration of about 0.005 mg per mL.

*Standard solution 2*—Use the *Standard preparation*, as described in the *Assay*.

*Test solution*—Use the *Assay preparation*, prepared as directed in the *Assay*.

*Chromatographic system*—Prepared as directed in the *Assay*. Use the liquid chromatograph equipped with a 310-nm detector in addition to using a 343-nm detector. [NOTE—Ecamsule related compound G is detected at 310 nm; and Ecamsule exo-2-hydroxyecamsule, Ecamsule endo-2-hydroxyecamsule, and unspecified impurities are detected at 343 nm.]

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of *Standard solution 1*, *Standard solution 2*, and the *Test solution* into a chromatograph, record the chromatograms for not less than 6 times the retention time of ecamsule trans-trans isomer, and measure the peak areas. Calculate the percentage of ecamsule related compound G in the portion of  $C_{28}H_{34}O_8S_2$  taken by the formula:

$$100(348.41/370.40)[100C_S / (C_U \times A)](r_U / r_S)$$

in which 348.41 and 370.40 are the molecular weights of ecamsule related compound G and USP Ecamsule Related Compound G RS, respectively;  $C_S$  is the concentration, in mg per mL, of USP Ecamsule Related Compound G RS in *Standard solution 1*;  $C_U$  is the concentration, in mg per mL, of the *Test solution*;  $A$  is the assay, in percent, obtained from the *Assay*; and  $r_U$  and  $r_S$  are the peak areas of ecamsule related compound G obtained from the *Test solution* and *Standard solution 1*, respectively. Calculate the percentage of Ecamsule exo-2-hydroxyecamsule and Ecamsule endo-2-hydroxyecamsule in the portion of  $C_{28}H_{34}O_8S_2$  taken by the formula:

$$100(1/F)[100C_S / (C_U \times A)](r_i / r_S)$$

in which  $F$  is the relative response factor for each impurity obtained from Table 2;  $C_S$  is the concentration, in mg per mL, of USP Ecamsule Triethanolamine RS in *Standard solution 2*;  $C_U$  is the concentration, in mg per mL, of the *Test solution*;  $A$  is the assay, in percent, obtained from the *Assay*;  $r_i$  is the peak area for each impurity obtained from the *Test solution*; and  $r_S$  is the sum of peak areas corresponding to the trans-trans and cis-trans isomers obtained from the *Standard solution*. Calculate the percentage of any unspecified impurity in the portion of  $C_{28}H_{34}O_8S_2$  taken by the formula:

$$100(r_i / r_S)$$

in which  $r_i$  is the peak area for each unspecified impurity obtained from the *Test solution*; and  $r_S$  is the sum of all peak areas obtained from the *Test solution*. The limits are given in Table 2.

Table 1

Name	Concentration (mg/mL) in the Standard solution	Detection wavelength (nm)	RRT <sup>1</sup>	Limit (%)
Ecamsule related compound A	0.001	200	0.42	0.2
Ecamsule related compound B	0.001	200	0.54	0.2
Ecamsule related compound C	0.001	200	0.70	0.2
Ecamsule related compound D	0.008	200	1.00	1.3
Ecamsule related compound E (free acid)	0.004	300	2.52	0.7
Ecamsule related compound F	0.004	300	3.26	0.7

<sup>1</sup>Ecamsule elutes after 27 minutes and is a broad peak in the *Test for related compounds A to F*. The relative retention times of related compounds are measured with respect to ecamsule related compound D.

Table 2

Name	RRT <sup>3</sup>	F	Limit (%)
Ecamsule related compound G	0.9	—	0.2
Ecamsule exo-2-hydroxyecamsule <sup>1</sup>	1.4	0.6	0.2
Ecamsule endo-2-hydroxyecamsule <sup>2</sup>	1.6	0.6	0.3
Any single unspecified impurity	—	1.0	0.5

<sup>1</sup>[(1*SR*,2*R*,4*SR*,*E*)-3-(4-((*E*)-[(1*SR*,4*SR*)-7,7-dimethyl-3-oxo-4-(sulfomethyl)bicyclo[2.2.1]heptan-2-ylidene)methyl)benzylidene)-2-hydroxy-7,7-dimethylbicyclo[2.2.1]heptan-1-yl)methanesulfonic acid [C<sub>28</sub>H<sub>36</sub>O<sub>8</sub>S<sub>2</sub>, 564.71].

<sup>2</sup>[(1*SR*,2*S*,4*SR*,*E*)-3-(4-((*E*)-[(1*SR*,4*SR*)-7,7-dimethyl-3-oxo-4-(sulfomethyl)bicyclo[2.2.1]heptan-2-ylidene)methyl)benzylidene)-2-hydroxy-7,7-dimethylbicyclo[2.2.1]heptan-1-yl)methanesulfonic acid [C<sub>28</sub>H<sub>36</sub>O<sub>8</sub>S<sub>2</sub>, 564.71].

<sup>3</sup>The relative retention times are measured with respect to ecamsule trans-trans isomer.

**Total impurities**—Calculate the sum of the related compounds and unspecified impurities from the *Test for related compounds A to F* and the *Test for related compound G*, *Ecamsule exo-2-hydroxyecamsule*, *Ecamsule endo-2-hydroxyecamsule*, and *unspecified impurities*: not more than 5.0% of total impurities is found.

**Assay**—[NOTE—Prepare solutions immediately before use, and protect them from light in low-actinic glassware.]

**1% Triethylamine solution**—Prepare a mixture of water and triethylamine (100:1), and adjust with phosphoric acid to a pH of 7.

**Mobile phase**—Prepare a mixture of 1% Triethylamine solution and methanol (50:50). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Ecamsule Triethanolamine RS in *Mobile phase*, sonicating if necessary, to obtain a solution having a known concentration of about 0.12 mg per mL of ecamsule triethanolamine.

**Assay preparation**—Transfer about 500 mg, accurately weighed, of Ecamsule Solution to a 100-mL volumetric flask, and dilute with water to volume. Transfer 5.0 mL of this solution into a 100-mL volumetric flask, and dilute with water to volume.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 343-nm detector and a 4.0-mm × 125-mm column that contains 5-μm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.0 for ecamsule trans-trans isomer and 2.9 for the ecamsule cis-trans isomer; the relative standard deviation of the sum of the ecamsule trans-trans and cis-trans peak areas for replicate injections is not more than 2.0%; and the number of theoretical plates of the peak corresponding to the trans-trans isomer is not less than 1430.

**Procedure**—Inject equal volumes (about 20 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak areas. Calculate the percentage of C<sub>28</sub>H<sub>34</sub>O<sub>8</sub>S<sub>2</sub> in the portion of Ecamsule Solution taken by the formula:

$$100(562.69/861.07)(V/W) C (r_U / r_S)$$

in which 562.69 and 861.07 are the molecular weights of ecamsule and ecamsule triethanolamine, respectively; *V* is the volume, in mL, of the *Assay preparation*; *W* is the weight, in mg, of Ecamsule Solution used for the *Assay preparation*; *C* is the concentration, in mg per mL, of ecamsule triethanolamine in the *Standard preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the sum of peak areas corresponding to trans-trans and

cis-trans isomers obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Echothiophate Iodide

C<sub>9</sub>H<sub>23</sub>INO<sub>3</sub>PS 383.23

Ethanaminium, 2-[(diethoxyphosphinyl)thio]-*N,N,N*-trimethyl-, iodide.

(2-Mercaptoethyl)trimethylammonium iodide *S*-ester with *O*, *O*-diethyl phosphorothioate [513-10-0].

» Echothiophate Iodide contains not less than 95.0 percent and not more than 100.5 percent of C<sub>9</sub>H<sub>23</sub>INO<sub>3</sub>PS, calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers, preferably at a temperature below 0°.

### Identification—

**A:** Dissolve about 100 mg in 2 mL of water in a test tube, and add 1 mL of nitric acid: a brown precipitate of iodine is formed. Transfer 1 drop of this mixture to another test tube, add 1 mL of solvent hexane, and shake: the solvent hexane takes on a pink color.

**B:** Heat the remainder of the brown reaction mixture from *Identification test A* over a flame until a colorless solution remains (about 3 minutes). Cool, and dilute with water to about 10 mL: a 2-mL portion of this solution responds to the tests for *Phosphate* <191>.

**C:** A 2-mL portion of the solution obtained in *Identification test B* responds to the tests for *Sulfate* <191>.

**Loss on drying** <731>—Dry it in vacuum over phosphorus pentoxide at 50° for 3 hours: it loses not more than 1.0% of its weight.

**Assay**—[NOTE—In the preparation of all reagents, and throughout this procedure, wherever water is specified, use only water that has been distilled, boiled for 10 minutes, and cooled while protected from the atmosphere.]

**pH 12 phosphate buffer**—Transfer 5.44 g of anhydrous dibasic sodium phosphate to a 100-mL volumetric flask, and add a volume of 1 N sodium hydroxide VS that contains 36.5 mEq of sodium hydroxide. Add about 40 mL of water, shake to dissolve the sodium phosphate, dilute with water to volume, and mix.

**0.004 N Iodine**—Dilute 0.1 N iodine with water to 0.004 N, and standardize the solution on the day of use as follows. Weigh accurately about 150 mg of arsenic trioxide, and dissolve in 20 mL of 1 N sodium hydroxide, by warming if necessary, in a 500-mL volumetric flask. Dilute with 40 mL of water, add 2 drops of methyl orange TS, then add 3 N hydrochloric acid until the yellow color is changed to pink. Add 2 g of sodium bicarbonate, add water to volume, and mix. Transfer 5.0 mL of this solution to a titration vessel, and add 50 mL of pH 7 phosphate buffer (see under *Solutions* in the section *Reagents, Indicators, and Solutions*). Titrate with 0.004 N iodine, determining the endpoint potentiometrically, using platinum and silver-silver chloride electrodes. Calculate the normality. Each 197.8 μg of arsenic trioxide is equivalent to 1 mL of 0.004 N iodine.

**Procedure**—Dissolve about 125 mg of Echothiophate Iodide, accurately weighed, in about 50 mL of water in a 100-mL volumetric flask, add water to volume, and mix. Transfer 10.0 mL of this solution to a titration vessel containing 30 mL of water. Add 10.0 mL of pH 12 phosphate buffer, mix, cover, and allow to stand for 20 minutes at 25 ± 3°. Add 2 mL of glacial acetic acid, rapidly and with mixing.

Titrate with 0.004 N iodine, determining the endpoint potentiometrically, using platinum and silver-silver chloride electrodes. Correct for the amount of free thiol sulfur by repeating the procedure but adding the glacial acetic acid first, then the pH 12 phosphate buffer, and titrating immediately. Subtract the volume of 0.004 N iodine used in the second titration from that used in the first. Each mL of 0.004 N iodine is equivalent to 1.533 mg of  $C_9H_{23}INO_3PS$ .

## Echothiophate Iodide for Ophthalmic Solution

» Echothiophate Iodide for Ophthalmic Solution is sterile Echothiophate Iodide. It may contain Mannitol or other suitable diluent. It contains not less than 95.0 percent and not more than 115.0 percent of the labeled amount of  $C_9H_{23}INO_3PS$ .

**Packaging and storage**—Preserve in tight containers, preferably of Type I glass, at controlled room temperature.

**Completeness of solution** (641)—The contents of 1 container dissolve in 10 mL of carbon dioxide-free water to yield a clear solution.

### Identification—

**A:** Dissolve a quantity, equivalent to about 12 mg of echothiophate iodide, in 10 mL of water. To 1 mL of this solution add 0.2 mL of 2 N hydrochloric acid and 0.2 mL of 30 percent hydrogen peroxide: the color turns brown. Add a few drops of solvent hexane, and shake: the solvent hexane acquires a pink color.

**B:** To 5 mL of the solution prepared for Identification test A add 0.5 mL of sodium hydroxide solution (1 in 2), heat at 50° for 2 minutes, cool to room temperature, then add 1 mL of sodium nitroferricyanide TS: a deep-red color is produced.

**Sterility** (71): meets the requirements.

**Water**—[NOTE—Dry all glassware used in the following procedure at 105° for 4 hours, and store in a desiccator or dry box. Perform as many operations as possible in a dry box.]

**Dry alcohol**—Wash about 150 g of 8- to 12-mesh type 3A molecular sieve with several portions of dehydrated alcohol to remove the fine particles. Place the washed molecular sieve in a shallow borosilicate glass tray, heat in an oven at 350° for 2 hours, and cool in a dry box. Transfer the dry molecular sieve to a 1-liter conical flask, add about 700 mL of dehydrated alcohol, insert the stopper, mix, and allow to stand for not less than 48 hours before using.

**Internal standard solution**—[NOTE—Prepare this solution fresh daily.] Place 0.17 mL of methanol in a 100-mL volumetric flask, add Dry alcohol to volume, and mix.

**Standard preparations**—[NOTE—Prepare these solutions fresh daily.] Into three 25-mL volumetric flasks, each containing about 15 mL of Internal standard solution, transfer 5  $\mu$ L, 40  $\mu$ L, and 75  $\mu$ L of water, respectively. Dilute with Internal standard solution to volume, and mix.

**Test preparation**—Carefully remove the protective retainer and cap from 5 vials of Echothiophate Iodide for Ophthalmic Solution without removing the elastomeric septum closure. Discard the separated parts, and weigh accurately each closed vial and contents. Inject through the septum of each vial 400  $\mu$ L of Internal standard solution,

accurately measured, using a suitable gas-tight syringe, and allow to stand for 1 hour, swirling occasionally to dissolve the residue. After 1 hour, using a gas-tight syringe, remove 300  $\mu$ L of solution from each vial, transfer to a dry small-volume sample-collecting vial equipped with a sampling valve system,\* and mix the combined solutions.

**Chromatographic system** (see Chromatography (621))—The chromatograph is equipped with a thermal conductivity detector and a 2-mm  $\times$  1.8-m silylated glass column packed with 80- to 100-mesh surface-silanized packing S3. The column is maintained at a temperature of about 115°, the injection port and detector block are maintained at temperatures of about 200° and 225°, respectively, and dry helium is used as the carrier gas at a flow rate of about 45 mL per minute. Chromatograph a sufficient number of injections of a Standard preparation, and record the peak responses as directed for Procedure: the resolution factor between the water and methanol peaks is not less than 2.0; and the relative standard deviation is not more than 5.0%.

**Procedure**—Inject a portion (3  $\mu$ L to 4  $\mu$ L) of each Standard preparation into the chromatograph, record the chromatogram, and measure the responses for the first (water) and second (methanol) major peaks obtained for each. Plot the ratios of the peak responses of water to methanol versus the concentration, in mg per mL, of water in each Standard preparation. [NOTE—If the plot is not linear, discard it, and repeat the chromatography on additional portions of the Standard preparations.] Similarly inject a portion of the Test preparation, record the chromatogram, and measure the responses for the two major peaks. By comparison with the linear standard plot, determine the concentration, in mg per mL, of water in the Test preparation as that corresponding to the ratio of the peak responses of water to methanol from the Test preparation. Remove the elastomeric septum closure from each test vial, discard the contents, and rinse each vial and closure with several portions of methanol. Dry the vials and the closures in a stream of dry nitrogen, weigh accurately, and subtract this weight from that of the closed vials and contents obtained as directed under Test preparation. Calculate the water content, in percentage, taken by the formula:

$$100CV / W$$

in which C is the concentration, in mg per mL, of water in the Test preparation, V is the volume, in mL, of Internal standard solution added to each test specimen vial as directed under Test preparation, and W is the average weight, in mg, of the test specimens in the vials: not more than 2.0% is found.

**Assay**—[NOTE—In the preparation of all reagents, and throughout this procedure, wherever water is specified, use only water that has been distilled, boiled for 10 minutes, and cooled while protected from the atmosphere.] Dissolve the contents of a counted number of vials of Echothiophate Iodide for Ophthalmic Solution, equivalent to not less than 30 mg of echothiophate iodide, by adding 5.0 mL of water to each vial. Combine the solutions, and mix. Dilute a portion of the mixture, equivalent to about 12 mg of echothiophate iodide, with water to 40 mL, and proceed as directed for Procedure in the Assay under Echothiophate Iodide, beginning with "Add 10.0 mL of pH 12 phosphate buffer."

\* Suitable sample-collecting vials and sampling valve systems are available as catalog Nos. 13098 and 13099 3-mL and 5-mL vials, and catalog No. 10135 valve, from Pierce Chemical Co., Box 117, Rockford, IL 61105.

## Econazole Nitrate

$C_{18}H_{15}Cl_3N_2O \cdot HNO_3$  444.70

1*H*-Imidazole, 1-[2-[(4-chlorophenyl)methoxy]-2-(2,4-dichlorophenyl)ethyl]-, mononitrate, (±)-

(±)-1-[2,4-Dichloro-β-[(*p*-chlorobenzyl)oxy]phenethyl]-imidazole mononitrate [68797-31-9].

» Econazole Nitrate contains not less than 98.5 percent and not more than 101.0 percent of  $C_{18}H_{15}Cl_3N_2O \cdot HNO_3$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers, protected from light.

**USP Reference standards** (11)—  
USP Econazole Nitrate RS

### Identification—

**A:** Infrared Absorption (197K).

**B:** Ultraviolet Absorption (197U)—

*Solution:* 800 μg per mL.

*Medium:* 0.1 N hydrochloric acid in methanol (1 in 10).

**C:** Shake 10 mg with 5 mL of water, and cool the resulting suspension in ice. Keeping the suspension cool, add 0.4 mL of potassium chloride solution (1 in 10), 0.1 mL of diphenylamine TS, and dropwise, with shaking, 5 mL of sulfuric acid: an intense blue color develops.

**Melting range** (741): between 162° and 166°, with decomposition.

**Loss on drying** (731)—Dry it at 105° to constant weight: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.1%.

### Chromatographic purity—

*Standard preparation*—Dissolve an accurately weighed quantity of USP Econazole Nitrate RS in methanol to obtain a solution containing 75 μg per mL.

*Test preparation*—Dissolve an accurately weighed quantity of Econazole Nitrate in methanol to obtain a solution containing 20 mg per mL.

*Procedure*—Apply separately 20 μL of the *Test preparation* and 20 μL of the *Standard preparation* to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel. Allow the spots to dry, place the plate in a chromatographic chamber, and develop the chromatograms in a solvent system consisting of a mixture of 1,4-dioxane, toluene, and 13.5 M ammonium hydroxide (60:40:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and dry the plate in a current of air. Expose the plate to iodine vapors for 1 hour, and air-dry until the iodine has dissipated. Compare the intensities of any secondary spots observed in the chromatogram of the *Test preparation* with that of the principal spot in the chromatogram of the *Standard preparation*: no individual secondary spots in the chromatogram of the *Test preparation* are larger or more intense than the principal spot produced by the *Standard preparation*, corresponding to not more than 0.375%, and the total of all such secondary spots observed is not more than 2.0%.

**Assay**—Dissolve about 400 mg of Econazole Nitrate, accurately weighed, in 50 mL of glacial acetic acid, and titrate

with 0.1 N perchloric acid VS, determining the endpoint potentiometrically, using a glass-calomel electrode system (see *Titrimetry* (541)). Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 44.47 mg of  $C_{18}H_{15}Cl_3N_2O \cdot HNO_3$ .

## Edetate Calcium Disodium

### Pharmacopeial Discussion Group Sign-Off Document

pH	+	+	+
Purity (1) Chloride	+	+	+
Purity (2) Disodium edetate	+	+	+
Water	+	+	+
Assay	+	+	+

**Legend:** + will adopt and implement; – will not stipulate.

**Nonharmonized attributes:** Clarity and/or color of solution, Heavy metals, Identification by IR absorption, Limit of nitrilotriacetic acid, Storage.

**Specific local attributes:** Description (JP), Iron (EP).

$C_{10}H_{12}CaN_2Na_2O_8 \cdot xH_2O$

374.27

Calciate (2-), [[*N,N'*-1,2-ethanediylbis[*N*-(carboxymethyl)glycinato]](4-)-*N,N',O,O',O'',O'''*]-, disodium, hydrate, (OC-6-21)-;

Disodium[(ethylenedinitrilo)tetraacetato]calciate(2-) hydrate [23411-34-9].

Anhydrous [62-33-9].

### DEFINITION

Edetate Calcium Disodium contains NLT 98.0% and NMT 102.0% of  $C_{10}H_{12}CaN_2Na_2O_8$  (374.27), calculated on the anhydrous basis.

### IDENTIFICATION

• **A. INFRARED ABSORPTION** (197M)

• **B. PROCEDURE**

*Sample:* 2 g

*Analysis:* Dissolve the *Sample* in 10 mL of water, add 6 mL of lead (II) nitrate solution (33 in 1000), shake, and add 3 mL of potassium iodide TS: no yellow precipitate is formed. Make this solution alkaline by the addition of diluted ammonia solution (7 in 50), and add 3 mL of ammonium oxalate TS.

**Acceptance criteria:** A white precipitate is formed.

• **C. PROCEDURE**

*Sample:* 0.5 g

*Analysis:* Dissolve 0.5 g in 10 mL of water, and add 10 mL of potassium pyroantimonate TS.

**Acceptance criteria:** A white, crystalline precipitate is formed. The formation of the precipitate is accelerated by rubbing the inside wall of the test tube with a glass rod.

### ASSAY

• **PROCEDURE**

*Sample:* 500 mg of Edetate Calcium Disodium

*Analysis:* Transfer the *Sample* into a 200-mL volumetric flask. Dissolve in and dilute with water to volume, and mix. Transfer exactly 20 mL of this solution to 80 mL of water, and adjust with dilute nitric acid to a pH of 2–3.

Add two drops of xylenol orange TS, and titrate with 0.01 M bismuth nitrate VS until the color of the solution changes from yellow to red. Each mL of 0.01 M bismuth nitrate VS is equivalent to 3.743 mg of  $C_{10}H_{12}CaN_2Na_2O_8$ .

**Acceptance criteria:** 98.0%–102.0% on the anhydrous basis

## IMPURITIES

### Inorganic Impurities

#### • CHLORIDE AND SULFATE, Chloride <221>

**Sample solution:** To 0.70 g of Edetate Calcium Disodium add 20 mL of water and 30 mL of diluted nitric acid. Allow to stand for 30 min, and filter. To 10 mL of the filtrate add water to make 50 mL.

**Control solution:** Prepare with 0.40 mL of 0.01 M hydrochloric acid VS.

**Analysis:** Proceed as directed in the chapter.

**Acceptance criteria:** NMT 0.10%

#### • HEAVY METALS, Method II <231>: NMT 20 ppm

### Organic Impurities

#### • PROCEDURE 1: DISODIUM EDETATE

**Sample:** 1.00 g of Edetate Calcium Disodium

**Analysis:** Dissolve the *Sample* in 50 mL of water. Add 5 mL of ammonia–ammonium chloride buffer TS, and 40 mg of eriochrome black T–sodium chloride indicator. Titrate with 0.01 M magnesium chloride VS until the color of the solution changes from blue to red-violet.

**Acceptance criteria:** NMT 3.0 mL of 0.01 M magnesium chloride VS is consumed (NMT 1.0%).

#### • PROCEDURE 2: LIMIT OF NITRILOTRIACETIC ACID

**Mobile phase:** Add 10 mL of 1.0 M tetrabutylammonium hydroxide in methanol to 200 mL of water, and adjust with 1 M phosphoric acid to a pH of  $7.5 \pm 0.1$ . Transfer the solution to a 1000-mL volumetric flask, add 90 mL of methanol, dilute with water to volume, pass through a filter of 0.5- $\mu$ m or finer pore size, and degas.

**Cupric nitrate solution:** 10 mg/mL of cupric nitrate ( $Cu(NO_3)_2$ ) in water

**Standard stock solution:** Transfer 100 mg of nitrilotriacetic acid to a 10-mL volumetric flask, add 0.5 mL of ammonium hydroxide, and mix. Dilute with water to volume, and mix.

**Standard solution:** Transfer 1.0 g of Edetate Calcium Disodium to a 100-mL volumetric flask, add 100  $\mu$ L of *Standard stock solution*, dilute with *Cupric nitrate solution* to volume, and mix. Sonicate, if necessary, to achieve complete solution.

**System suitability solution:** Transfer 10 mg of Edetate Calcium Disodium to a 100-mL volumetric flask, add 100  $\mu$ L of *Standard stock solution*, dilute with *Cupric nitrate solution* to volume, and mix. Sonicate, if necessary, to dissolve.

**Sample solution:** 10 mg/mL of Edetate Calcium Disodium in *Cupric nitrate solution*. Sonicate, if necessary, to achieve complete solution.

### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm  $\times$  15-cm; packing L7

**Flow rate:** 2 mL/min

**Injection size:** 50  $\mu$ L

### System suitability

**Samples:** *System suitability solution* and *Standard solution*

[NOTE— The relative retention times for nitrilotriacetic acid, copper, and edetate are about 0.35, 0.65, and 1.0, respectively.]

### Suitability requirements

**Resolution:** NLT 3 between nitrilotriacetic acid and copper, *System suitability solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Measure the responses for the major peaks.

**Acceptance criteria:** The peak response of nitrilotriacetic acid from the *Sample solution* does not exceed the difference between the nitrilotriacetic acid peak responses obtained from the *Standard solution* and the *Sample solution* (0.1%).

## SPECIFIC TESTS

### • pH <791>

**Sample solution:** A solution (1 in 5)

**Acceptance criteria:** 6.5–8.0

### • WATER DETERMINATION, Method I <921>

**Sample:** 0.2 g

**Acceptance criteria:** 5.0%–13.0%

## ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers. No storage requirements specified.

• **USP REFERENCE STANDARDS <11>**  
USP Edetate Calcium Disodium RS

## Edetate Calcium Disodium Injection

» Edetate Calcium Disodium Injection is a sterile solution of Edetate Calcium Disodium in Water for Injection. It contains, in each mL, not less than 180 mg and not more than 220 mg of  $C_{10}H_{12}CaN_2Na_2O_8$ .

**Packaging and storage**—Preserve in single-dose containers, preferably of Type I glass.

**USP Reference standards <11>**—

USP Edetate Calcium Disodium RS

USP Endotoxin RS

### Identification—

**A:** Transfer a volume of Injection, equivalent to about 1 g of edetate calcium disodium, to an evaporating dish, and evaporate on a steam bath to dryness: the residue responds to *Identification test A* under *Edetate Calcium Disodium*.

**B:** It responds to *Identification test B* under *Edetate Calcium Disodium*.

**Bacterial endotoxins <85>**—It contains not more than 0.01 USP Endotoxin Unit per mg of edetate calcium disodium.

**pH <791>:** between 6.5 and 8.0.

**Particulate matter <788>:** meets the requirements for small-volume injections.

**Other requirements**—It meets the requirements under *Injections* <1>.

**Assay**—Dilute an accurately measured volume of Injection, equivalent to about 1 g of edetate calcium disodium with water to about 75 mL. Add 25 mL of 1 N acetic acid and 1 mL of diphenylcarbazone TS, mix, and titrate slowly with 0.1 M mercuric nitrate VS to the appearance of the first purplish color. Perform a blank determination, and make any necessary correction. Each mL of 0.1 M mercuric nitrate is equivalent to 37.43 mg of  $C_{10}H_{12}CaN_2Na_2O_8$ .

## Edetate Disodium

$C_{10}H_{14}N_2Na_2O_8 \cdot 2H_2O$  372.24

$C_{10}H_{14}N_2Na_2O_8$  336.21

Glycine, *N,N'*-1,2-ethanediyldis[*N*-(carboxymethyl)-, disodium salt, dihydrate;

Disodium (ethylenedinitrilo)tetraacetate dihydrate [6381-92-6].

Anhydrous [139-33-3].

### DEFINITION

Edetate Disodium contains NLT 99.0% and NMT 101.0% of edetate disodium ( $C_{10}H_{14}N_2Na_2O_8$ ), calculated on the dried basis.

### IDENTIFICATION

#### • A. INFRARED ABSORPTION <197K>

Sample: Undried

Acceptance criteria: Meets the requirements

#### • B.

Sample: 50 mg

Analysis: To 5 mL of water in a test tube add 2 drops of ammonium thiocyanate TS and 2 drops of ferric chloride TS. To the deep red solution add the *Sample*.

Acceptance criteria: The red color is discharged, leaving a yellowish solution.

#### • C. IDENTIFICATION TESTS—GENERAL, Sodium <191>: It meets the requirements of the flame test.

### ASSAY

#### • PROCEDURE

Sample solution: Dissolve 5 g of Edetate Disodium in about 100 mL of water contained in a 250-mL volumetric flask. Add water to volume.

#### Titrimetric system

(See *Titrimetry* <541>.)

Mode: Direct titration

Titrant: 0.1 N sodium hydroxide VS

Endpoint detection: Visual

Analysis: Place 200 mg of chelometric standard calcium carbonate, previously dried at 110° for 2 h and cooled in a desiccator, into a 400-mL beaker. Add 10 mL of water, and swirl to form a slurry. Cover the beaker with a watch glass, and without removing the latter, add 2 mL of 3 N hydrochloric acid from a pipet. Swirl the contents of the beaker, and dissolve the calcium carbonate. With water, wash down the sides of the beaker, the outer surface of the pipet, and the watch glass, and dilute with water to 100 mL. While stirring the solution, preferably with a magnetic stirrer, add 30 mL of the *Sample solution* from a 50-mL buret. Add 15 mL of 1 N sodium hydroxide and 0.30 g of hydroxy naphthol blue, and continue the titration with the *Sample solution* to a blue endpoint.

Calculate the percentage of edetate disodium ( $C_{10}H_{14}N_2Na_2O_8$ ) in the portion of Edetate Disodium taken:

$$\text{Result} = (V_T/V_U) \times W \times (M_{r1}/M_{r2}) \times 100$$

$V_T$  = total volume of the *Sample solution* (mL)

$V_U$  = volume of the *Sample solution* consumed in the titration (mL)

$W$  = weight of calcium carbonate (mg)

$M_{r1}$  = molecular weight of edetate disodium, 336.21

$M_{r2}$  = molecular weight of calcium carbonate, 100.09

Acceptance criteria: 99.0%–101.0% on the dried basis

### IMPURITIES

#### • HEAVY METALS, Method II <231>: NMT 50 ppm

#### • CALCIUM

Sample solution: 1 g of Edetate Disodium in 20 mL of water

Analysis: To the *Sample solution* add 2 drops of methyl red TS, and neutralize with 6 N ammonium hydroxide. Add 3 N hydrochloric acid dropwise until the solution is just acid, and then add 1 mL of ammonium oxalate TS. Acceptance criteria: No precipitate is formed.

#### • LIMIT OF NITRILOTRIACETIC ACID

Mobile phase: Add 10 mL of 1.0 M tetrabutylammonium hydroxide in methanol to 200 mL of water, and adjust with 1 M phosphoric acid to a pH of  $7.5 \pm 0.1$ . Transfer the solution so obtained to a 1000-mL volumetric flask. Add 90 mL of methanol, and dilute with water to volume. Pass through a filter of 0.5- $\mu$ m or finer pore size, and degas.

Cupric nitrate solution: 10 mg/mL of cupric nitrate [ $Cu(NO_3)_2$ ]

Standard stock solution: Transfer 100 mg of nitrilotriacetic acid to a 10-mL volumetric flask. Add 0.5 mL of ammonium hydroxide, mix, and dilute with water to volume.

Standard solution: Transfer 1.0 g of Edetate Disodium to a 100-mL volumetric flask. Add 100  $\mu$ L of *Standard stock solution*, and dilute with *Cupric nitrate solution* to volume. If necessary, sonicate to dissolve.

System suitability solution: Transfer 10 mg of Edetate Disodium to a 100-mL volumetric flask. Add 100  $\mu$ L of *Standard stock solution*, and dilute with *Cupric nitrate solution* to volume. If necessary, sonicate to dissolve.

Sample solution: 10 mg/mL of Edetate Disodium in *Cupric nitrate solution*. If necessary, sonicate to dissolve.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm  $\times$  15-cm; packing L7

Flow rate: 2 mL/min

Injection volume: 50  $\mu$ L

#### System suitability

Samples: *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for nitrilotriacetic acid, copper, and edetate are about 0.35, 0.65, and 1.0, respectively.]

#### Suitability requirements

Resolution: NLT 3 between nitrilotriacetic acid and copper, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

#### Analysis

Samples: *Standard solution* and *Sample solution*

Acceptance criteria: NMT 0.1%; the response of the nitrilotriacetic acid peak of the *Sample solution* does not exceed the difference between the nitrilotriacetic acid peak responses from the *Standard solution* and the *Sample solution*.

### SPECIFIC TESTS

#### • pH <791>

Sample solution: 50 mg/mL

Acceptance criteria: 4.0–6.0

#### • LOSS ON DRYING <731>

Analysis: Dry at 150° for 6 h.

Acceptance criteria: 8.7%–11.4%

### ADDITIONAL REQUIREMENTS

#### • PACKAGING AND STORAGE: Preserve in well-closed containers.

#### • USP REFERENCE STANDARDS <11>

USP Edetate Disodium RS

## Edetate Disodium Injection

» Edetate Disodium Injection is a sterile solution of Edetate Disodium in Water for Injection, which, as a result of pH adjustment, contains varying amounts of the disodium and trisodium salts. It contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{10}H_{14}N_2Na_2O_8$ .

**Packaging and storage**—Preserve in single-dose containers, preferably of Type I glass.

### USP Reference standards (11)—

USP Edetate Disodium RS

USP Endotoxin RS

**Identification**—Transfer a volume of Injection, equivalent to about 1 g of edetate disodium, to an evaporating dish, adjust with 3 N hydrochloric acid to a pH of 5.0, and evaporate on a steam bath to dryness: the residue responds to Identification tests A and C under *Edetate Disodium*.

**Bacterial endotoxins** (85)—It contains not more than 0.2 USP Endotoxin Unit per mg of edetate disodium.

**pH** (791): between 6.5 and 7.5.

**Other requirements**—It meets the requirements under *Injections* (1).

### Assay—

*Assay preparation*—Dilute an accurately measured volume of Injection, equivalent to about 2 g of edetate disodium, with water to volume in a 100-mL volumetric flask, and mix.

*Procedure*—Proceed as directed for *Procedure* in the Assay under *Edetate Disodium*. Calculate the weight, in mg, of  $C_{10}H_{14}N_2Na_2O_8$  in the volume of Injection taken by the formula:

$$(336.21/100.09)W(V_T/V)$$

in which 336.21 and 100.09 are the molecular weights of edetate disodium and calcium carbonate, respectively;  $W$  is the weight, in mg, of calcium carbonate;  $V_T$  is the volume, in mL, of the *Assay preparation*; and  $V$  is the volume, in mL, of the *Assay preparation* consumed in the titration.

## Edrophonium Chloride

$C_{10}H_{16}ClNO$  201.69

Benzenaminium, *N*-ethyl-3-hydroxy-*N,N*-dimethyl-, chloride. Ethyl(*m*-hydroxyphenyl)dimethylammonium chloride [116-38-1].

» Edrophonium Chloride contains not less than 98.0 percent and not more than 100.5 percent of  $C_{10}H_{16}ClNO$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

### USP Reference standards (11)—

USP Edrophonium Chloride RS

### Identification—

**A:** *Infrared Absorption* (197K).

**B:** *Ultraviolet Absorption* (197U)—

*Solution:* 50 µg per mL.

*Medium:* 0.1 N hydrochloric acid.

Absorptivities at 273 nm, calculated on the dried basis, do not differ by more than 2.0%.

**C:** To 10 mL of a solution (1 in 10) add 1 drop of ferric chloride TS: a violet-blue color is produced.

**D:** It responds to the tests for *Chloride* (191).

**Melting range** (741): between 165° and 170°, with decomposition.

**pH** (791): between 4.0 and 5.0, in a solution (1 in 10).

**Loss on drying** (731)—Dry it in a suitable vacuum drying tube, using phosphorus pentoxide as the desiccant, for 3 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals** (231)—Dissolve 1.0 g in 25 mL of water: the limit is 0.002%.

**Limit of dimethylaminophenol**—Dissolve about 500 mg, accurately weighed, in 5 mL of water in a separator. Add 5 mL of pH 8.0 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*), and shake. Extract with five 20-mL portions of chloroform, pooling the extracts in a 100-mL volumetric flask, and add chloroform to volume. The absorbance of this solution, determined in a 1-cm cell at 252 nm, with a suitable spectrophotometer, is not more than that of a 1 in 200,000 solution of dimethylaminophenol in chloroform, similarly measured (0.1%).

**Assay**—Transfer about 175 mg of Edrophonium Chloride, accurately weighed, to a suitable flask, and dissolve in about 20 mL of glacial acetic acid. Add 5 mL of mercuric acetate TS, then add 1 drop of crystal violet TS, and titrate with 0.1 N perchloric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 20.17 mg of  $C_{10}H_{16}ClNO$ .

## Edrophonium Chloride Injection

» Edrophonium Chloride Injection is a sterile solution of Edrophonium Chloride in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of  $C_{10}H_{16}ClNO$ .

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass.

**Labeling**—Label the Injection in multiple-dose containers to indicate an expiration date of not later than 3 years after the date of manufacture, and label the Injection in single-dose containers to indicate an expiration date of not later than 4 years after the date of manufacture.

### USP Reference standards (11)—

USP Edrophonium Chloride RS

USP Endotoxin RS

### Identification—

**A:** *Ultraviolet Absorption* (197U)—Test solution versus standard solution prepared as directed in the Assay.

**B:** Place in a small separator a volume of Injection, equivalent to about 30 mg of edrophonium chloride, add 15 mL of pH 9.6 alkaline borate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*) and 5 mL of a 1 in 1000 solution of thymol blue in pH 9.6 alkaline borate buffer, and mix. Add 10 mL of chloroform, shake thoroughly, and allow to settle: a yellow color is produced in the chloroform layer.

**C:** It responds to the tests for *Chloride* (191).

**Bacterial endotoxins** (85)—It contains not more than 8.33 USP Endotoxin Units per mg of edrophonium chloride.

**pH** (791): between 5.0 and 5.8.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—Pipet a volume of Injection, equivalent to about 50 mg of edrophonium chloride, into a glass-stoppered, 50-mL centrifuge tube. Add 5 mL of pH 8.0 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*) and 5 g of sodium chloride. Wash the solution with four 20-mL portions of a mixture of equal volumes of solvent hexane and ether. Transfer the aqueous phase to a 100-mL volumetric flask, add 0.1 N hydrochloric acid to volume, and mix. Transfer a 5-mL aliquot of this solution to a 50-mL volumetric flask, add 0.1 N hydrochloric acid to volume, and mix test solution. Dissolve an accurately weighed quantity of USP Edrophonium Chloride RS in 0.1 N hydrochloric acid, and dilute quantitatively and stepwise with the acid to obtain a Standard solution having a known concentration of about 50 µg per mL. Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 273 nm, with a suitable spectrophotometer, using 0.1 N hydrochloric acid as the blank. Calculate the quantity, in mg, of C<sub>10</sub>H<sub>16</sub>ClNO in each mL of the Injection taken by the formula:

$$(C/V)(A_U/A_S)$$

in which C is the concentration, in µg per mL, of USP Edrophonium Chloride RS in the Standard solution; V is the volume, in mL, of Injection taken; and A<sub>U</sub> and A<sub>S</sub> are the absorbances of the test solution and the Standard solution, respectively.

## Efavirenz

C<sub>14</sub>H<sub>9</sub>ClF<sub>3</sub>NO<sub>2</sub> 315.67  
 1*H*-Benzo[d][1,3]oxazin-2(4*H*)-one, 6-chloro-4-cyclopropylethynyl-4-trifluoromethyl;  
 (S)-6-Chloro-4-(cyclopropylethynyl)-1,4-dihydro-4-(trifluoromethyl)-2*H*-3,1-benzoxazin-2-one [154598-52-4].

### DEFINITION

Efavirenz contains NLT 98.0% and NMT 102.0% of C<sub>14</sub>H<sub>9</sub>ClF<sub>3</sub>NO<sub>2</sub>, calculated on the anhydrous, solvent-free basis.

### IDENTIFICATION

#### A. INFRARED ABSORPTION (197K)

**Sample:** Dry at 105° for 30 min, and cool in desiccator.

#### B. ULTRAVIOLET ABSORPTION (197U)

**Solvent:** Methanol

**Standard solution:** 10 µg/mL of USP Efavirenz RS in Solvent

**Sample solution:** 10 µg/mL of Efavirenz in Solvent

**Acceptance criteria:** Meets the requirements

### ASSAY

#### PROCEDURE

[NOTE—Protect solutions of efavirenz from light. Use of polypropylene HPLC vials is recommended to avoid possible degradation from certain types of glass vials.]

**Diluent:** Acetonitrile and water (1:1)

**Solution A:** Methanol, trifluoroacetic acid, and water (1:0.005:9). [NOTE—Use only freshly-opened trifluoroacetic acid, ≤6 months.]

**Solution B:** Methanol, trifluoroacetic acid, and water (9:0.005:1). [NOTE—Use only freshly-opened trifluoroacetic acid, ≤6 months.]

**Mobile phase:** See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	60	40
16	50	50
23	35	65
28	30	70
29	20	80
31	20	80
32	60	40
40	60	40

**Standard solution:** 250 µg/mL of USP Efavirenz RS and 1.0 µg/mL of USP Efavirenz Related Compound B RS in Diluent. [NOTE—Dissolve in about 65% of the flask volume in Diluent and shake for 30 min or until dissolved before diluting with Diluent to volume.]

**Sample solution:** 250 µg/mL of Efavirenz in Diluent.

[NOTE—Dissolve in about 65% of the flask volume of Diluent, and shake for 30 min or until dissolved before diluting with Diluent to volume.]

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 250 nm

**Column:** 4.6-mm × 15-cm; 5-µm packing L10

**Column temperature:** 40°

**Flow rate:** 1.5 mL/min

**Injection size:** 35 µL

#### System suitability

**Sample:** Standard solution

#### Suitability requirements

**Resolution:** NLT 1.2 between efavirenz related compound B and efavirenz

**Relative standard deviation:** NMT 1.0% for efavirenz

#### Analysis

**Samples:** Standard solution and Sample solution

Calculate the percentage of C<sub>14</sub>H<sub>9</sub>ClF<sub>3</sub>NO<sub>2</sub> in the portion of Efavirenz taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r<sub>U</sub> = peak response for efavirenz from the Sample solution

r<sub>S</sub> = peak response for efavirenz from the Standard solution

C<sub>S</sub> = concentration of USP Efavirenz RS in the Standard solution (mg/mL)

C<sub>U</sub> = concentration of efavirenz in the Sample solution (mg/mL)

Acceptance criteria: 98.0%–102.0% on the anhydrous, solvent-free basis

## IMPURITIES

### Inorganic Impurities

• **RESIDUE ON IGNITION** (281): NMT 0.2%, use a platinum crucible

• **HEAVY METALS**, Method II (231): NMT 20 ppm

### Organic Impurities

#### • PROCEDURE 1

**Diluent, Solution A, Solution B, Sample solution, and Chromatographic system:** Proceed as directed in the Assay.

**System suitability solution:** Use the *Standard solution* prepared as directed in the Assay.

**Standard solution:** 1.25 µg/mL of USP Efavirenz RS in *Diluent*, prepared from the *System suitability solution*

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

#### Suitability requirements

**Resolution:** NLT 1.2 between efavirenz related compound B and efavirenz, *System suitability solution*

**Relative standard deviation:** NMT 5.0% for efavirenz, *Standard solution*

## Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of any individual impurity in the portion of Efavirenz taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response for any individual impurity from the *Sample solution*

$r_S$  = peak response for efavirenz from the *Standard solution*

$C_S$  = concentration of USP Efavirenz RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Efavirenz in the *Sample solution* (mg/mL)

$F$  = relative response factor (see *Impurity Table 1*)

#### Acceptance criteria

**Individual impurities:** See *Impurity Table 1*. [NOTE—Disregard any peak less than 0.05%.]

**Total impurities:** NMT 1.0%

#### • PROCEDURE 2

[NOTE— Perform *Procedure 2* in addition to *Procedure 1* if the result for the total of the three impurities at a relative retention time of 1.16 in *Procedure 1* exceeds 0.10%.]

**Diluent:** Acetonitrile, trifluoroacetic acid, and water (55:0.05:45)

**Solution A:** Acetonitrile, trifluoroacetic acid, and water (4:0.005:6). [NOTE—Use only freshly-opened trifluoroacetic acid, ≤6 months.]

Impurity Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Efavirenz aminoalcohol <sup>a</sup>	0.48	0.26	0.15
Efavirenz ethene analog <sup>b</sup> (efavirenz related compound B)	0.93	0.91	0.40

<sup>m</sup> Relative retention time of 1.60.

<sup>n</sup> (S)-Ethyl 4-chloro-2-[4-cyclopropyl-2-(ethoxycarbonyloxy)-1,1,1-trifluorobut-3-yn-2-yl]phenylcarbamate.

<sup>o</sup> Relative retention time of 2.1.

<sup>p</sup> Ethyl 5-chloro-2-cyclobutenyl-3-(trifluoromethyl)-1H-indole-1-carboxylate.

<sup>q</sup> [NOTE—If results exceed 0.10%, perform *Procedure 2* to separate the three coeluting impurities and ensure that each impurity meets the limit.]

**Solution B:** Acetonitrile, trifluoroacetic acid, and water (8:0.005:2). [NOTE—Use only freshly-opened trifluoroacetic acid, ≤6 months.]

**Mobile phase:** See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	100	0
40	0	100
45	0	100
45.1	100	0
50	100	0

**Standard solution:** 1.25 µg/mL of USP Efavirenz RS in *Diluent*

**Sample solution:** 250 µg/mL of Efavirenz in *Diluent*

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 250 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L1

**Column temperature:** 35°

**Flow rate:** 1.5 mL/min

**Injection size:** 20 µL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** NMT 1.5 for efavirenz

**Relative standard deviation:** NMT 5.0% for efavirenz

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each of the three specified impurities in the portion of Efavirenz taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response for each of the three specified impurities from the *Sample solution*

$r_S$  = peak response for efavirenz from the *Standard solution*

$C_S$  = concentration of USP Efavirenz RS in the *Standard solution* (µg/mL)

$C_U$  = concentration of Efavirenz in the *Sample solution* (µg/mL)

$F$  = relative response factor (see *Impurity Table 2*)

#### Acceptance criteria

**Individual impurities:** See *Impurity Table 2*. [NOTE—Disregard any peak less than 0.05%.]

#### SPECIFIC TESTS

- **COMPLETENESS OF SOLUTION** <641>: Meets the requirements

**Solvent:** Methanol

**Sample solution:** 50 mg/mL of Efavirenz in *Solvent*

- **WATER DETERMINATION, Method 1c** <921>

**Sample:** 100 mg/mL of Efavirenz in methanol

**Acceptance criteria:** NMT 0.5%

- **ENANTIOMERIC PURITY**

**Mobile phase:** Hexane and ethanol (97:3)

**Retention time solution:** 1 mg/mL of USP Efavirenz RS in *Mobile phase*

**Standard solution:** 10 µg/mL of USP Efavirenz Racemic RS in *Mobile phase*

**Sample solution:** 1 mg/mL of Efavirenz in *Mobile phase*

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 250 nm

**Column:** 4.6-mm × 25-cm column; 5-µm packing L10 connected in-line and before 4.6-mm × 25-cm column; 10-µm packing L40

**Column temperature:** 35°

**Flow rate:** 1.0 mL/min

**Injection size:** 20 µL

#### System suitability

**Samples:** *Standard solution* and *Retention time solution*

#### Suitability requirements

**Efavirenz identification:** Identify the (S)-efavirenz enantiomer peak, *Retention time solution*

**Resolution:** NLT 3.0 between (R)-efavirenz enantiomer and (S)-efavirenz enantiomer, *Standard solution*

**Relative standard deviation:** NMT 5.0% for (R)-efavirenz enantiomer

#### Analysis

**Samples:** *Retention time solution*, *Standard solution*, and *Sample solution*

[NOTE—Verify the identification of the efavirenz peak based on the chromatogram of the *Retention time solution*. The relative retention times for (R)-efavirenz enantiomer and (S)-efavirenz enantiomer are 0.88 and 1.00, respectively.]

Calculate the percentage of (R)-efavirenz enantiomer in the portion of Efavirenz taken:

$$\text{Result} = 100 \times [r_R/(r_R + r_S)]$$

$r_R$  = peak response of (R)-efavirenz enantiomer from the *Sample solution*

$r_S$  = peak response of (S)-efavirenz enantiomer from the *Sample solution*

**Acceptance criteria:** NMT 0.5% of (R)-efavirenz enantiomer

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light, and store at controlled room temperature.

**Impurity Table 2**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)

## Efavirenz Capsules

### DEFINITION

Efavirenz Capsules contain NLT 92.0% and NMT 108.0% of the labeled amount of efavirenz ( $C_{14}H_9ClF_3NO_2$ ).

### IDENTIFICATION

- **A. INFRARED ABSORPTION** <197K>  
**Sample solution:** Dissolve the contents of 1 Capsule in about 5 mL of acetonitrile by mixing on a vortex mixer. Allow to settle, remove about 3 mL of the solution, and centrifuge for about 5 min. Transfer 1–2 mL of supernatant to a clean suitable container, and evaporate to dryness under nitrogen. Mix 0.5–1 mg of the powder with 200 mg of potassium bromide.
- **B. ULTRAVIOLET ABSORPTION** <197U>  
**Solvent:** Acetonitrile  
**Standard solution:** 10 µg/mL in *Solvent*  
**Sample solution:** Dissolve the contents of 1 Capsule in about 40 mL of *Solvent* by shaking for about 30 min. Pass through a suitable nylon or PVDF membrane filter, discarding the first 2 mL of filtrate, and dilute a portion with acetonitrile to a concentration of 10 µg/mL of efavirenz.  
**Acceptance criteria:** The UV absorption spectrum of the *Sample solution* exhibits maxima and minima at the same wavelengths as does the *Standard solution*.

### ASSAY

- **PROCEDURE**  
**Diluent:** Acetonitrile and water (1:1)  
**Solution A:** Methanol, trifluoroacetic acid, and water (1:0.005:9). [NOTE—Use only freshly-opened trifluoroacetic acid, ≤6 months.]  
**Solution B:** Methanol, trifluoroacetic acid, and water (9:0.005:1). [NOTE—Use only freshly-opened trifluoroacetic acid, ≤6 months.]  
**Mobile phase:** See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	60	40
16	50	50
23	35	65
28	30	70
29	20	80
31	20	80
32	60	40
40	60	40

**Standard solution 1:** 0.2 mg/mL of USP Efavirenz Related Compound B RS in *Diluent*

**Standard solution 2:** 5 mg/mL of USP Efavirenz RS in acetonitrile. [NOTE—Sonicate to dissolve before diluting to final volume.]

**Standard solution:** 250 µg/mL of USP Efavirenz RS and 1 µg/mL of USP Efavirenz Related Compound B RS in *Diluent* prepared from *Standard solution 2* and *Standard solution 1*, respectively. [NOTE—Store protected from light. For the HPLC analysis, it is recommended to use polypropylene vials, because degradation has been noted with certain brands made of glass.]

**Sample stock solution:** Transfer the contents of NLT 10 Capsules to a suitable container, and extract the contents in acetonitrile by mixing for about 30 min to obtain a quantitative solution equivalent to about 5 mg/mL of efavirenz. [NOTE—Store protected from light.]

**Sample solution:** Filter a portion of the *Sample stock solution*, and dilute the filtrate with *Diluent* to obtain a solution of about 250 µg/mL of efavirenz. [NOTE—Store protected from light. For the HPLC analysis, it is recommended to use polypropylene vials, because degradation has been noted with certain brands made of glass.]

### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 250 nm

**Column:** 4.6-mm × 15-cm; packing L10

**Column temperature:** 40°

**Flow rate:** 1.5 mL/min

**Injection size:** 35 µL

### System suitability

**Sample:** *Standard solution*

### Suitability requirements

**Resolution:** NLT 1.2 between efavirenz related compound B and efavirenz

**Relative standard deviation:** NMT 2.0% for efavirenz

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of efavirenz ( $C_{14}H_9ClF_3NO_2$ ) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of efavirenz from the *Sample solution*

$r_S$  = peak response of efavirenz from the *Standard solution*

$C_S$  = concentration of USP Efavirenz RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of efavirenz in the *Sample solution* (mg/mL)

**Acceptance criteria:** 92.0%–108.0%

### PERFORMANCE TESTS

#### • DISSOLUTION <711>

**Medium:** 1.0% (w/v) sodium lauryl sulfate in water; 900 mL. [NOTE—Do not deaerate.]

**Apparatus 2:** 50 rpm, with helix sinker

**Time:** 45 min

**Standard solution:** (L/900) mg/mL of USP Efavirenz RS in *Medium*, where L is the Capsule label claim in mg. A small volume of methanol, NMT 10% of the final volume, could be used to solubilize efavirenz. Dilute this solution with *Medium* to obtain a final concentration of about 0.01 mg/mL for Capsules labeled to contain 50 mg, or about 0.02 mg/mL for Capsules labeled to contain 100 mg or 200 mg.

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size, and dilute with *Medium* to obtain a theoretical concentration similar to the *Standard solution*, assuming complete dissolution of the Capsule label claim.

**Analytical wavelength:** UV 247 nm

**Cell:** 1 cm

**Blank:** *Medium*

### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of efavirenz dissolved:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times D \times V \times 100$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

L = label claim (mg/Capsule)

D = dilution factor of the *Sample solution*

V = volume of *Medium*, 900 mL

**Tolerances:** NLT 80% (Q) of the labeled amount of efavirenz is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

**Procedure for content uniformity**

**Standard solution:** 10 µg/mL of USP Efavirenz RS in acetonitrile

**Sample solution:** Transfer the contents of 1 Capsule into a suitable container, and dissolve in 40.0 mL of acetonitrile. Shake for about 30 min and pass through a suitable nylon or PVDF membrane filter. Dilute a portion of the filtrate to an efavirenz concentration of about 10 µg/mL.

**Spectrometric conditions**

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** UV absorption spectroscopy

**Analytical wavelength:** UV 246 nm

**Cell:** 1 cm

**Blank:** Acetonitrile

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of efavirenz (C<sub>14</sub>H<sub>9</sub>ClF<sub>3</sub>NO<sub>2</sub>) in the portion of Capsules taken:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times V \times D \times 100$$

A<sub>U</sub> = absorbance of efavirenz from the *Sample solution*

A<sub>S</sub> = absorbance of efavirenz from the *Standard solution*

C<sub>S</sub> = concentration of USP Efavirenz RS in the *Standard solution* (mg/mL)

L = label claim (mg/Capsule)

V = volume of the *Sample solution*

D = dilution factor of the *Sample solution*

**IMPURITIES**

**Organic Impurities**

• **PROCEDURE**

**Diluent, Solution A, Solution B, Sample solution, and Chromatographic system:** Prepare as directed in the *Assay*.

**System suitability solution:** Use the *Standard solution* prepared as directed in the *Assay*.

**Standard solution:** 1.25 µg/mL of USP Efavirenz RS and 0.005 µg/mL of USP Efavirenz Related Compound B RS in *Diluent* from the *System suitability solution*

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

**Suitability requirements**

**Resolution:** NLT 1.2 between efavirenz related compound B and efavirenz, *System suitability solution*

**Relative standard deviation:** NMT 5.0% for efavirenz, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of any individual impurity in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r<sub>U</sub> = peak response of any individual impurity (degradation product) from the *Sample solution*

r<sub>S</sub> = peak response of efavirenz from the *Standard solution*

C<sub>S</sub> = concentration of USP Efavirenz RS in the *Standard solution* (mg/mL)

C<sub>U</sub> = nominal concentration of efavirenz in the *Sample solution* (mg/mL)

F = relative response factor (see *Impurity Table 1*)

**Acceptance criteria**

**Individual impurities:** See *Impurity Table 1*. [NOTE— Disregard any peak less than 0.05%.]

**Total impurities:** NMT 0.50%. [NOTE— Include only the degradation products in the calculation of the total impurities.]

**Impurity Table 1**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Store in well-closed containers at controlled room temperature.
- **USP REFERENCE STANDARDS** (11)
  - USP Efavirenz RS
  - USP Efavirenz Related Compound B RS
  - (S,E)-6-Chloro-4-(2-cyclopropylvinyl)-4-(trifluoromethyl)-2H-3,1-benzoxazin-2-one.
  - C<sub>14</sub>H<sub>11</sub>ClF<sub>3</sub>NO<sub>2</sub> 317.69

**Multiple Electrolytes Injection Type 1**

» Multiple Electrolytes Injection Type 1 is a sterile solution of suitable salts in Water for Injection to provide sodium, potassium, magnesium, and chloride ions. In addition, the salts provide ions of acetate, or acetate and gluconate, or acetate, gluconate, and phosphate. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of sodium (Na), potassium (K), magnesium (Mg), chloride (Cl), acetate (C<sub>2</sub>H<sub>3</sub>O<sub>2</sub>), gluconate (C<sub>6</sub>H<sub>11</sub>O<sub>7</sub>), and phosphate (PO<sub>4</sub>). It may contain Hydrochloric Acid or Sodium Hydroxide used to adjust the pH. It contains no antimicrobial agents.

**Packaging and storage**—Preserve in single-dose glass or plastic containers. Glass containers are preferably of Type I or Type II glass.

**Labeling**—The label states the content of each electrolyte in terms of milliequivalents in a given volume. The label states the total osmolar concentration in mOsmol per L. When the contents are less than 100 mL, the label alterna-

tively may state the total osmolar concentration in mOsmol per mL.

**USP Reference standards** (11)—

USP Endotoxin RS

USP Potassium Gluconate RS

**Identification**—

**A:** It responds to the flame tests for *Sodium* (191) and *Potassium* (191), and to the tests for *Magnesium* (191) and *Chloride* (191).

**B:** The retention time of the acetate peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation*, obtained as directed in the *Assay for acetate*.

**C:** Where gluconate is purported to be present, the retention time of the gluconate peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation*, obtained as directed in the *Assay for gluconate*.

**D:** Where phosphate is purported to be present, add 5 mL of the Injection and 1 mL of ammonium molybdate TS to a test tube, and mix: a yellow precipitate, which is soluble in 6 N ammonium hydroxide, is formed.

**Bacterial endotoxins** (85)—It contains not more than 0.5 USP Endotoxin Unit per mL.

**pH** (791): between 4.0 and 8.0.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay for potassium and sodium**—

*Internal standard solution*, *Potassium stock solution*, *Sodium stock solution*, *Stock standard preparation*, and *Standard preparation*—Prepare as directed in the *Assay for potassium and sodium* under *Potassium Chloride in Sodium Chloride Injection*.

*Assay preparation*—Transfer 5.0 mL of Injection to a 500-mL volumetric flask, dilute with *Internal standard solution* to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the *Assay for potassium and sodium* under *Potassium Chloride in Sodium Chloride Injection*. Calculate the quantity, in mg, of potassium (K) in each mL of the Injection taken by the formula:

$$C(R_{U,766} / R_{U,671})(R_{S,671} / R_{S,766})$$

in which the terms are as defined therein. Each mg of potassium is equivalent to 0.02558 mEq of potassium. Calculate the quantity, in mg, of sodium (Na) in each mL of the Injection taken by the formula:

$$C(R_{U,589} / R_{U,671})(R_{S,671} / R_{S,589})$$

in which the terms are as defined therein. Each mg of sodium is equivalent to 0.04350 mEq of sodium.

**Assay for magnesium**—[NOTE—Concentrations of the *Standard preparations* and the *Assay preparation* may be modified to fit the linear or working range of the atomic absorption spectrophotometer.]

*Lanthanum chloride solution*—Transfer 17.69 g of lanthanum chloride to a 200-mL volumetric flask, add 100 mL of water, and carefully add 50 mL of hydrochloric acid. Mix, and allow to cool. Dilute with water to volume, and mix.

*Dilute hydrochloric acid*—Prepare by mixing 678 mL of hydrochloric acid with sufficient water to make 3000 mL.

*Blank solution*—Transfer 5.0 mL of *Lanthanum chloride solution* to a 100-mL volumetric flask, dilute with *Dilute hydrochloric acid* to volume, and mix.

*Magnesium stock solution*—Transfer 1.00 g of magnesium metal to a 1000-mL volumetric flask containing 10 mL of water. Slowly add 10 mL of hydrochloric acid, and swirl to dissolve the metal. Dilute with *Dilute hydrochloric acid* to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with *Dilute hydrochloric acid* to volume, and mix. This solution contains 100 µg of magnesium (Mg) per mL.

**Standard preparations**—To three separate 100-mL volumetric flasks, each containing 5.0 mL of *Lanthanum chloride solution*, add 10.0, 15.0, and 20 mL, respectively, of *Magnesium stock solution*. Dilute the contents of each flask with *Dilute hydrochloric acid* to volume, and mix. These three solutions contain 10.0, 15.0, and 20.0 µg, respectively, of magnesium (Mg) per mL.

**Assay preparation**—Transfer an accurately measured volume of Injection, equivalent to about 20 mg (1.65 mEq) of magnesium, to a 1000-mL volumetric flask containing 50.0 mL of *Lanthanum chloride solution*. Dilute the contents of the flask with *Dilute hydrochloric acid* to volume, and mix.

**Procedure**—Concomitantly determine the absorbances of the *Standard preparations* and the *Assay preparation* at the magnesium emission line at 285.2 nm, with an atomic absorption spectrophotometer (see *Spectrophotometry and Light-scattering* (851)) equipped with a magnesium hollow-cathode lamp and an air-acetylene flame, using the *Blank solution* as the blank. Plot the absorbances of the *Standard preparations* versus concentration, in µg per mL, of magnesium, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration, *C*, in µg per mL, of magnesium in the *Assay preparation*. Calculate the quantity, in µg, of magnesium (Mg) in each mL of the Injection taken by the formula:

$$1000(C/V)$$

in which *V* is the volume, in mL, of Injection taken to prepare the *Assay preparation*.

**Assay for chloride**—Transfer an accurately measured volume of Injection, equivalent to about 55 mg of chloride (1.55 mEq), to a suitable conical flask, and add water, if necessary, to bring the volume to about 10 mL. Add 10 mL of glacial acetic acid, 75 mL of methanol, and 0.5 mL of eosin Y TS. Titrate, with shaking, with 0.1 N silver nitrate VS to a pink endpoint. Each mL of 0.1 N silver nitrate is equivalent to 3.545 mg (0.1 mEq) of Cl.

#### Assay for acetate—

**Mobile phase**—Prepare a filtered and degassed solution of 0.05 N sulfuric acid. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of sodium acetate trihydrate in water to obtain a *Standard preparation* having a known concentration of about 1.2 mg of sodium acetate trihydrate (about 0.0088 mEq of acetate) per mL.

**Assay preparation**—Quantitatively dilute an accurately measured volume of Injection with water to obtain a solution containing about 0.0088 mEq of acetate per mL.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 210-nm detector, a 4.6-mm × 3-cm guard column containing packing L17, and a 7.8-mm × 30-cm analytical column containing packing L17. The column temperature is maintained at about 60°. The flow rate is about 0.8 mL per minute. Chromatograph the *Standard preparation*, and record the responses as directed for *Procedure*: the tailing factor for the analyte peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mEq per L, of acetate (C<sub>2</sub>H<sub>3</sub>O<sub>2</sub>) in the Injection taken by the formula:

$$(C/136.08)(L/D)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of sodium acetate trihydrate in the *Standard preparation*; 136.08 is the molecular weight of sodium acetate trihydrate; *L* is the labeled quantity, in mEq per L, of acetate in the Injection; *D*

is the quantity, in mEq per mL, of acetate in the *Assay preparation*, based on the labeled quantity and the extent of dilution; and *r<sub>U</sub>* and *r<sub>S</sub>* are the acetate peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

#### Assay for gluconate (if present)—

**Mobile phase**—Prepare a filtered and degassed solution of 0.05 N sulfuric acid. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Potassium Gluconate RS in water to obtain a *Standard preparation* having a known concentration of about 1 mg of USP Potassium Gluconate RS (about 0.0043 mEq of gluconate) per mL.

**Assay preparation**—Dilute an accurately measured volume of Injection quantitatively with water to obtain a solution containing about 0.004 mEq of gluconate per mL.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 210-nm detector, a 4.6-mm × 3-cm guard column containing packing L17, and a 7.8-mm × 30-cm analytical column containing packing L17. The flow rate is about 0.8 mL per minute. Chromatograph the *Standard preparation*, and record the responses as directed for *Procedure*: the tailing factor for the analyte peak is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mEq per L, of gluconate (C<sub>6</sub>H<sub>11</sub>O<sub>7</sub>) in the Injection taken by the formula:

$$(C/234.25)(L/D)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Potassium Gluconate RS in the *Standard preparation*; 234.25 is the molecular weight of anhydrous potassium gluconate; *L* is the labeled quantity, in mEq per L, of gluconate in the Injection; *D* is the quantity, in mEq per mL, of gluconate in the *Assay preparation*, based on the labeled quantity and the extent of dilution; and *r<sub>U</sub>* and *r<sub>S</sub>* are the gluconate peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

#### Assay for phosphate (if present)—

**Ammonium molybdate solution**—Transfer 25 g of ammonium molybdate to a 500-mL volumetric flask, add about 300 mL of water, and swirl to dissolve solution. Add 75 mL of sulfuric acid, and swirl. Allow to cool, dilute with water to volume, and mix.

**Hydroquinone solution**—Dissolve 0.5 g of hydroquinone in 100 mL of water, add 1 drop of sulfuric acid, and mix. [NOTE—Prepare this solution fresh daily.]

**Sodium sulfite solution**—Dissolve 1 g of sodium sulfite in water to make 5 mL of solution. [NOTE—Prepare this solution fresh daily.]

**Standard preparation**—Dissolve an accurately weighed quantity of monobasic potassium phosphate in water to obtain a solution having a known concentration of about 0.11 mg per mL.

**Assay preparation**—Transfer an accurately measured volume of Injection, equivalent to about 4 mg (0.126 mEq) of phosphate, to a 50-mL volumetric flask, dilute with water to volume, and mix.

**Blank**—Use water.

**Procedure**—Transfer 2.0 mL each of the *Standard preparation*, the *Assay preparation*, and the *Blank* to separate test tubes. To each test tube add 1.0 mL of *Ammonium molybdate solution*, mix, and allow to stand for 3 minutes. Add 1.0 mL of *Hydroquinone solution*, and mix. Add 1.0 mL of *Sodium sulfite solution*, mix, and allow to stand for 30 minutes. Concomitantly determine the absorbances of the *Assay*

preparation and the *Standard preparation* at 640 nm, using water to zero the instrument. Calculate the quantity, in mg, of phosphate ( $\text{PO}_4$ ) in each mL of the Injection taken by the formula:

$$50(94.97/136.09)(C/V)(A_U / A_S)$$

in which 94.97 is the formula weight of phosphate ( $\text{PO}_4$ ); 136.09 is the molecular weight of monobasic potassium phosphate; C is the concentration, in mg per mL, of monobasic potassium phosphate in the *Standard preparation*; V is the volume, in mL, of Injection taken; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively, corrected for any absorbance of the solution from the *Blank*.

## Multiple Electrolytes Injection Type 2

» Multiple Electrolytes Injection Type 2 is a sterile solution of suitable salts in Water for Injection to provide sodium, potassium, calcium, magnesium, and chloride ions. In addition, the salts provide ions of either acetate and citrate, or acetate and lactate. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of sodium (Na), potassium (K), magnesium (Mg), calcium (Ca), chloride (Cl), acetate ( $\text{C}_2\text{H}_3\text{O}_2$ ), citrate ( $\text{C}_6\text{H}_5\text{O}_7$ ), and lactate ( $\text{C}_3\text{H}_5\text{O}_3$ ). It may contain Hydrochloric Acid or Sodium Hydroxide used to adjust the pH. It contains no antimicrobial agents.

**Packaging and storage**—Preserve in single-dose glass or plastic containers. Glass containers are preferably of Type I or Type II glass.

**Labeling**—The label states the content of each electrolyte in terms of milliequivalents in a given volume. The label states the total osmolar concentration in mOsmol per L. When the contents are less than 100 mL, the label alternatively may state the total osmolar concentration in mOsmol per mL.

### USP Reference standards (11)—

USP Citric Acid RS  
USP Endotoxin RS  
USP Sodium Lactate RS

### Identification—

**A:** It responds to the flame tests for *Sodium* (191) and *Potassium* (191), to the oxalate test for *Calcium* (191), and to the tests for *Magnesium* (191) and *Chloride* (191).

**B:** The retention time of the acetate peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for acetate*.

**C:** Where citrate is purported to be present, the retention time of the citrate peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for citrate*.

**D:** Where lactate is purported to be present, the retention time of the lactate peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for lactate*.

**Bacterial endotoxins** (85)—It contains not more than 0.5 USP Endotoxin Unit per mL.

**pH** (791): between 4.0 and 8.0.

**Other requirements**—It meets the requirements under *Injections* (1).

### Assay for potassium and sodium—

*Internal standard solution*, *Potassium stock solution*, *Sodium stock solution*, *Stock standard preparation*, and *Standard preparation*—Prepare as directed in the *Assay for potassium and sodium* under *Potassium Chloride in Sodium Chloride Injection*.

*Assay preparation*—Transfer 5.0 mL of Injection to a 500-mL volumetric flask, dilute with *Internal standard solution* to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the *Assay for potassium and sodium* under *Potassium Chloride in Sodium Chloride Injection*. Calculate the quantity, in mg, of potassium (K) in each mL of the Injection taken by the formula:

$$C(R_{U,766} / R_{U,671})(R_{S,671} / R_{S,766})$$

in which the terms are as defined therein. Each mg of potassium is equivalent to 0.02558 mEq of potassium. Calculate the quantity, in mg, of sodium (Na) in each mL of the Injection taken by the formula:

$$C(R_{U,589} / R_{U,671})(R_{S,671} / R_{S,589})$$

in which the terms are as defined therein. Each mg of sodium is equivalent to 0.04350 mEq of sodium.

**Assay for magnesium**—[NOTE—Concentrations of the *Standard preparations* and the *Assay preparation* may be modified to fit the linear or working range of the atomic absorption spectrophotometer.]

*Lanthanum chloride solution*, *Dilute hydrochloric acid*, *Blank solution*, *Magnesium stock solution*, and *Standard preparations*—Prepare as directed in the *Assay for magnesium* under *Multiple Electrolytes Injection Type 1*.

*Assay preparation*—Transfer an accurately measured volume of Injection, equivalent to about 20 mg (1.65 mEq) of magnesium, to a 1000-mL volumetric flask containing 50.0 mL of *Lanthanum chloride solution*. Dilute the contents of the flask with *Dilute hydrochloric acid* to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the *Assay for magnesium* under *Multiple Electrolytes Injection Type 1*. Calculate the quantity, in  $\mu\text{g}$ , of magnesium (Mg) in each mL of the Injection taken by the formula:

$$1000(C/V)$$

in which V is the volume, in mL, of Injection taken to prepare the *Assay preparation*, and the other terms are as defined therein.

**Assay for calcium**—[NOTE—Concentrations of the *Standard preparations* and the *Assay preparation* may be modified to fit the linear or working range of the atomic absorption spectrophotometer.]

*Lanthanum chloride solution*, *Dilute hydrochloric acid*, and *Blank solution*—Prepare as directed in the *Assay for magnesium* under *Multiple Electrolytes Injection Type 1*.

*Calcium stock solution*—Transfer 499.5 mg of primary standard calcium carbonate to a 200-mL volumetric flask, and add 10 mL of water. Carefully add 5 mL of *Dilute hydrochloric acid*, and swirl to dissolve the calcium carbonate. Dilute with water to volume, and mix. This solution contains 1000  $\mu\text{g}$  of calcium (Ca) per mL.

*Standard preparations*—To three separate 100-mL volumetric flasks, each containing 5.0 mL of *Lanthanum chloride solution*, add 1.0, 1.5, and 2.0 mL, respectively, of *Calcium stock solution*. Dilute the contents of each flask with *Dilute hydrochloric acid* to volume, and mix. These three solutions contain 10.0, 15.0, and 20.0  $\mu\text{g}$ , respectively, of calcium (Ca) per mL.

*Assay preparation*—Transfer an accurately measured volume of Injection, equivalent to about 20 mg (1 mEq) of

calcium, to a 1000-mL volumetric flask containing 50.0 mL of *Lanthanum chloride solution*. Dilute the contents of the flask with *Dilute hydrochloric acid* to volume, and mix.

**Procedure**—Concomitantly determine the absorbances of the *Standard preparations* and the *Assay preparation* at the calcium emission line at 422.7 nm, with an atomic absorption spectrophotometer (see *Spectrophotometry and Light-scattering* (851)) equipped with a calcium hollow-cathode lamp and an air-acetylene flame, using the *Blank solution* as the blank. Plot the absorbances of the *Standard preparations* versus concentration, in  $\mu\text{g}$  per mL, of calcium, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration,  $C$ , in  $\mu\text{g}$  per mL, of calcium in the *Assay preparation*. Calculate the quantity, in  $\mu\text{g}$ , of calcium in each mL of the Injection taken by the formula:

$$1000(C/V)$$

in which  $V$  is the volume, in mL, of Injection taken to prepare the *Assay preparation*.

**Assay for chloride**—Using the Injection, proceed as directed for the *Assay for chloride* under *Multiple Electrolytes Injection Type 1*.

#### **Assay for acetate**—

*Mobile phase, Standard preparation, and Chromatographic system*—Prepare as directed in the *Assay for acetate* under *Multiple Electrolytes Injection Type 1*.

**Assay preparation**—Quantitatively dilute an accurately measured volume of Injection with water to obtain a solution containing about 0.0088 mEq of acetate per mL.

**Procedure**—Proceed as directed for *Procedure* in the *Assay for acetate* under *Multiple Electrolytes Injection Type 1*. Calculate the quantity, in mEq per L, of acetate ( $\text{C}_2\text{H}_3\text{O}_2$ ) in the Injection taken by the formula:

$$(C/136.08)(L/D)(r_U / r_S)$$

in which the terms are as defined therein.

#### **Assay for citrate (if present)**—

*Mobile Phase and Chromatographic System*—Proceed as directed under *Assay for Citric Acid/Citrate and Phosphate* (345).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Citric Acid RS in freshly prepared 1 mM sodium hydroxide to obtain a solution having a known concentration of about 0.3 mEq of citrate ( $\text{C}_6\text{H}_5\text{O}_7$ ) per L.

**Assay preparation**—Dilute an accurately measured volume of Injection quantitatively with freshly prepared sodium hydroxide to obtain a solution having a concentration of about 0.3 mEq of citrate per L in 1 mM sodium hydroxide.

**Procedure**—Proceed as directed for *Procedure* under general chapter (345), calculate the quantity, in mEq per L, of citrate ( $\text{C}_6\text{H}_5\text{O}_7$ ) in the Injection taken by the formula:

$$C_S D(r_U / r_S)$$

in which  $C_S$  is the concentration, in mEq per L, of citrate in the *Standard preparation*;  $D$  is the dilution factor; and  $r_U$  and  $r_S$  are the citrate peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.

#### **Assay for lactate (if present)**—

*Mobile phase*—Prepare a solution in water containing about 1 mL of formic acid and 1 mL of dicyclohexylamine per L, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Resolution solution**—Prepare a solution in water containing about 3 mg of anhydrous sodium acetate and 3 mg of USP Sodium Lactate RS per mL.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Sodium Lactate RS in water to obtain a

solution having a known concentration of about 2 mg per mL.

**Assay preparation**—Where the labeled quantity of lactate is greater than 20 mEq per L, quantitatively dilute an accurately measured volume of Injection with water to obtain a solution containing about 0.02 mEq of lactate per mL. Where the labeled quantity of lactate is 20 mEq or less per L, use the undiluted Injection as the *Assay preparation*.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm  $\times$  10-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between acetate and lactate is not less than 2. Chromatograph the *Standard preparation*, and record the responses as directed for *Procedure*: the tailing factor for the analyte peak is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu\text{L}$ ) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mEq per L, of lactate ( $\text{C}_3\text{H}_5\text{O}_3$ ) in the Injection taken by the formula:

$$(C/112.06)(L/D)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Sodium Lactate RS in the *Standard preparation*; 112.06 is the molecular weight of sodium lactate;  $L$  is the labeled quantity, in mEq per L, of lactate in Injection;  $D$  is the quantity, in mEq per mL, of lactate in the *Assay preparation*, based on the labeled quantity and the extent of dilution; and  $r_U$  and  $r_S$  are the lactate peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## **Multiple Electrolytes and Dextrose Injection Type 1**

» Multiple Electrolytes and Dextrose Injection Type 1 is a sterile solution of Dextrose and suitable salts in Water for Injection to provide sodium, potassium, magnesium, and chloride ions. In addition, the salts provide ions of acetate, or acetate and gluconate, or acetate and phosphate, or phosphate and lactate, or phosphate and sulfate. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of sodium (Na), potassium (K), magnesium (Mg), acetate ( $\text{C}_2\text{H}_3\text{O}_2$ ), gluconate ( $\text{C}_6\text{H}_{11}\text{O}_7$ ), phosphate ( $\text{PO}_4$ ), lactate ( $\text{C}_3\text{H}_5\text{O}_3$ ), and sulfate ( $\text{SO}_4$ ), not less than 90.0 percent and not more than 120.0 percent of the labeled amount of chloride (Cl), and not less than 90.0 percent and not more than 105.0 percent of the labeled amount of dextrose ( $\text{C}_6\text{H}_{12}\text{O}_6 \cdot \text{H}_2\text{O}$ ). It may contain Hydrochloric Acid or Sodium Hydroxide used to adjust the pH. It contains no antimicrobial agents.

**Packaging and storage**—Preserve in single-dose glass or plastic containers. Glass containers are preferably of Type I or Type II glass.

**Labeling**—The label states the content of each electrolyte in terms of milliequivalents in a given volume. The label states the total osmolar concentration in mOsmol per L.

When the contents are less than 100 mL, the label alternatively may state the total osmolar concentration in mOsmol per mL.

**USP Reference standards** <11>—

USP Endotoxin RS  
USP Potassium Gluconate RS  
USP Sodium Lactate RS

**Identification**—

**A:** It responds to the *Identification* test under *Dextrose*.

**B:** It responds to the flame tests for *Sodium* <191> and *Potassium* <191>, and to the tests for *Magnesium* <191> and *Chloride* <191>.

**C:** Where acetate is purported to be present, the retention time of the acetate peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for acetate*.

**D:** Where gluconate is purported to be present, the retention time of the gluconate peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for gluconate*.

**E:** Where phosphate is purported to be present, add 5 mL of Injection and 1 mL of ammonium molybdate TS to a test tube, and mix: a yellow precipitate, which is soluble in 6 N ammonium hydroxide, is formed.

**F:** Where lactate is purported to be present, the retention time of the lactate peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for lactate*.

**G:** Where sulfate is purported to be present, it responds to the barium chloride test for *Sulfate* <191>.

**Bacterial endotoxins** <85>—It contains not more than 0.5 USP Endotoxin Unit per mL.

**pH** <791>: between 4.0 and 6.5.

**Other requirements**—It meets the requirements under *Injections* <1>.

**Assay for potassium and sodium**—

*Internal standard solution, Potassium stock solution, Sodium stock solution, Stock standard preparation, and Standard preparation*—Prepare as directed in the *Assay for potassium and sodium* under *Potassium Chloride* in *Sodium Chloride Injection*.

*Assay preparation*—Transfer 5.0 mL of Injection to a 500-mL volumetric flask, dilute with *Internal standard solution* to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the *Assay for potassium and sodium* under *Potassium Chloride* in *Sodium Chloride Injection*. Calculate the quantity, in mg, of potassium (K) in each mL of the Injection taken by the formula:

$$C(R_{U,766} / R_{U,671})(R_{S,671} / R_{S,766})$$

in which the terms are as defined therein. Each mg of potassium is equivalent to 0.02558 mEq of potassium. Calculate the quantity, in mg, of sodium (Na) in each mL of the Injection taken by the formula:

$$C(R_{U,589} / R_{U,671})(R_{S,671} / R_{S,589})$$

in which the terms are as defined therein. Each mg of sodium is equivalent to 0.04350 mEq of sodium.

**Assay for magnesium**—[NOTE—Concentrations of the *Standard preparations* and the *Assay preparation* may be modified to fit the linear or working range of the atomic absorption spectrophotometer.]

*Lanthanum chloride solution, Dilute hydrochloric acid, Blank solution, Magnesium stock solution, and Standard preparations*—Prepare as directed in the *Assay for magnesium* under *Multiple Electrolytes Injection Type 1*.

*Assay preparation*—Transfer an accurately measured volume of Injection, equivalent to about 20 mg (1.65 mEq) of magnesium, to a 1000-mL volumetric flask containing 50.0 mL of *Lanthanum chloride solution*. Dilute the contents of the flask with *Dilute hydrochloric acid* to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the *Assay for magnesium* under *Multiple Electrolytes Injection Type 1*. Calculate the quantity, in µg, of magnesium (Mg) in each mL of the Injection taken by the formula:

$$1000(C/V)$$

in which V is the volume, in mL, of Injection taken to prepare the *Assay preparation*.

**Assay for chloride**—Using the Injection, proceed as directed in the *Assay for chloride* under *Multiple Electrolytes Injection Type 1*.

**Assay for acetate** (if present)—

*Mobile phase, Standard preparation, and Chromatographic system*—Prepare as directed in the *Assay for acetate* under *Multiple Electrolytes Injection Type 1*.

*Assay preparation*—Quantitatively dilute an accurately measured volume of Injection with water to obtain a solution containing about 0.0088 mEq of acetate per mL.

*Procedure*—Proceed as directed for *Procedure* in the *Assay for acetate* under *Multiple Electrolytes Injection Type 1*. Calculate the quantity, in mEq per L, of acetate (C<sub>2</sub>H<sub>3</sub>O<sub>2</sub>) in the Injection taken by the formula:

$$(C/136.08)(L/D)(r_U / r_S)$$

in which the terms are as defined therein.

**Assay for gluconate** (if present)—

*Mobile phase*—Dissolve 7.0 g of calcium acetate in 1900 mL of water, and adjust with glacial acetic acid to a pH of 4.5 ± 0.1. Dilute with water to 2000 mL, mix, pass through a filter having a 0.5-µm porosity or finer, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>). Maintain the *Mobile phase* at 70 ± 2° at all times.

*Standard preparation*—Quantitatively dissolve an accurately weighed quantity of USP Potassium Gluconate RS in water to obtain a solution having a known concentration of about 4.6 mg per mL.

*Resolution solution*—Prepare an aqueous solution containing about 5 mg each of USP Sodium Lactate RS and USP Potassium Gluconate RS per mL.

*Assay preparation*—Quantitatively dilute an accurately measured volume of Injection with water, if necessary, to obtain a solution containing about 0.023 mEq of gluconate per mL.

*Chromatographic system* (see *Chromatography* <621>)—The liquid chromatograph is equipped with a refractive index detector and a 7.8-mm × 30-cm column that contains packing L19 in the calcium form and is maintained at 70 ± 2°. The flow rate is about 1 mL per minute. Condition the column for about 60 minutes by pumping *Mobile phase* through it. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the resolution R<sub>s</sub> between lactate and gluconate is not less than 4.0. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quan-

tity, in mEq per L, of gluconate ( $\text{C}_6\text{H}_{11}\text{O}_7$ ) in the Injection taken by the formula:

$$(C/234.25)(L/D)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Potassium Gluconate RS in the *Standard preparation*; 234.25 is the molecular weight of potassium gluconate;  $L$  is the labeled quantity, in mEq per L, of gluconate in the Injection;  $D$  is the quantity, in mEq per L, of gluconate in the *Assay preparation*, based on the labeled quantity and the extent of dilution, if any; and  $r_U$  and  $r_S$  are the gluconate peak responses for the *Assay preparation* and the *Standard preparation*, respectively.

#### Assay for phosphate (if present)—

*Ammonium molybdate solution*, *Hydroquinone solution*, *Sodium sulfite solution*, *Standard preparation*, and *Blank*—Prepare as directed in the *Assay for phosphate* under *Multiple Electrolytes Injection Type 1*.

*Assay preparation*—Transfer an accurately measured volume of Injection, equivalent to about 4 mg (0.126 mEq) of phosphate, to a 50-mL volumetric flask, dilute with water to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the *Assay for phosphate* under *Multiple Electrolytes Injection Type 1*. Calculate the quantity, in mg, of phosphate ( $\text{PO}_4$ ) in each mL of the Injection taken by the formula:

$$50(94.97/136.08)(C/V)(A_U / A_S)$$

in which the terms are as defined therein.

#### Assay for lactate (if present)—

*Mobile phase*, *Resolution solution*, *Standard preparation*, and *Chromatographic system*—Prepare as directed in the *Assay for lactate* under *Multiple Electrolytes Injection Type 2*.

*Assay preparation*—Where the labeled quantity of lactate is greater than 20 mEq per L, quantitatively dilute an accurately measured volume of Injection with water to obtain a solution containing about 0.02 mEq of lactate per mL. Where the labeled quantity of lactate is 20 mEq or less per L, use the undiluted Injection as the *Assay preparation*.

*Procedure*—Proceed as directed for *Procedure* in the *Assay for lactate* under *Multiple Electrolytes Injection Type 2*. Calculate the quantity, in mEq per L, of lactate ( $\text{C}_3\text{H}_5\text{O}_3$ ) in the Injection taken by the formula:

$$(C/112.06)(L/D)(r_U / r_S)$$

in which the terms are as defined therein.

**Assay for sulfate (if present)**—Transfer an accurately measured volume of Injection, equivalent to about 120 mg (1.22 mEq) of sulfate, to a suitable vessel. Dilute if necessary to 200 mL, and add 1 mL of hydrochloric acid. Heat to boiling, and gradually add, in small portions and while constantly stirring, an excess of hot barium chloride TS (about 8 mL). Heat the mixture on a steam bath for 1 hour, collect the precipitate of barium sulfate on a tared filtering crucible, wash until free from chloride, dry, ignite, and weigh. The weight of the barium sulfate so obtained, multiplied by 0.4116, represents its equivalent of sulfate ( $\text{SO}_4$ ). Each mg of barium sulfate represents 0.004285 mEq of sulfate.

**Assay for dextrose**—Transfer an accurately measured volume of Injection, containing 2 to 5 g of dextrose, to a 100-mL volumetric flask. Add 0.2 mL of 6 N ammonium hydroxide, dilute with water to volume, and mix. Determine the angular rotation in a polarimeter tube (see *Optical Rotation* <781>). Calculate the percentage (g per 100 mL) of dex-

trose ( $\text{C}_6\text{H}_{12}\text{O}_6 \cdot \text{H}_2\text{O}$ ) in the portion of Injection taken by the formula:

$$(100/52.9)(198.17/180.16)AR$$

in which 100 is the percentage; 52.9 is the midpoint of the specific rotation range for anhydrous dextrose, in degrees; 198.17 and 180.16 are the molecular weights for dextrose monohydrate and anhydrous dextrose, respectively;  $A$  is 100 mm divided by the length of the polarimeter tube, in mm; and  $R$  is the observed rotation, in degrees.

## Multiple Electrolytes and Dextrose Injection Type 2

» Multiple Electrolytes and Dextrose Injection Type 2 is a sterile solution of Dextrose and suitable salts in Water for Injection to provide sodium, potassium, magnesium, calcium, and chloride ions. In addition, the salts provide ions of acetate, or acetate and citrate, or acetate and lactate, or gluconate and sulfate. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of sodium (Na), potassium (K), magnesium (Mg), calcium (Ca), acetate ( $\text{C}_2\text{H}_3\text{O}_2$ ), citrate ( $\text{C}_6\text{H}_5\text{O}_7$ ), lactate ( $\text{C}_3\text{H}_5\text{O}_3$ ), gluconate ( $\text{C}_6\text{H}_{11}\text{O}_7$ ), and sulfate ( $\text{SO}_4$ ), and not less than 90.0 percent and not more than 120.0 percent of the labeled amount of chloride (Cl), and not less than 90.0 percent and not more than 105.0 percent of the labeled amount of dextrose ( $\text{C}_6\text{H}_{12}\text{O}_6 \cdot \text{H}_2\text{O}$ ). It may contain Hydrochloric Acid or Sodium Hydroxide used to adjust the pH. It contains no antimicrobial agents.

**Packaging and storage**—Preserve in single-dose glass or plastic containers. Glass containers are preferably of Type I or Type II glass.

**Labeling**—The label states the content of each electrolyte in terms of milliequivalents in a given volume. The label states the total osmolar concentration in mOsmol per L. When the contents are less than 100 mL, the label alternatively may state the total osmolar concentration in mOsmol per mL.

#### USP Reference standards <11>—

USP Citric Acid RS  
USP Endotoxin RS  
USP Potassium Gluconate RS  
USP Sodium Lactate RS

#### Identification—

**A:** It responds to the *Identification* test under *Dextrose*.

**B:** It responds to the flame tests for *Sodium* <191> and *Potassium* <191>, to the tests for *Magnesium* <191> and *Chloride* <191>, and to the oxalate test for *Calcium* <191>.

**C:** Where acetate is purported to be present, the retention time of the acetate peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for acetate*.

**D:** Where citrate is purported to be present, the retention time of the citrate peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for citrate*.

**E:** Where lactate is purported to be present, the retention time of the lactate peak in the chromatogram of the *Assay*

preparation corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for lactate*.

**F:** Where gluconate is purported to be present, the retention time of the gluconate peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for gluconate*.

**G:** Where sulfate is purported to be present, it responds to the barium chloride test for *Sulfate* (191).

**Bacterial endotoxins** (85)—It contains not more than 0.5 USP Endotoxin Unit per mL.

**pH** (791): between 4.0 and 6.5.

**Other requirements**—It meets the requirements under *Injections* (1).

#### **Assay for potassium and sodium—**

*Internal standard solution, Potassium stock solution, Sodium stock solution, Stock standard preparation, and Standard preparation*—Prepare as directed in the *Assay for potassium and sodium* under *Potassium Chloride in Sodium Chloride Injection*.

*Assay preparation*—Transfer 5.0 mL of Injection to a 500-mL volumetric flask, dilute with *Internal standard solution* to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the *Assay for potassium and sodium* under *Potassium Chloride in Sodium Chloride Injection*. Calculate the quantity, in mg, of potassium (K) in each mL of the Injection taken by the formula:

$$C(R_{U,766} / R_{U,671})(R_{S,671} / R_{S,766})$$

in which the terms are as defined therein. Each mg of potassium is equivalent to 0.02558 mEq of potassium. Calculate the quantity, in mg, of sodium (Na) in each mL of the Injection taken by the formula:

$$C(R_{U,589} / R_{U,671})(R_{S,671} / R_{S,589})$$

in which the terms are as defined therein. Each mg of sodium is equivalent to 0.04350 mEq of sodium.

**Assay for magnesium**—[NOTE—Concentrations of the *Standard preparations* and the *Assay preparation* may be modified to fit the linear or working range of the atomic absorption spectrophotometer.]

*Lanthanum chloride solution, Dilute hydrochloric acid, Blank solution, Magnesium stock solution, and Standard preparations*—Prepare as directed in the *Assay for magnesium* under *Multiple Electrolytes Injection Type 1*.

*Assay preparation*—Transfer an accurately measured volume of Injection, equivalent to about 20 mg (1.65 mEq) of magnesium, to a 1000-mL volumetric flask containing 50.0 mL of *Lanthanum chloride solution*. Dilute the contents of the flask with *Dilute hydrochloric acid* to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the *Assay for magnesium* under *Multiple Electrolytes Injection Type 1*. Calculate the quantity, in µg, of magnesium (Mg) in each mL of the Injection taken by the formula:

$$1000(C/V)$$

in which V is the volume, in mL, of Injection taken to prepare the *Assay preparation*.

**Assay for calcium**—[NOTE—Concentrations of the *Standard preparations* and the *Assay preparation* may be modified to fit the linear or working range of the atomic absorption spectrophotometer.]

*Lanthanum chloride solution, Dilute hydrochloric acid, and Blank solution*—Prepare as directed in the *Assay for magnesium* under *Multiple Electrolytes Injection Type 1*.

*Calcium stock solution and Standard preparations*—Prepare as directed in the *Assay for calcium* under *Multiple Electrolytes Injection Type 2*.

*Assay preparation*—Transfer an accurately measured volume of Injection, equivalent to about 20 mg (1 mEq) of calcium, to a 1000-mL volumetric flask containing 50.0 mL of *Lanthanum chloride solution*. Dilute the contents of the flask with *Dilute hydrochloric acid* to volume, and mix.

*Procedure*—Proceed as directed in the *Assay for calcium* under *Multiple Electrolytes Injection Type 2*. Calculate the quantity, in µg, of calcium in each mL of the Injection taken by the formula:

$$1000(C/V)$$

in which the terms are as defined therein.

**Assay for chloride**—Using the Injection, proceed as directed in the *Assay for chloride* under *Multiple Electrolytes Injection Type 1*.

**Assay for acetate (if present)**—

*Mobile phase, Standard preparation, and Chromatographic system*—Prepare as directed in the *Assay for acetate* under *Multiple Electrolytes Injection Type 1*.

*Assay preparation*—Quantitatively dilute an accurately measured volume of Injection with water to obtain a solution containing about 0.0088 mEq of acetate per mL.

*Procedure*—Proceed as directed for *Procedure* in the *Assay for acetate* under *Multiple Electrolytes Injection Type 1*. Calculate the quantity, in mEq per liter, of acetate (C<sub>2</sub>H<sub>3</sub>O<sub>2</sub>) in the Injection taken by the formula:

$$(C/136.08)(L/D)(r_U / r_S)$$

in which the terms are as defined therein.

**Assay for citrate (if present)**—

*Mobile Phase and Chromatographic System*—Proceed as directed under *Assay for Citric Acid/Citrate and Phosphate* (345).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Citric Acid RS in freshly prepared 1 mM sodium hydroxide to obtain a solution having a known concentration of about 0.3 mEq of citrate (C<sub>6</sub>H<sub>5</sub>O<sub>7</sub>) per L.

*Assay preparation*—Dilute an accurately measured volume of Injection quantitatively with freshly prepared sodium hydroxide to obtain a solution having a concentration of about 0.3 mEq of citrate per L in 1 mM sodium hydroxide.

*Procedure*—Proceed as directed for *Procedure* under general chapter (345). Calculate the quantity, in mEq per L, of citrate (C<sub>6</sub>H<sub>5</sub>O<sub>7</sub>) in the portion of Injection taken by the formula:

$$C_S D(r_U / r_S)$$

in which C<sub>S</sub> is the concentration, in mEq per L, of citrate in the *Standard preparation*; D is the dilution factor; and r<sub>U</sub> and r<sub>S</sub> are the citrate peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for lactate (if present)**—

*Mobile phase, Resolution solution, Standard preparation, and Chromatographic system*—Prepare as directed in the *Assay for lactate* under *Multiple Electrolytes Injection Type 2*.

*Assay preparation*—Where the labeled quantity of lactate is greater than 20 mEq per L, quantitatively dilute an accurately measured volume of Injection with water to obtain a solution containing about 0.02 mEq of lactate per mL. Where the labeled quantity of lactate is 20 mEq or less per L, use the undiluted Injection as the *Assay preparation*.

*Procedure*—Proceed as directed for *Procedure* in the *Assay for lactate* under *Multiple Electrolytes Injection Type 2*. Calculate the quantity, in mEq per L, of lactate (C<sub>3</sub>H<sub>5</sub>O<sub>3</sub>) in the Injection taken by the formula:

$$(C/112.06)(L/D)(r_U / r_S)$$

in which the terms are as defined therein.

**Assay for gluconate (if present)**—

*Mobile phase, Standard preparation, Resolution solution, and Chromatographic system*—Prepare as directed in the *Assay for gluconate* under *Multiple Electrolytes and Dextrose Injection Type 1*.

*Assay preparation*—Quantitatively dilute an accurately measured volume of Injection with water to obtain a solution containing about 0.023 mEq of gluconate per mL.

*Procedure*—Proceed as directed for *Procedure* in the *Assay for gluconate* under *Multiple Electrolytes and Dextrose Injection Type 1*. Calculate the quantity, in mEq per L, of gluconate ( $C_6H_{11}O_7$ ) in the Injection taken by the formula:

$$(C/234.25)(L/D)(r_U / r_S)$$

in which the terms are as defined therein.

**Assay for sulfate (if present)**—Using the Injection, proceed as directed in the *Assay for sulfate* under *Multiple Electrolytes and Dextrose Injection Type 1*.

**Assay for dextrose**—Using the Injection, proceed as directed in the *Assay for dextrose* under *Multiple Electrolytes and Dextrose Injection Type 1*.

## Multiple Electrolytes and Dextrose Injection Type 3

» Multiple Electrolytes and Dextrose Injection Type 3 is a sterile solution of Dextrose and suitable salts in Water for Injection to provide sodium, potassium, and chloride ions. In addition, the salts provide ions of ammonium, or acetate and phosphate, or phosphate and lactate. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of sodium (Na), potassium (K), ammonium ( $NH_4$ ), acetate ( $C_2H_3O_2$ ), phosphate ( $PO_4$ ), and lactate ( $C_3H_5O_3$ ), not less than 90.0 percent and not more than 120.0 percent of the labeled amount of chloride (Cl), and not less than 90.0 percent and not more than 105.0 percent of the labeled amount of dextrose ( $C_6H_{12}O_6 \cdot H_2O$ ). It may contain Hydrochloric Acid or Sodium Hydroxide used to adjust the pH. It contains no antimicrobial agents.

**Packaging and storage**—Preserve in single-dose glass or plastic containers. Glass containers are preferably of Type I or Type II glass.

**Labeling**—The label states the content of each electrolyte in terms of milliequivalents in a given volume. The label states the total osmolar concentration in mOsmol per L. When the contents are less than 100 mL, the label alternatively may state the total osmolar concentration in mOsmol per mL.

**USP Reference standards (11)**—

USP Endotoxin RS

USP Sodium Lactate RS

**Identification**—

**A:** It responds to the *Identification* test under *Dextrose*.

**B:** It responds to the flame tests for *Sodium* (191) and *Potassium* (191), and to the tests for *Chloride* (191) and *Ammonium* (191).

**C:** Where acetate is purported to be present, the retention time of the acetate peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation*, obtained as directed in the *Assay for acetate*.

**D:** Where phosphate is purported to be present, add 5 mL of the Injection and 1 mL of ammonium molybdate TS to a test tube, and mix: a yellow precipitate, which is soluble in 6 N ammonium hydroxide, is formed.

**E:** Where lactate is purported to be present, the retention time of the lactate peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for lactate*.

**Bacterial endotoxins** (85)—It contains not more than 0.5 USP Endotoxin Unit per mL.

**pH** (791): between 4.0 and 6.5.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay for potassium and sodium**—

*Internal standard solution, Potassium stock solution, Sodium stock solution, Stock standard preparation, and Standard preparation*—Prepare as directed in the *Assay for potassium and sodium* under *Potassium Chloride in Sodium Chloride Injection*.

*Assay preparation*—Transfer 5.0 mL of Injection to a 500-mL volumetric flask, dilute with *Internal standard solution* to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the *Assay for potassium and sodium* under *Potassium Chloride in Sodium Chloride Injection*. Calculate the quantity, in mg, of potassium (K) in each mL of the Injection taken by the formula:

$$C(R_{U,766} / R_{U,671})(R_{S,671} / R_{S,766})$$

in which the terms are as defined therein. Each mg of potassium is equivalent to 0.02558 mEq of potassium. Calculate the quantity, in mg, of sodium (Na) in each mL of the Injection taken by the formula:

$$C(R_{U,589} / R_{U,671})(R_{S,671} / R_{S,589})$$

in which the terms are as defined therein. Each mg of sodium is equivalent to 0.04350 mEq of sodium.

**Assay for chloride**—Using the Injection, proceed as directed in the *Assay for chloride* under *Multiple Electrolytes Injection Type 1*.

**Assay for ammonium (if present)**—Transfer an accurately measured volume of Injection, equivalent to about 63 mg (3.5 mEq) of ammonium, to a 500-mL Kjeldahl flask, dilute with water to 200 mL, mix, and add 50 mL of sodium hydroxide solution (2 in 5). Immediately connect the flask by means of a distillation trap to a well-cooled condenser, the delivery tube of which dips into 40 mL of boric acid solution (1 in 25) contained in a suitable receiver. Heat to boiling, and distill about 200 mL. Cool the liquid in the receiver, if necessary, then add methyl red TS, and titrate with 0.1 N sulfuric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N sulfuric acid is equivalent to 1.804 mg (0.1 mEq) of ammonium ( $NH_4$ ).

**Assay for acetate (if present)**—

*Mobile phase, Standard preparation, and Chromatographic system*—Prepare as directed in the *Assay for acetate* under *Multiple Electrolytes Injection Type 1*.

*Assay preparation*—Quantitatively dilute an accurately measured volume of Injection with water to obtain a solution containing about 0.0088 mEq of acetate per mL.

*Procedure*—Proceed as directed for *Procedure* in the *Assay for acetate* under *Multiple Electrolytes Injection Type 1*. Calculate the quantity, in mEq per L, of acetate ( $C_2H_3O_2$ ) in the Injection taken by the formula:

$$(C/136.08)(L/D)(r_U / r_S)$$

in which the terms are as defined therein.

**Assay for phosphate (if present)**—

*Ammonium molybdate solution, Hydroquinone solution, Sodium sulfite solution, Standard preparation, and Blank*—Pre-

pare as directed in the *Assay for phosphate* under *Multiple Electrolytes Injection Type 1*.

**Assay preparation**—Transfer an accurately measured volume of Injection, equivalent to about 4 mg (0.126 mEq) of phosphate, to a 50-mL volumetric flask, dilute with water to volume, and mix.

**Procedure**—Proceed as directed for *Procedure* in the *Assay for phosphate* under *Multiple Electrolytes Injection Type 1*. Calculate the quantity, in mg, of phosphate ( $\text{PO}_4$ ) in each mL of the Injection taken by the formula:

$$50(94.97/136.09)(C/V)(A_U / A_S)$$

in which the terms are as defined therein.

#### **Assay for lactate (if present)**—

**Mobile phase, Resolution solution, Standard preparation, and Chromatographic system**—Prepare as directed in the *Assay for lactate* under *Multiple Electrolytes Injection Type 2*.

**Assay preparation**—Where the labeled quantity of lactate is greater than 20 mEq per L, quantitatively dilute an accurately measured volume of Injection with water to obtain a solution containing about 0.02 mEq of lactate per mL. Where the labeled quantity of lactate is 20 mEq or less per L, use the undiluted Injection as the *Assay preparation*.

**Procedure**—Proceed as directed for *Procedure* in the *Assay for lactate* under *Multiple Electrolytes Injection Type 2*. Calculate the quantity, in mEq per L, of lactate ( $\text{C}_3\text{H}_5\text{O}_3$ ) in the Injection taken by the formula:

$$(C/112.06)(L/D)(r_U / r_S)$$

in which the terms are as defined therein.

**Assay for dextrose**—Using the Injection, proceed as directed in the *Assay for dextrose* under *Multiple Electrolytes and Dextrose Injection Type 1*.

## **Multiple Electrolytes and Dextrose Injection Type 4**

» Multiple Electrolytes and Dextrose Injection Type 4 is a sterile solution of Dextrose and suitable salts in Water for Injection to provide sodium, magnesium, calcium, chloride, gluconate, and sulfate ions. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of sodium (Na), magnesium (Mg), calcium (Ca), gluconate ( $\text{C}_6\text{H}_{11}\text{O}_7$ ), and sulfate ( $\text{SO}_4$ ), not less than 90.0 percent and not more than 120.0 percent of the labeled amount of chloride (Cl), and not less than 90.0 percent and not more than 105.0 percent of the labeled amount of dextrose ( $\text{C}_6\text{H}_{12}\text{O}_6 \cdot \text{H}_2\text{O}$ ). It may contain Hydrochloric Acid or Sodium Hydroxide used to adjust the pH. It contains no antimicrobial agents.

**Packaging and storage**—Preserve in single-dose glass or plastic containers. Glass containers are preferably of Type I or Type II glass.

**Labeling**—The label states the content of each electrolyte in terms of milliequivalents in a given volume. The label states the total osmolar concentration in mOsmol per L. When the contents are less than 100 mL, the label alternatively may state the total osmolar concentration in mOsmol per mL.

#### **USP Reference standards** (11)—

USP Endotoxin RS

USP Potassium Gluconate RS

#### **Identification**—

**A:** It responds to the *Identification* test under *Dextrose*.

**B:** It responds to the flame test for *Sodium* (191), to the tests for *Magnesium* (191) and *Chloride* (191), to the oxalate test for *Calcium* (191), and to the barium chloride test for *Sulfate* (191).

**C:** The retention time of the gluconate peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation* obtained as directed in the *Assay for gluconate*.

**Bacterial endotoxins** (85)—It contains not more than 0.5 USP Endotoxin Unit per mL.

**pH** (791): between 4.2 and 5.2.

**Other requirements**—It meets the requirements under *Injections* (1).

#### **Assay for sodium**—

**Internal standard solution**—Transfer 1.04 g of lithium nitrate to a 1000-mL volumetric flask, add a suitable nonionic surfactant, dilute with water to volume, and mix.

**Standard preparation**—Transfer 7.31 g of sodium chloride, previously dried at 105° for 2 hours and accurately weighed, to a 250-mL volumetric flask, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 500-mL volumetric flask, dilute with *Internal standard solution* to volume, and mix. Each mL of this solution contains 0.0292 mg of sodium chloride, equivalent to 0.0115 mg (0.0005 mEq) of sodium (Na).

**Assay preparation**—Dilute an accurately measured volume of Injection quantitatively with *Internal standard solution* to obtain a solution containing about 0.0115 mg (0.0005 mEq) of sodium per mL.

**Procedure**—Using a flame photometer, adjusted to read zero with *Internal standard solution*, concomitantly determine the flame emission readings for the *Standard preparation* and the *Assay preparation* at the wavelengths of maximum emission for sodium and lithium (589 nm and 671 nm, respectively). Calculate the quantity, in mg, of sodium (Na) in each mL of the Injection taken by the formula:

$$(22.99 / 58.44)(C)(L / D)(R_{U,589} / R_{U,671})(R_{S,671} / R_{S,589})$$

in which 22.99 is the atomic weight of sodium, 58.44 is the molecular weight of sodium chloride, C is the concentration, in mg per mL, of sodium chloride in the *Standard preparation*, L is the labeled quantity, in mg, of sodium in each mL of the Injection, D is the concentration, in mg per mL, of sodium in the *Assay preparation*, based on the volume of Injection taken and the extent of dilution, and  $R_{U,589}$  and  $R_{U,671}$  are the emission readings at the wavelengths identified by the subscript numbers obtained for the *Assay preparation*, and  $R_{S,589}$  and  $R_{S,671}$  are the emission readings at the wavelengths identified by the subscript numbers obtained from the *Standard preparation*. Each mg of sodium is equivalent to 0.0435 of mEq of sodium.

**Assay for magnesium**—[NOTE—Concentrations of the *Standard preparations* and the *Assay preparation* may be modified to fit the linear or working range of the atomic absorption spectrophotometer.]

**Lanthanum chloride solution, Dilute hydrochloric acid, Blank solution, Magnesium stock solution, and Standard preparations**—Prepare as directed in the *Assay for magnesium* under *Multiple Electrolytes Injection Type 1*.

**Assay preparation**—Transfer an accurately measured volume of Injection, equivalent to about 20 mg (1.65 mEq) of magnesium, to a 1000-mL volumetric flask containing 50.0 mL of *Lanthanum chloride solution*. Dilute the contents of the flask with *Dilute hydrochloric acid* to volume, and mix.

**Procedure**—Proceed as directed for *Procedure* in the *Assay for magnesium* under *Multiple Electrolytes Injection Type 1*. Calculate the quantity, in  $\mu\text{g}$ , of magnesium (Mg) in each mL of Injection taken by the formula:

$$1000(C/V)$$

in which the terms are as defined therein.

**Assay for calcium**—[NOTE—Concentrations of the *Standard preparations* and the *Assay preparation* may be modified to fit the linear or working range of the atomic absorption spectrophotometer.]

*Lanthanum chloride solution*, *Dilute hydrochloric acid*, and *Blank solution*—Prepare as directed in the *Assay for magnesium* under *Multiple Electrolytes Injection Type 1*.

*Calcium stock solution* and *Standard preparations*—Prepare as directed in the *Assay for calcium* under *Multiple Electrolytes Injection Type 2*.

*Assay preparation*—Transfer an accurately measured volume of Injection, equivalent to about 20 mg (1 mEq) of calcium, to a 1000-mL volumetric flask containing 50.0 mL of *Lanthanum chloride solution*. Dilute the contents of the flask with *Dilute hydrochloric acid* to volume, and mix.

**Procedure**—Proceed as directed for *Procedure* in the *Assay for calcium* under *Multiple Electrolytes Injection Type 2*. Calculate the quantity, in  $\mu\text{g}$ , of calcium in each mL of Injection taken by the formula:

$$1000(C/V)$$

in which the terms are as defined therein.

**Assay for chloride**—Using the Injection, proceed as directed in the *Assay for chloride* under *Multiple Electrolytes Injection Type 1*.

**Assay for gluconate**—

*Mobile phase*, *Standard preparation*, *Resolution solution*, and *Chromatographic system*—Prepare as directed in the *Assay for gluconate* under *Multiple Electrolytes and Dextrose Injection Type 1*.

*Assay preparation*—Dilute an accurately measured volume of Injection quantitatively with water to obtain a solution containing about 0.023 mEq of gluconate per mL.

**Procedure**—Proceed as directed for *Procedure* in the *Assay for gluconate* under *Multiple Electrolytes and Dextrose Injection Type 1*. Calculate the quantity, in mEq per liter, of gluconate ( $\text{C}_6\text{H}_{11}\text{O}_7$ ) in the Injection taken by the formula:

$$(C/234.25)(L/D)(r_U/r_S)$$

in which the terms are as defined therein.

**Assay for sulfate**—Using the Injection, proceed as directed in the *Assay for sulfate* under *Multiple Electrolytes and Dextrose Injection Type 1*.

**Assay for dextrose**—Using the Injection, proceed as directed in the *Assay for dextrose* under *Multiple Electrolytes and Dextrose Injection Type 1*.

## Multiple Electrolytes and Invert Sugar Injection Type 1

» Multiple Electrolytes and Invert Sugar Injection Type 1 is a sterile solution of a mixture of equal amounts of Dextrose and Fructose, or an equivalent solution produced by the hydrolysis of Sucrose, and suitable salts in Water for Injection to provide sodium, potassium, magnesium, chloride, phosphate, and lactate ions. It contains not

less than 90.0 percent and not more than 110.0 percent of the labeled amounts of sodium (Na), potassium (K), magnesium (Mg), phosphate ( $\text{PO}_4$ ), lactate ( $\text{C}_3\text{H}_5\text{O}_3$ ), and invert sugar ( $\text{C}_6\text{H}_{12}\text{O}_6$ ), and not less than 90.0 percent and not more than 120.0 percent of the labeled amount of chloride (Cl). It may contain Hydrochloric Acid or Sodium Hydroxide used to adjust the pH. It contains no antimicrobial agents.

**Packaging and storage**—Preserve in single-dose glass or plastic containers. Glass containers are preferably of Type I or Type II glass.

**Labeling**—The label states the content of each electrolyte in terms of milliequivalents in a given volume. The label states the total osmolar concentration in mOsmol per L. When the contents are less than 100 mL, the label alternatively may state the total osmolar concentration in mOsmol per mL.

**USP Reference standards** (11)—  
USP Sodium Lactate RS

**Identification**—

**A:** It responds to the *Identification* test under *Invert Sugar Injection*.

**B:** It responds to the flame tests for *Sodium* (191) and *Potassium* (191), and to the tests for *Magnesium* (191) and *Chloride* (191).

**C:** Add 5 mL of the Injection and 1 mL of ammonium molybdate TS to a test tube, and mix: a yellow precipitate, which is soluble in 6 N ammonium hydroxide, is formed (presence of phosphate).

**D:** The retention time of the lactate peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation* obtained as directed in the *Assay for lactate*.

**Pyrogen**—It meets the requirements of the *Pyrogen Test* (151). [NOTE—Dilute, with Water for Injection, Injection containing more than 10% of invert sugar to give a concentration of 10% invert sugar.]

**pH** (791): between 3.0 and 6.0.

**Completeness of inversion**—

*Mobile phase*, *Standard preparation*, and *Chromatographic system*—Prepare as directed in the test for *Completeness of inversion* under *Invert Sugar Injection*.

*Test preparation*—Transfer an accurately measured volume of Injection, equivalent to about 2.5 g of invert sugar, to a 100-mL volumetric flask, dilute with water to volume, and mix.

**Procedure**—Proceed as directed for *Procedure* in the test for *Completeness of inversion* under *Invert Sugar Injection*. Calculate the quantity, in mg, of sucrose in the volume of the Injection taken by the formula:

$$100C(r_U/r_S)$$

in which the terms are as defined therein. Not more than 1.5% of the quantity of invert sugar in the volume of the Injection taken, based on the labeled amount, is found.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay for potassium and sodium**—

*Internal standard solution*, *Potassium stock solution*, *Sodium stock solution*, *Stock standard preparation*, and *Standard preparation*—Prepare as directed in the *Assay for potassium and sodium* under *Potassium Chloride in Sodium Chloride Injection*.

*Assay preparation*—Transfer 5.0 mL of Injection to a 500-mL volumetric flask, dilute with *Internal standard solution* to volume, and mix.

**Procedure**—Proceed as directed for *Procedure* in the *Assay for potassium and sodium under Potassium Chloride in Sodium Chloride Injection*. Calculate the quantity, in mg, of potassium (K) in each mL of the Injection taken by the formula:

$$C(R_{U,766} / R_{U,671})(R_{S,671} / R_{S,766})$$

in which the terms are as defined therein. Each mg of potassium is equivalent to 0.02558 mEq of potassium. Calculate the quantity, in mg, of sodium (Na) in each mL of the Injection taken by the formula:

$$C(R_{U,589} / R_{U,671})(R_{S,671} / R_{S,589})$$

in which the terms are as defined therein. Each mg of sodium is equivalent to 0.04350 mEq of sodium.

**Assay for magnesium**—[NOTE—Concentrations of the *Standard preparations* and the *Assay preparation* may be modified to fit the linear or working range of the atomic absorption spectrophotometer.]

*Lanthanum chloride solution, Dilute hydrochloric acid, Blank solution, Magnesium stock solution, and Standard preparations*—Prepare as directed in the *Assay for magnesium under Multiple Electrolytes Injection Type 1*.

**Assay preparation**—Transfer an accurately measured volume of Injection, equivalent to about 20 mg (1.65 mEq) of magnesium, to a 1000-mL volumetric flask containing 50.0 mL of *Lanthanum chloride solution*. Dilute the contents of the flask with *Dilute hydrochloric acid* to volume, and mix.

**Procedure**—Proceed as directed for *Procedure* in the *Assay for magnesium under Multiple Electrolytes Injection Type 1*. Calculate the quantity, in µg, of magnesium (Mg) in each mL of the Injection taken by the formula:

$$1000(C / V)$$

in which the terms are as defined therein.

**Assay for chloride**—Using the Injection, proceed as directed in the *Assay for chloride under Multiple Electrolytes Injection Type 1*.

**Assay for phosphate**—

*Ammonium molybdate solution, Hydroquinone solution, Sodium sulfite solution, Standard preparation, and Blank*—Prepare as directed in the *Assay for phosphate under Multiple Electrolytes Injection Type 1*.

**Assay preparation**—Transfer an accurately measured volume of Injection, equivalent to about 4 mg (0.126 mEq) of phosphate, to a 50-mL volumetric flask, dilute with water to volume, and mix.

**Procedure**—Proceed as directed for *Procedure* in the *Assay for phosphate under Multiple Electrolytes Injection Type 1*. Calculate the quantity, in mg, of phosphate (PO<sub>4</sub>) in each mL of the Injection taken by the formula:

$$50(94.97 / 136.09)(C / V)(A_U / A_S)$$

in which the terms are as defined therein.

**Assay for lactate**—

*Mobile phase, Resolution solution, Standard preparation, and Chromatographic system*—Prepare as directed in the *Assay for lactate under Multiple Electrolytes Injection Type 2*.

**Assay preparation**—Where the labeled quantity of lactate is greater than 20 mEq per liter, dilute an accurately measured volume of Injection quantitatively with water to obtain a solution containing about 0.02 mEq of lactate per mL. Where the labeled quantity of lactate is 20 mEq or less per liter, use the undiluted Injection as the *Assay preparation*.

**Procedure**—Proceed as directed for *Procedure* in the *Assay for lactate under Multiple Electrolytes Injection Type 2*. Calculate the quantity, in mEq per liter, of lactate (C<sub>3</sub>H<sub>5</sub>O<sub>3</sub>) in the Injection taken by the formula:

late the quantity, in mEq per liter, of lactate (C<sub>3</sub>H<sub>5</sub>O<sub>3</sub>) in the Injection taken by the formula:

$$(C / 112.06)(L / D)(r_U / r_S)$$

in which the terms are as defined therein.

**Assay for invert sugar**—Tare a clean, medium-porosity filtering crucible containing several carborundum boiling chips or glass beads. Transfer 50.0 mL of freshly mixed alkaline cupric tartrate TS to a 400-mL beaker. To the beaker add the boiling chips or glass beads from the tared crucible, 48 mL of water, and 2.0 mL of Injection that has been diluted quantitatively with water, if necessary, to a 5.0% concentration of invert sugar. Heat the beaker and contents over a burner that has been adjusted to cause boiling of the solution to start in 3.5 to 4 minutes. Boil the solution for 2.0 minutes, accurately timed, and filter immediately through the tared crucible, taking care to transfer all of the boiling chips or glass beads to the crucible. Wash the precipitate with hot water and 10 mL of alcohol. Dry the crucible and contents at 110° to constant weight, and make any necessary correction. The corrected weight of the precipitate so obtained is not less than 193.6 mg and not more than 234.5 mg, corresponding to between 90.0 and 110.0 mg of invert sugar (C<sub>6</sub>H<sub>12</sub>O<sub>6</sub>).

## Multiple Electrolytes and Invert Sugar Injection Type 2

» Multiple Electrolytes and Invert Sugar Injection Type 2 is a sterile solution of a mixture of equal amounts of Dextrose and Fructose, or an equivalent solution produced by the hydrolysis of Sucrose, and suitable salts in Water for Injection to provide sodium, potassium, magnesium, calcium, chloride, and lactate ions. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of sodium (Na), potassium (K), magnesium (Mg), calcium (Ca), lactate (C<sub>3</sub>H<sub>5</sub>O<sub>3</sub>), and invert sugar (C<sub>6</sub>H<sub>12</sub>O<sub>6</sub>), and not less than 90.0 percent and not more than 120.0 percent of the labeled amount of chloride (Cl). It may contain Hydrochloric Acid or Sodium Hydroxide used to adjust the pH. It contains no antimicrobial agents.

**Packaging and storage**—Preserve in single-dose glass or plastic containers. Glass containers are preferably of Type I or Type II glass.

**Labeling**—The label states the content of each electrolyte in terms of milliequivalents in a given volume. The label states the total osmolar concentration in mOsmol per L. When the contents are less than 100 mL, the label alternatively may state the total osmolar concentration in mOsmol per mL.

**USP Reference standards** <11>—

USP Sodium Lactate RS

**Identification**—

**A:** It responds to the *Identification* test under *Invert Sugar Injection*.

**B:** It responds to the flame tests for *Sodium* <191> and *Potassium* <191>, to the tests for *Magnesium* <191> and *Chloride* <191>, and to the oxalate test for *Calcium* <191>.

**C:** The retention time of the lactate peak in the chromatogram of the *Assay preparation* corresponds to that of the

Standard preparation obtained as directed in the Assay for lactate.

**Pyrogen**—It meets the requirements of the Pyrogen Test (151). [NOTE—Dilute, with Water for Injection, Injection containing more than 10% of invert sugar to give a concentration of 10% invert sugar.]

**pH** (791): between 4.5 and 6.0.

**Completeness of inversion—**

*Mobile phase, Standard preparation, and Chromatographic system*—Prepare as directed in the test for Completeness of inversion under Invert Sugar Injection.

*Test preparation*—Transfer an accurately measured volume of Injection, equivalent to about 2.5 g of invert sugar, to a 100-mL volumetric flask, dilute with water to volume, and mix.

*Procedure*—Proceed as directed for Procedure in the test for Completeness of inversion under Invert Sugar Injection. Calculate the quantity, in mg, of sucrose in the volume of Injection taken by the formula:

$$100C(r_u / r_s)$$

in which the terms are as defined therein. Not more than 1.5% of the quantity of invert sugar in the volume of Injection taken, based on the labeled amount, is found.

**Other requirements**—It meets the requirements under Injections (1).

**Assay for potassium and sodium—**

*Internal standard solution, Potassium stock solution, Sodium stock solution, Stock standard preparation, and Standard preparation*—Prepare as directed in the Assay for potassium and sodium under Potassium Chloride in Sodium Chloride Injection.

*Assay preparation*—Transfer 5.0 mL of Injection to a 500-mL volumetric flask, dilute with Internal standard solution to volume, and mix.

*Procedure*—Proceed as directed for Procedure in the Assay for potassium and sodium under Potassium Chloride in Sodium Chloride Injection. Calculate the quantity, in mg, of potassium (K) in each mL of the Injection taken by the formula:

$$C(R_{U,766} / R_{U,671})(R_{S,671} / R_{S,766})$$

in which the terms are as defined therein. Each mg of potassium is equivalent to 0.02558 mEq of potassium. Calculate the quantity, in mg, of sodium (Na) in each mL of the Injection taken by the formula:

$$C(R_{U,589} / R_{U,671})(R_{S,671} / R_{S,589})$$

in which the terms are as defined therein. Each mg of sodium is equivalent to 0.04350 mEq of sodium.

**Assay for magnesium**—[NOTE—Concentrations of the Standard preparations and the Assay preparation may be modified to fit the linear or working range of the atomic absorption spectrophotometer.]

*Lanthanum chloride solution, Dilute hydrochloric acid, Blank solution, Magnesium stock solution, and Standard preparations*—Prepare as directed in the Assay for magnesium under Multiple Electrolytes Injection Type 1.

*Assay preparation*—Transfer an accurately measured volume of Injection, equivalent to about 20 mg (1.65 mEq) of magnesium, to a 1000-mL volumetric flask containing 50.0 mL of Lanthanum chloride solution. Dilute the contents of the flask with Dilute hydrochloric acid to volume, and mix.

*Procedure*—Proceed as directed for Procedure in the Assay for magnesium under Multiple Electrolytes Injection Type 1. Calculate the quantity, in µg, of magnesium (Mg) in each mL of the Injection taken by the formula:

$$1000(C / V)$$

in which the terms are as defined therein.

**Assay for calcium**—[NOTE—Concentrations of the Standard preparations and the Assay preparation may be modified to fit the linear or working range of the atomic absorption spectrophotometer.]

*Lanthanum chloride solution, Dilute hydrochloric acid, and Blank solution*—Prepare as directed in the Assay for magnesium under Multiple Electrolytes Injection Type 1.

*Calcium stock solution and Standard preparations*—Prepare as directed in the Assay for calcium under Multiple Electrolytes Injection Type 2.

*Assay preparation*—Transfer an accurately measured volume of Injection, equivalent to about 20 mg (1 mEq) of calcium, to a 1000-mL volumetric flask containing 50.0 mL of Lanthanum chloride solution. Dilute the contents of the flask with Dilute hydrochloric acid to volume, and mix.

*Procedure*—Proceed as directed for Procedure in the Assay for calcium under Multiple Electrolytes Injection Type 2. Calculate the quantity, in µg, of calcium in each mL of the Injection taken by the formula:

$$1000(C / V)$$

in which the terms are as defined therein.

**Assay for chloride**—Using the Injection, proceed as directed in the Assay for chloride under Multiple Electrolytes Injection Type 1.

**Assay for lactate—**

*Mobile phase, Resolution solution, Standard preparation, and Chromatographic system*—Prepare as directed in the Assay for lactate under Multiple Electrolytes Injection Type 2.

*Assay preparation*—Where the labeled quantity of lactate is greater than 20 mEq per liter, dilute an accurately measured volume of Injection quantitatively with water to obtain a solution containing about 0.02 mEq of lactate per mL. Where the labeled quantity of lactate is 20 mEq or less per liter, use the undiluted Injection as the Assay preparation.

*Procedure*—Proceed as directed for Procedure in the Assay for lactate under Multiple Electrolytes Injection Type 2. Calculate the quantity, in mEq per liter, of lactate ( $C_3H_5O_3$ ) in the Injection taken by the formula:

$$(C / 112.06)(L / D)(r_u / r_s)$$

in which the terms are as defined therein.

**Assay for invert sugar**—Using the Injection, proceed as directed in the Assay for invert sugar under Multiple Electrolytes and Invert Sugar Injection Type 1.

## Multiple Electrolytes and Invert Sugar Injection Type 3

» Multiple Electrolytes and Invert Sugar Injection Type 3 is a sterile solution of a mixture of equal amounts of Dextrose and Fructose, or an equivalent solution produced by the hydrolysis of Sucrose, and suitable salts in Water for Injection to provide sodium, potassium, chloride, and ammonium ions. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of sodium (Na), potassium (K), ammonium ( $NH_4$ ), and invert sugar ( $C_6H_{12}O_6$ ), and not less than 90.0 percent and not more than 120.0 percent of the labeled amount of chloride (Cl). It may contain Hydrochloric Acid or Sodium Hydroxide used to adjust the pH. It contains no antimicrobial agents.

**Packaging and storage**—Preserve in single-dose glass or plastic containers. Glass containers are preferably of Type I or Type II glass.

**Labeling**—The label states the content of each electrolyte in terms of milliequivalents in a given volume. The label states the total osmolar concentration in mOsmol per L. When the contents are less than 100 mL, the label alternatively may state the total osmolar concentration in mOsmol per mL.

**Identification**—

**A:** It responds to the *Identification* test under *Invert Sugar Injection*.

**B:** It responds to the flame tests for *Sodium* <191> and *Potassium* <191>, and to the tests for *Chloride* <191> and *Ammonium* <191>.

**Pyrogen**—It meets the requirements of the *Pyrogen Test* <151>. [NOTE—Dilute, with Water for Injection, Injection containing more than 10% of invert sugar to give a concentration of 10% invert sugar.]

**pH** <791>: between 3.0 and 5.5.

**Completeness of inversion**—

*Mobile phase, Standard preparation, and Chromatographic system*—Prepare as directed in the test for *Completeness of inversion* under *Invert Sugar Injection*.

*Test preparation*—Transfer an accurately measured volume of Injection, equivalent to about 2.5 g of invert sugar, to a 100-mL volumetric flask, dilute with water to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the test for *Completeness of inversion* under *Invert Sugar Injection*. Calculate the quantity, in mg, of sucrose in the volume of Injection taken by the formula:

$$100C(r_u / r_s)$$

in which the terms are as defined therein. Not more than 1.5% of the quantity of invert sugar in the volume of Injection taken, based on the labeled amount, is found.

**Other requirements**—It meets the requirements under *Injections* <1>.

**Assay for potassium and sodium**—

*Internal standard solution, Potassium stock solution, Sodium stock solution, Stock standard preparation, and Standard preparation*—Prepare as directed in the *Assay for potassium and sodium* under *Potassium Chloride in Sodium Chloride Injection*.

*Assay preparation*—Transfer 5.0 mL of Injection to a 500-mL volumetric flask, dilute with *Internal standard solution* to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the *Assay for potassium and sodium* under *Potassium Chloride in Sodium Chloride Injection*. Calculate the quantity, in mg, of potassium (K) in each mL of the Injection taken by the formula:

$$C(R_{U,766} / R_{U,671})(R_{S,671} / R_{S,766})$$

in which the terms are as defined therein. Each mg of potassium is equivalent to 0.02558 mEq of potassium. Calculate the quantity, in mg, of sodium (Na) in each mL of the Injection taken by the formula:

$$C(R_{U,589} / R_{U,671})(R_{S,671} / R_{S,589})$$

in which the terms are as defined therein. Each mg of sodium is equivalent to 0.04350 mEq of sodium.

**Assay for chloride**—Using the Injection, proceed as directed in the *Assay for chloride* under *Multiple Electrolytes Injection Type 1*.

**Assay for ammonium**—Using the Injection, proceed as directed in the *Assay for ammonium* under *Multiple Electrolytes and Dextrose Injection Type 3*.

**Assay for invert sugar**—Using the Injection, proceed as directed in the *Assay for invert sugar* under *Multiple Electrolytes and Invert Sugar Injection Type 1*.

## Trace Elements Injection

» Trace Elements Injection is a sterile solution in Water for Injection of two or more of the following: Zinc Chloride or Zinc Sulfate, Cupric Chloride or Cupric Sulfate, Chromic Chloride, Manganese Chloride or Manganese Sulfate, Selenious Acid, Sodium Iodide, and Ammonium Molybdate. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of zinc (Zn), copper (Cu), chromium (Cr), manganese (Mn), selenium (Se), iodine (I), and molybdenum (Mo).

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers, preferably of Type I or Type II glass.

**Labeling**—Label the Injection to specify that it is to be diluted to the appropriate strength with Sterile Water for Injection or other suitable fluid prior to administration. The label shows by an appropriate number juxtaposed to the official name, the number of trace elements contained in the Injection according to the following: zinc and copper (2), and then cumulatively, chromium (3), manganese (4), selenium (5), iodine (6), and molybdenum (7). Other combinations are indicated separately by citing the number of trace elements contained in each followed by an asterisk that is repeated with the list of labeled ingredients. Label the Injection for its contents of zinc chloride (ZnCl<sub>2</sub>), zinc sulfate (ZnSO<sub>4</sub> · 7H<sub>2</sub>O), cupric chloride (CuCl<sub>2</sub>), cupric sulfate (CuSO<sub>4</sub>), chromic chloride (CrCl<sub>3</sub>), manganese chloride (MnCl<sub>2</sub>), manganese sulfate (MnSO<sub>4</sub>), selenious acid (H<sub>2</sub>SeO<sub>3</sub>), sodium iodide (NaI), and ammonium molybdate [(NH<sub>4</sub>)Mo<sub>7</sub> · 4H<sub>2</sub>O], and for elemental zinc (Zn), copper (Cu), chromium (Cr), manganese (Mn), selenium (Se), iodine (I), and molybdenum (Mo), as appropriate in relation to the ingredients claimed to be present.

**Identification**—

**A:** The *Assay preparation* prepared as directed in the *Assay for zinc*, the *Assay for copper*, the *Assay for chromium*, the *Assay for manganese*, the *Assay for selenium*, and the *Assay for molybdenum*, as appropriate, based on the elements claimed in the labeling to be present, exhibit maximum absorption at the relevant wavelengths specified when tested as directed for the *Procedures* in the respective *Assays*.

**B:** If iodine is claimed in the labeling to be present, the retention time of the iodine peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation* as obtained in the *Assay for iodine*.

**Pyrogen**—When diluted with Sodium Chloride Injection so that each mL contains not more than 20 µg of zinc, 20 µg of copper, 0.1 µg of chromium, 4 µg of manganese, 4 µg of selenium, 5 µg of iodine, or 5 µg of molybdenum, it meets the requirements of the *Pyrogen Test* <151>.

**pH** <791>: between 1.5 and 3.5.

**Particulate matter** <788>: meets the requirements.

**Other requirements**—It meets the requirements under *Injections* <1>.

**Assay for zinc**—

*Standard preparations*—Prepare as directed in the *Assay* under *Zinc Chloride Injection*.

**Assay preparation**—Using the Injection, proceed as directed for *Assay preparation* in the Assay under *Zinc Chloride Injection*.

**Procedure**—Proceed as directed for *Procedure* in the Assay under *Zinc Chloride Injection*. Calculate the quantity, in  $\mu\text{g}$ , of zinc (Zn) in each mL of the Injection taken by the formula:

$$5C/V$$

in which C is the concentration, in  $\mu\text{g}$  per mL, of zinc in the *Assay preparation*, and V is the volume, in mL, of Injection taken.

#### **Assay for copper—**

**Sodium chloride solution, Copper stock solution, and Standard preparations**—Prepare as directed in the Assay preparation under *Cupric Chloride Injection*.

**Assay preparation**—Using the Injection, proceed as directed for the *Assay preparation* in the Assay under *Cupric Chloride Injection*.

**Procedure**—Proceed as directed for *Procedure* in the Assay preparation under *Cupric Chloride Injection*. Calculate the quantity, in mg, of copper (Cu) in each mL of the Injection taken by the formula:

$$2C/3V$$

in which C is the concentration, in  $\mu\text{g}$  per mL, of copper in the *Assay preparation*, and V is the volume, in mL, of Injection taken.

#### **Assay for chromium (if present)—**

INJECTIONS CONTAINING 3  $\mu\text{g}$  OR MORE OF Cr PER mL—

**Sodium chloride solution, Chromium stock solution, Standard preparations, Assay preparation, and Procedure**—Proceed as directed in the Assay under *Chromic Chloride Injection*. Calculate the quantity, in  $\mu\text{g}$ , of chromium (Cr) in each mL of the Injection taken by the formula:

$$25C/V$$

in which C is the concentration, in  $\mu\text{g}$  per mL, of chromium in the *Assay preparation*, and V is the volume, in mL, of Injection taken.

INJECTIONS CONTAINING LESS THAN 3  $\mu\text{g}$  OF Cr PER mL—

**Sodium chloride solution and Chromium stock solution**—Proceed as directed in the Assay under *Chromium Chloride Injection*.

**Standard preparations**—Prepare as directed in the Assay under *Chromic Chloride Injection*. If the Injection is not labeled as containing sodium chloride, omit the addition of the *Sodium chloride solution*.

**Assay preparation**—Use the undiluted Injection.

**Procedure**—Proceed as directed for *Procedure* in the Assay under *Chromic Chloride Injection*. Calculate the quantity, in  $\mu\text{g}$ , of chromium (Cr) in each mL of the Injection taken by the formula:

$$25C/V$$

in which C is the concentration, in  $\mu\text{g}$  per mL, of chromium in the *Assay preparation*, and V is the volume, in mL, of Injection taken.

#### **Assay for manganese (if present)—**

**Sodium chloride solution, Manganese stock solution, and Standard preparations**—Prepare as directed in the Assay under *Manganese Chloride Injection*.

**Assay preparation**—Using the Injection, proceed as directed for the *Assay preparation* in the Assay under *Manganese Chloride Injection*.

**Procedure**—Proceed as directed for *Procedure* in the Assay under *Manganese Chloride Injection*. Calculate the quantity,

in  $\mu\text{g}$ , of manganese (Mn) in each mL of the Injection taken by the formula:

$$0.5C/V$$

in which C is the concentration, in  $\mu\text{g}$  per mL, of manganese in the *Assay preparation*, and V is the volume, in mL, of Injection taken.

#### **Assay for selenium (if present)—**

**Selenium stock solution and Standard preparations**—Prepare as directed in the Assay under *Selenious Acid Injection*.

**Assay preparation**—Using the Injection, proceed as directed for *Assay preparation* in the Assay under *Selenious Acid Injection*.

**Procedure**—Proceed as directed for *Procedure* in the Assay under *Selenious Acid Injection*. Calculate the quantity, in mg, of selenium (Se) in each mL of the Injection taken by the formula:

$$LC/D$$

in which L is the labeled quantity, in mg per mL, of selenium in the Injection taken, C is the concentration, in  $\mu\text{g}$  per mL, in the *Assay preparation*, and D is the concentration, in  $\mu\text{g}$  of selenium per mL, of the *Assay preparation* on the basis of the labeled quantity in the Injection and the extent of dilution.

#### **Assay for iodine (if present)—**

**Mobile phase**—Prepare a suitable mixture of 0.05 M dibasic sodium phosphate, 0.0025 M cetyltrimethylammonium chloride (prepared by diluting 3.20 g of a 25% solution of cetyltrimethylammonium chloride with water to 1000 mL), and acetonitrile (45:25:25). Filter this mixture through a suitable filter of 0.5  $\mu\text{m}$  or finer porosity, adjust with phosphoric acid to a pH of  $6.8 \pm 0.1$ , and mix. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparations**—Transfer about 52 mg of potassium iodide, accurately weighed, to a 250-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 200-mL volumetric flask, dilute with water to volume, and mix. This solution contains about 5.2  $\mu\text{g}$  of potassium iodide per mL (equivalent to about 4  $\mu\text{g}$  of iodine per mL).

**Assay preparation**—Dilute an accurately measured volume of Injection quantitatively with water to obtain a solution containing about 4  $\mu\text{g}$  of iodine per mL.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 226-nm detector, a precolumn containing packing L3, and a  $4.6 \times 25\text{-cm}$  column that contains packing L1. The flow rate is about 2.5 mL per minute. [NOTE—Equilibrate the column with *Mobile phase* recirculating at a rate of about 1 mL per minute for at least 12 hours before use.] Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the tailing factor for the iodine peak is not more than 2, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu\text{L}$ ) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the iodine peaks. Calculate the quantity, in  $\mu\text{g}$ , of iodine in each mL of the Injection taken by the formula:

$$(126.9 / 166.0)(CL / D)$$

in which 126.9 is the atomic weight of iodine, 166.0 is the molecular weight of potassium iodide, C is the concentration, in  $\mu\text{g}$  per mL, of potassium iodide, calculated on the dried basis, in the *Standard preparation*, L is the labeled concentration, in  $\mu\text{g}$  per mL, of iodine in the Injection, and D is the concentration, in  $\mu\text{g}$  per mL, of iodine in the *Assay prep-*

aration based on the labeled concentration and the extent of dilution.

#### Assay for molybdenum (if present)—

Ammonium hydroxide diluent, Sodium sulfate solution, Molybdenum stock solution, and Standard preparations—Prepare as directed in the Assay under Ammonium Molybdate Injection.

Assay preparation—Using the Injection, proceed as directed for the Assay preparation in the Assay under Ammonium Molybdate Injection.

Procedure—Proceed as directed for Procedure in the Assay under Ammonium Molybdate Injection. Calculate the quantity, in  $\mu\text{g}$ , of molybdenum (Mo) in each mL of the Injection taken by the formula:

$$25C / V$$

in which C is the concentration, in  $\mu\text{g}$  per mL, of molybdenum in the Assay preparation, and V is the volume, in mL, of Injection taken.

## Elm

### DEFINITION

Elm is the dried inner bark of *Ulmus rubra* Muhl. (*Ulmus fulva* Michx.) (Fam. Ulmaceae).

### IDENTIFICATION

#### • A. MUCILAGINOUS SUBSTANCE

Sample: 1 g of finely powdered Elm

Analysis: Macerate the Sample with 40 mL of cold water for 1 h.

Acceptance criteria: The resulting mixture is of a thick mucilaginous consistency and yellowish brown in color.

#### • B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST

Standard solution: 0.025% rutin in methanol

Sample solution: Extract 1 g of powdered Elm with 10 mL of 60% methanol on a water bath for 15 min. Cool, filter, and concentrate the filtrate to 2.5 mL.

##### Chromatographic system

(See Chromatography <621>, Thin-Layer Chromatography.)

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture, typically 20 cm long (TLC plates)

Application volume: 20  $\mu\text{L}$

Developing solvent system: Ethyl acetate, anhydrous formic acid, glacial acetic acid, and water (100:11:11:27)

Spray reagent: 1% solution of 2-aminoethyl diphenylborinate ester in methanol, followed by a 5% solution of polyethylene glycol 4000 in alcohol

##### Analysis

Samples: Standard solution and Sample solution

Develop the chromatograms in the Developing solvent system until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the chromatographic chamber, and allow to air-dry. Spray the plate with Spray reagent, and examine the plate under UV light at 366 nm.

Acceptance criteria: The  $R_f$  values of the principal spots relative to rutin are 1.05 (blue) and 0.8 (orange).

### SPECIFIC TESTS

#### • BOTANIC CHARACTERISTICS

##### Macroscopic

Unground Elm: Unground Elm occurs as broad, flat, oblong pieces 1–4 mm in thickness. The outer surface is yellow-orange with some brown outer bark or cork layers attached; the inner surface, which is pale yellow,

is marked faintly with striated phloem lines. The fracture is fibrous with projections of five bast bundles.

Powdered Elm: Weak yellowish orange with a distinctive fenugreek-like odor

##### Microscopic

Powdered Elm: Bast fibers are numerous, very long, usually broken, up to 25  $\mu\text{m}$  in diameter, thick-walled, unligified, or with only a thin outer sheath of the wall lignified; have calcium oxalate prisms 10–35  $\mu\text{m}$  in length; have starch grains that are spheroidal, or polygonal, usually 3–15  $\mu\text{m}$  in diameter, occasionally up to 25  $\mu\text{m}$  in length; and have numerous mucilage fragments, frequently lamellated. Cork cells are few or absent.

- **OUTER BARK:** Contains NMT 2% of adhering outer bark
- **ARTICLES OF BOTANICAL ORIGIN, Foreign Organic Matter <561>:** NMT 2%
- **LOSS ON DRYING <731>:** Dry 2 g at 105° to constant weight: it loses NMT 12% of its weight.
- **ARTICLES OF BOTANICAL ORIGIN, Total Ash <561>:** NMT 10% on the dried basis
- **ARTICLES OF BOTANICAL ORIGIN, Acid-Insoluble Ash <561>:** NMT 0.65% on the dried basis

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store in a cool, dry place.

## Emedastine Difumarate

$\text{C}_{17}\text{H}_{26}\text{N}_4\text{O} \cdot 2\text{C}_4\text{H}_4\text{O}_4$  534.56

1*H*-Benzimidazole, 1-(2-ethoxyethyl)-2-(hexahydro-4-methyl-1*H*-1,4-diazepin-1-yl)-, (*E*)-2-butenedioate (1:2). 1-(2-Ethoxyethyl)-2-(hexahydro-4-methyl-1*H*-1,4-diazepin-1-yl)benzimidazole fumarate (1:2) [87233-62-3].

» Emedastine Difumarate contains not less than 98.5 percent and not more than 101.0 percent of  $\text{C}_{17}\text{H}_{26}\text{N}_4\text{O} \cdot 2\text{C}_4\text{H}_4\text{O}_4$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers, at controlled room temperature.

#### USP Reference standards <11>—

USP Emedastine Difumarate RS

#### Identification—

**A:** Infrared Absorption <197K>—

Test specimen—Dry for 3 hours at 105°.

**B:** The retention time of the major peak in the chromatogram of the Test solution corresponds to that of emedastine in the chromatogram of the System suitability solution, as obtained from the Chromatographic purity test.

**C:** Dissolve about 23 mg of Emedastine Difumarate in 25 mL of water. Add 1 mL of a solution prepared by mixing 20 mL of cupric sulfate solution (1 in 5) and 8 mL of pyridine: a precipitate is formed in the blue solution within one minute.

**pH <791>:** between 3.0 and 4.5, in a solution (2 in 1000).

**Loss on drying <731>—**Dry at 105° for 3 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals, Method II** (231): not more than 0.002%.

**Chromatographic purity—**

**Buffer solution**—Dissolve 3.9 g of monobasic sodium phosphate and 2.5 g of sodium dodecyl sulfate in 1.0 L of water. Adjust with phosphoric acid to a pH of 2.4.

**Mobile phase**—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (1:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**System suitability solution**—Prepare a solution in *Mobile phase* containing 0.10 mg of USP Emedastine Difumarate RS and 0.04 mg of 4-methylbenzophenone per mL.

**Standard solution**—Dissolve an accurately weighed quantity of USP Emedastine Difumarate RS in *Mobile phase*, and dilute, stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.003 mg per mL.

**Test solution**—Prepare a solution of Emedastine Difumarate in *Mobile phase* containing about 1.0 mg per mL.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm × 15-cm column that contains 5-μm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.2 for fumaric acid, 1.0 for emedastine, and 2.0 for 4-methylbenzophenone; the resolution, *R*, is not less than 2.0; the column efficiency determined from the emedastine peak is not less than 1500 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 μL) of the *Mobile phase*, *Standard solution*, and *Test solution* into the chromatograph, and record the chromatograms, allowing the elution to continue for a period of not less than twice the retention time of emedastine. Measure the areas for all of the peaks, disregarding the fumaric acid peak and peaks corresponding to those obtained from the *Mobile phase*. Calculate the percentage of each impurity in the portion of Emedastine Difumarate taken by the formula:

$$100(r_i / r_s)$$

in which *r<sub>i</sub>* is the peak response for each impurity obtained from the *Test solution*; and *r<sub>s</sub>* is the peak response for emedastine in the *Standard solution*: not more than 0.3% of any individual impurity is found; and not more than 1.0% of total impurities is found.

**Assay**—Dissolve about 200 mg of Emedastine Difumarate, accurately weighed, in 50.0 mL of glacial acetic acid. Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically, using suitable electrodes (see *Titrimetry* (541)). Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 26.73 mg of C<sub>17</sub>H<sub>26</sub>N<sub>4</sub>O · 2C<sub>4</sub>H<sub>4</sub>O<sub>4</sub>.

## Emedastine Ophthalmic Solution

» Emedastine Ophthalmic Solution is a sterile, aqueous solution containing an amount of Emedastine Difumarate equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of emedastine (C<sub>17</sub>H<sub>26</sub>N<sub>4</sub>O).

**Packaging and storage**—Preserve in tight, light-resistant containers, in a refrigerator or at controlled room temperature.

**USP Reference standards** (11)—

USP Emedastine Difumarate RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** (791): between 5.0 and 8.0.

**Assay—**

**Buffer solution**—Dissolve 13.8 g of monobasic sodium phosphate and 10 mL of triethylamine in 800 mL of water. Adjust with phosphoric acid to a pH of 5.7, dilute with water to 1000 mL, and mix.

**Mobile phase**—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (83:17). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Emedastine Difumarate RS in *Mobile phase* to obtain a solution having a known concentration of about 0.057 mg of emedastine per mL.

**System suitability solution**—Add 50 μL of 30 percent hydrogen peroxide to 2 mL of *Standard preparation*, and heat at 100° for 30 minutes. Add another 2 mL of *Standard preparation*, mix, and use immediately.

**Assay preparation**—Transfer an accurately measured volume of Ophthalmic Solution into a suitable volumetric flask to obtain a solution having a known concentration of about 0.057 mg of emedastine per mL.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 3.9-mm × 15-cm column that contains packing L7. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.0 for emedastine and 1.2 for emedastine *N*-oxide; the resolution, *R*, between emedastine and emedastine *N*-oxide is not less than 1.5; the column efficiency determined from the emedastine peak is not less than 1000 theoretical plates; and the tailing factor is not more than 2.0. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses for emedastine. Calculate the quantity, in mg, of emedastine (C<sub>17</sub>H<sub>26</sub>N<sub>4</sub>O) in each mL of the Ophthalmic Solution taken by the formula:

$$(302.42/534.57)C(V_1/V_2)(r_U/r_S)$$

in which 302.42 and 534.57 are the molecular weights of emedastine and emedastine difumarate, respectively; *C* is the concentration, in mg per mL, of USP Emedastine Difumarate RS in the *Standard preparation*; *V<sub>1</sub>* is the volume, in mL, of the volumetric flask used to prepare the *Assay preparation*; *V<sub>2</sub>* is the volume, in mL, of Ophthalmic Solution taken; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Emetine Hydrochloride

$C_{29}H_{40}N_2O_4 \cdot 2HCl$  553.56

Emetan, 6',7',10,11-tetramethoxy-, dihydrochloride.

Emetine dihydrochloride [316-42-7].

» Emetine Hydrochloride is the hydrochloride of an alkaloid obtained from *Ipecac*, or prepared by methylation of cephaeline, or prepared synthetically. It contains not less than 98.0 percent and not more than 101.5 percent of  $C_{29}H_{40}N_2O_4 \cdot 2HCl$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

**USP Reference standards** (11)—

USP Cephaeline Hydrobromide RS

USP Emetine Hydrochloride RS

**Identification**—

**A:** Infrared Absorption (197K).

**B:** Ultraviolet Absorption (197U)—

*Solution:* 50 µg per mL.

*Medium:* 0.5 N sulfuric acid.

**C:** A solution (1 in 20) responds to the tests for *Chloride* (191).

**Water**, *Method I* (921): between 15.0% and 19.0%.

**Residue on ignition** (281): not more than 0.2%.

**Acidity**—Dissolve 100 mg in 10 mL of water, add 1 drop of methyl red TS, and titrate with 0.020 N sodium hydroxide: not more than 0.5 mL is required to produce a yellow color.

**Limit of cephaeline**—[NOTE—Conduct this test in subdued light until after the chromatogram has been completely developed.]

*Standard preparation*—Dissolve 23 mg of USP Cephaeline Hydrobromide RS in 100.0 mL of methanol.

*Test preparation*—Dissolve 100 mg of Emetine Hydrochloride in 10.0 mL of methanol.

*Spray reagent*—Dissolve 300 mg of *p*-nitroaniline in 25 mL of 2 N hydrochloric acid, and cool to about 4°. Slowly add 5 mL of sodium nitrite solution (1 in 25), maintaining the temperature at about 4°. Freshly prepare the solution for each test.

*Procedure*—Apply 10-µL portions of the *Standard preparation* and the *Test preparation*, respectively, to a suitable thin-layer chromatographic plate coated with a 0.25-mm layer of chromatographic silica gel. Place the plate in a chromatographic tank containing a mixture of 9 volumes of chloroform and 1 volume of diethylamine, and develop the chromatogram until the solvent front has moved about 12 cm. Remove the plate from the tank, and allow the plate to air-dry for 20 minutes. Spray the dried plate with 2.5 N sodium hydroxide solution, and dry at 50° for 5 minutes. Then spray the plate with *Spray reagent*: any cephaeline spot from the *Test preparation* is not larger or more intense than that produced by the *Standard preparation* (2%).

**Assay**—Dissolve about 150 mg of Emetine Hydrochloride, accurately weighed, in 5 mL of glacial acetic acid, warming, if necessary. Allow the solution to cool, add 10 mL of diox-

ane, 5 mL of mercuric acetate TS, and 3 drops of crystal violet TS, and titrate with 0.1 N perchloric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 27.68 mg of  $C_{29}H_{40}N_2O_4 \cdot 2HCl$ .

## Emetine Hydrochloride Injection

» Emetine Hydrochloride Injection is a sterile solution of Emetine Hydrochloride in Water for Injection. It contains an amount of anhydrous emetine hydrochloride ( $C_{29}H_{40}N_2O_4 \cdot 2HCl$ ) equivalent to not less than 84.0 percent and not more than 94.0 percent of the labeled amount of emetine hydrochloride.

**Packaging and storage**—Preserve in single-dose, light-resistant containers, preferably of Type I glass.

**USP Reference standards** (11)—

USP Cephaeline Hydrobromide RS

USP Emetine Hydrochloride RS

USP Endotoxin RS

**Identification**—

**A:** Evaporate 1 mL of Injection on a steam bath to dryness: the residue responds to *Identification test A* under *Emetine Hydrochloride*.

**B:** The Injection responds to *Identification test C* under *Emetine Hydrochloride*.

**Bacterial endotoxins** (85)—It contains not more than 5.4 USP Endotoxin Units per mg of emetine hydrochloride.

**pH** (791): between 3.0 and 5.0.

**Limit of cephaeline**—[NOTE—Conduct this test in subdued light until after the chromatogram has been completely developed.]

*Standard preparation* and *Spray reagent*—Prepare as directed in the test for *Limit of cephaeline* under *Emetine Hydrochloride*.

*Test preparation*—Evaporate 1.0 mL of Injection on a steam bath with the aid of a stream of nitrogen just to dryness. Dissolve the residue in a sufficient volume of methanol to obtain a *Test preparation* having a concentration of 10 mg of emetine hydrochloride per mL.

*Procedure*—Proceed as directed for *Procedure* in the test for *Limit of cephaeline* under *Emetine Hydrochloride*.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—Transfer an accurately measured volume of Injection, equivalent to about 120 mg of emetine hydrochloride, to a suitable extraction apparatus containing about 20 mL of water. Add 6 N ammonium hydroxide until the solution is strongly alkaline, and extract with ether until 0.5 mL of the water layer, slightly acidified with hydrochloric acid, remains unaffected by the addition of a few drops of mercuric-potassium iodide TS. Evaporate the combined ether extracts on a steam bath, allowing the last few mL of the ether to evaporate spontaneously. Add to the residue 2 mL of neutralized alcohol and 30.0 mL of 0.02 N sulfuric acid VS, and warm gently until the alkaloid is dissolved. Cool, add methyl red TS, and titrate the excess acid with 0.02 N sodium hydroxide VS. Each mL of 0.02 N sulfuric acid is equivalent to 5.536 mg of  $C_{29}H_{40}N_2O_4 \cdot 2HCl$ .

## Enalapril Maleate

$C_{20}H_{28}N_2O_5 \cdot C_4H_4O_4$  492.52

L-Proline, 1-[N-[1-(ethoxycarbonyl)-3-phenylpropyl]-L-alanyl]-  
(S), (Z)-2-butenedioate (1:1).

1-[N-[(S)-1-Carboxy-3-phenylpropyl]-L-alanyl]-L-proline 1'-  
ethyl ester, maleate (1:1) [76095-16-4].

» Enalapril Maleate contains not less than 98.0 percent and not more than 102.0 percent of  $C_{20}H_{28}N_2O_5 \cdot C_4H_4O_4$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers, and store at controlled room temperature.

**USP Reference standards** (11)—

USP Enalapril Maleate RS

**Identification**—

**A:** *Infrared Absorption* (197M).

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Specific rotation** (781S): between  $-41.0^\circ$  and  $-43.5^\circ$ .

*Test solution*: 10 mg per mL, in methanol.

**Loss on drying** (731)—Dry it in vacuum at a pressure not exceeding 5 mm of mercury at  $60^\circ$  for 2 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.2%.

**Heavy metals**, *Method II* (231): 0.001%.

**Related compounds**—

*pH 6.8 Phosphate buffer*, *pH 2.5 Phosphate buffer*, *Solution A*, *Solution B*, *Mobile phase*, *Diluent*, *Enalapril diketopiperazine solution*, *System suitability solution*, and *Chromatographic system*—Proceed as directed in the *Assay*.

*Standard solution*—Dissolve an accurately weighed quantity of USP Enalapril Maleate RS in *Diluent*, and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 3  $\mu$ g per mL.

*Test solution*—Use the *Assay preparation*.

*Procedure*—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak area responses. Calculate the percentage of each impurity in the portion of Enalapril Maleate taken by the formula:

$$100(C_S / C_T)(r_i / r_S)$$

in which  $C_S$  is the concentration, in mg per mL, of USP Enalapril Maleate RS in the *Standard solution*;  $C_T$  is the concentration, in mg per mL, of Enalapril Maleate in the *Test solution*;  $r_i$  is the peak area of each impurity obtained from the *Test solution*; and  $r_S$  is the peak area of enalapril obtained from the *Standard solution*: not more than 1.0% of any impurity having a relative retention time of about 1.10 is found; not more than 0.3% of any other individual impurity is found; and not more than 2% of total impurities is found.

**Assay**—

*pH 6.8 Phosphate buffer*—Dissolve 2.8 g of monobasic sodium phosphate in about 900 mL of water in a 1000-mL

volumetric flask. Adjust with a 9 M sodium hydroxide solution to a pH of about 6.8, dilute with water to volume, and mix.

*pH 2.5 Phosphate buffer*—Dissolve 2.8 g of monobasic sodium phosphate in about 900 mL of water in a 1000-mL volumetric flask. Adjust with phosphoric acid to a pH of about 2.5, dilute with water to volume, and mix.

*Solution A*—Prepare a filtered and degassed mixture of *pH 6.8 Phosphate buffer* and acetonitrile (19:1).

*Solution B*—Prepare a filtered and degassed mixture of acetonitrile and *pH 6.8 Phosphate buffer* (33:17).

*Mobile phase*—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Diluent*—Prepare a mixture of *pH 2.5 Phosphate buffer* and acetonitrile (95:5).

*Enalapril diketopiperazine solution*—Carefully place about 20 mg of USP Enalapril Maleate RS in a 100-mL beaker to form a mound on the bottom of the beaker. Place the beaker on a hot plate at about one-half the maximum hot plate temperature setting. Heat for about 5 to 10 minutes until the solid is melted. Immediately remove the beaker from the hot plate, and allow to cool. [NOTE—Avoid overheating to prevent heat-induced degradation, which would give rise to a brown color.] To the cooled residue in the beaker add 50 mL of acetonitrile, and sonicate for a few minutes to dissolve. The solution typically contains, in each mL, between 0.2 mg and 0.4 mg of enalapril diketopiperazine.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Enalapril Maleate RS in *Diluent*, and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.3 mg per mL.

*System suitability solution*—Add 1 mL of *Enalapril diketopiperazine solution* to a 50-mL portion of the *Standard preparation*, and mix.

*Assay preparation*—Transfer about 30 mg of Enalapril Maleate, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 215-nm detector and a 4.1-mm  $\times$  15-cm column that contains packing L21. The flow rate is about 1.5 mL per minute. The column temperature is maintained at  $70^\circ$ . The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0	95	5	equilibration
0-20	95 $\rightarrow$ 40	5 $\rightarrow$ 60	linear gradient
20-25	40	60	isocratic
25-26	40 $\rightarrow$ 95	60 $\rightarrow$ 5	linear gradient
26-30	95	5	isocratic

Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.0 for enalapril and 2.1 for enalapril diketopiperazine; and the resolution,  $R$ , between enalapril and enalapril diketopiperazine is not less than 3.5. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 1.0%.

*Procedure*—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quan-

tity, in mg, of  $C_{20}H_{28}N_2O_5 \cdot C_4H_4O_4$  in the portion of Enalapril Maleate taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Enalapril Maleate RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

#### Add the following:

### ▲Enalapril Maleate Oral Suspension

#### DEFINITION

Enalapril Maleate Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled content of enalapril maleate ( $C_{20}H_{28}N_2O_5 \cdot C_4H_4O_4$ ).

Prepare Enalapril Maleate Oral Suspension 1 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Enalapril Maleate tablets <sup>a</sup> equivalent to	100 mg
Vehicle: a 1:1 mixture of Ora-Sweet <sup>b</sup> (regular or sugar-free) and Ora-Plus <sup>b</sup> , a sufficient quantity to make	100 mL

<sup>a</sup> Vasotec 20-mg tablets, Merck Sharp & Dohme, West Point, PA.

<sup>b</sup> Paddock Laboratories, Minneapolis, MN.

Calculate the required quantity of each ingredient for the total amount to be prepared. Place the required number of tablets in a suitable mortar, and comminute to a fine powder. Add the *Vehicle* in small portions, and triturate to make a smooth paste. Add increasing volumes of the *Vehicle* to make an enalapril maleate liquid that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough of the *Vehicle* to bring to final volume, and mix well.

#### ASSAY

##### • PROCEDURE

**Buffer solution:** 1 M monobasic potassium phosphate, adjusted with phosphoric acid to a pH of 4.0

**Mobile phase:** Acetonitrile, *Buffer solution*, and water (30:2:68). Filter and degas.

**Standard solution:** 0.1 mg/mL of USP Enalapril Maleate RS in *Mobile phase*

**Sample solution:** Shake thoroughly by hand each bottle of Oral Suspension. Pipet 1.0 mL of the Oral Suspension into a 10-mL volumetric flask, and dilute with *Mobile phase* to volume to obtain a solution with a nominal concentration of 0.1 mg/mL of enalapril maleate.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 215 nm

**Column:** 4.6-mm × 25-cm; 5-μm packing L7

**Flow rate:** 1.5 mL/min

**Injection volume:** 20 μL

#### System suitability

**Sample:** *Standard solution*

[NOTE—The retention time for enalapril maleate is about 8.8 min.]

#### Suitability requirements

**Relative standard deviation:** NMT 2.1% for the replicate injections

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of enalapril maleate ( $C_{20}H_{28}N_2O_5 \cdot C_4H_4O_4$ ) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of enalapril maleate in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of enalapril maleate in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

#### SPECIFIC TESTS

• **pH (791):** 4.2–5.3

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at controlled room temperature or at controlled cold temperature.

• **LABELING:** Label it to indicate that it is to be well shaken before use, and to state the *Beyond-Use Date*.

• **BEYOND-USE DATE:** NMT 60 days after the date on which it was compounded, when stored at controlled cold temperature or controlled room temperature

• **USP REFERENCE STANDARDS (11)**

USP Enalapril Maleate RS<sup>▲</sup><sub>USP36</sub>

### Enalapril Maleate Tablets

» Enalapril Maleate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{20}H_{28}N_2O_5 \cdot C_4H_4O_4$ .

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards (11)**—

USP Enalapril Maleate RS

USP Enalaprilat RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation* as obtained in the *Assay*.

**Dissolution (711)**—

**Medium:** pH 6.8 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*); 900 mL.

**Apparatus 2:** 50 rpm.

**Time:** 30 minutes.

**Procedure**—Determine the amount of  $C_{20}H_{28}N_2O_5 \cdot C_4H_4O_4$  dissolved as directed for *Procedure for content uniformity* under *Uniformity of dosage units* except to use pH 6.8 phosphate buffer instead of the *Buffer solution* to prepare the *Standard preparation*, to use a filtered portion of the solution under test as the *Test preparation*, and to make any necessary modifications for appropriate sample and standard concentrations.

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_{20}H_{28}N_2O_5 \cdot C_4H_4O_4$  is dissolved in 30 minutes.

**Uniformity of dosage units (905):** meet the requirements.

PROCEDURE FOR CONTENT UNIFORMITY—

**Buffer solution and Mobile phase**—Prepare as directed in the *Assay*.

**Standard preparation**—Transfer about 10 mg of USP Enalapril Maleate RS to a 100-mL volumetric flask. Add about 50 mL of *Buffer solution*, shake, and use sonication if

necessary to dissolve. Dilute with *Buffer solution* to volume, and mix to obtain a solution having a known concentration of about 0.1 mg of USP Enalapril Maleate RS per mL.

**Test preparation**—Transfer one Tablet to a volumetric flask of capacity such that, when filled to volume, will produce a solution having a concentration of about 0.1 mg of enalapril maleate per mL. Proceed as directed for *Assay preparation* in the *Assay*, beginning with “Add a volume of *Buffer solution* that is about one-half the nominal volume of the flask.”

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm × 25-cm column that contains 5-μm packing L7. The column temperature is maintained at 50°, and the flow rate is about 2 mL per minute. Chromatograph the *Standard preparation* and record the peak responses as directed for *Procedure*: the column efficiency is not less than 300 theoretical plates; the tailing factor is not more than 2.0; the capacity factor,  $K'$ , is not less than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%. [NOTE—The enalapril peak tailing factor may be minimized by controlling the column temperature between 45° and 50° and by raising the pH of the aqueous component of the *Mobile phase* from 2.2 to 2.6; the capacity factor may be increased by decreasing the amount of acetonitrile in the *Mobile phase*.]

**Procedure**—Separately inject equal volumes (about 50 μL) of the *Test preparation* and the *Standard preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{20}H_{28}N_2O_5 \cdot C_4H_4O_4$  in the Tablet taken by the formula:

$$(TC/D)(r_U / r_S)$$

in which  $T$  is the labeled quantity, in mg, of enalapril maleate in the Tablet;  $C$  is the concentration, in mg per mL, of USP Enalapril Maleate RS in the *Standard preparation*;  $D$  is the concentration, in mg per mL, of enalapril maleate in the *Test preparation*, based upon the labeled quantity per Tablet and the extent of dilution; and  $r_U$  and  $r_S$  are the enalapril peak responses obtained from the *Test preparation* and the *Standard preparation*, respectively.

#### Related compounds—

*Buffer solution*, *Mobile phase*, *Enalaprilat standard solution*, *Enalapril diketopiperazine solution*, *System suitability solution*, *Standard preparation*, and *Chromatographic system*—Proceed as directed in the *Assay*.

**Test preparation**—Use the *Assay preparation*.

**Related compounds standard solution**—Transfer 1.0 mL of the *Standard preparation* to a 100-mL volumetric flask, dilute with *Buffer solution* to volume, and mix.

**Procedure**—Separately inject equal volumes (about 50 μL) of the *Standard preparation*, the *Test preparation*, the *Related compounds standard solution*, and the *Buffer solution*, into the chromatograph, record the chromatograms, and measure the responses for all of the peaks in the *Test preparation* greater than 0.1% of the response of the enalapril peak that are not observed in the *Buffer solution*. Calculate the percentage of anhydrous enalaprilat (as enalapril maleate) present in the portion of Tablets taken by the formula:

$$(492.52/348.39)(CV/N)(r_U / r_S)(100/L)$$

in which 492.52 and 348.39 are the molecular weights of enalapril maleate and anhydrous enalaprilat, respectively;  $C$  is the concentration, in mg per mL, of USP Enalaprilat RS in the *Standard preparation*;  $V$  is the nominal capacity, in mL, of the volumetric flask containing the *Test preparation*;  $N$  is the number of Tablets taken for the *Test preparation*;  $r_U$  and  $r_S$  are the enalaprilat peak responses obtained from the *Test preparation* and the *Standard preparation*, respectively; and  $L$  is the labeled amount of enalapril maleate in the Tablet.

Calculate the percentage of enalapril diketopiperazine (as enalapril maleate) present in the portion of Tablets taken by the formula:

$$(492.52/358.44)(C'V/N)(r_U / 1.25 r_S)(100/L)$$

in which 492.52 and 358.44 are the molecular weights of enalapril maleate and enalapril diketopiperazine, respectively;  $C'$  is the concentration, in mg per mL, of USP Enalapril Maleate RS in the *Related compounds standard solution*;  $V$  is the nominal capacity, in mL, of the volumetric flask containing the *Test preparation*;  $N$  is the number of Tablets taken for the *Test preparation*;  $r_U$  is the enalapril diketopiperazine peak response obtained from the *Test preparation*; 1.25 is the response for enalapril diketopiperazine relative to that for enalapril maleate;  $r_S$  is the enalapril peak response obtained from the *Related compounds standard solution*; and  $L$  is the labeled amount, in mg, of enalapril maleate in the Tablet.

Calculate the percentage of any other related compound by the formula:

$$(C'V/N)(r_R / r_S)(100/L)$$

in which  $r_R$  is the sum of the responses of any related compound, other than those from maleic acid, enalapril, enalaprilat, and enalapril diketopiperazine obtained from the *Test preparation*;  $r_S$  is the enalapril peak response obtained from the *Related compounds standard solution*; and  $C'$ ,  $V$ ,  $N$ , and  $L$  are as defined above: the sum of all related compounds including those from enalaprilat and enalapril diketopiperazine is not greater than 5.0%.

#### Assay—

**Buffer solution**—Dissolve 1.38 g of monobasic sodium phosphate in about 800 mL of water. Adjust with phosphoric acid to a pH of 2.2, dilute with water to 1000 mL, and mix.

**Mobile phase**—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (75:25). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Enalaprilat standard solution**—Dissolve an accurately weighed quantity of USP Enalaprilat RS in water to obtain a solution having a known concentration of about 0.4 mg per mL.

**Enalapril diketopiperazine solution**—Carefully place about 20 mg of USP Enalapril Maleate RS in a 100-mL beaker to form a mound on the bottom of the beaker. Place the beaker on a hot plate at about one-half the maximum hot plate temperature setting to melt the solid. When melting is observed, (after 5 to 10 minutes of heating), immediately remove the beaker from the hot plate, and allow it to cool. [NOTE—Avoid over heating beyond the melting initially observed to prevent heat-induced degradation, which would give rise to a brown color.] To the cooled residue in the beaker add 50 mL of acetonitrile and sonicate for a few minutes to dissolve the residue. The solution typically contains, in each mL, between 0.2 mg and 0.4 mg of enalapril diketopiperazine.

**Standard preparation**—Transfer about 20 mg of USP Enalapril Maleate RS, accurately weighed, to a 100-mL volumetric flask. Transfer 0.5 mL of *Enalaprilat standard solution* to the flask, and add about 50 mL of *Buffer solution* to dissolve, using sonication if necessary. Dilute with *Buffer solution* to volume, and mix to obtain a solution having known concentrations of about 0.2 mg of USP Enalapril Maleate RS per mL and 0.002 mg of USP Enalaprilat RS per mL.

**System suitability solution**—Transfer 0.5 mL of *Enalapril diketopiperazine solution* to a 25-mL volumetric flask, dilute with *Standard preparation* to volume, and mix.

**Assay preparation**—Transfer not fewer than 10 Tablets to a volumetric flask of capacity such that, when filled to volume, will produce a solution having a concentration of

about 0.2 mg of enalapril maleate per mL. Add a volume of *Buffer solution* that is about one-half the nominal volume of the flask, sonicate for 15 minutes, and shake by mechanical means for 30 minutes. Dilute with *Buffer solution* to volume, shake well, and sonicate for 15 minutes. Pass through a filter of 0.45- $\mu$ m or finer porosity, discarding the first portion of the filtrate.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm  $\times$  25-cm column that contains 5- $\mu$ m packing L7. The column temperature is maintained at 50°, and the flow rate is about 2 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.3 for maleic acid, 0.5 for enalaprilat, 1.0 for enalapril, and 1.5 for enalapril diketopiperazine. [NOTE—A peak response for heat-induced degradation product of enalapril diketopiperazine (if present with relative retention time about 1.2) is not greater than 15% of the response for enalapril diketopiperazine.] The column efficiency is not less than 1000 theoretical plates for enalaprilat, not less than 300 theoretical plates for enalapril, and not less than 2500 theoretical plates for enalapril diketopiperazine; the tailing factor for enalapril is not more than 2.0; the resolution, *R*, between maleic acid and enalaprilat is not less than 2.0, between enalaprilat and enalapril is not less than 2.0, and between enalapril and enalapril diketopiperazine is not less than 2.0. Chromatograph the *Standard preparation* as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0% for the enalapril peak, and responses for the enalaprilat peak agree within 5%.

**Procedure**—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of enalapril maleate ( $C_{20}H_{28}N_2O_5 \cdot C_4H_4O_4$ ) in each Tablet taken by the formula:

$$(CV/N)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Enalapril Maleate RS in the *Standard preparation*; *V* is the nominal capacity, in mL, of the volumetric flask containing the *Assay preparation*; *N* is the number of Tablets taken for the *Assay preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the enalapril peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Enalapril Maleate and Hydrochlorothiazide Tablets

» Enalapril Maleate and Hydrochlorothiazide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of Enalapril Maleate ( $C_{20}H_{28}N_2O_5 \cdot C_4H_4O_4$ ) and Hydrochlorothiazide ( $C_7H_8ClN_3O_4S_2$ ).

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** <11>—

USP Enalaprilat RS

USP Enalapril Maleate RS

USP Hydrochlorothiazide RS

**Identification**—

**A:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for enalapril maleate*.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for hydrochlorothiazide*.

**Dissolution** <711>—

*Medium*: water; 900 mL.

*Apparatus 2*: 50 rpm.

*Time*: 30 minutes.

Determine the amount of  $C_{20}H_{28}N_2O_5 \cdot C_4H_4O_4$  dissolved, using filtered portions of the solution under test and following the *Procedure for content uniformity of enalapril maleate* in the test for *Uniformity of dosage units*, making any necessary volumetric adjustments, in comparison with a Standard solution of USP Enalapril Maleate RS having similar concentrations in the same *Medium*.

Determine the amount of  $C_7H_8ClN_3O_4S_2$  dissolved by employing UV absorption at the wavelength of maximum absorbance at about 320 nm and at 360 nm in 1-cm cells, on filtered portions of the solution under test, suitably diluted with *Medium*, in comparison with a Standard solution having a known concentration of USP Hydrochlorothiazide RS dissolved in 20 mL of methanol and diluted with *Medium*. Calculate the quantity, in mg, of hydrochlorothiazide dissolved by the formula:

$$(TC/D)(A_{320} - A_{360})_U / (A_{320} - A_{360})_S$$

in which *T* is the Tablet label claim, in mg, for hydrochlorothiazide; *C* is the concentration, in mg per mL, of hydrochlorothiazide in the Standard solution; *D* is the concentration, in mg per mL, of hydrochlorothiazide in the solution under test; and  $(A_{320} - A_{360})_U$  and  $(A_{320} - A_{360})_S$  are the differences in the absorbances at 320 and 360 nm of the solution under test and the Standard solution, respectively.

**Tolerances**—Not less than 80% (*Q*) of the labeled amount of enalapril maleate ( $C_{20}H_{28}N_2O_5 \cdot C_4H_4O_4$ ) and not less than 60% (*Q*) of the labeled amount of hydrochlorothiazide ( $C_7H_8ClN_3O_4S_2$ ) are dissolved in 30 minutes.

**Uniformity of dosage units** <905>: meet the requirements.

PROCEDURE FOR CONTENT UNIFORMITY OF ENALAPRIL MALEATE—

**Buffer solution A**—Dissolve 136 g of monobasic potassium phosphate in 800 mL of water, adjust with phosphoric acid to a pH of 4.0, dilute with water to 1000 mL, and mix.

**Buffer solution B**—Transfer 20.0 mL of *Buffer solution A* to a 1000-mL volumetric flask, dilute with water to volume, and mix.

**Mobile phase**—Prepare a filtered and degassed mixture of water, acetonitrile, and *Buffer solution A* (34:15:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard solution**—Dissolve an accurately weighed quantity of USP Enalapril Maleate RS in *Buffer solution B* to obtain a solution having a known concentration of about 100  $\mu$ g per mL.

**Test solution**—Transfer one finely powdered Tablet to a 50-mL volumetric flask, add about 30 mL of *Buffer solution B*, and sonicate for 15 minutes. Shake by mechanical means for 30 minutes, dilute with *Buffer solution B* to volume, sonicate for 30 minutes, mix, and filter, discarding the first portion of the filtrate. Dilute a portion of the filtrate with *Buffer solution B* quantitatively to obtain a solution containing about 100  $\mu$ g per mL.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm  $\times$  20-cm column containing 10- $\mu$ m packing L7 and maintained at a temperature of 80°. The flow rate is about 2 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the capacity factor, *k'*, is not less than 2.5; the column efficiency determined from the analyte peak is not less than 1000 theoretical plates; the tailing factor for the

analyte peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 50  $\mu$ L) of the *Test solution* and the *Standard solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{20}H_{28}N_2O_5 \cdot C_4H_4O_4$  in the Tablet taken by the formula:

$$(TC/D)(r_U / r_S)$$

in which  $T$  is the labeled quantity, in mg, of enalapril maleate in the Tablet;  $C$  is the concentration, in  $\mu$ g per mL, of USP Enalapril Maleate RS in the *Standard solution*;  $D$  is the concentration, in  $\mu$ g per mL, of enalapril maleate in the *Test solution*; based upon the labeled quantity per Tablet and the extent of dilution; and  $r_U$  and  $r_S$  are the enalapril peak responses obtained from the *Test solution* and the *Standard solution*, respectively.

#### PROCEDURE FOR CONTENT UNIFORMITY OF HYDROCHLOROTHIAZIDE—

**Buffer solution A** and **Buffer solution B**—Prepare as directed under *Procedure for content uniformity of enalapril maleate*.

**Standard solution**—Transfer about 50 mg of USP Hydrochlorothiazide RS, accurately weighed, to a 200-mL volumetric flask. Add 20 mL of methanol to dissolve the material, dilute with *Buffer solution B* to volume, and mix to obtain a stock solution. Transfer 5.0 mL of the stock solution to a 25-mL volumetric flask, dilute with *Buffer solution B* to volume, and mix to obtain a solution having a known concentration of about 50  $\mu$ g per mL.

**Test solution**—Transfer 1 Tablet to a volumetric flask of a suitable size such that, when the hydrochlorothiazide is dissolved from the Tablet, a solution having a concentration of about 250  $\mu$ g per mL is obtained. Add a volume of *Buffer solution B* equal to about half the capacity of the flask, and sonicate with occasional shaking for 15 minutes. Shake by mechanical means for 30 minutes, dilute with *Buffer solution B* to volume, sonicate for 30 minutes, mix, and filter, discarding the first portion of the filtrate. Transfer 5.0 mL of the clear filtrate to a 25-mL volumetric flask, dilute with *Buffer solution B* to volume, and mix.

**Procedure**—Determine the absorbances of the *Standard solution* and the *Test solution* in 1-cm cells at the wavelength of maximum absorbance at about 320 nm and at 360 nm, with a suitable spectrophotometer, relative to *Buffer solution B* as the blank. Calculate the quantity, in mg, of  $C_7H_8ClN_3O_4S_2$  in the Tablet taken by the formula:

$$(TC / D)(A_{320} - A_{360})_U / (A_{320} - A_{360})_S$$

in which  $T$  is the labeled quantity, in mg, of hydrochlorothiazide in the Tablet;  $C$  is the concentration, in  $\mu$ g per mL, of USP Hydrochlorothiazide RS in the *Standard solution*;  $D$  is the concentration, in  $\mu$ g per mL, of hydrochlorothiazide in the *Test solution*, based upon the labeled quantity per Tablet and the extent of dilution; and the parenthetical expressions are the differences in absorbances of the two solutions at the wavelengths indicated by the subscripts for the *Test solution* ( $U$ ) and the *Standard solution* ( $S$ ), respectively.

#### Related compounds—

**Buffer solution** and **Mobile phase**—Proceed as directed in the *Assay for enalapril maleate*.

**Test solution**—Use the *Assay preparation* prepared as directed in the *Assay for enalapril maleate*.

**Enalaprilat solution**—Transfer about 10 mg of USP Enalaprilat RS, accurately weighed, to a 25-mL volumetric flask, dilute with water to volume, and mix.

**Enalapril diketopiperazine solution**—Carefully place about 20 mg of USP Enalapril Maleate RS in a 100-mL beaker to form a mound on the bottom of the beaker. Place the beaker on a hot plate at about one-half the maximum hot plate temperature setting. Heat for about 5 to 10 minutes

until the solid is melted. Immediately remove the beaker from the hot plate, and allow to cool. [NOTE—Avoid overheating to prevent heat-induced degradation, which would give rise to a brown color.] To the cooled residue in the beaker add 50 mL of acetonitrile, and sonicate for a few minutes to dissolve. The solution typically contains, in each mL, between 0.2 mg and 0.4 mg of enalapril diketopiperazine.

**Standard solution**—Transfer about 40 mg of USP Enalapril Maleate RS, accurately weighed, to a 200-mL volumetric flask, and dissolve with about 50 mL of methanol. Pipet 1 mL each of *Enalaprilat solution* and *Enalapril diketopiperazine solution* into the volumetric flask, dilute with *Buffer solution* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm  $\times$  25-cm column that contains 5- $\mu$ m packing L7. The column temperature is maintained at 65°, and the flow rate is about 1.5 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.3, 0.4, and 1.0 for enalaprilat, enalapril diketopiperazine, and enalapril, respectively; the resolution,  $R$ , between any of the peaks is not less than 1.3; the column efficiency is not less than 700 theoretical plates for enalapril, 1500 for enalaprilat, and 1500 for enalapril diketopiperazine; the tailing factor is not more than 3.5; and the relative standard deviation for replicate injections is not more than 5.0% for enalaprilat and enalapril diketopiperazine and not more than 2.0% for enalapril.

**Procedure**—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the peaks. Calculate the quantity, in mg, of enalaprilat (enalapril related compound A) in the portion of Tablets taken by the formula:

$$0.2C(r_U / r_S)$$

in which  $C$  is the concentration, in  $\mu$ g per mL, of enalaprilat in the *Standard solution*; and  $r_U$  and  $r_S$  are the peak responses of enalaprilat obtained from the *Test solution* and the *Standard solution*, respectively.

Calculate the quantity, in mg, of enalapril diketopiperazine in the portion of Tablets taken by the formula:

$$0.2C(r_U / r_S)$$

in which  $C$  is the concentration, in  $\mu$ g per mL, of enalapril diketopiperazine in the *Standard solution*; and  $r_U$  and  $r_S$  are the peak responses of enalapril diketopiperazine obtained from the *Test solution* and the *Standard solution*, respectively: not more than 5.0% of total related compounds is found, calculated on the basis of the portion of Tablets taken as directed under *Assay for enalapril maleate*.

#### Assay for enalapril maleate—

**Buffer solution**—Transfer 136 mg of monobasic potassium phosphate to a 1000-mL volumetric flask, add 800 mL of water, adjust with phosphoric acid to a pH of 2.0, dilute with water to volume, and mix.

**Mobile phase**—Prepare a degassed and filtered solution of *Buffer solution* and acetonitrile (6:4). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Transfer about 40 mg of USP Enalapril Maleate RS, accurately weighed, to a 200-mL volumetric flask, add about 50 mL of methanol to dissolve, dilute with *Buffer solution* to volume, and mix.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 40 mg of enalapril maleate, to a 200-mL volumetric flask, add about 50 mL of *Buffer solution*, and sonicate for 15 minutes. Add about 50 mL of

methanol to the flask, sonicate for 15 minutes, dilute with *Buffer solution* to volume, mix, and filter.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm × 25-cm column that contains 5-μm packing L7. The column temperature is maintained at 65°, and the flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 700 theoretical plates; the tailing factor is not more than 3.5; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 50 μL) of the *Assay preparation* and the *Standard preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of enalapril maleate (C<sub>20</sub>H<sub>28</sub>N<sub>2</sub>O<sub>5</sub> · C<sub>4</sub>H<sub>4</sub>O<sub>4</sub>) in the portion of Tablets taken by the formula:

$$200C(r_u / r_s)$$

in which C is the concentration, in μg per mL, of USP Enalapril Maleate RS in the *Standard preparation*; and  $r_u$  and  $r_s$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

#### Assay for hydrochlorothiazide—

**Buffer solution**—Prepare as directed under *Assay for enalapril maleate*.

**Mobile phase**—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (9:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Transfer about 20 mg of USP Hydrochlorothiazide RS, accurately weighed, to a 200-mL volumetric flask, add about 50 mL of methanol to dissolve, dilute with *Buffer solution* to volume, and mix.

**Assay preparation**—Prepare as directed for the *Assay preparation* under *Assay for enalapril maleate*, except to weigh a portion of the powdered Tablets equivalent to about 20 mg of hydrochlorothiazide.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 310-nm detector and a 4.6-mm × 20-cm column that contains 10-μm packing L7. The column temperature is maintained at 30°, and the flow rate is about 2.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the capacity factor,  $k'$ , is not less than 2.0; the column efficiency is not less than 1000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 50 μL) of the *Assay preparation* and the *Standard preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of hydrochlorothiazide (C<sub>7</sub>H<sub>8</sub>ClN<sub>3</sub>O<sub>4</sub>S<sub>2</sub>) in the portion of Tablets taken by the formula:

$$200C(r_u / r_s)$$

in which C is the concentration, in μg per mL, of USP Hydrochlorothiazide RS in the *Standard preparation*; and  $r_u$  and  $r_s$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Enalaprilat

C<sub>18</sub>H<sub>24</sub>N<sub>2</sub>O<sub>5</sub> · 2H<sub>2</sub>O 384.42

L-Proline, 1-[N-(1-carboxy-3-phenylpropyl)-L-alanyl]-, dihydrate, (S)-.

1-[N-[(S)-1-Carboxy-3-phenylpropyl]-L-alanyl]-L-proline dihydrate [84680-54-6].

» Enalaprilat contains not less than 98.0 percent and not more than 101.0 percent of C<sub>18</sub>H<sub>24</sub>N<sub>2</sub>O<sub>5</sub>, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** <11>—

USP Enalaprilat RS

#### Identification—

**A: Infrared Absorption** <197M>—[NOTE—If the spectrum is not comparable to that of the Reference Standard, expose the specimen and Reference Standard to an environment of 98% relative humidity (use a chamber conditioned with a saturated solution of calcium sulfate) for 1 to 3 days to equilibrate them. Prepare dispersions from the equilibrated specimen and Reference Standard, and record the spectra.]

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation* as obtained in the *Assay*.

**Specific rotation** <781S>: between −53.0° and −56.0°.

**Test solution:** 10 mg per mL, in methanol.

**Water, Method I** <921>: between 7.0% and 11.0%.

**Residue on ignition** <281>: not more than 0.2%.

**Heavy metals, Method II** <231>: 0.002%.

#### Assay—

**pH 3 buffer**—Dissolve 1.36 g of monobasic potassium phosphate in 950 mL of water, adjust with phosphoric acid to a pH of 3.0 ± 0.1, dilute with water to 1000 mL, and mix.

**Solvent mixture**—Prepare a mixture of acetonitrile, methanol, and pH 3 buffer (2:2:1). Adjust with phosphoric acid to a pH of 3.0 ± 0.1, and mix.

**Diluent**—Prepare a mixture of pH 3 buffer and *Solvent mixture* (92:8), and filter.

**Mobile phase**—Prepare a filtered and degassed mixture of pH 3 buffer and *Solvent mixture* (85:15). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Enalaprilat RS in *Diluent* to obtain a solution having a known concentration of about 0.3 mg per mL. [NOTE—Use this solution within 24 hours.]

**Assay preparation**—Transfer about 30 mg of Enalaprilat, accurately weighed, to a 100-mL volumetric flask, dissolve in *Diluent*, dilute with *Diluent* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 15-cm column that contains 4-μm packing L1 and is maintained at 70°. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency determined from the analyte peak is not less than 500 theoretical plates; the tailing factor for the analyte peak is not more than 1.7; and the relative standard deviation for replicate injections is not more than 1.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{18}H_{24}N_2O_5$  in the portion of Enalaprilat taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Enalaprilat RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the enalaprilat peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Enalaprilat Injection

» Enalaprilat Injection is a sterile solution of enalaprilat in a suitable vehicle for injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of enalaprilat ( $C_{18}H_{24}N_2O_5$ ).

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers, and store at controlled room temperature.

### USP Reference standards (11)—

USP Benzyl Alcohol RS  
USP Enalaprilat RS  
USP Enalapril Maleate RS  
USP Endotoxin RS

### Identification—

**A:** The retention time of the enalaprilat peak in the chromatogram of the *Assay preparation* corresponds to that of the corresponding peak in the chromatogram of the *Standard preparation*, obtained as directed in the *Assay*.

**Bacterial endotoxins** (85)—It contains no more than 280 USP Endotoxin Units per mg of enalaprilat.

**Sterility** (71): meets the requirements.

**pH** (791): between 6.5 and 7.5.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Osmolality** (785): between 276 to 305 mOsm per kg.

### Related compounds—

**Diluent**—Prepare a mixture of water and acetonitrile (84:16).

**Buffer solution**—Dilute 3.4 mL of phosphoric acid with water to 1 L. Adjust with potassium hydroxide to a pH of 2.5.

**Solution A**—Use a mixture of *Buffer solution* and acetonitrile (84:16).

**Solution B**—Use acetonitrile.

**Mobile phase**—Use variable mixtures of *Solution A* and *Solution B*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Stock solution A**—Dissolve 20 mg of USP Enalaprilat RS in a 100-mL volumetric flask with approximately 80 mL of *Diluent*. Heat at 80° for 24 hours to generate enalaprilat related compound A. Cool the solution to room temperature, and dilute with *Diluent* to volume.

**Stock solution B**—Dissolve 10 mg of USP Enalapril Maleate RS in a 200-mL volumetric flask, and dilute with *Diluent* to volume.

**Stock solution C**—Dissolve accurately weighed quantities of benzyl alcohol, benzaldehyde, and benzoic acid in *Diluent*. Dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of 0.1 mg per mL of each of the three substances.

**System suitability solution**—Pipet 4.0 mL of *Stock solution A*, 5 mL of *Stock solution B*, and 5 mL of *Stock solution C* into a 25-mL volumetric flask, and dilute with *Diluent* to volume to obtain a solution containing about 0.0032 mg per mL of enalaprilat related impurity A, 0.01 mg per mL of enalapril, and 0.02 mg per mL of each of benzyl alcohol, benzaldehyde, and benzoic acid, respectively.

**Test solution**—Transfer an accurately measured volume of Injection, equivalent to about 12.5 mg of enalaprilat, to a 25-mL volumetric flask. Dilute with *Diluent* to volume, and mix.

**Diluted test solution**—Dilute the *Test solution* (1 in 100) with *Diluent* to obtain a solution having a known concentration of 0.005 mg per mL (corresponds to 1% of the *Test solution*).

**Chromatographic system** (see *Chromatography* (621))—The chromatograph is equipped with 215-nm detector and a 4.6-mm  $\times$  15-cm, 5- $\mu$ m column that contains packing L1. The column temperature is maintained at 60°. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as follows:

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–5	97.0	3.0	isocratic
5–20	97→77.5	3→22.5	linear gradient
20–25	77.5→10	22.5→90	linear gradient
25–25.01	10→97	90→3.0	step gradient
25.01–30	97	3.0	re-equilibrium

Chromatograph the *System suitability solution* and the *Diluted test solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between enalapril maleate and enalaprilat related impurity A is not less than 1.2; the capacity factor for enalaprilat is not less than 1.5; and the relative standard deviation of the enalaprilat peak in replicate injections of the *Diluted test solution* is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Diluted test solution* and the *Test solution* into the chromatograph, record the chromatogram, and measure the peak response for enalaprilat in the *Diluted test solution* and all of the peak responses from the *Test solution* that do not correspond to enalaprilat, benzyl alcohol, benzoic acid, benzaldehyde, and benzyl alcohol related compounds (see *Table 1* for RRT). Calculate the percentage of specified and unspecified impurities using the formula:

$$(r_i / r_S)$$

in which  $r_i$  is the peak response for each specified impurity in the *Test solution*; and  $r_S$  is the peak response for enalaprilat in the *Diluted test solution*: the impurities meet the specified limits in *Table 1*.

Table 1

Component	Relative Retention Time (minutes)	Limit (w/w, %)
Enalaprilat heat degradation product	0.6 vs enalaprilat	0.5
Enalaprilat	1 vs enalaprilat	—
Benzyl alcohol	1 vs benzyl alcohol	—
Benzyl alcohol related unknown impurity 1	1.2 vs benzyl alcohol	—
Benzoic acid	1.4 vs benzyl alcohol	—
Benzyl alcohol related unknown impurity 2	1.7 vs benzyl alcohol	—
Benzaldehyde	2.1 vs benzyl alcohol	—
Enalapril maleate	4.7 vs enalaprilat	0.25
Enalaprilat related impurity A	5.1 vs enalaprilat	1.0
Any other unspecified individual impurity	—	0.10
Total impurities	—	2.0

**Change to read:****Benzyl alcohol content** (if present)—

*Buffer solution, Mobile phase, System suitability solution, and Chromatographic system*—Proceed as directed in the Assay.

*Standard solution*—Dissolve an accurately weighed quantity of USP Benzyl Alcohol RS in **Mobile phase**. (ERR 1-Jul-2012) to obtain a solution having a known concentration of 0.72 mg per mL.

*Test solution*—Use the Assay preparation, prepared as directed in the Assay.

*Procedure*—Proceed as directed in the Assay. Calculate the percentage of benzyl alcohol, based on the label claim, in the volume of Injection taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which  $C_S$  is the concentration, in mg per mL, of USP Benzyl Alcohol RS in the *Standard solution*;  $C_U$  is the concentration, in mg per mL, of benzyl alcohol in the *Test solution*; and  $r_U$  and  $r_S$  are the benzyl alcohol peak responses obtained from the *Test solution* and the *Standard solution*, respectively: between 75.0% and 120.0% of the labeled amount is found.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—

*Buffer solution*—Prepare a solution of 0.05 M monobasic potassium phosphate. Adjust with phosphoric acid to a pH of 2.5.

*Mobile phase*—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (84 : 16). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*System suitability preparation*—Use the *Standard preparation*.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Enalaprilat RS and USP Benzyl Alcohol RS in *Buffer solution*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.1 mg per mL of enalaprilat and 0.72 mg per mL of benzyl alcohol.

*Assay preparation*—Transfer an accurately measured volume of Injection, equivalent to about 5 mg of enalaprilat, to a 50-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 215-nm and 258-nm detector (use 215 nm as the initial wavelength, and switch to 258 nm after the elution of enalaprilat and before the elution of benzyl alcohol) and a 4.6-mm×15-cm, 5-μm

column that contains packing L1. The flow rate is about 1.5 mL per minute. The column temperature is maintained at 60°. Chromatograph the *System suitability preparation*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between benzyl alcohol and enalaprilat is not less than 3.0; the tailing factor for benzyl alcohol and the enalaprilat peaks is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 20 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure all of the peak responses. Calculate the quantity, in percentage of the label claim, of enalaprilat ( $C_{18}H_{24}N_2O_5$ ) in the portion of Injection taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which  $C_S$  is the concentration, in mg per mL, of USP Enalaprilat RS in the *Standard preparation*;  $C_U$  is the concentration, in mg per mL, of enalaprilat in the *Assay preparation*, based on the label claim; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Enflurane**

$C_3H_2ClF_5O$  184.49  
Ethane, 2-chloro-1-(difluoromethoxy)-1,1,2-trifluoro-, (±)-; (±)-2-Chloro-1,1,2-trifluoroethyl difluoromethyl ether [13838-16-9].

**DEFINITION**

Enflurane contains NLT 99.9% and NMT 100.0% of enflurane ( $C_3H_2ClF_5O$ ).

**IDENTIFICATION**

- **A. INFRARED ABSORPTION** (197F)

**ASSAY**

- **PROCEDURE**

**Sample solution:** Enflurane

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** GC

**Detector:** Thermal conductivity

**Column:** 4-mm × 3-m stainless steel; packed with 20% liquid phase G4 on 60- to 80-mesh S1A

**Temperatures**

Injection port: 200°

Column: See Table 1.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
60	6	125	0

Carrier gas: Dry helium

Flow rate: 60 mL/min

Injection volume: NMT 30 µL

**Analysis**Sample: *Sample solution*

Calculate the percentage of purity:

$$\text{Result} = (r_U/r_T) \times 100$$

 $r_U$  = peak area of Enflurane $r_T$  = sum of all the peak areas

Acceptance criteria: 99.9%–100.0%

**IMPURITIES**• **CHLORIDE AND SULFATE**, Chloride <221>

Sample: Shake 25 mL with 25 mL of water for 5 min, and allow the liquids to separate completely. Draw off the water layer, and add to it 1 drop of nitric acid and 5 drops of silver nitrate TS.

Acceptance criteria: Any turbidity produced is not greater than that produced in a solution containing 0.35 mL of 0.020 N hydrochloric acid.

• **LIMIT OF FLUORIDE**

[NOTE—Use plasticware throughout this test.]

Buffer: Dissolve 110 g of sodium chloride and 1 g of sodium citrate in 700 mL of water in a 2000-mL volumetric flask. Cautiously add 150 g of sodium hydroxide, and dissolve with shaking. Cool to room temperature, and, while stirring, cautiously add 450 mL of glacial acetic acid to the cooled solution. Cool, add 600 mL of isopropyl alcohol, and dilute with water to volume; the pH of this solution is 5.0–5.5.

Standard stock solution: 1 mg/mL of fluoride ion, prepared as follows. Transfer 221 mg of sodium fluoride, previously dried at 150° for 4 h, to a 100-mL volumetric flask. Add 20 mL of water, and mix to dissolve. Add 1.0 mL of sodium hydroxide solution (1 in 2500), and dilute with water to volume. [NOTE—Store in a tightly closed plastic container.]

Standard solution A: 100 mL of a solution containing 1 µg/mL of fluoride ion in Buffer, from Standard stock solution

Standard solution B: 100 mL of a solution containing 3 µg/mL of fluoride ion in Buffer, from Standard stock solution

Standard solution C: 100 mL of a solution containing 5 µg/mL of fluoride ion in Buffer, from Standard stock solution

Standard solution D: 100 mL of a solution containing 10 µg/mL of fluoride ion in Buffer, from Standard stock solution

Sample stock solution: Enflurane and water (1:1). Shake the Sample stock solution for 5 min, allow the liquids to separate completely, and use the water layer.

Sample solution: Sample stock solution and Buffer (1:1). Use volumetric glassware.

Electrode system: Use a pH meter capable of a minimum reproducibility of ±0.2 mV, equipped with a glass-sleeved, calomel-fluoride, specific-ion electrode system (see pH <791>).

**Analysis**Samples: *Standard solutions* and *Sample solution*

Transfer the solution to a 150-mL beaker, add a polytetrafluoroethylene-coated stirring bar, and immerse the electrodes in the solution. Stir with a magnetic stirrer having an insulated top until equilibrium is obtained (1–2 min), and record the potential, in mV. [NOTE—Rinse and dry the electrodes between measurements, taking care to avoid damaging the crystal of the specific-ion electrode.]

Plot the logarithm of the fluoride-ion concentrations, in µg/mL, of the *Standard solutions* versus the potential, in mV. From the measured potential of the *Sample solution* and the standard curve, determine the concentration, in µg/mL, of fluoride ions in the *Sample solution*.

Acceptance criteria: NMT 10 µg/mL

• **LIMIT OF NONVOLATILE RESIDUE**

Analysis: Allow 10.0 mL to evaporate at room temperature in a tared evaporating dish, dry the residue at 50° for 2 h, and weigh.

Acceptance criteria: NMT 2 mg of residue remains.

**SPECIFIC TESTS**• **SPECIFIC GRAVITY** <841>: 1.516–1.519• **REFRACTIVE INDEX** <831>: 1.3020–1.3038 at 20°• **WATER DETERMINATION**, Method I <921>: NMT 0.14%• **ACIDITY OR ALKALINITY**

Sample: Shake 20 mL of Enflurane with 20 mL of carbon dioxide-free water for 3 min, and allow the layers to separate. Draw off the water layer, add bromocresol purple TS as the indicator, and titrate with 0.010 N sodium hydroxide or 0.010 N hydrochloric acid.

Acceptance criteria: NMT 0.10 mL of 0.010 N sodium hydroxide or NMT 0.60 mL of 0.010 N hydrochloric acid is required for neutralization.

**ADDITIONAL REQUIREMENTS**

• **PACKAGING AND STORAGE**: Preserve in tight, light-resistant containers, and avoid exposure to excessive heat.

• **USP REFERENCE STANDARDS** <11>  
USP Enflurane RS

## Endotoxin Indicator for Depyrogenation

**DEFINITION**

An Endotoxin Indicator is an article (challenge vial of endotoxin or a carrier spiked with endotoxin) designed for use in depyrogenation studies. The endotoxin (a purified lipopolysaccharide) is validated for use in or on an Endotoxin Indicator. The carrier is made from a material appropriate for the intended depyrogenation processes to which it will be subjected. The endotoxin on a carrier is added at a concentration sufficient to allow recovery of a minimum of 1000 USP Endotoxin Units/carrier. The Endotoxin Indicator would allow for accurate indication of at least a 3-log reduction in USP Endotoxin Units during depyrogenation process challenges.

**IDENTIFICATION**• **CHARACTERISTICS**

The endotoxin (lipopolysaccharide) has equivalent characteristics to those of the USP Endotoxin RS.

**PERFORMANCE TESTS**

- **CARRIER:** The carrier should be the same as or chemically similar to the surface or material used for measuring depyrogenation, e.g., glass or stainless steel. If not similar, then the carrier and endotoxin combination must be at least as resistant to the depyrogenation process as the surface or material being measured. The carrier must be depyrogenated, or the inherent endotoxin level of the carrier should be determined before the addition of the endotoxin to the carrier.

• **ENDOTOXIN RECOVERY TESTS**

**Analysis:** Proceed as directed for the relevant technique under *Bacterial Endotoxins Test* (85).

**Acceptance criteria:** The determined endotoxin concentration is within a factor of 2 of the labeled endotoxin concentration.

**SPECIFIC TESTS**• **PURITY****Absence of assay enhancing substances**

**Analysis:** Proceed as directed in the test for interfering factors in *Bacterial Endotoxins Test* (85).

**Acceptance criteria:** The Endotoxin Indicator should contain no substances (e.g., glucans) that can result in enhancement of endotoxin spike recovery.

**Absence of depyrogenation enhancing/inhibiting substances:** No substance (e.g., lactose, albumin, polyethylene glycol) should be present as filler for the endotoxin, as this can result in enhanced or inhibited depyrogenation effects.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Store in the original package under conditions recommended on the label, and protect from light, toxic substances, excessive heat, and moisture. The packaging and container materials do not adversely affect the performance of the article, when used as directed on the labeling.
- **EXPIRATION DATE:** The expiration date is determined on the basis of stability studies from the date of manufacture, which is the date on which the first determination of Endotoxin Units was made.
- **LABELING:** The label states that the article is or may be used as an Endotoxin Indicator. It indicates the concentration in USP Endotoxin Units/indicator and the recommended storage conditions. The labeling states the source of the endotoxin (e.g. species and strain number) and includes instructions for preparation and safe disposal of the indicator. If the carrier is labeled, the label must be either easily removable or heat resistant, with no substances that could interfere with the assay. For Endotoxin Indicator vials, the label must include instructions for removal of the stopper from vials before use. If the stopper is heat resistant and designed to be left in the vial, the maximum processing temperature is stated.
- **DISPOSAL:** For destruction or discard, follow instructions recommended by the manufacturer, or depyrogenate at 250° for NLT 120 min.
- **USP REFERENCE STANDARDS**  
USP Endotoxin RS

**Enoxaparin Sodium**

R =	$X = 15 - 25\%$		$n = 0 \text{ to } 20$
	100-X	H	$n = 1 \text{ to } 21$

[9041-08-1].

**DEFINITION**

Enoxaparin Sodium is the sodium salt of a depolymerized heparin. It is obtained by alkaline depolymerization of heparin benzyl ester. The starting material, heparin, is obtained exclusively from porcine intestinal mucosa. Heparin source material used in the manufacture of Enoxaparin Sodium complies with the compendial requirements stated in the Heparin Sodium monograph. Enoxaparin Sodium consists of a complex set of oligosaccharides that have not yet been completely characterized. The majority of the components have a 4-enopyranose uronate structure at the nonreducing end of their chain. About 20% of the materials contain a 1,6-anhydro derivative on the reducing end of the chain, the range being between 15% and 25%. The weight-average molecular weight of Enoxaparin Sodium is 4500 Da, the range being between 3800 and 5000 Da; about 16% have a molecular weight of less than 2000 Da, the range being between 12.0% and 20.0%; about 74% have a molecular weight between 2000 and 8000 Da, the range being between 68.0% and 82.0%. NMT 18.0% have a molecular weight higher than 8000 Da. When prepared as a solution, the solution is analyzed for clarity and degree of color using a validated method. The degree of sulfation is NLT 1.8 per disaccharide unit. It has a potency of NLT 90 and NMT 125 Anti-Factor Xa International Units (IU)/mg, and NLT 20.0 and NMT 35.0 Anti-Factor IIa IU/mg, calculated on the dried basis. The ratio of Anti-Factor Xa activity to Anti-Factor IIa activity is between 3.3 and 5.3.

**IDENTIFICATION**• **A. ULTRAVIOLET ABSORPTION (197U)**

**Medium:** 0.01 N hydrochloric acid

**Sample solution:** 500 µg/mL

**Acceptance criteria:** The spectra exhibit maxima at  $231 \pm 2$  nm.

• **B. <sup>13</sup>C NMR SPECTRUM**

(See *Nuclear Magnetic Resonance* (761).)

**Standard solution:** Dissolve 200 mg of USP Enoxaparin Sodium RS in a mixture of 0.2 mL of deuterium oxide and 0.8 mL of water. Add 0.05 mL of deuterated methanol to serve as an internal reference.

**Sample solution:** Dissolve 200 mg of Enoxaparin Sodium in a mixture of 0.2 mL of deuterium oxide and 0.8 mL of water. Add 0.05 mL of deuterated methanol.

**Analysis:** Transfer the *Standard solution* and the *Sample solution* to NMR tubes of 5-mm diameter. Using a pulsed (Fourier transform) NMR spectrometer operating at NLT 75 MHz for  $^{13}\text{C}$ , record the  $^{13}\text{C}$  NMR spectra of the *Standard solution* and the *Sample solution* at 40°.

**Acceptance criteria:** The spectra are similar.

- C.** The ratio of the numerical value of the Anti-Factor Xa activity, in Anti-Factor Xa IU/mg, to the numerical value of the Anti-Factor IIa activity, in Anti-Factor IIa IU/mg, as determined by the *Assay (Anti-Factor Xa Activity)* and *Impurities (Anti-Factor IIa Activity)*, respectively, is NLT 3.3 and NMT 5.3.

**D. MOLECULAR WEIGHT DISTRIBUTION AND WEIGHT-AVERAGE MOLECULAR WEIGHT**

**Mobile phase:** Prepare a 0.5 M lithium nitrate solution. Pass through a membrane filter of 0.45- $\mu\text{m}$  or smaller pore size, and degas with helium.

**Standard solution:** 10 mg/mL of USP Enoxaparin Sodium RS in *Mobile phase*

**Sample solution:** 10 mg/mL of Enoxaparin Sodium in *Mobile phase*

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** Size exclusion LC

**Detector:** Differential refractive index

**Column**

**Guard:** 6-mm  $\times$  40-mm; packing L59

**Analytical:** Two 7.8-mm  $\times$  300-mm columns in series; packing L59

**Temperature:** Room temperature

**Flow rate:** 0.6 mL/min maintained constant to  $\pm 1.0\%$

**Analysis:** Reconstitute 1 vial each of USP Enoxaparin Sodium Molecular Weight Calibrant A RS and USP Enoxaparin Sodium Molecular Weight Calibrant B RS in 1 mL of *Mobile phase*. Separately inject 20  $\mu\text{L}$  of USP Enoxaparin Sodium Molecular Weight Calibrant A RS and USP Enoxaparin Sodium Molecular Weight Calibrant B RS, record the chromatograms, and measure the retention times. Inject in duplicate 20  $\mu\text{L}$  each of the *Standard solution* and the *Sample solution*, and record the chromatograms for a length of time to ensure complete elution, including salt and solvent peaks. Calculate the total peak areas under each of the *Standard solution* and *Sample solution* chromatograms, excluding salt and solvent peaks at the end.

**Calibration curve:** Plot the retention times on the *x*-axis against the peak molecular weights on the *y*-axis for the peaks from USP Enoxaparin Sodium Molecular Weight Calibrant A RS and USP Enoxaparin Sodium Molecular Weight Calibrant B RS, and fit the data to a third-order polynomial, using suitable gel permeation chromatography (GPC) software.

**Calculations:** Compute the data, using the same GPC software; determine the weight-average molecular weight,  $M_w$ , for each of the duplicate chromatograms of the *Standard solution* and the *Sample solution*; and take the average for each solution. Correct the mean value of  $M_w$  to the nearest 50. The *Chromatographic system* is suitable if  $M_w$  for USP Enoxaparin Sodium RS is within 150 Da of the labeled  $M_w$  value. The  $M_w$  for the *Sample solution* is between 3800 and 5000 Da. Using the same software, determine for each of the duplicate *Sample solution* chromatograms the percentage of Enoxaparin Sodium chains with molecular weights lower than 2000 Da,  $M_{2000}$ , the percentage of Enoxaparin Sodium chains with molecular weights in the range 2000–8000 Da,  $M_{2000-8000}$ , and the percentage of Enoxaparin Sodium chains with molecular weights greater than 8000 Da,  $M_{8000}$ . Average the duplicate values, and express to the nearest 0.5%.

**Acceptance criteria:**  $M_{2000}$  is between 12.0% and 20.0%,  $M_{2000-8000}$  is between 68.0% and 82.0%, and  $M_{8000}$  is NMT 18.0%.

- E. IDENTIFICATION TESTS—GENERAL, Sodium <191>:** Meets the requirements

**ASSAY**

**• ANTI-FACTOR Xa ACTIVITY**

**Acetic acid solution:** Glacial acetic acid and water (42:58)

**pH 7.4 polyethylene glycol 6000 buffer:** Dissolve 6.08 g of tris(hydroxymethyl)aminomethane and 8.77 g of sodium chloride in 500 mL of water. Add 1.0 g of polyethylene glycol 6000, adjust with hydrochloric acid to a pH of 7.4, and dilute with water to 1000 mL.

**pH 7.4 buffer:** Dissolve 6.08 g of tris(hydroxymethyl)aminomethane and 8.77 g of sodium chloride in 500 mL of water. Adjust with hydrochloric acid to a pH of 7.4, and dilute with water to 1000 mL.

**pH 8.4 buffer:** Dissolve 3.03 g of tris(hydroxymethyl)aminomethane, 5.12 g of sodium chloride, and 1.40 g of edetate sodium in 250 mL of water. Adjust with hydrochloric acid to a pH of 8.4, and dilute with water to 500 mL.

**Human antithrombin III solution:** Reconstitute a vial of antithrombin III (see *Reagents, Indicators, and Solutions—Reagent Specifications*) in water to obtain a solution containing 5 Antithrombin III Units/mL. Dilute this solution with *pH 7.4 polyethylene glycol 6000 buffer* to obtain a solution having a concentration of 1.0 Anti-thrombin III Unit/mL.

**Factor Xa solution:** Reconstitute a weighed quantity of bovine factor Xa (see *Reagents, Indicators, and Solutions—Reagent Specifications*) in *pH 7.4 polyethylene glycol 6000 buffer* to obtain a solution that gives an increase in absorbance value at 405 nm of NMT 0.20 absorbance units/min when assayed as described below but using as an appropriate volume, *V*, the volume in  $\mu\text{L}$  of *pH 7.4 buffer* instead of *V*  $\mu\text{L}$  of the enoxaparin solution.

**Chromogenic substrate solution:** Prepare a solution of a suitable chromogenic substrate for amidolytic test (see *Reagents, Indicators, and Solutions—Reagent Specifications*) for factor Xa in water to obtain a concentration of about 3 mM. Dilute with *pH 8.4 buffer* to obtain a solution having a concentration of 0.5 mM.

**Standard solutions:** Reconstitute the entire contents of an ampul of USP Enoxaparin Sodium for Bioassays RS with water, and dilute with *pH 7.4 buffer* to obtain four dilutions in the concentration range between 0.025 and 0.2 Anti-Factor Xa IU/mL.

**Sample solutions:** Proceed as directed for *Standard solutions* to obtain concentrations of Enoxaparin Sodium similar to those obtained for the *Standard solutions*.

**Analysis**

**Samples:** *Standard solutions*, *Sample solutions*, *Human antithrombin III solution*, *pH 7.4 buffer*, *Factor Xa solution*, *Chromogenic substrate solution*, and *Acetic acid solution*

Label 18 suitable tubes: B1 and B2 for blanks; T1, T2, T3, and T4 each in duplicate for the dilutions of the *Sample solutions*; and S1, S2, S3, and S4 each in duplicate for the dilutions of the *Standard solutions*. [NOTE—Treat the tubes in the order B1, S1, S2, S3, S4, T1, T2, T3, T4, T1, T2, T3, T4, S1, S2, S3, S4, B2.] To each tube add the same volume, *V* (20–50  $\mu\text{L}$ ), of *Human antithrombin III solution* and an equal volume, *V*, of either the blank (*pH 7.4 buffer*) or an appropriate dilution of the *Sample solutions* or the *Standard solutions*. Mix, but do not allow bubbles to form. Incubate at 37° for 1.0 min. Add to each tube 2*V* (40–100  $\mu\text{L}$ ) of *Factor Xa solution*, and incubate for 1.0 min. Add a 5*V* (100–250  $\mu\text{L}$ ) volume of *Chromogenic substrate solution*. Stop the reaction after 4.0 min with a 5*V* (100–250  $\mu\text{L}$ ) volume of *Acetic acid solution*. Measure the absorbance of each solution at 405 nm, using a suitable spectrophotometer (see *Spectrophotometry and Light-Scattering* <851>) against blank B1. The reading of blank B2 relative to blank B1 is NMT  $\pm 0.05$  absorbance unit.

**Calculations:** For each series, calculate the regression of the absorbance against log concentrations of the *Sam-*

ple solutions and of the Standard solutions, and calculate the potency of the Enoxaparin Sodium in IU of Anti-Factor Xa activity/mL, using statistical methods for parallel-line assays. The four independent log relative potency estimates are then combined to obtain the final geometric mean. Its confidence limits are calculated. Express the Anti-Factor Xa activity of Enoxaparin Sodium/mg.

**Acceptance criteria:** The potency is NLT 90 and NMT 125 Anti-Factor Xa IU/mg on the dried basis.

## OTHER COMPONENTS

### • BENZYL ALCOHOL CONTENT

**Mobile phase:** Acetonitrile, methanol, and water (3:1:16)

**Standard solution:** 0.1 mg/mL of USP Benzyl Alcohol RS in water

**Sample solution:** Weigh 0.5 g of Enoxaparin Sodium into a 10-mL volumetric flask, and dissolve in 5.0 mL of 1 N sodium hydroxide. Allow to stand at room temperature for about 1 h. Add 1.0 mL of glacial acetic acid, dilute with water to volume, and mix.

### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 256 nm

**Column:** 4.6-mm × 15-cm stainless steel; packing L7

**Flow rate:** 1.0 mL/min, maintained constant to ±10%

**Injection volume:** 20 µL

### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of benzyl alcohol in the portion of Enoxaparin Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area of benzyl alcohol from the *Sample solution*

$r_S$  = peak area of benzyl alcohol from the *Standard solution*

$C_S$  = concentration of benzyl alcohol in the *Standard solution* (mg/mL)

$C_U$  = concentration of Enoxaparin Sodium in the *Sample solution* (mg/mL)

**Acceptance criteria:** NMT 0.1%

### • NITROGEN DETERMINATION, Method II <461>: 1.8%–2.5% on the dried basis

### • SODIUM CONTENT

(See *Spectrophotometry and Light-Scattering* <851>.)

**Cesium chloride solution:** 1.27 mg/mL of cesium chloride in 0.1 N hydrochloric acid

**Standard solution A:** 0.0025% of sodium chloride in *Cesium chloride solution*

**Standard solution B:** 0.0050% of sodium chloride in *Cesium chloride solution*

**Standard solution C:** 0.0075% of sodium chloride in *Cesium chloride solution*

**Sample solution:** Transfer 50.0 mg of Enoxaparin Sodium to a 100-mL volumetric flask, and dissolve in and dilute with *Cesium chloride solution* to volume.

### Analysis

**Samples:** *Standard solution A*, *Standard solution B*, *Standard solution C*, *Cesium chloride solution*, and *Sample solution*

Concomitantly determine the absorbances of the *Cesium chloride solution* (blank), *Sample solution*, and *Standard solutions* at 330.3 nm, using a sodium hollow-cathode lamp and an air-acetylene flame. Using the absorbances of *Standard solutions A–C*, determine the sodium content in the *Sample solution* after an appropriate blank correction.

**Acceptance criteria:** 11.3%–13.5% on the dried basis

## IMPURITIES

- **HEAVY METALS, Method I <231>:** NMT 30 µg/g, using a 2.7% solution in water

## SPECIFIC TESTS

- **pH <791>:** 6.2–7.7 for a 10.0% solution in water
- **LOSS ON DRYING <731>:** Dry 1 g in a vacuum at 70° for 6 h: it loses NMT 10.0% of its weight.

### • SPECIFIC ABSORBANCE

(See *Spectrophotometry and Light-Scattering* <851>.)

**Sample solution:** 0.5 mg/mL of Enoxaparin Sodium in 0.01 N hydrochloric acid

**Analysis:** Obtain the UV spectra of the *Standard solution* and the *Sample solution* between 200 nm and 300 nm against a 0.01 N hydrochloric acid blank.

Calculate the specific absorbance at the wavelength of maximum absorbance at  $231 \pm 2$  nm, with reference to the dried substance:

$$\text{Result} = A \times 100 \times 1000 / [M \times l \times (100 - E)]$$

$A$  = absorbance at the wavelength of maximum absorbance

$M$  = weight of Enoxaparin Sodium in the *Sample solution* (mg)

$l$  = path length (typically 1 cm)

$E$  = loss on drying (%)

**Acceptance criteria:** 14.0–20.0 on the dried basis

- **BACTERIAL ENDOTOXINS TEST <85>:** It contains NMT 0.01 USP Endotoxin Unit/IU of Anti-Factor Xa activity.

### • ANTI-FACTOR IIa ACTIVITY

**Acetic acid solution, pH 7.4 polyethylene glycol 6000**

**buffer, pH 7.4 buffer, pH 8.4 buffer, and Human antithrombin III solution:** Proceed as directed in the *Assay for Anti-Factor Xa Activity*, except that the concentration of the *Human antithrombin III solution* is 0.5 Antithrombin III Unit/mL.

**Thrombin human solution:** Reconstitute thrombin human (see *Reagents, Indicators and Solutions—Reagent Specifications*) in water, and dilute in *pH 7.4 polyethylene glycol 6000 buffer* to obtain a solution having a concentration of 5 Thrombin Units/mL.

**Chromogenic substrate solution:** Prepare a solution of a suitable chromogenic substrate for an amidolytic test (see *Reagents, Indicators, and Solutions—Reagent Specifications*) for thrombin in water to obtain a concentration of about 3 mM. Immediately before use, dilute with *pH 8.4 buffer* to 0.5 mM.

**Standard solutions:** Reconstitute the entire contents of an ampul of USP Enoxaparin Sodium for Bioassays RS with water, and dilute with *pH 7.4 buffer* to obtain four dilutions having concentrations in the range between 0.015 and 0.075 IU of Anti-Factor IIa activity/mL.

**Sample solutions:** Proceed as directed under *Standard solutions* to obtain concentrations of Enoxaparin Sodium similar to those obtained for the *Standard solutions*.

**Analysis:** Proceed as directed in the *Assay for Anti-Factor Xa Activity*, except to use *Thrombin human solution* instead of *Factor Xa solution* and to use *Human antithrombin III solution* as described above.

**Calculations:** For each series, calculate the regression of the absorbance against log concentrations of the *Sample solutions* and of the *Standard solutions*, and calculate the potency of the Enoxaparin Sodium in IU of Anti-Factor IIa activity/mg, using statistical methods for parallel-line assays. The four independent dilution estimates are then combined to obtain the final weighted mean. Then calculate the confidence limits. Express the Anti-Factor IIa activity of Enoxaparin Sodium/mg.

**Acceptance criteria:** It has a potency of NLT 20.0 and NMT 35.0 Anti-Factor IIa IU/mg on the dried basis.

• **MOLAR RATIO OF SULFATE TO CARBOXYLATE**

**Mobile phase:** Carbon dioxide-free water

**Sample solution:** 5 mg/mL of Enoxaparin Sodium in carbon dioxide-free water

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** Ion

**Column:** Two columns; one 1.5-cm × 2.5-cm column, packed with an anion-exchange resin L64 packing; and one 1.5-cm × 7.5-cm column, packed with a cation-exchange resin L65 packing. The outlet of the anion-exchange column is connected to the inlet of the cation-exchange column.

**Flow rate:** 1 mL/min

**Analysis**

**Sample:** *Sample solution*

[NOTE—Regenerate the anion-exchange column and the cation-exchange column with 1 N sodium hydroxide and 1 N hydrochloric acid, respectively, between two injections.]

Inject the *Sample solution* into the anion-exchange column, and collect the eluate from the cation-exchange column in a beaker at the outlet until the ion detector reading returns to the baseline value. Quantitatively transfer the eluate to a titration vessel containing a magnetic stirring bar, and dilute with carbon dioxide-free water to about 60 mL. Position the titration vessel on a magnetic stirrer, and immerse the electrodes. Note the initial conductivity reading, and titrate with approximately 0.1 N sodium hydroxide added in 100-μL portions. [NOTE—Prepare the sodium hydroxide solution in carbon dioxide-free water.] Record the buret reading and the conductivity meter reading after each addition of the sodium hydroxide solution.

**Calculations:** Plot the conductivity measurements on the y-axis against the volumes of sodium hydroxide added on the x-axis. The graph will have three linear sections—an initial downward slope, a middle slight rise, and a final rise. For each of these sections draw the best-fit straight lines, using linear regression analysis. At the points where the first and second straight lines intersect and where the second and third lines intersect, draw perpendiculars to the x-axis to determine the volumes of sodium hydroxide taken up by the sample at those points. The point where the first and second lines intersect corresponds to the volume of sodium hydroxide taken up by the sulfate groups ( $V_S$ ). The point where the second and third lines intersect corresponds to the volume of sodium hydroxide consumed by the sulfate and the carboxylate groups together ( $V_T$ ). Calculate the molar ratio of sulfate to carboxylate:

$$\text{Result} = V_S / (V_T - V_S)$$

**Acceptance criteria:** The molar ratio of sulfate to carboxylate is NLT 1.8.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store below 40°, preferably at room temperature.
- **USP REFERENCE STANDARDS** (11)
  - USP Benzyl Alcohol RS
  - USP Endotoxin RS
  - USP Enoxaparin Sodium RS
  - USP Enoxaparin Sodium Molecular Weight Calibrant A RS
  - USP Enoxaparin Sodium Molecular Weight Calibrant B RS
  - USP Enoxaparin Sodium for Bioassays RS

## Enoxaparin Sodium Injection

**DEFINITION**

Enoxaparin Sodium Injection is a sterile solution of Enoxaparin Sodium in Water for Injection. Its appearance is analyzed for clarity and degree of color, using a validated method. Its potency value is NLT 90% and NMT 110% of the potency stated on the label in terms of International Anti-Factor Xa Units (IU). It may contain, in multiple-dose containers, a suitable antimicrobial preservative, such as benzyl alcohol.

**IDENTIFICATION**

• **A.**

**Analysis:** Transfer the total contents of a single-dose container or 0.4 mL from a multiple-dose container to a glass test tube, add 2 mL of water and 1 mL of 2% (w/v) protamine sulfate solution, and mix.

**Acceptance criteria:** A creamy white precipitate is formed.

• **B. ULTRAVIOLET ABSORPTION** (197U)

**Medium:** 0.01 N hydrochloric acid

**Standard solution:** 500 μg/mL

**Sample solution:** Transfer the total content of a single-dose container or 0.4 mL from a multiple-dose container to a 100-mL volumetric flask. Dilute with *Medium* to volume.

**Acceptance criteria:** The spectra exhibit maxima at  $231 \pm 2$  nm.

• **C. IDENTIFICATION TESTS—GENERAL, Sodium** (191): Meets the requirements

**ASSAY**

• **ANTI-FACTOR Xa ACTIVITY**

**Acetic acid solution:** Glacial acetic acid and water (42:58)

**pH 7.4 polyethylene glycol 6000 buffer:** Dissolve 6.08 g of tris(hydroxymethyl)aminomethane and 8.77 g of sodium chloride in 500 mL of water. Add 1.0 g of polyethylene glycol 6000, adjust with hydrochloric acid to a pH of 7.4, and dilute with water to 1000 mL.

**pH 7.4 buffer:** Dissolve 6.08 g of tris(hydroxymethyl)aminomethane and 8.77 g of sodium chloride in 500 mL of water. Adjust with hydrochloric acid to a pH of 7.4, and dilute with water to 1000 mL.

**pH 8.4 buffer:** Dissolve 3.03 g of tris(hydroxymethyl)aminomethane, 5.12 g of sodium chloride, and 1.40 g of edetate sodium in 250 mL of water. Adjust with hydrochloric acid to a pH of 8.4, and dilute with water to 500 mL.

**Human antithrombin III solution:** Reconstitute a vial of antithrombin III (see *Reagents, Indicators, and Solutions—Reagent Specifications*) in water to obtain a solution containing 5 Antithrombin III Units/mL. Dilute this solution with *pH 7.4 polyethylene glycol 6000 buffer* to obtain a solution having a concentration of 1.0 Antithrombin III Unit/mL.

**Factor Xa solution:** Reconstitute a weighed quantity of bovine factor Xa (see *Reagents, Indicators, and Solutions—Reagent Specifications*) in *pH 7.4 polyethylene glycol 6000 buffer* to obtain a solution that gives an increase in absorbance value at 405 nm of NMT 0.20 absorbance units/min when assayed as described below but using as an appropriate volume,  $V$ , the volume in μL of *pH 7.4 buffer* instead of  $V$  μL of the enoxaparin solution.

**Chromogenic substrate solution:** Prepare a solution of a suitable chromogenic substrate for an amidolytic test (see *Reagents, Indicators, and Solutions—Reagent Specifications*) for Factor Xa in water to obtain a concentration of about 3 mM. Dilute with *pH 8.4 buffer* to obtain a solution having a concentration of 0.5 mM.

**Standard solutions:** Reconstitute the entire contents of an ampul of USP Enoxaparin Sodium for Bioassays RS

with water, and dilute with *pH 7.4 buffer* to obtain four dilutions in the concentration range between 0.025 and 0.2 Anti-Factor Xa IU/mL.

**Sample solutions:** Proceed as directed for *Standard solutions* to obtain concentrations of Injection similar to those obtained for the *Standard solutions*.

#### Analysis

**Samples:** *Standard solutions*, *Sample solutions*, *Human antithrombin III solution*, *pH 7.4 buffer*, *Factor Xa solution*, *Chromogenic substrate solution*, and *Acetic acid solution*

Label 18 suitable tubes: B1 and B2 for blanks; T1, T2, T3, and T4 each in duplicate for the dilutions of the *Sample solutions*; and S1, S2, S3, and S4 each in duplicate for the dilutions of the *Standard solutions*. [NOTE—Treat the tubes in the order B1, S1, S2, S3, S4, T1, T2, T3, T4, T1, T2, T3, T4, S1, S2, S3, S4, B2.] To each tube add the same volume, *V* (20–50 µL), of *Human antithrombin III solution* and an equal volume, *V*, of either the blank (*pH 7.4 buffer*) or an appropriate dilution of the *Sample solutions* or the *Standard solutions*. Mix, but do not allow bubbles to form. Incubate at 37° for 1.0 min. Add to each tube 2*V* (40–100 µL) of *Factor Xa solution*, and incubate for 1.0 min. Add a 5*V* (100–250 µL) volume of *Chromogenic substrate solution*. Stop the reaction after 4.0 min with a 5*V* (100–250 µL) volume of *Acetic acid solution*. Measure the absorbance of each solution at 405 nm, using a suitable spectrophotometer (see *Spectrophotometry and Light-Scattering* <851>) against blank B1. The reading of blank B2 relative to blank B1 is NMT ±0.05 absorbance unit.

**Calculations:** For each series, calculate the regression of the absorbance against log concentrations of the *Sample solutions* and of the *Standard solutions*, and calculate the potency of the enoxaparin sodium in the Injection in IU of Anti-Factor Xa activity/mL, using statistical methods for parallel-line assays. The four independent log relative potency estimates are then combined to obtain the final geometric mean. Its confidence limits are calculated.

**Acceptance criteria:** The potency is NLT 90% and NMT 110% of the potency stated on the label in terms of International Anti-Factor Xa Units (IU).

- **ANTI-FACTOR Xa TO ANTI-FACTOR IIa RATIO:** The ratio of the numerical value of the Anti-Factor Xa activity in Anti-Factor Xa IU/mL to the numerical value of the Anti-Factor IIa activity in Anti-Factor IIa IU/mL, as determined by *Anti-Factor Xa Activity* and *Anti-Factor IIa Activity*, respectively, is NLT 3.3 and NMT 5.3.

#### OTHER COMPONENTS

##### • BENZYL ALCOHOL CONTENT (IF PRESENT)

**Mobile phase:** Acetonitrile, methanol, and water (3:1:16)

**Standard solution:** 1.5 mg/mL of USP Benzyl Alcohol RS in *Mobile phase*

**Sample solution:** Transfer exactly 5.0 mL of the Injection to a 50-mL volumetric flask. Dilute with *Mobile phase* to volume.

##### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 256 nm

**Column:** 4.6-mm × 15-cm stainless steel; packing L7<sup>1</sup>

**Flow rate:** 1.0 mL/min, maintained constant to ±10%

**Injection volume:** 20 µL

##### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage (w/v) of benzyl alcohol in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times C$$

*r<sub>U</sub>* = peak area of benzyl alcohol from the *Sample solution*

*r<sub>S</sub>* = peak area of benzyl alcohol from the *Standard solution*

*C* = concentration of benzyl alcohol in the *Standard solution* (mg/mL)

**Acceptance criteria:** 1.35%–1.65%

#### SPECIFIC TESTS

- **pH <791>:** 5.5–7.5

- **BACTERIAL ENDOTOXINS TEST <85>:** It contains less than 0.01 USP Endotoxin Unit/unit of Anti-Factor Xa activity in Anti-factor Xa IU.

##### • ANTI-FACTOR IIa ACTIVITY

**Acetic acid solution, pH 7.4 polyethylene glycol 6000 buffer, pH 7.4 buffer, pH 8.4 buffer, and Human antithrombin III solution:** Proceed as directed in the

*Assay for Anti-Factor Xa Activity*, except that the concentration of the *Human antithrombin III solution* is 0.5 Antithrombin III Unit/mL.

**Thrombin human solution:** Reconstitute thrombin human (see *Reagents, Indicators, and Solutions—Reagent Specifications*) in water, and dilute in *pH 7.4 polyethylene glycol 6000 buffer* to obtain a solution having a concentration of 5 Thrombin Units/mL.

**Chromogenic substrate solution:** Prepare a solution of a suitable chromogenic substrate for an amidolytic test (see *Reagents, Indicators, and Solutions—Reagent Specifications*) for thrombin in water to obtain a concentration of about 3 mM. Immediately before use, dilute with *pH 8.4 buffer* to 0.5 mM.

**Standard solutions:** Reconstitute the entire contents of an ampul of USP Enoxaparin Sodium for Bioassays RS with water, and dilute with *pH 7.4 buffer* to obtain four dilutions having concentrations in the range between 0.015 and 0.075 IU of Anti-Factor IIa activity/mL.

**Standard solutions:** Dilute USP Enoxaparin Sodium Solution for Bioassays RS with *pH 7.4 buffer* to obtain four dilutions having concentrations in the range between 0.015 and 0.075 IU of Anti-Factor IIa activity/mL.

**Sample solutions:** Proceed as directed under *Standard solutions* to obtain concentrations of Injection similar to those obtained for the *Standard solutions*.

**Analysis:** Proceed as directed in the *Assay for Anti-Factor Xa Activity*, except to use *Thrombin human solution* instead of *Factor Xa solution* and to use *Human antithrombin III solution* as described above.

**Calculations:** For each series, calculate the regression of the absorbance against log concentrations of the *Sample solutions* and of the *Standard solutions*, and calculate the potency of the enoxaparin sodium in the Injection in IU of Anti-Factor IIa activity/mL, using statistical methods for parallel-line assays. The four independent dilution estimates are then combined to obtain the final weighted mean. Then calculate the confidence limits.

**Acceptance criteria:** The Anti-Factor IIa activity IU (or IU/mL) is NLT 20.0% and NMT 35.0% of the potency stated on the label in terms of International Anti-Factor Xa Units (IU or IU/mL).

##### • FREE SULFATE CONTENT

**Mobile phase:** 3.0 mM sodium carbonate solution

**System suitability solution:** 3 µg/mL of sulfate anion and 5 µg/mL of oxalate anion

**Standard sulfate stock solution:** Prepare a solution of sodium sulfate in *Mobile phase* in a suitable sulfate-free container such that the concentration of sulfate is accurately known at about 1 mg/mL. Transfer 5 g of the solution to a similar container, and add *Mobile phase* to obtain 25 g of solution.

**Standard solution A:** 0.1 µg/g of sulfate from *Standard sulfate stock solution* in *Mobile phase*

**Standard solution B:** 0.5 µg/g of sulfate from *Standard sulfate stock solution* in *Mobile phase*

**Standard solution C:** 1 µg/g of sulfate from *Standard sulfate stock solution* in *Mobile phase*

<sup>1</sup> Available as Lichrospher 100 RP 18, pore size 100 Å, particle size 5 µm, or equivalent.

**Standard solution D:** 2 µg/g of sulfate from *Standard sulfate stock solution* in *Mobile phase*

**Standard solution E:** 4 µg/g of sulfate from *Standard sulfate stock solution* in *Mobile phase*

**Standard solution F:** 5 µg/g of sulfate from *Standard sulfate stock solution* in *Mobile phase*

**Sample solution:** Transfer a known quantity, *m*, of Enoxaparin Sodium Injection, accurately weighed, to a suitable previously tared sulfate-free vial. Add *Mobile phase* to obtain a solution having a known concentration of about 10 mg/g.

#### Chromatographic system

(See *Chromatography* <621>, *System suitability*.)

**Mode:** Ion chromatography

**Detector:** Conductivity

#### Column

**Guard:** 4-mm × 5-cm; packing L61

**Analytical:** 4-mm × 25-cm; packing L61

[NOTE—Use a micromembrane anion autosuppressor<sup>2</sup> or a suitable chemical suppression system.]

**Flow rate:** 2.0 mL/min

**Injection size:** 25 µL

#### System suitability

**Sample:** *System suitability solution*

#### Suitability requirements

**Resolution:** NLT 1 between the sulfate and oxalate peaks

#### Analysis

**Samples:** *Standard solutions A–F* and *Sample solution*  
Plot the standard curve of sulfate peak height as a function of sulfate concentration (in µg/g) in *Standard solutions A–F*. From the sulfate peak height determine the concentration of sulfate, *C*, in µg/g, in the *Sample solution*, using the standard curve.

Calculate the percentage of free sulfate content (w/w) in the portion of Injection taken:

$$\text{Result} = [(C \times M_s)/10m]$$

*M<sub>s</sub>* = total mass of the *Sample solution* (g)

*m* = mass of Injection taken to prepare the *Sample solution* (mg)

**Acceptance criteria:** The percentage of free sulfate is NMT 0.12% (w/w).

- **STERILITY TESTS** <71>: Meets the requirements
- **PARTICULATE MATTER IN INJECTIONS** <788>: Meets the requirements
- **OTHER REQUIREMENTS:** It meets the requirements under *Injections* <1>.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in single-dose or multiple-dose containers in Type I glass. Store between 20° and 25°, excursions permitted between 15° and 30°.
- **LABELING:** Label it to indicate the amount (mg) of Enoxaparin Sodium in the total volume of contents. The label states also that the Enoxaparin Sodium starting material is porcine derived.
- **USP REFERENCE STANDARDS** <11>
  - USP Benzyl Alcohol RS
  - USP Endotoxin RS
  - USP Enoxaparin Sodium RS
  - USP Enoxaparin Sodium for Bioassays RS

## Enrofloxacin

C<sub>19</sub>H<sub>22</sub>FN<sub>3</sub>O<sub>3</sub> 359.39

3-Quinolonecarboxylic acid, 1-cyclopropyl-7-(4-ethyl-1-piperazinyl)-6-fluoro-1,4-dihydro-4-oxo-;

1-Cyclopropyl-7-(4-ethyl-1-piperazinyl)-6-fluoro-1,4-dihydro-4-oxo-3-quinolinecarboxylic acid [93106-60-6].

» Enrofloxacin contains not less than 98.5 percent and not more than 101.5 percent of C<sub>19</sub>H<sub>22</sub>FN<sub>3</sub>O<sub>3</sub>, calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed, tight, light-resistant containers.

**Labeling**—Label it to indicate that it is for veterinary use only.

#### USP Reference standards <11>—

USP Enrofloxacin RS

USP Fluoroquinolonic Acid RS

USP N-Ethylpiperazine RS

USP Enrofloxacin Related Compound Mixture RS

Contains a mixture of USP Enrofloxacin RS, desfluoro-enrofloxacin, and USP Ciprofloxacin RS.

*Desfluoro-enrofloxacin*: 1-cyclopropyl-7-(4-ethyl-1-piperazinyl)-1,4-dihydro-4-oxo-3-quinoline-carboxylic acid.

#### Clarity of solution—

**Hydrazine sulfate solution**—Transfer 1.0 g of hydrazine sulfate to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Allow to stand for 4 to 6 hours.

**Hexamethylenetetramine solution**—Transfer 2.5 g of hexamethylenetetramine to a 100-mL volumetric flask, add 25.0 mL of water, insert a glass stopper, and mix to dissolve.

**Primary opalescent suspension**—[NOTE—This suspension is stable for 2 months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well-mixed before use.] Transfer 25.0 mL of the *Hydrazine sulfate solution* to the *Hexamethylenetetramine solution* in the 100-mL glass-stoppered flask. Mix, and allow to stand for 24 hours.

**Opalescence standard**—[NOTE—This suspension should not be used beyond 24 hours after preparation.] Transfer 15.0 mL of the *Primary opalescent suspension* to a 1000-mL volumetric flask, dilute with water to volume, and mix.

**Reference suspension**—Transfer 10.0 mL of the *Opalescence standard* to a 100-mL volumetric flask, dilute with water to volume, and mix.

**Test solution**—To 1.0 g of Enrofloxacin add about 0.25 g of potassium hydroxide and 7 mL of water. Sonicate to dissolve, and dilute with water to 10.0 mL.

**Procedure**—Transfer a sufficient portion of the *Test solution*, the *Reference suspension*, and water to separate test tubes of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 to 25 mm to obtain a depth of 40 mm. Compare the *Test solution*, the *Reference suspension*, and water in diffused daylight 5 minutes after preparation of the *Reference suspension*, viewing vertically against a black background (see *Visual Comparison* under *Spectrophotometry and Light-Scattering* <851>). [NOTE—The diffusion of light must be such that the *Reference suspension* can be readily distinguished from water.] The *Test solution* shows the same clarity as that of water or its opalescence is not more pronounced than that of the *Reference suspension*.

<sup>2</sup>Available as Anion Self-Regenerating Suppressor (ASRS) from Dionex Inc, or equivalent.

**Color of solution—**

**Standard stock solution**—Combine 9.6 mL of ferric chloride CS, 0.2 mL of cobaltous chloride CS, and 0.2 mL of cupric sulfate CS, and mix.

**Standard solution**—[NOTE—Prepare the *Standard solution* immediately before use.] Transfer 5.0 mL of the *Standard stock solution* to a 100-mL volumetric flask, and dilute with dilute hydrochloric acid (10 g per 1000 mL).

**Test solution**—To 1.0 g of Enrofloxacin add about 0.25 g of potassium hydroxide and 7 mL of water. Sonicate to dissolve, and dilute with water to 10.0 mL.

**Procedure**—Transfer a sufficient portion of the *Test solution*, the *Standard solution*, and water to separate test tubes of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 mm to 25 mm to obtain a depth of 40 mm. Compare the *Test solution*, the *Standard solution*, and water in diffused daylight, viewing vertically against a white background (see *Visual Comparison under Spectrophotometry and Light-Scattering* (851)). [NOTE—The diffusion of light must be such that the *Reference suspension* can be readily distinguished from water.] The *Test solution* has the appearance of water or is not more intensely colored than the *Standard solution*.

**Identification—**

**A: Infrared Absorption** (197K).

**B: Thin-Layer Chromatographic Identification Test** (201)—

**Test solution:** Prepare a solution containing 10 mg of Enrofloxacin per mL of 0.05 M hydrochloric acid.

**Application volume:** 5  $\mu$ L.

**Developing solvent solution:** methylene chloride, methanol, 25% ammonia solution, and acetonitrile (2:2:1:0.5).

**Procedure**—Proceed as directed in the chapter except apply 5- $\mu$ L portions of the *Test solution* and the *Standard solution* to the starting line of the chromatographic plate. Place the plate in an atmosphere of ammonia for approximately 15 minutes. Develop the chromatogram in an unsaturated chamber with the *Developing solvent solution*.

**Loss on drying** (731)—Dry a 2-g sample, accurately weighed, 5 to 7 hours under vacuum at 120° to constant weight: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.1%, based on a test specimen of about 2 g.

**Chloride** (221)—Add 58 mL of water to 0.5 g of Enrofloxacin, shake for 5 minutes, and pass through a chloride-free filter paper, add 2 mL of 2 M acetic acid, and mix. Transfer 15.0 mL of the filtrate to a 50-mL color-comparison tube (*Test solution*). To a second matched 50-mL color-comparison tube transfer 10.0 mL of a *Standard solution* of sodium chloride having a concentration of 8.2  $\mu$ g per mL, corresponding to 5  $\mu$ g of chloride per mL, add 5.0 mL of water, and mix. To each tube add 1 mL of 2 N nitric acid, mix, add 1 mL of silver nitrate TS, and mix. Allow the solutions to stand for 5 minutes, protected from light. Examine the tubes vertically against a black background (see *Visual Comparison under Spectrophotometry and Light-Scattering* (851)). Any opalescence in the *Test solution* is not more intense than that in the *Standard solution* (0.04%).

**Sulfate** (221)—Dissolve 0.5 g of Enrofloxacin in 5.0 mL of 2 N acetic acid and 15.0 mL of water (*Test solution*). To each of two 50-mL matched color-comparison tubes transfer 1.50 mL of a *Standard solution* of potassium sulfate in 30% alcohol having a concentration of 18.1  $\mu$ g per mL, equivalent to 10  $\mu$ g of sulfate per mL. To each tube add, successively and with continuous shaking, 1.0 mL of barium chloride solution (1 in 4), and allow to stand for 1 minute. To one of the tubes transfer 15.0 mL of the *Standard solution* and 0.5 mL of 30% acetic acid, and mix. To the second tube add 15.0 mL of the *Test solution* and 0.5 mL of 30% acetic acid, and mix. Allow solutions to stand for 5 minutes. Examine the tubes vertically against a black background (see *Visual Comparison under Spectrophotometry and Light-Scattering* (851)).

Any opalescence in the *Test solution* is not more intense than that in the *Standard solution* (0.04%).

**Heavy metals, Method II** (231): 0.002%.

**Limit of N-ethylpiperazine—**

**Internal standard solution**—Dissolve an accurately weighed quantity of *n*-decane in chloroform, and dilute quantitatively, and stepwise if necessary, with chloroform to obtain a solution having a known concentration of about 0.1 mg per mL.

**Standard stock solution**—Dissolve an accurately weighed quantity of USP N-Ethylpiperazine RS in chloroform, and dilute quantitatively, and stepwise if necessary, with chloroform to obtain a solution having a known concentration of about 9.0 mg per mL.

**Standard solution**—To 2.0 mL of the *Internal standard solution* add 20  $\mu$ L of the *Standard stock solution*, and mix.

**Test solution**—To 200 mg of Enrofloxacin, accurately weighed, add 2.0 mL of the *Internal standard solution*, and mix.

**Chromatographic system** (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and a split injector system and contains a 0.32-mm  $\times$  50-m column with 100% liquid phase G1 with a film thickness of about 5.0  $\mu$ m. The carrier gas is hydrogen (helium may be used), flowing at a rate of about 2.9 mL per minute. The auxiliary gas is nitrogen flowing at a rate of about 30 mL per minute. The chromatograph is programmed as follows. Initially the temperature of the column is equilibrated at 80°, then the temperature is increased at a rate of 10° per minute to 240°, and maintained at 240° for 15 minutes. The split injector (25:1 split ratio) temperature is maintained at 200°, and the detector is maintained at 250°. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.90 for N-ethylpiperazine and 1.0 for *n*-decane.

**Procedure**—Inject a volume (about 1.0  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatogram, and measure the responses for the major peaks. Calculate the percentage of the impurity in the portion of Enrofloxacin taken by the formula:

$$100(C_S / C_U)(R_U / R_S)$$

in which  $C_S$  is the concentration of the impurity, in mg per mL, in the *Standard solution*;  $C_U$  is the concentration, in mg per mL, of Enrofloxacin in the *Test solution*;  $R_U$  is the peak response ratio of the impurity peak to the internal standard peak obtained from the *Test solution*; and  $R_S$  is the peak response ratio of the impurity peak to the internal standard peak obtained from the *Standard solution*. Not more than 0.1% of the impurity is found.

**Related compounds—**

TEST 1 (FOR FLUOROQUINOLONIC ACID)—

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture.

**Test solution**—Prepare as directed for the *Test solution* in Identification test B.

**Diluent**—Transfer 0.1 mL of 6 M ammonium to a 100-mL volumetric flask, mix, and dilute with water to volume.

**Standard stock solution**—Dissolve and mix an accurately weighed quantity of USP Fluroquinolonic Acid RS with *Diluent* to prepare a solution containing about 0.10 mg per mL, and mix.

**Standard solution 1 (0.1%)**—Transfer 1.0 mL of the *Standard stock solution* to a 10-mL volumetric flask, dilute with water to volume, and mix.

**Standard solution 2 (0.2%)**—Transfer 2.0 mL of the *Standard stock solution* to a 10-mL volumetric flask, dilute with water to volume, and mix.

**Application volume:** 5  $\mu$ L.

**Developing solvent system**—[NOTE—Carefully follow the mixing order stated below.] Shake butyl acetate, *n*-butanol, water, and glacial acetic acid (50:9:15:25), and allow to settle. Use the upper layer as the mobile phase and discard the lower layer.

**Procedure**—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* (621). Apply separately the *Test solution*, *Standard solution 1*, and *Standard solution 2* to the thin-layer plate, and chromatograph using the *Developing solvent system*. Dry the developed chromatogram in the air under a fume hood for 30 to 60 minutes, then view under short-wavelength UV light. Determine the quantity of fluoroquinolonic acid by comparing the size and intensity of the spots from the *Test solution* to the *Standard solutions*. The intensity of any spot from the *Test solution* at about the same retardation factor,  $R_f$ , as that of the *Standard solutions* is not greater than the intensity of the *Standard solution 2* (0.2%) spot.

**TEST 2 (FOR CIPROFLOXACIN, DES-FLUORO COMPOUND AND OTHER UNSPECIFIED IMPURITIES)**—

**Phosphoric acid buffer**—Prepare 25 mM phosphoric acid, and adjust with triethylamine to a pH of 3.0.

**Mobile phase**—Prepare a solution containing *Phosphoric acid buffer* and acetonitrile (87:13).

**Control solution**—Dissolve about 5 mg of USP Enrofloxacin Related Compound Mixture RS, accurately weighed, in *Mobile phase* in a 5-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Test solution 1**—Dissolve about 50 mg of Enrofloxacin, accurately weighed, in *Mobile phase* in a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Test solution 2**—Transfer 1.0 mL of *Test solution 1* into a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Transfer 1.0 mL of this solution into a 10-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 278-nm detector and a 4.6-mm × 25-cm stainless steel column that contains 5-μm packing L1. The column temperature is maintained at 40°, and the flow rate is about 1.5 mL per minute. Chromatograph the *Control solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.58 for the des-fluoro compound, 0.74 for ciprofloxacin, and 1.0 for enrofloxacin. The resolution,  $R$ , between the des-fluoro compound and ciprofloxacin is not less than 1.5.

**Procedure**—Inject a volume (about 25 μL) of *Test solution 1*, *Test solution 2*, and the *Control solution* into the chromatograph, record the chromatogram, and measure the peak responses. Identify the ciprofloxacin and the des-fluoro compound peaks in *Test solution 2* by comparing their retention times with those from the *Control solution*. Calculate the percentage of each related compound in the portion of Enrofloxacin taken by the formula:

$$100C(r_1 / r_2)$$

in which  $C$  is the concentration of Enrofloxacin in *Test solution 2* as a percentage of *Test solution 1* (0.2%);  $r_1$  is the individual peak response of each related compound obtained from *Test solution 1*; and  $r_2$  is the individual peak area of enrofloxacin obtained from *Test solution 2*: not more than 0.1% of des-fluoro compound, not more than 0.3% of ciprofloxacin, not more than 0.1% of any unspecified impurity, and not more than 0.5% of total impurities are found.

**Assay**—Transfer about 250 mg of Enrofloxacin, accurately weighed, to a 125-mL flask, dissolve in 100 mL of anhydrous acetic acid, and titrate with 0.1 M perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.1 M perchloric acid is equivalent to 35.94 mg of  $C_{19}H_{22}FN_3O_3$ .

## Ensulizole

$C_{13}H_{10}N_2O_3S$  274.30  
1H-Benzimidazole-5-sulfonic acid-2-phenyl-;  
2-Phenylbenzimidazole-5-sulfonic acid [27503-81-7].

### DEFINITION

Ensulizole contains NLT 98.0% and NMT 102.0% of  $C_{13}H_{10}N_2O_3S$ , calculated on the dried basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B. ULTRAVIOLET ABSORPTION** (197U)

**Sample solution:** 5 μg/mL

[NOTE—Transfer 100 mg of Ensulizole to a 100-mL volumetric flask, dissolve in 4 mL of 1 N sodium hydroxide, and dilute with water to volume. Transfer 0.5 mL of the solution to a 100-mL volumetric flask, and dilute with water to volume.]

**Acceptance criteria:** The absorptivities, calculated on the dried basis, at the wavelength of maximum absorbance at about 302 nm, do not differ by more than 3.0%.

### ASSAY

#### PROCEDURE

**Sample solution:** 48 mg/mL of Ensulizole in 0.5 N sodium hydroxide

**Titratant:** 0.5 N hydrochloric acid VS

**Analysis:** To the *Sample solution*, add phenolphthalein TS, and titrate the excess with *Titratant*. Perform a blank determination, and make any necessary corrections (see *Titrimetry* (541)). Each mL of 0.5 N sodium hydroxide is equivalent to 137.15 mg of  $C_{13}H_{10}N_2O_3S$ .

Calculate the percentage of  $C_{13}H_{10}N_2O_3S$  in the portion of Ensulizole taken:

$$\text{Result} = [(N \times (V_B - V_A)) / (W \times (1 - \text{LOD}))] \times M_{r1} \times 100$$

$N$  = actual normality of the *Titratant*

$V_B$  = volume of *Titratant* used for the blank (mL)

$V_A$  = volume of *Titratant* used for the *Sample solution* (mL)

$W$  = weight of Ensulizole taken for the *Sample solution* (mg)

$\text{LOD}$  = percentage of loss on drying expressed as a decimal fraction, as determined in the test for *Loss on Drying*

$M_{r1}$  = molecular weight of ensulizole (274.30)

**Acceptance criteria:** 98.0%–102.0% on the dried basis

### SPECIFIC TESTS

- **LOSS ON DRYING** (731): Dry a sample at 105° for 4 h: it loses NMT 2.0% of its weight.

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers in a cool place.
- **USP REFERENCE STANDARDS** (11)  
USP Ensulizole RS

## Entacapone

$C_{14}H_{15}N_3O_5$  305.29  
(*E*)- $\alpha$ -Cyano-*N,N*-diethyl-3,4-dihydroxy-5-nitrocinnamamide;  
2-Propenamides, 2-cyano-3-(3,4-dihydroxy-5-nitrophenyl)-*N,N*-diethyl-, (*E*)- [130929-57-6].

### DEFINITION

Entacapone contains NLT 98.0% and NMT 102.0% of  $C_{14}H_{15}N_3O_5$ , calculated on the dried basis.

### IDENTIFICATION

- A. INFRARED ABSORPTION** (197K)
- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

**Buffer:** 2.34 g/L of monobasic sodium phosphate dihydrate. Adjust with phosphoric acid to a pH of 2.1.

**Diluent:** Methanol and tetrahydrofuran (7:3)

**Mobile phase:** Methanol, tetrahydrofuran, and *Buffer* (22:1:27)

**System suitability solution:** 1  $\mu$ g/mL each of USP Entacapone Related Compound A RS and USP Entacapone RS in *Diluent*

**Standard solution:** 0.1 mg/mL of USP Entacapone RS in *Diluent*

**Sample solution:** 0.1 mg/mL of Entacapone in *Diluent*

**Chromatographic system**  
(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 300 nm

**Column:** 4.6-mm  $\times$  25-cm; 5- $\mu$ m packing L11

**Flow rate:** 1 mL/min

**Injection size:** 10  $\mu$ L

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for entacapone related compound A and entacapone are 0.8 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 2.0 between entacapone related compound A and entacapone, *System suitability solution*

**Tailing factor:** NMT 2.0, *Standard solution*

**Relative standard deviation:** NMT 1.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{14}H_{15}N_3O_5$  in the portion of Entacapone taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Entacapone RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of entacapone in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

### IMPURITIES

#### Inorganic Impurities

• **RESIDUE ON IGNITION** (281): NMT 0.1%

• **HEAVY METALS**, *Method II* (231): NMT 10 ppm

#### Organic Impurities

##### PROCEDURE

**Buffer, Diluent, and Mobile phase:** Proceed as directed in the *Assay*.

**Standard solution:** Use the *System suitability solution* prepared as directed in the *Assay*.

**Sample solution:** 1.0 mg/mL of Entacapone in *Diluent*

**Chromatographic system:** Prepare as directed in the *Assay*.

**Run time:** 2 times the retention time of the entacapone peak

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Resolution:** NLT 2.0 between entacapone related compound A and entacapone

**Relative standard deviation:** NMT 10.0% based on the entacapone peak

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of any individual impurity in the portion of Entacapone taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of any impurity from the *Sample solution*

$r_S$  = peak response of entacapone from the *Standard solution*

$C_S$  = concentration of USP Entacapone RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Entacapone in the *Sample solution* (mg/mL)

#### Acceptance criteria

**Individual impurities:** See *Impurity Table 1*.

**Total impurities:** NMT 0.2%

[NOTE— Do not include entacapone related compound A in the calculation of total impurities.]

Impurity Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Entacapone related compound A <sup>a</sup>	0.8	0.1
Entacapone	1.0	—
Any other unknown individual impurity	—	0.10
Total impurities	—	0.2

<sup>a</sup> (Z)-2-Cyano-3-(3,4-dihydroxy-5-nitrophenyl)-*N,N*-diethylacrylamide.

### SPECIFIC TESTS

#### Loss on Drying (731)

**Analysis:** Dry 1.0 g of the sample in vacuum at a pressure not exceeding 49 mm of mercury at 65° to constant weight.

**Acceptance criteria:** NMT 0.5%

### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers, and store at room temperature.

#### USP REFERENCE STANDARDS (11)

USP Entacapone RS

USP Entacapone Related Compound A RS

(Z)-2-Cyano-3-(3,4-dihydroxy-5-nitrophenyl)-*N,N*-diethylacrylamide.

$C_{14}H_{15}N_3O_5$  305.29

## Entacapone Tablets

### DEFINITION

Entacapone Tablets contain an amount of entacapone equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of entacapone ( $C_{14}H_{15}N_3O_5$ ).

### IDENTIFICATION

#### Change to read:

- **A. INFRARED ABSORPTION** (197K): The sample shows a medium band at about  $2216\text{ cm}^{-1}$  and strong bands at about  $1628, 1604, 1544, 1512, 1440, 1376, 1348, 1296, 1280$ , and  $1208\text{ cm}^{-1}$  (ERR 1-Jul-2012) similar to the reference preparation.
- **B.** The retention time of the major peak from the *Sample solution* corresponds to that from the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

[NOTE—Protect solutions from light.]

**Buffer:** 2.1 g/L of monobasic sodium phosphate. Adjust with phosphoric acid to a pH of 2.1.

**Diluent:** Methanol and tetrahydrofuran (7:3)

**Mobile phase:** Methanol, tetrahydrofuran, and *Buffer* (22:1:27)

**Standard solution:** 0.5 mg/mL of USP Entacapone RS in *Diluent*

**Sample solution:** 0.5 mg/mL of entacapone from finely powdered Tablets (NLT 20). Add tetrahydrofuran up to 30% of the final volume, and sonicate for 3 min. Add methanol up to 30% of the final volume, and shake for 5 min. Dilute with methanol to volume. Centrifuge a portion of this solution.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 300 nm

**Column:** 4.6-mm  $\times$  25-cm; 5- $\mu$ m packing L11

**Flow rate:** 1 mL/min

**Run time:** 1.5 times the retention time of the entacapone peak

**Injection size:** 10  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** NMT 1.5

**Relative standard deviation:** NMT 1.5%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{14}H_{15}N_3O_5$  in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Entacapone RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of entacapone in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

### PERFORMANCE TESTS

#### DISSOLUTION (711)

**Medium:** pH 5.5 Phosphate buffer (6.8 g/L of monobasic potassium phosphate in water. Adjust with 1 M sodium hydroxide to a pH of 5.5); 900 mL.

**Apparatus 2:** 50 rpm

**Time:** 30 min

**Standard stock solution:** 0.22 mg/mL of USP Entacapone RS, prepared by dissolving in 2% of the flask volume in tetrahydrofuran and diluting with *Medium* to volume. Protect this solution from the light.

**Standard solution:** 22  $\mu$ g/mL of USP Entacapone RS in *Medium* from the *Standard stock solution*. Protect this solution from the light.

**Sample solution:** Pass a portion of the solution through a suitable filter of 20- $\mu$ m pore size. Dilute with *Medium*, if necessary. Protect this solution from the light.

#### Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** UV

**Analytical wavelength:** 313 nm

**Path length:** 1 cm

**Blank:** Tetrahydrofuran and *Medium* (0.2:99.8)

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of  $C_{14}H_{15}N_3O_5$  dissolved:

$$\text{Result} = A_U/A_S \times C_S/L \times V \times 100$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$L$  = label claim (mg/Tablet)

$V$  = volume of *Medium*, 900 mL

**Tolerances:** NLT 80% (Q) of the labeled amount of  $C_{14}H_{15}N_3O_5$  is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

### IMPURITIES

#### Organic Impurities

#### PROCEDURE

[NOTE—Protect solutions from light.]

**Buffer, Diluent, Mobile phase, and Chromatographic system:** Proceed as directed in the *Assay*.

**System suitability solution:** 0.03 mg/mL each of USP Entacapone RS and USP Entacapone Related Compound A RS in *Diluent*

**Standard solution:** 3  $\mu$ g/mL of USP Entacapone RS in *Diluent*

**Sample solution:** 3 mg/mL of entacapone from finely powdered Tablets (NLT 20). Add tetrahydrofuran up to 30% of the final volume, and sonicate for 3 min. Add methanol up to 30% of the final volume, and sonicate for 5 min. Dilute with methanol to volume. Centrifuge a portion of this solution. [NOTE—Prepare the *Sample solution* fresh and use within 7 h of preparation.]

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

#### Suitability requirements

**Resolution:** NLT 2.0 between entacapone related compound A and entacapone, *System suitability solution*

**Relative standard deviation:** NMT 10.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_S$  = peak response of entacapone from the *Standard solution*

$C_S$  = concentration of USP Entacapone RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of entacapone in the *Sample solution* (mg/mL)

#### Acceptance criteria

**Individual impurities:** See *Impurity Table 1*.

**Total impurities:** NMT 0.2%

[NOTE— Do not include entacapone related compound A in the calculation of total impurities.]

**Impurity Table 1**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Entacapone related compound A <sup>a</sup>	0.8	0.2
Entacapone	1.0	—
Any individual unspecified degradation product	—	0.1

<sup>a</sup> (Z)-2-Cyano-3-(3,4-dihydroxy-5-nitrophenyl)-N,N-diethylacrylamide.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in light-resistant containers. Store at controlled room temperature.
- **USP REFERENCE STANDARDS (11)**
  - USP Entacapone RS
  - USP Entacapone Related Compound A RS
  - (Z)-2-Cyano-3-(3,4-dihydroxy-5-nitrophenyl)-N,N-diethylacrylamide.
  - $C_{14}H_{15}N_3O_5$

## Enzacamene

$C_{18}H_{22}O$  254.37

3-(4-Methylbenzylidene)-camphor [36861-47-9].

» Enzacamene contains not less than 98.0 percent and not more than 102.0 percent of  $C_{18}H_{22}O$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards (11)**—

USP Methyl Benzylidene Camphor RS

#### Identification—

**A:** *Infrared Absorption* (197K).

**B:** *Ultraviolet Absorption* (197U)—

*Solution:* 10 µg per mL.

*Medium:* methanol.

Absorptivities at the wavelength of maximum absorbance, about 299 nm, calculated on the dried basis, do not differ by more than 3.0%.

**Melting range, Class Ia (741):** between 66° and 68°.

**Loss on drying (731)**—Dry it in vacuum at 50° to constant weight; it loses not more than 0.2% of its weight.

#### Related compounds—

*Standard solution*—Use the *Standard preparation* prepared as directed in the *Assay*.

*Test solution*—Use the *Assay preparation*.

*Chromatographic system*—Proceed as directed in the *Assay*.

*Procedure*—Separately inject equal volumes (about 1 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of each impurity in the portion of Enzacamene taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the peak response for each impurity obtained from the *Test solution*; and  $r_s$  is the peak response of enzacamene obtained from the *Standard solution*: not more than 0.02% of camphor is found; not more than 0.1% of any other individual impurity is found; and not more than 0.5% of total impurities is found.

#### Assay—

*Standard preparation*—Dissolve accurately weighed quantities of camphor and USP Methyl Benzylidene Camphor RS in dichloromethane, and dilute quantitatively, and stepwise if necessary, with dichloromethane to obtain a solution having a known concentration of about 250 µg of each per mL.

*Assay preparation*—Transfer about 25 mg of Enzacamene, accurately weighed, to a 100-mL volumetric flask, and dissolve in and dilute with dichloromethane to volume.

*Chromatographic system* (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and a 0.32-mm × 30-m fused-silica capillary column coated with a 0.25-µm layer of phase G1. The carrier gas is helium flowing at a rate of about 1.2 mL per minute. The chromatograph is programmed as follows. Initially the temperature of the column is equilibrated at 100°, then 5 minutes after injection the temperature is increased at a rate of 10° per minute to 230°, and maintained at 230° for 10 minutes. The temperature is then increased at a rate of 10° per minute to 300°, and maintained at 300° until the end of the procedure. The injection port temperature is maintained at 295°, and the detector is maintained at 305°. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.2 for camphor and 1.0 for enzacamene; the tailing factor is not more than 1.0; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 1 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{18}H_{22}O$  in the portion of Enzacamene taken by the formula:

$$100C(r_U / r_s)$$

in which C is the concentration, in mg per mL, of USP Methyl Benzylidene Camphor RS in the *Standard preparation*; and  $r_U$  and  $r_s$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Ephedrine

$C_{10}H_{15}NO$  165.23

Benzenemethanol, α-[1-(methylamino)ethyl]-, [R-(R\*,S\*)]-.

(-)-Ephedrine [299-42-3].

Hemihydrate 174.24 [50906-05-3].

» Ephedrine is anhydrous or contains not more than one-half molecule of water of hydration. It

contains not less than 98.5 percent and not more than 100.5 percent of  $C_{10}H_{15}NO$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight, light-resistant containers, in a cold place.

**Labeling**—Label it to indicate whether it is hydrous or anhydrous. Where the quantity of Ephedrine is indicated in the labeling of any preparation containing Ephedrine, this shall be understood to be in terms of anhydrous Ephedrine.

**USP Reference standards** (11)—

USP Ephedrine Sulfate RS

**Identification**—Accurately weigh about 100 mg, and add by buret the exact volume of 0.1 N sulfuric acid, determined in the Assay, to neutralize it. Dilute with water in a volumetric flask to 25 mL. Mix 2 mL with 10 mL of alcohol, and evaporate on a steam bath with the aid of a current of air to dryness: the residue so obtained responds to *Identification* test A under *Ephedrine Sulfate*.

**Specific rotation** (781S): between  $-40.3^\circ$  and  $-43.3^\circ$ .

*Test solution*: 25 mg per mL, in 0.6 N hydrochloric acid.

**Water**, *Method 1b* (921): between 4.5% and 5.5%, for hydrated Ephedrine; not more than 0.5% for anhydrous Ephedrine.

**Residue on ignition** (281): not more than 0.1%.

**Chloride** (221)—A solution of 500 mg shows no more chloride than corresponds to 0.20 mL of 0.020 N hydrochloric acid (0.030%).

**Sulfate**—Dissolve 100 mg in 40 mL of water, and add 1 mL of 3 N hydrochloric acid and 1 mL of barium chloride TS: no turbidity develops within 10 minutes.

**Ordinary impurities** (466)—

*Test solution*: methanol.

*Standard solution*: methanol.

*Eluant*: a mixture of isopropyl alcohol, ammonium hydroxide, and chloroform (80:15:5).

*Visualization*: 1, followed by 4.

**Assay**—Dissolve about 500 mg of Ephedrine, accurately weighed, in 10 mL of neutralized alcohol, and add 5 drops of methyl red TS and 40.0 mL of 0.1 N hydrochloric acid VS. Titrate the excess acid with 0.1 N sodium hydroxide VS. Perform a blank determination (see *Residual Titrations* under *Titrimetry* (541)). Each mL of 0.1 N hydrochloric acid is equivalent to 16.52 mg of  $C_{10}H_{15}NO$ .

## Ephedrine Hydrochloride

$C_{10}H_{15}NO \cdot HCl$  201.69

Benzenemethanol,  $\alpha$ -[1-(methyamino)ethyl]-, hydrochloride,  $[R-(R^*, S^*)]$ -.

(-)-Ephedrine hydrochloride [50-98-6].

» Ephedrine Hydrochloride contains not less than 98.0 percent and not more than 100.5 percent of  $C_{10}H_{15}NO \cdot HCl$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

**USP Reference standards** (11)—

USP Ephedrine Sulfate RS

**Identification**—

A: Dissolve 100 mg in 5 mL of water, add 1 mL of potassium carbonate solution (1 in 5), and extract with 2 mL of chloroform: the IR absorption spectrum of the chloroform extract so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Ephedrine Sulfate RS.

B: A solution of it responds to the tests for *Chloride* (191).

**Melting range**, *Class I* (741): between  $217^\circ$  and  $220^\circ$ .

**Specific rotation** (781S): between  $-33.0^\circ$  and  $-35.5^\circ$ .

*Test solution*: 50 mg per mL, in water.

**Acidity or alkalinity**—Dissolve 1.0 g in 20 mL of water, and add 1 drop of methyl red TS. If the solution is yellow, it is changed to red by not more than 0.10 mL of 0.020 N sulfuric acid. If the solution is pink, it is changed to yellow by not more than 0.20 mL of 0.020 N sodium hydroxide.

**Loss on drying** (731)—Dry it at  $105^\circ$  for 3 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Sulfate**—Dissolve 50 mg in 40 mL of water, and add 1 mL of 3 N hydrochloric acid and 1 mL of barium chloride TS: no turbidity develops within 10 minutes.

**Ordinary impurities** (466)—

*Test solution*: alcohol.

*Standard solution*: alcohol.

*Eluant*: a mixture of isopropyl alcohol, ammonium hydroxide, and chloroform (80:15:5).

*Visualization*: 1, followed by 4.

**Assay**—Dissolve about 500 mg of Ephedrine Hydrochloride, accurately weighed, in 25 mL of glacial acetic acid. Add 10 mL of mercuric acetate TS and 2 drops of crystal violet TS, and titrate with 0.1 N perchloric acid VS to an emerald-green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 20.17 mg of  $C_{10}H_{15}NO \cdot HCl$ .

## Ephedrine Sulfate

$(C_{10}H_{15}NO)_2 \cdot H_2SO_4$  428.54

Benzenemethanol,  $\alpha$ -[1-(methyamino)ethyl]-,  $[R-(R^*, S^*)]$ -, sulfate (2:1) (salt).

(-)-Ephedrine sulfate (2:1) (salt) [134-72-5].

» Ephedrine Sulfate contains not less than 98.0 percent and not more than 101.0 percent of  $(C_{10}H_{15}NO)_2 \cdot H_2SO_4$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

**USP Reference standards** (11)—

USP Ephedrine Sulfate RS

**Identification**—

A: *Infrared Absorption* (197K).

B: A solution of it responds to the tests for *Sulfate* (191).

**Specific rotation** (781S): between  $-30.5^\circ$  and  $-32.5^\circ$ .

*Test solution*: 50 mg per mL, in water.

**Acidity or alkalinity**—Dissolve 1.0 g in 20 mL of water, and add 1 drop of methyl red TS. If the solution is yellow, it is changed to red by not more than 0.10 mL of 0.020 N sulfuric acid. If the solution is pink, it is changed to yellow by not more than 0.20 mL of 0.020 N sodium hydroxide.

**Loss on drying** (731)—Dry about 500 mg, accurately weighed, at  $105^\circ$  for 3 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Chloride** (221)—A 200-mg portion shows no more chloride than corresponds to 0.40 mL of 0.020 N hydrochloric acid (0.14%).

**Ordinary impurities** <466>—

*Test solution:* alcohol.

*Standard solution:* alcohol.

*Eluant:* a mixture of isopropyl alcohol, ammonium hydroxide, and chloroform (80:15:5).

*Visualization:* 1, followed by 4.

**Assay**—Transfer about 300 mg of Ephedrine Sulfate, accurately weighed, to a separator, and dissolve in about 10 mL of water. Saturate the solution with sodium chloride (about 3 g), add 5 mL of 1 N sodium hydroxide, and extract with four 25-mL portions of chloroform. Wash the combined chloroform extracts by shaking with 10 mL of a saturated solution of sodium chloride, and filter through chloroform-saturated purified cotton into a beaker. Extract the wash solution with 10 mL of chloroform, and add to the main chloroform extract. Add methyl red TS, and titrate with 0.1 N perchloric acid in dioxane VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 21.43 mg of  $(C_{10}H_{15}NO)_2 \cdot H_2SO_4$ .

---

**Ephedrine Sulfate Capsules**

---

» Ephedrine Sulfate Capsules contain not less than 92.0 percent and not more than 108.0 percent of the labeled amount of  $(C_{10}H_{15}NO)_2 \cdot H_2SO_4$ .

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** <11>—

USP Ephedrine Sulfate RS

**Identification**—Macerate the contents of a sufficient number of Capsules, equivalent to about 200 mg of ephedrine sulfate, with 15 mL of warm alcohol for 20 minutes, filter, and evaporate the filtrate on a steam bath to dryness: the residue so obtained responds to the *Identification* tests under *Ephedrine Sulfate*.

**Dissolution** <711>—

*Medium:* water; 500 mL.

*Apparatus 1:* 100 rpm.

*Time:* 30 minutes.

**Procedure**—Dilute filtered portions of the solutions under test with water to a concentration of about 25 µg per mL. Transfer 5.0-mL portions to suitable tubes. Add 1 mL of a saturated sodium carbonate solution and 2 mL of sodium metaperiodate solution (2 in 100) to each, mix, and allow to stand for 10 minutes. Add 20.0 mL of hexanes, shake for 30 seconds, and allow the phases to separate. Measure the absorbances of the hexanes extract in 1-cm cells at the wavelength of maximum absorbance, at about 242 nm, with a suitable spectrophotometer, using hexanes as the blank. Determine the amount of  $(C_{10}H_{15}NO)_2 \cdot H_2SO_4$  dissolved by comparison with a similarly treated Standard solution having a known concentration of USP Ephedrine Sulfate RS in water. Remove the contents of 1 Capsule as completely as possible, with the aid of a current of air, dissolve the empty capsule shell in the *Medium*, determine the absorbance at the same dilution and in the same manner as for the Capsules, and make any necessary corrections.

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $(C_{10}H_{15}NO)_2 \cdot H_2SO_4$  is dissolved in 30 minutes.

**Uniformity of dosage units** <905>: meet the requirements.

**Assay**—

**Standard preparation**—Weigh accurately about 25 mg of USP Ephedrine Sulfate RS, transfer to a 50-mL volumetric

flask with the aid of 10 mL of water, add methanol to volume, and mix. Dilute 5.0 mL of this solution with water to 100.0 mL.

**Assay preparation**—Weigh accurately the contents of not less than 20 Capsules, and mix. Transfer an accurately weighed portion of the mixture, equivalent to about 25 mg of ephedrine sulfate, to a glass-stoppered conical flask, and add by pipet 50 mL of a 1 in 5 mixture of water in methanol. Shake by mechanical means for 10 minutes, and filter. Dilute 5.0 mL of the filtrate with water to 100.0 mL.

**Procedure**—Transfer 5-mL portions of the *Assay preparation* and the *Standard preparation* to separate glass-stoppered, 50-mL centrifuge tubes. Add 1 mL of saturated sodium carbonate solution and 2 mL of sodium metaperiodate solution (1 in 50) to each tube, mix, and allow to stand for 10 minutes. Pipet 20 mL of *n*-hexane into each tube, shake for 30 seconds, and allow the phases to separate. Concomitantly determine the absorbances of the *n*-hexane extracts in 1-cm cells at the wavelength of maximum absorbance at about 242 nm, with a suitable spectrophotometer, using *n*-hexane as the blank. Calculate the quantity, in mg, of  $(C_{10}H_{15}NO)_2 \cdot H_2SO_4$  in the portion of Capsule contents taken by the formula:

$$C(A_U / A_S)$$

in which *C* is the concentration, in µg per mL, of USP Ephedrine Sulfate RS in the *Standard preparation*, and *A<sub>U</sub>* and *A<sub>S</sub>* are the absorbances of the hexane extracts of the *Assay preparation* and the *Standard preparation*, respectively.

---

**Ephedrine Sulfate Injection**

---

» Ephedrine Sulfate Injection is a sterile solution of Ephedrine Sulfate in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of  $(C_{10}H_{15}NO)_2 \cdot H_2SO_4$ .

**Packaging and storage**—Preserve in single-dose or in multiple-dose, light-resistant containers, preferably of Type I glass.

**USP Reference standards** <11>—

USP Endotoxin RS

USP Ephedrine Sulfate RS

**Identification**—

**A:** Mix 1 mL of Injection with 5 mL of alcohol, and evaporate on a steam bath with the aid of a current of air to dryness: the residue so obtained responds to *Identification* tests under *Ephedrine Sulfate*.

**B:** It responds to the tests for *Sulfate* <191>.

**Bacterial endotoxins** <85>—It contains not more than 1.7 USP Endotoxin Units per mg of ephedrine sulfate.

**pH** <791>: between 4.5 and 7.0.

**Other requirements**—It meets the requirements under *Injections* <1>.

**Assay**—Transfer an accurately measured volume of Injection, equivalent to about 250 mg of ephedrine sulfate, to a separator, add water, if necessary, to make about 10 mL, and proceed as directed in the *Assay* under *Ephedrine Sulfate*, beginning with "Saturate the solution."

## Ephedrine Sulfate Nasal Solution

» Ephedrine Sulfate Nasal Solution contains not less than 93.0 percent and not more than 107.0 percent of the labeled amount of  $(C_{10}H_{15}NO)_2 \cdot H_2SO_4$ .

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Ephedrine Sulfate RS

**Identification**—It responds to the *Identification* tests under *Ephedrine Sulfate Injection*.

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**Assay**—

**Standard preparation**—Weigh accurately about 26 mg of USP Ephedrine Sulfate RS, transfer to a 50-mL volumetric flask with the aid of 10 mL of water, add methanol to volume, and mix. Pipet 5 mL of the resulting solution into a 100-mL volumetric flask, dilute with water to volume, and mix.

**Assay preparation**—Transfer an accurately measured volume of Nasal Solution, equivalent to about 26 mg of ephedrine sulfate, to a 50-mL volumetric flask, dilute with a 1 in 5 mixture of water in methanol to volume, and mix. Pipet 5 mL of the resulting solution into a 100-mL volumetric flask, dilute with water to volume, and mix.

**Procedure**—Transfer 5-mL portions of the *Assay preparation* and the *Standard preparation* to separate glass-stoppered, 50-mL centrifuge tubes. Add 1 mL of saturated sodium carbonate solution and 2 mL of sodium metaperiodate solution (1 in 50) to each tube, mix, and allow to stand for 10 minutes. Pipet 20 mL of *n*-hexane into each tube, shake for 30 seconds, and allow the phases to separate. Concomitantly determine the absorbances of the *n*-hexane extracts in 1-cm cells at the wavelength of maximum absorbance at about 242 nm, with a suitable spectrophotometer, using *n*-hexane as the blank. Calculate the quantity, in mg, of  $(C_{10}H_{15}NO)_2 \cdot H_2SO_4$  in each mL of the Nasal Solution taken by the formula:

$$(C / V)(A_U / A_S)$$

in which *V* is the volume, in mL, of Nasal Solution taken, *C* is the concentration, in  $\mu\text{g}$  per mL, of USP Ephedrine Sulfate RS in the *Standard preparation*, and *A<sub>U</sub>* and *A<sub>S</sub>* are the absorbances of the hexane extracts of the *Assay preparation* and the *Standard preparation*, respectively.

## Ephedrine Sulfate Oral Solution

» Ephedrine Sulfate Oral Solution contains, in each 100 mL, not less than 360 mg and not more than 440 mg of ephedrine sulfate  $[(C_{10}H_{15}NO)_2 \cdot H_2SO_4]$ .

**Packaging and storage**—Preserve in tight, light-resistant containers, and avoid exposure to excessive heat.

**USP Reference standards** (11)—

USP Ephedrine Sulfate RS

**Identification**, *Angular rotation* (781A)—Use the 0.1 N sulfuric acid extract of the chloroform solution obtained as directed for *Assay preparation*: the angular rotation is levorotatory.

**Alcohol content** (611): between 2.0% and 4.0% of  $C_2H_5OH$ .

**Assay**—

**Standard preparation**—Dissolve an accurately weighed quantity of USP Ephedrine Sulfate RS in 0.1 N sulfuric acid to obtain a solution having a known concentration of about 20  $\mu\text{g}$  per mL.

**Assay preparation**—Transfer 5 mL of Oral Solution to a separator, add 1 mL of 1 N sulfuric acid, and extract with 10 mL of chloroform. Discard the extract, and add 5 mL of potassium carbonate solution (1 in 5). After gas evolution has ceased, extract the solution with three 10-mL portions of chloroform, and combine the extracts in a second separator. Extract the chloroform solution with 50.0 mL of 0.1 N sulfuric acid. Filter the acid layer through paper, and dilute 5.0 mL of it with 0.1 N sulfuric acid to 100.0 mL.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Ephedrine Sulfate Capsules*. Calculate the quantity, in mg, of ephedrine sulfate  $[(C_{10}H_{15}NO)_2 \cdot H_2SO_4]$  in the portion of Oral Solution taken by the formula:

$$C(A_U / A_S)$$

in which *C* is the concentration, in  $\mu\text{g}$  per mL, of USP Ephedrine Sulfate RS in the *Standard preparation*; and *A<sub>U</sub>* and *A<sub>S</sub>* are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

## Epinephrine

$C_9H_{13}NO_3$  183.20  
1,2-Benzenediol, 4-[1-hydroxy-2-(methylamino)ethyl]-, (*R*)-; (-)-3,4-Dihydroxy- $\alpha$ -[(methylamino)methyl]benzyl alcohol [51-43-4].

### DEFINITION

Epinephrine contains NLT 97.0% and NMT 100.5% of  $C_9H_{13}NO_3$ , calculated on the dried basis.

### IDENTIFICATION

- A.** To 5 mL of pH 4.0 acid phthalate buffer (see *Reagents, Indicators, and Solutions—Buffer Solutions*) add 0.5 mL of a slightly acid solution of Epinephrine (1 in 1000) and 1.0 mL of 0.1 N iodine. Mix, and allow to stand for 5 min. Add 2 mL of sodium thiosulfate solution (1 in 40). **Acceptance criteria:** A deep red color is produced.

### ASSAY

#### PROCEDURE

**Sample:** 300 mg

**Analysis:** Dissolve the *Sample* in 50 mL of glacial acetic acid, warming slightly if needed to dissolve. Add crystal violet TS to the *Sample*, and titrate with 0.1 N perchloric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 18.32 mg of epinephrine ( $C_9H_{13}NO_3$ ).

Acceptance criteria: 97.0%–100.5% on the dried basis

#### IMPURITIES

- **RESIDUE ON IGNITION** (281): Negligible, from 100 mg
- **LIMIT OF ADRENALONE**

**Sample solution:** 2 mg/mL of Epinephrine in dilute hydrochloric acid (1 in 200)

**Analysis:** Determine the absorptivity of the *Sample solution* at 310 nm (see *Spectrophotometry and Light-Scattering* (851)).

Acceptance criteria: NMT 0.2

- **LIMIT OF NOREPINEPHRINE**

**Standard stock solution A:** 364 mg/mL of USP Epinephrine Bitartrate RS in formic acid

**Standard solution A:** 20 mg/mL of epinephrine in methanol, from *Standard stock solution A*

**Standard stock solution B:** 16 mg/mL of USP Norepinephrine Bitartrate RS in formic acid

**Standard solution B:** 1.6 mg/mL of USP Norepinephrine Bitartrate RS in methanol from *Standard stock solution B*

**Sample solution:** 20 mg/mL of Epinephrine. Dissolve 200 mg of Epinephrine in 1.0 mL of formic acid, and dilute with methanol to 10.0 mL.

#### Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

**Mode:** TLC

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture

**Application volume:** 5  $\mu$ L

**Developing solvent system:** *n*-Butanol, water, and formic acid (7:2:1)

**Spray reagent:** Folin-Ciocalteu phenol TS

#### Analysis

**Samples:** *Standard solution A*, *Standard solution B*, and *Sample solution*

In an unsaturated chamber, develop the plate in the *Developing solvent system* until the solvent front has moved three-fourths the length of the plate. Remove the plate from the chamber, mark the solvent front, and allow the solvent to evaporate in warm circulating air. Spray with *Spray reagent*, followed by sodium carbonate solution (1 in 10).

**Acceptance criteria:** The  $R_f$  value of the principal spot from the *Sample solution* corresponds to that of *Standard solution A*. Any spot from the *Sample solution* is not larger or more intense than the spot with the same  $R_f$  value from *Standard solution B*, corresponding to NMT 4.0% norepinephrine.

#### SPECIFIC TESTS

- **OPTICAL ROTATION**, *Specific Rotation* (781S):  $-50.0^\circ$  to  $-54.0^\circ$   
**Sample solution:** 20 mg/mL, in 0.6 N hydrochloric acid
- **LOSS ON DRYING** (731): Dry it in a vacuum over silica gel for 18 h: it loses NMT 2.0% of its weight.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **USP REFERENCE STANDARDS** (11)  
USP Epinephrine Bitartrate RS  
USP Norepinephrine Bitartrate RS

not more than 115.0 percent of the labeled amount of epinephrine ( $C_9H_{13}NO_3$ ).

**Packaging and storage**—Preserve in small, nonreactive, light-resistant aerosol containers equipped with metered-dose valves and provided with oral inhalation actuators.

#### USP Reference standards (11)—

USP Epinephrine Bitartrate RS

**Identification**—Place 10 mL of water in a small beaker, and deliver 2 sprays from the Inhalation Aerosol under the surface of the water, actuating the valve by pressing the tip against the bottom of the beaker. To 5 mL of the solution add 1 drop of dilute sulfuric acid (1 in 200), add 0.5 mL of 0.1 N iodine, allow to stand for 5 minutes, and add 1 mL of 0.1 N sodium thiosulfate: a red-brown color is produced.

**Delivered dose uniformity over the entire contents:** meets the requirements for *Metered-Dose Inhalers* under *Aerosols*, *Nasal Sprays*, *Metered-Dose Inhalers*, and *Dry Powder Inhalers* (601).

#### PROCEDURE FOR DOSE UNIFORMITY—

*Ferro-citrate solution* and *Buffer solution*—Prepare as directed under *Epinephrine Assay* (391).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Epinephrine Bitartrate RS in a freshly prepared sodium bisulfite solution (1 in 500), and dilute quantitatively and stepwise with the same sodium bisulfite solution as necessary to obtain a solution having a known concentration of about 18  $\mu$ g per mL.

*Test preparation*—Discharge the minimum recommended dose into the sampling apparatus and detach the inhaler as directed. Rinse the apparatus (filter and interior) with four 5.0-mL portions of a freshly prepared sodium bisulfite solution (1 in 500), and transfer the resulting solutions quantitatively to a 50-mL centrifuge tube. Add 10 mL of chloroform, insert the stopper, shake vigorously for 1 minute, and centrifuge for 5 minutes. Use the clear supernatant as directed in the *Procedure*.

*Procedure*—Into three separate flasks, transfer the *Test preparation*, 20.0 mL of the *Standard preparation*, and 20.0 mL of water to provide the blank. To each flask add 100  $\mu$ L of *Ferro-citrate solution* and 1.0 mL of *Buffer solution*, and mix. Concomitantly determine the absorbances with a suitable spectrophotometer, in 5-cm cells, of the solutions from the *Test preparation* and the *Standard preparation*, at the wavelength of maximum absorbance at about 530 nm, against the blank. Calculate the quantity, in  $\mu$ g, of  $C_9H_{13}NO_3$  contained in the minimum dose taken by the formula:

$$(183.20 / 333.29)(20CN)(A_U / A_S)$$

in which *C* is the concentration, in  $\mu$ g per mL, of USP Epinephrine Bitartrate RS in the *Standard preparation*; *N* is the number of sprays discharged to obtain the minimum recommended dose; 183.20 and 333.29 are the molecular weights of epinephrine and epinephrine bitartrate, respectively; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Test preparation* and the *Standard preparation*, respectively.

**Assay**—Weigh the Inhalation Aerosol, chill to a temperature below  $-30^\circ$ , remove the valve by suitable means, and allow the Inhalation Aerosol to warm slowly to room temperature to expel the more volatile propellant fractions. Transfer the residues in the aerosol container and valve to a 125-mL separator with the aid of six 5-mL portions of dilute sulfuric acid (1 in 1000), and extract the solution with three 25-mL portions of chloroform. Proceed as directed in the *Assay* under *Epinephrine Nasal Solution*, beginning with "Rinse the stopper and mouth of the separator," but use 10.0 mL instead of 5.0 mL of chloroform in the determination of the specific rotation. Dry the empty aerosol container and valve, weigh them, and determine the net weight of the Inhalation

## Epinephrine Inhalation Aerosol

» Epinephrine Inhalation Aerosol is a solution of Epinephrine in propellants and Alcohol prepared with the aid of mineral acid in a pressurized container. It contains not less than 90.0 percent and

Aerosol. Calculate the quantity, in mg, of  $C_9H_{13}NO_3$  in the Inhalation Aerosol taken by the formula:

$$(183.20 / 309.32)(W)(0.5 + 0.5R / 93)$$

in which 183.20 and 309.32 are the molecular weights of epinephrine and triacetylepinephrine, respectively, and  $W$  is the weight, in mg, and  $R$  is the specific rotation (in degrees, without regard to the sign), of the isolated triacetylepinephrine.

## Epinephrine Injection

» Epinephrine Injection is a sterile solution of Epinephrine in Water for Injection prepared with the aid of Hydrochloric Acid or other suitable buffers. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of epinephrine ( $C_9H_{13}NO_3$ ).

**Packaging and storage**—Preserve in single-dose or multiple-dose, light-resistant containers, preferably of Type I glass.

**Labeling**—The label indicates that the Injection is not to be used if its color is pinkish or darker than slightly yellow or if it contains a precipitate.

**USP Reference standards** (11)—

USP Endotoxin RS

USP Epinephrine Bitartrate RS

**Color and clarity**—

**Standard solution**—Transfer 2.0 mL of 0.100 N iodine VS to a 500-mL volumetric flask, dilute with water to volume, and mix.

**Procedure**—Visually examine a portion of the Injection (*Test solution*) in a suitable clear glass test tube against a white background: it is not pinkish and it contains no precipitate. If any yellow color is observed in the *Test solution*, concomitantly determine the absorbances of the *Test solution* and the *Standard solution* in 1-cm cells with a suitable spectrophotometer set at 460 nm: the absorbance of the *Test solution* does not exceed that of the *Standard solution*.

**Identification**—

**A:** It responds to the *Identification* test under *Epinephrine Nasal Solution*.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Bacterial endotoxins** (85)—It contains not more than 357.0 USP Endotoxin Units per mg of epinephrine.

**pH** (791): between 2.2 and 5.0.

**Total acidity**—Transfer 5.0 mL of Injection to a flask, add 10 mL of water, and titrate with 0.01 N sodium hydroxide VS to a pH of 7.40. Perform a blank determination, and make any necessary correction. Not more than 25.0 mL of 0.01 N sodium hydroxide is required.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—

**Mobile phase**—To 1 L of 0.05 M monobasic sodium phosphate add about 519 mg of sodium 1-octanesulfonate and about 45 mg of edetate disodium, and mix. Adjust by the dropwise addition of phosphoric acid, if necessary, to a pH of 3.8. Mix 85 volumes of this solution with 15 volumes of methanol. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Epinephrine Bitartrate RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.1 mg of epinephrine per mL.

**Assay preparation**—Transfer an accurately measured volume of Injection, equivalent to about 1 mg of epinephrine, to a 10-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**System suitability preparation**—Dissolve 10 mg of dopamine hydrochloride in 100 mL of the *Standard preparation*, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm × 15-cm column that contains packing L7. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation* and the *System suitability preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.0 for epinephrine and 2.0 for dopamine hydrochloride; the resolution,  $R$ , between epinephrine and dopamine hydrochloride is not less than 3.5; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of epinephrine ( $C_9H_{13}NO_3$ ) in each mL of the Injection taken by the formula:

$$(183.20/333.29)(10)(C/V)(r_U / r_S)$$

in which 183.20 and 333.29 are the molecular weights of epinephrine and epinephrine bitartrate, respectively;  $C$  is the concentration, in mg per mL, of USP Epinephrine Bitartrate RS in the *Standard preparation*;  $V$  is the volume, in mL, of Injection taken; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Epinephrine Inhalation Solution

» Epinephrine Inhalation Solution is a sterile solution of Epinephrine in Purified Water prepared with the aid of Hydrochloric Acid. It contains, in each 100 mL, not less than 0.9 g and not more than 1.15 g of  $C_9H_{13}NO_3$ .

**Packaging and storage**—Preserve in small, well-filled, tight, light-resistant containers.

**Labeling**—The label indicates that the Inhalation Solution is not to be used if its color is pinkish or darker than slightly yellow or if it contains a precipitate.

**Color and clarity**—Using the Inhalation Solution as the *Test solution*, proceed as directed for *Color and clarity* under *Epinephrine Injection*.

**Identification**—It meets the requirements for the *Identification* test under *Epinephrine Nasal Solution*.

**Sterility** (71): meets the requirements.

**Assay**—Pipet 10 mL of Inhalation Solution into a 125-mL separator, and extract the solution with two 10-mL portions of chloroform. Proceed as directed in the *Assay* under *Epinephrine Nasal Solution*, beginning with "Rinse the stopper and mouth of the separator," but use for the acetylation 1.05 g of sodium bicarbonate and 0.50 mL of acetic anhydride, and extract the acetylated product with six 15-mL portions of chloroform instead of the 25-mL portions speci-

fied therein, and use 15.0 mL of chloroform instead of 5.0 mL in the determination of the specific rotation.

## Epinephrine Nasal Solution

» Epinephrine Nasal Solution is a solution of Epinephrine in Purified Water prepared with the aid of Hydrochloric Acid. It contains, in each 100 mL, not less than 90 mg and not more than 115 mg of  $C_9H_{13}NO_3$ .

**Packaging and storage**—Preserve in small, well-filled, tight, light-resistant containers.

**Labeling**—The label indicates that the Nasal Solution is not to be used if its color is pinkish or darker than slightly yellow or if it contains a precipitate.

**Color and clarity**—Using the Nasal Solution as the *Test solution*, proceed as directed for *Color and clarity* under *Epinephrine Injection*.

**Identification**—To 5 mL of pH 4.0 acid phthalate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*) add 0.5 mL of Nasal Solution and 1.0 mL of 0.1 N iodine. Mix, and allow to stand for 5 minutes. Add 2 mL of sodium thiosulfate solution (1 in 40): a deep red color is produced.

**Assay**—Pipet 30 mL of Nasal Solution into a 125-mL separator, add 25 mL of chloroform, shake vigorously for 1 minute, allow the liquids to separate, and discard the chloroform. Wash twice more with chloroform, separating and discarding the lower layer as completely as possible each time. Rinse the stopper and mouth of the separator with a few drops of water. Add 0.2 mL of starch TS, then while swirling the separator add iodine and potassium iodide TS 1 dropwise until the blue color formed persists, and immediately add just sufficient 0.1 N sodium thiosulfate to discharge the blue color. [NOTE—Proceed with the assay from this point without delay.]

Add to the liquid in the separator 2.10 g of sodium bicarbonate, preventing it from coming in contact with the mouth of the separator, and swirl until most of the bicarbonate has dissolved. By means of a 1-mL syringe that is not fitted with a needle, rapidly inject 1.0 mL of acetic anhydride directly into the contents of the separator. Immediately insert the stopper in the separator, and shake vigorously until the evolution of carbon dioxide has ceased (7 to 10 minutes), releasing the pressure as necessary through the stopcock. Allow to stand for 5 minutes, and extract the solution with six 25-mL portions of chloroform, filtering each extract through a small pledget of cotton, previously washed with chloroform, into a beaker.

Evaporate the combined chloroform extracts on a steam bath in a current of air to about 3 mL, transfer the residue by means of small portions of chloroform to a tared 50-mL beaker, and heat again to evaporate the solvent completely. Heat further at  $105^\circ$  for 30 minutes, cool in a desiccator, and weigh the residue of triacetylepinephrine. Add 5.0 mL of chloroform, cover the beaker, gently swirl the contents until the residue has completely dissolved, and determine the specific rotation,  $R$ , using a 200-mm semimicro polarimeter tube.

Calculate the quantity, in mg, of  $C_9H_{13}NO_3$  in the volume of Nasal Solution taken by the formula:

$$(183.20/309.32)(W)(0.5 + 0.5R / 93)$$

in which 183.20 and 309.32 are the molecular weights of epinephrine and triacetylepinephrine, respectively; and  $W$  is the weight, in mg, and  $R$  is the specific rotation (in degrees, without regard to the sign), of the isolated triacetylepinephrine.

## Epinephrine Ophthalmic Solution

» Epinephrine Ophthalmic Solution is a sterile, aqueous solution of Epinephrine prepared with the aid of Hydrochloric Acid. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of  $C_9H_{13}NO_3$ . It contains a suitable antibacterial agent and may contain an anti-oxidant, suitable buffers, and chelating and tonicity-adjusting agents.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**Labeling**—The label indicates that the Ophthalmic Solution is not to be used if its color is pinkish or darker than slightly yellow or if it contains a precipitate.

**USP Reference standards** (11)—

USP Epinephrine Bitartrate RS

**Color and clarity**—Using the Ophthalmic Solution as the *Test solution*, proceed as directed for *Color and clarity* under *Epinephrine Injection*.

**Identification**—

**A:** The UV absorption spectrum of the *Assay preparation* prepared as directed in the *Assay* exhibits maxima and minima at the same wavelengths as that of a similar solution of USP Epinephrine Bitartrate RS.

**B:** A solution (1 in 2) is levorotatory.

**Sterility** (71): meets the requirements.

**pH** (791): between 2.2 and 4.5.

**Assay**—

**pH 5.8 Buffer**—Mix 1 volume of 1 M dibasic potassium phosphate with 9 volumes of 1 M monobasic potassium phosphate. Adjust by the addition of small volumes of either solution to a pH of  $5.80 \pm 0.05$ .

**Standard preparation**—Dissolve a suitable quantity of USP Epinephrine Bitartrate RS, accurately weighed, in 0.1 N hydrochloric acid to obtain a solution having a known concentration of about 40  $\mu$ g of epinephrine per mL.

**Assay preparation**—Transfer an accurately measured volume of Ophthalmic Solution, equivalent to about 20 mg of epinephrine, to a 250-mL beaker containing 2.0 mL of pH 5.8 Buffer. Add 9 g of chromatographic siliceous earth, and mix. Carefully transfer the mixture to a 45- $\times$  2.2-cm chromatographic tube containing a pledget of glass wool at the bottom, and tap the column gently to effect packing. Dry-wash the beaker with about 1 g of chromatographic siliceous earth, add to the column, and plug the top with a pledget of glass wool. Wash the column with 100 mL of water-washed ether, and discard the eluant. Add 10.0 mL of 0.1 N hydrochloric acid to a 125-mL separator, and place the separator under the column. To about 100 mL of water-washed ether add 1 mL of bis(2-ethylhexyl) phosphoric acid, and elute the column with this solution, collecting the eluate in the separator. Extract the epinephrine into the aqueous acid layer, and carefully transfer the aqueous layer to a 500-mL volumetric flask. Shake the ether layer with two 50-mL portions of 0.1 N hydrochloric acid, add the acidic aqueous extracts to the volumetric flask, dilute with 0.1 N hydrochloric acid to volume, and mix.

**Procedure**—Concomitantly determine the absorbances of the *Assay preparation* and the *Standard preparation* at the wavelength of maximum absorbance at about 280 nm, with a suitable spectrophotometer, using 0.1 N hydrochloric acid

as the blank. Calculate the quantity, in mg, of  $C_9H_{13}NO_3$  in each mL of the Ophthalmic Solution taken by the formula:

$$0.5(C/V)(A_U/A_S)$$

in which C is the concentration, in  $\mu\text{g}$  per mL, of epinephrine in the *Standard preparation*; V is the volume, in mL, of Ophthalmic Solution taken; and  $A_U$  and  $A_S$  are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

## Epinephrine Bitartrate

$C_9H_{13}NO_3 \cdot C_4H_6O_6$  333.29

1,2-Benzenediol, 4-[1-hydroxy-2-(methylamino)ethyl]-, (R)-, [R-(R\*,R\*)]-2,3-dihydroxybutanedioate (1:1) (salt).  
(-)-3,4-Dihydroxy- $\alpha$ -[(methylamino)methyl]benzyl alcohol  
(+)-tartrate (1:1) salt [51-42-3].

» Epinephrine Bitartrate contains not less than 97.0 percent and not more than 102.0 percent of  $C_9H_{13}NO_3 \cdot C_4H_6O_6$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Epinephrine Bitartrate RS

USP Norepinephrine Bitartrate RS

**Identification**—Dissolve about 500 mg in 20 mL of water containing about 100 mg of sodium bisulfite. Add 6 N ammonium hydroxide until the solution has a distinct odor of ammonia, and allow to stand in a refrigerator for 1 hour. Filter the precipitate, wash it with three 2-mL portions of cold water, then with 5 mL of cold alcohol, and finally with 5 mL of cold ether, and dry in vacuum over silica gel for 3 hours. The epinephrine so obtained responds to the *Identification* test under *Epinephrine*, and its specific rotation (see *Optical Rotation* (781)), determined by dissolving 200 mg, accurately weighed, in sufficient dilute hydrochloric acid (1 in 20) to make 10.0 mL, is between  $-50^\circ$  and  $-53.5^\circ$ .

**Melting range** (741): between  $147^\circ$  and  $152^\circ$ , with decomposition.

**Loss on drying** (731)—Dry it in vacuum over silica gel for 3 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): negligible, from 100 mg.

**Limit of adrenalone**—Its absorptivity (see *Spectrophotometry and Light-scattering* (851)) at 310 nm, determined in a solution in dilute hydrochloric acid (1 in 200) containing 4 mg per mL, is not more than 0.2.

**Limit of norepinephrine bitartrate**—

*Epinephrine standard solution*—Dilute with methanol an accurately measured volume of an aqueous solution of USP Epinephrine Bitartrate RS containing about 200 mg per mL to obtain a solution having a known concentration of about 20 mg per mL.

*Norepinephrine standard solution*—Dilute with methanol an accurately measured volume of an aqueous solution of USP Norepinephrine Bitartrate RS containing 8.0 mg per mL to obtain a solution having a known concentration of 0.80 mg per mL.

*Test solution*—Dissolve 200 mg of Epinephrine Bitartrate in 1.0 mL of water, dilute with methanol to 10.0 mL, and mix.

*Procedure*—Apply 5- $\mu\text{L}$  portions of *Epinephrine standard solution*, *Norepinephrine standard solution*, and *Test solution* to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in an unsaturated tank using a

solvent system consisting of *n*-butanol, water, and formic acid (7:2:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate in warm circulating air. Spray with Folin-Ciocalteu Phenol TS, followed by sodium carbonate solution (1 to 10): the  $R_f$  value of the principal spot obtained from the *Test solution* corresponds to that obtained from the *Epinephrine standard solution*. Any spot obtained from the *Test solution* is not larger nor more intense than the spot with the same  $R_f$  value obtained from *Norepinephrine standard solution*, corresponding to not more than 4.0% of norepinephrine bitartrate.

**Assay**—Dissolve about 500 mg of Epinephrine Bitartrate, accurately weighed, in 20 mL of glacial acetic acid, warming slightly if necessary to effect solution. Add crystal violet TS, and titrate with 0.1 N perchloric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 33.33 mg of  $C_9H_{13}NO_3 \cdot C_4H_6O_6$ .

## Epinephrine Bitartrate Inhalation Aerosol

» Epinephrine Bitartrate Inhalation Aerosol is a suspension of microfine Epinephrine Bitartrate in propellants in a pressurized container. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of epinephrine bitartrate ( $C_9H_{13}NO_3 \cdot C_4H_6O_6$ ).

**Packaging and storage**—Preserve in small, nonreactive, light-resistant aerosol containers equipped with metered-dose valves and provided with oral inhalation actuators.

**USP Reference standards** (11)—

USP Epinephrine Bitartrate RS

**Identification**—

**A:** Place 10 mL of water in a small beaker, and deliver 3 sprays from the Aerosol under the surface of the water, actuating the valve by pressing the tip against the bottom of the beaker. Filter, and to 5 mL of the filtrate add 1 drop of dilute hydrochloric acid (1 in 120). Add 0.5 mL of 0.1 N iodine, allow to stand for 5 minutes, and add 1 mL of 0.1 N sodium thiosulfate: a red-brown color is produced.

**B:** Actuate the valve of the Aerosol by pressing the tip against a station of a white porcelain spot plate. Cover the spot with 2 or 3 drops of a mixture of 3 volumes of pyridine and 1 volume of acetic anhydride: an emerald-green color is produced.

**Delivered dose uniformity over the entire contents:**

meets the requirements for *Metered-Dose Inhalers under Aerosols*, *Nasal Sprays*, *Metered-Dose Inhalers*, and *Dry Powder Inhalers* (601).

PROCEDURE FOR DOSE UNIFORMITY—

*Ferro-citrate solution* and *Buffer solution*—Prepare as directed under *Epinephrine Assay* (391).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Epinephrine Bitartrate RS in a freshly prepared sodium bisulfite solution (1 in 500), and dilute quantitatively and stepwise with the same sodium bisulfite solution as necessary to obtain a solution having a known concentration of about 15  $\mu\text{g}$  per mL.

*Test preparation*—Discharge the minimum recommended dose into the sampling apparatus and detach the inhaler as directed. Rinse the apparatus (filter and interior) with four 5.0-mL portions of a freshly prepared sodium bisulfite solution (1 in 500), and transfer the resulting solutions quantitatively to a 50-mL centrifuge tube. Add 10 mL of chloroform,

insert the stopper, shake vigorously for 1 minute and centrifuge for 5 minutes. Use the clear supernatant as directed in the *Procedure*.

**Procedure**—Into three separate flasks, transfer the *Test preparation*, 20.0 mL of the *Standard preparation*, and 20.0 mL of water to provide the blank. To each flask add 100  $\mu$ L of *Ferro-citrate solution* and 1.0 mL of *Buffer solution*, and mix. Concomitantly determine the absorbances with a suitable spectrophotometer, in 5-cm cells, of the solutions from the *Test preparation* and the *Standard preparation*, at the wavelength of maximum absorbance at about 530 nm, against the blank. Calculate the quantity, in  $\mu$ g of  $C_9H_{13}NO_3 \cdot C_4H_6O_6$  contained in the minimum dose taken by the formula:

$$(20CN)(A_U / A_S)$$

in which C is the concentration, in  $\mu$ g per mL, of USP Epinephrine Bitartrate RS in the *Standard preparation*; N is the number of sprays discharged to obtain the minimum recommended dose; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Test preparation* and the *Standard preparation*, respectively.

**Particle size**—Proceed with Epinephrine Bitartrate Inhalation Aerosol as directed in the test for *Particle size* under *Isoproterenol Sulfate Inhalation Aerosol*. It meets the limits of the test.

#### Assay—

*Ferro-citrate solution* and *Buffer solution*—Prepare as directed under *Epinephrine Assay* <391>.

*Standard preparation*—Prepare as directed under *Delivered dose uniformity over the entire contents*.

*Assay preparation*—[NOTE—A suitable specimen beaker is one having a small indentation formed on its inside bottom surface having dimensions adequate to accept the aerosol valve stem during actuation, thereby preventing particle entrapment and side-of-stem leakage during the delivery of the specimen.] Place 20 mL of chloroform in a suitable 100-mL beaker. Prime the valve of Epinephrine Bitartrate Inhalation Aerosol by alternately shaking and firing it 10 times through its oral inhalation actuator. Accurately weigh the Aerosol, shake it, and immediately deliver a single spray under the surface of the chloroform, actuating the valve by pressing the tip into the indentation in the bottom of the beaker. Raise the Aerosol above the surface of the chloroform, and shake it gently preparatory to delivering another spray similarly under the surface of the chloroform. Deliver a total of 3 sprays in this manner. Rinse the valve stem and ferrule with about 2 mL of chloroform, collecting the rinsing with the specimen in the beaker. Allow the Aerosol to dry, weigh it, and determine the total weight of the 3 sprays. Transfer the solution to a centrifuge tube with the aid of two 3-mL portions of chloroform, and add 10.0 mL of freshly prepared sodium bisulfite solution (1 in 500). Insert the stopper, shake vigorously for 1 minute, centrifuge for 5 minutes, and use the clear supernatant as the *Assay preparation*.

**Procedure**—Transfer 5.0 mL each of the *Standard preparation* and the *Assay preparation* to separate test tubes. To each tube add 100  $\mu$ L of *Ferro-citrate solution* and 1.0 mL of *Buffer solution*, and mix. Concomitantly determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 530 nm, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg, of  $C_9H_{13}NO_3 \cdot C_4H_6O_6$  in each mL of the Aerosol taken by the formula:

$$(0.01Cd / W)(A_U / A_S)$$

in which C is the concentration, in  $\mu$ g per mL, of USP Epinephrine Bitartrate RS in the *Standard preparation*, d is the density, in g per mL, of the Aerosol, determined as directed for d in the *Procedure* in the Assay under *Isoproterenol Sulfate*

*Inhalation Aerosol*, W is the weight, in g, of the specimen taken, and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

## Epinephrine Bitartrate Ophthalmic Solution

» Epinephrine Bitartrate Ophthalmic Solution is a sterile, buffered, aqueous solution of Epinephrine Bitartrate. It contains an amount of epinephrine bitartrate equivalent to not less than 90.0 percent and not more than 115.0 percent of the labeled amount of epinephrine ( $C_9H_{13}NO_3$ ). It contains a suitable antibacterial agent and may contain suitable preservatives.

**Packaging and storage**—Preserve in small, well-filled, tight, light-resistant containers.

**Labeling**—The label indicates that the Ophthalmic Solution is not to be used if its color is pinkish or darker than slightly yellow or if it contains a precipitate.

**USP Reference standards** <11>—

USP Epinephrine Bitartrate RS

**Color and clarity**—Using the Ophthalmic Solution as the *Test solution*, proceed as directed for *Color and clarity* under *Epinephrine Injection*.

**pH** <791>: between 3.0 and 3.8.

**Other requirements**—It responds to the *Identification* test under *Epinephrine Nasal Solution*, and meets the requirements under *Sterility Tests* <71>.

#### Assay—

*pH 2.5 Buffer*—Transfer 6.8 g of monobasic potassium phosphate and 1.1 g of sodium 1-octanesulfonate to a 1-liter volumetric flask. Dissolve in water, dilute with water to volume, and mix. Adjust the solution with phosphoric acid to a pH of  $2.5 \pm 0.1$ .

*Mobile phase*—Prepare a filtered and degassed mixture of *pH 2.5 Buffer* and acetonitrile (850:150). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Epinephrine Bitartrate RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.1 mg per mL.

*Assay preparation*—Transfer an accurately measured volume of Ophthalmic Solution, freshly mixed and free from air bubbles, equivalent to about 50 mg of epinephrine bitartrate, to a 500-mL volumetric flask, dilute with water to volume, and mix.

*Chromatographic system* (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 280-nm detector and a 3.2-mm  $\times$  25-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the column efficiency determined from the analyte peak is not less than 2000 theoretical plates, the tailing factor for the analyte peak is not more than 2.5, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quan-

tity, in mg, of epinephrine ( $C_9H_{13}NO_3$ ) in each mL of the Ophthalmic Solution taken by the formula:

$$(183.20 / 333.29)(500C / V)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Epinephrine Bitartrate RS in the *Standard preparation*, V is the volume, in mL, of Ophthalmic Solution taken, and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Epinephrine Bitartrate for Ophthalmic Solution

» Epinephrine Bitartrate for Ophthalmic Solution is a sterile, dry mixture of Epinephrine Bitartrate and suitable antioxidants, prepared by freeze-drying. It contains an amount of epinephrine bitartrate equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of epinephrine ( $C_9H_{13}NO_3$ ).

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* (1).

**Completeness of solution** (641)—A 100-mg portion dissolves in 5 mL of water to yield a clear solution.

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* (1).

**Other requirements**—A solution of it responds to the *Identification* test under *Epinephrine Nasal Solution*, and meets the requirements of the *Assay* under *Epinephrine Bitartrate Ophthalmic Solution*. It meets also the requirements under *Sterility Tests* (71) and *Uniformity of Dosage Units* (905).

## Epinephryl Borate Ophthalmic Solution

$C_9H_{12}BNO_4$  209.01

1,3,2-Benzodioxaborole-5-methanol, 2-hydroxy- $\alpha$ -[(methylamino)methyl]-, (R)-.

(-)-3,4-Dihydroxy- $\alpha$ -[(methylamino)methyl]benzyl alcohol, cyclic 3,4-ester with boric acid [5579-16-8].

» Epinephryl Borate Ophthalmic Solution is a sterile solution in water of Epinephrine as a borate complex. It contains an amount of epinephryl borate ( $C_9H_{12}BNO_4$ ) equivalent to not less than 90.0 percent and not more than 115.0 percent of the labeled amount of epinephrine ( $C_9H_{13}NO_3$ ). It contains a suitable antibacterial agent and one or more suitable preservatives and buffering agents.

**Packaging and storage**—Preserve in small, well-filled, tight, light-resistant containers.

**Labeling**—The label indicates that the Ophthalmic Solution is not to be used if its color is pinkish or darker than slightly yellow or if it contains a precipitate.

### Color and clarity—

**Standard solution**—Transfer 2.0 mL of 0.100 N iodine VS to a 500-mL volumetric flask, dilute with water to volume, and mix.

**Procedure**—Visually examine a portion of the Ophthalmic Solution (*Test solution*) in a suitable clear glass test tube against a white background: it is not pinkish, and it contains no precipitate. If any yellow color is observed in the *Test solution*, concomitantly determine the absorbances of the *Test solution* and the *Standard solution* in 1-cm cells with a suitable spectrophotometer set at 460 nm: the absorbance of the *Test solution* does not exceed that of the *Standard solution*.

### Identification—

**A:** To 5 mL of pH 4.0 acid phthalate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*) add 0.5 mL of Ophthalmic Solution and 1 mL of 0.1 N iodine. Mix, allow to stand for 5 minutes, and add 2 mL of 0.1 N sodium thiosulfate: a deep red color is produced.

**B:** To 5 mL in a porcelain evaporating dish add 5 drops of sulfuric acid and 5 mL of methanol: the ignited mixture burns with a green-bordered flame.

**Sterility** (71): meets the requirements.

**pH** (791): between 5.5 and 7.6.

**Assay**—Transfer an accurately measured volume of Ophthalmic Solution, equivalent to about 100 mg of epinephrine, to a 250-mL separator. Dilute with water to 30 mL, and adjust with dilute hydrochloric acid (1 in 12) to a pH of  $4.0 \pm 0.2$ . Add 25 mL of carbon tetrachloride, shake vigorously for 1 minute, allow the phases to separate, and discard the carbon tetrachloride washing. In the same manner, wash with two additional 25-mL portions of carbon tetrachloride, and discard the washings. Rinse the stopper and the mouth of the separator with 2 to 3 mL of water such that the rinsings enter the separator and combine with the solution under assay. Add 0.2 mL of starch TS, and, while swirling the separator, add iodine and potassium iodide TS 1 dropwise until the blue color persists. Immediately add a volume of 0.1 N sodium thiosulfate just sufficient to discharge the blue color. [NOTE—Proceed with the assay from this point without delay.]

Add 2.10 g of sodium bicarbonate through a dry powder funnel to prevent the powder from coming in contact with the mouth of the separator, and swirl to dissolve most of the solid. By means of a syringe fitted with a suitable pipet, rapidly inject 1.0 mL of acetic anhydride directly into the contents of the separator. Swirl the unstoppered separator gently for 3 minutes to allow carbon dioxide to escape. Insert the stopper, and shake gently until the evolution of carbon dioxide has ceased (7 to 10 minutes), releasing the pressure through the stopcock as necessary. Allow to stand for 5 minutes. Extract with six 25-mL portions of chloroform, shaking for 1 minute each time, filtering each extract through a small pledget of chloroform-saturated cotton and collecting the extracts in a 400-mL beaker. Add several glass beads, and evaporate on a steam bath to about 3 mL. With the aid of 15 to 20 mL of chloroform, transfer the residue to a tared 50-mL beaker, and evaporate on the steam bath to dryness. Dry the residue at  $105^\circ$  for 30 minutes, cool in a desiccator, and weigh the triacetylepinephrine so obtained. Transfer 10.0 mL of chloroform to the beaker, and gently swirl to dissolve the residue, dislodging the semisolid residue from the glass surface, if necessary, with a small metal spatula. Determine the angular rotation of the solution in a 100-mm polarimeter tube.

Calculate the quantity, in mg, of epinephrine ( $C_9H_{13}NO_3$ ) in the volume of Ophthalmic Solution taken by the formula:

$$(183.20/309.32)(W)(0.5 + 0.5R/93)$$

in which 183.20 and 309.32 are the molecular weights of epinephrine and triacetylepinephrine, respectively; W is the weight, in mg, of the isolated triacetylepinephrine; and R is

the specific rotation, in degrees, of the triacetylepinephrine solution.

## Epirubicin Hydrochloride

$C_{27}H_{29}NO_{11} \cdot HCl$  579.98  
 5,12-Naphthacenedione, 10-[(3-amino-2,3,6-trideoxy- $\alpha$ -L-arabino-hexopyranosyl)oxy]-7,8,9,10-tetrahydro-6,8,11-trihydroxy-8-(hydroxyacetyl)-1-methoxy-, hydrochloride, (8*S*-*cis*)-;  
 (1*S*,3*S*)-3-Glycoloyl-1,2,3,4,6,11-hexahydro-3,5,12-trihydroxy-10-methoxy-6,11-dioxo-1-naphthacenyl-3-amino-2,3,6-trideoxy- $\alpha$ -L-arabino-hexopyranoside hydrochloride. [56390-09-1].

### DEFINITION

Epirubicin Hydrochloride contains NLT 97.0% and NMT 102.0% of  $C_{27}H_{29}NO_{11} \cdot HCl$ , calculated on the anhydrous and solvent-free basis.

### IDENTIFICATION

- A. INFRARED ABSORPTION** <197M>
- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- C. IDENTIFICATION TESTS—GENERAL, Chloride** <191>: A 10 mg/mL solution in a mixture of nitric acid and water (1:1) meets the requirements.

### ASSAY

#### PROCEDURE

[NOTE—Allow the *System suitability solution*, *Standard solution*, and the *Sample solution* to stand for 3 h before use.]

**Solution A:** Dissolve 3.7 g of sodium lauryl sulfate in 950 mL of water. To the resulting solution, add 28 mL of 10% phosphoric acid, and dilute with water to 1000 mL.

**Mobile phase:** Acetonitrile, methanol, and *Solution A* (29:17:54)

**System suitability solution:** 0.1 mg/mL each of USP Epirubicin Hydrochloride RS and USP Doxorubicin Hydrochloride RS in *Mobile phase*

**Standard solution:** 1 mg/mL of USP Epirubicin Hydrochloride RS in *Mobile phase*

**Sample solution:** 1 mg/mL of Epirubicin Hydrochloride in *Mobile phase*

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm  $\times$  25-cm; 6- $\mu$ m packing L13

**Temperature:** 35°

**Flow rate:** 2.5 mL/min

**Injection size:** 10  $\mu$ L

**Run time:** About 3.5 times the retention time of the epirubicin peak

#### System suitability

**Sample:** *System suitability solution*

#### Suitability requirements

**Resolution:** NLT 2.0 between doxorubicin and epirubicin

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{27}H_{29}NO_{11} \cdot HCl$  in the portion of Epirubicin Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$C_U$  = concentration of the *Sample solution* (mg/mL)

**Acceptance criteria:** 97.0%–102.0% on the anhydrous and solvent-free basis

### IMPURITIES

#### Organic Impurities

##### PROCEDURE 1

[NOTE—Allow the *System suitability solution*, *Sample solution*, and *Standard solution* to stand for 3 h before use.]

**Mobile phase, System suitability solution, Sample solution, Chromatographic system, and System suitability:** Proceed as directed in the *Assay*.

**Standard solution:** 0.01 mg/mL of USP Epirubicin Hydrochloride RS in *Mobile phase*

**Peak identification solution:** Dissolve 10 mg of USP Doxorubicin Hydrochloride RS in 10 mL of a mixture of water and phosphoric acid (1:1). Allow to stand for 30 min. Adjust with 2 N sodium hydroxide solution to a pH of 2.6. Add 15 mL of acetonitrile and 10 mL of methanol, and mix.

#### Analysis

**Samples:** *Sample solution*, *Standard solution*, and *Peak identification solution*

[NOTE—Use the *Peak identification solution* to identify peaks using the relative retention times in *Impurity Table 1*.]

Calculate the percentage of each impurity in the portion of Epirubicin Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response of the impurity peak from the *Sample solution*

$r_S$  = peak response of the epirubicin peak from the *Standard solution*

$C_S$  = concentration of USP Epirubicin Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Epirubicin Hydrochloride in the *Sample solution* (mg/mL)

$F$  = relative response factor (see *Impurity Table 1*)

#### Acceptance criteria

**Individual impurities:** See *Impurity Table 1*.

**Total impurities:** NMT 3.0%

Impurity Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Doxorubicinone	0.3	1.4	1.0
Daunorubicinone	0.4	1.0	0.5
Doxorubicin	0.8	1.0	1.0
Epirubicin	1.0	—	—
Dihydrodaunorubicin	1.1	1.0	0.5
Daunorubicin	1.5	1.0	0.5
Epidaunorubicin	1.7	1.0	1.0
Epirubicin dimer	2.1	1.0	1.0
Individual unspecified impurity	—	1.0	0.5

• **PROCEDURE 2: LIMIT OF ACETONE**

Analysis: See *Residual Solvents* (467).

Acceptance criteria: NMT 1.5%

**SPECIFIC TESTS**

- **WATER DETERMINATION**, *Method 1c* (921): NMT 4.0%
- **PH** (791): 4.0–5.5 for a 5 mg/mL solution
- **BACTERIAL ENDOTOXINS TEST** (85): NMT 1.1 USP Endotoxin Units/mg, where the label states that Epirubicin Hydrochloride is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Store in airtight containers, protected from light, at a temperature between 2° and 8°. If the substance is sterile, store in a sterile, airtight, tamper-proof container.
- **LABELING:** Where applicable, the label states that the substance is free from bacterial endotoxins.
- **USP REFERENCE STANDARDS** (11)
  - USP Endotoxin RS
  - USP Doxorubicin Hydrochloride RS
  - USP Epirubicin Hydrochloride RS

## Epitetracycline Hydrochloride

$C_{22}H_{24}N_2O_8 \cdot HCl$  480.90

2-Naphthacenecarboxamide, 4-(dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,6,10,12,12a-pentahydroxy-6-methyl-1,11-dioxo-, monohydrochloride, [4R-(4 $\alpha$ ,4 $\beta$ ,5 $\alpha$ ,6 $\alpha$ ,12 $\alpha$ )]-

(4R,4aS,5aS,6S,12aS) 4-(dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,6,10,12,12a-pentahydroxy-6-methyl-1,11-dioxo-2-naphthacenecarboxamide monohydrochloride [23313-80-6].

» Epitetracycline Hydrochloride contains not less than 70.0 percent of  $C_{22}H_{24}N_2O_8 \cdot HCl$ .

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Tetracycline Hydrochloride RS

**pH** (791): between 2.3 and 4.0, in a solution containing 10 mg per mL.

**Loss on drying** (731)—Dry about 100 mg in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 6.0% of its weight.

**4-Epianhydrotetracycline** (226)—Dissolve about 250 mg, accurately weighed, in 10 mL of 0.1 N hydrochloric acid, and adjust with 6 N ammonium hydroxide to a pH of 7.8. Transfer this solution with the aid of *EDTA buffer* to a 50-mL volumetric flask, dilute with *EDTA buffer* to volume, and mix. Use this solution, without delay, as the *Test solution*: not more than 2.0% is found.

**Assay**—

*Edetate disodium solution*, *Stationary phase*, *Alkaline methanol solution*, *Column support*, *Chromatographic column*, and *Standard preparation*—Prepare as directed in the section *Epitetracycline hydrochloride content and Assay for tetracycline hydrochloride* under *Tetracycline Hydrochloride for Topical Solution*.

**Assay preparation**—Transfer about 22 mg of Epitetracycline Hydrochloride, accurately weighed, to a 25-mL volumetric flask, add 1 mL of methanol, and swirl to dissolve. Dilute with *Stationary phase* to volume, and mix. Transfer 2.0 mL of this solution to a 10-mL volumetric flask, dilute with *Stationary phase* to volume, and mix. Pipet 2.0 mL of this solution into the *Chromatographic column*, and allow it to penetrate the *Column support*. Add 20 mL of benzene to the solvent reservoir, and collect the eluate at the rate of about 1 mL per minute. When the benzene level reaches the top of the *Column support*, add 60 mL of chloroform to the solvent reservoir, and continue collecting eluate. When the chloroform level reaches the top of the *Column support*, discard the collected eluate, add 50 mL of a mixture of butyl alcohol and methanol (1:1), and collect 8 mL of eluate in a 10-mL graduated cylinder. Replace the 10-mL graduated cylinder with a low-actinic 50-mL volumetric flask, and continue collecting eluate until the column runs dry. The eluate in the 50-mL volumetric flask is the *Assay preparation*.

**Procedure**—Add 2.0 mL of *Alkaline methanol solution* to the *Standard preparation* and to the *Assay preparation*, dilute each with chloroform to volume, and mix. Concomitantly, within 10 minutes of preparation, determine the absorbances of these solutions at the wavelength of maximum absorbance at about 366 nm, with a suitable spectrophotometer, using chloroform as the blank. Calculate the quantity, in mg, of  $C_{22}H_{24}N_2O_8 \cdot HCl$  in the Epitetracycline Hydrochloride taken by the formula:

$$0.001(WP)(A_U / A_S)$$

in which *W* is the weight, in mg, of USP Tetracycline Hydrochloride RS taken, *P* is the potency, in  $\mu$ g per mg, of the USP Tetracycline Hydrochloride RS, and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

## Eprinomectin

$C_{50}H_{75}NO_{14}$  (Component B<sub>1a</sub>) 914.13.

$C_{49}H_{73}NO_{14}$  (Component B<sub>1b</sub>) 900.10.

Component B<sub>1a</sub>

Avermectin A<sub>1a</sub>, 4''-(acetylamino)-5-O-demethyl-4''-deoxy-, (4''R)-.

(2aE,4E,5'S,6S,6'R,7S,8E,11R,13S,15S,17aR,20R,20aR,20bS)-6'-(S)-sec-Butyl-5',6,6',7,10,11,14,15,17a,20,20a,20b-dodecahydro-20,20b-dihydroxy-5',6,8,19-tetramethyl-17-oxospiro[11,15-methano-2H,13H,17H-furo[4,3,2-pq][2,6]benzodioxacyclooctadecin-13,2'-[2H]pyran]-7-yl-4-O-(4-acetamido-2,4,6-trideoxy-3-O-methyl- $\alpha$ -L-lyxohexopyranosyl)-2,6-dideoxy-3-O-methyl- $\alpha$ -L-arabinohexopyranoside (or (4''R)-4''-(acetylamino)-5-O-demethyl-4''-deoxyavermectin A<sub>1a</sub>) [133305-88-1].

Component B<sub>1b</sub>

Avermectin A<sub>1a</sub>, 4''-(acetylamino)-5-O-demethyl-25-de(1-methylpropyl)-4''-deoxy-25-(1-methylethyl)-, (4''R)-.

(2aE,4E,5'S,6S,6'R,7S,8E,11R,13S,15S,17aR,20R,20aR,20bS)-5',6,6',7,10,11,14,15,17a,20,20a,20b-Dodecahydro-20,20b-dihydroxy-6'-isopropyl-5',6,8,19-tetramethyl-

17-oxospiro[11,15-methano-2*H*,13*H*,17*H*-furo[4,3,2-*pq*][2,6]benzodioxacyclooctadecin-13,2'-[2*H*]pyran]-7-yl-4-*O*-(4-acetamido-2,4,6-trideoxy-3-*O*-methyl- $\alpha$ -*L*-lyxo-hexopyranosyl)-2,6-dideoxy-3-*O*-methyl- $\alpha$ -*L*-arabino-hexopyranoside (or (4''*R*)-4''-(acetylamino)-5-*O*-demethyl-25-de(1-methyl-propyl)-4''-deoxy-25-(1-methylethyl) avermectin A<sub>1a</sub>) [133305-89-2].

» Eprinomectin is a mixture of Component B<sub>1a</sub> and Component B<sub>1b</sub>. It contains not less than 90.0 percent of Component B<sub>1a</sub> and not less than 95.0 percent of Components B<sub>1a</sub> and B<sub>1b</sub>, calculated on the anhydrous, solvent-free, and antioxidant-free basis. It may contain small amounts of a suitable antioxidant.

**Packaging and storage**—Preserve in tight containers, and store between 2° and 8° at ambient humidity.

**Labeling**—Label it to state the name(s) and amount(s) of any added substance(s). Label to indicate that it is for veterinary use only.

**USP Reference standards** (11)—

USP Eprinomectin RS

**Identification**—

**A:** *Infrared Absorption* (197M).

**B:** The retention times of the Component B<sub>1a</sub> peak and the Component B<sub>1b</sub> peak in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Specific rotation** (781S): between +132° and +140°, determined at 405 nm on the anhydrous, solvent-free, and antioxidant-free basis.

*Test solution:* 5 mg per mL, in chloroform.

**Water, Method Ia** (921): not more than 2.0%, determined on 0.250 g.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals, Method II** (231): not more than 10 ppm.

**Limit of residual solvents**—

*Standard solution I*—Transfer 3.0 mL of acetonitrile, 3.0 mL of methanol, 3.0 mL of isopropyl acetate, and 3.0 mL of heptane to a 50-mL volumetric flask. Dilute with dimethylacetamide to volume, and mix well.

*Standard solution II*—Transfer 1.0 mL of *Standard solution I* to a 100-mL volumetric flask, dilute with dimethylacetamide to volume, and mix well. Further dilute 10.0 mL of this solution with dimethylacetamide to 50.0 mL, and mix well.

*Test solution*—Transfer 1 g of Eprinomectin in dimethylacetamide to a 10-mL volumetric flask. Dilute with dimethylacetamide to volume, and mix well.

*Sensitivity solution I*—Transfer 3.0 mL each of methanol, isopropyl acetate, and heptane to a 50-mL volumetric flask. Dilute with dimethylacetamide to volume, and mix well. Further dilute 50  $\mu$ L of this solution with dimethylacetamide to 25 mL, and mix well.

*Sensitivity solution II*—Transfer 3.0 mL of acetonitrile to a 50-mL volumetric flask, dilute with dimethylacetamide to volume, and mix well. Further dilute 50  $\mu$ L of this solution with dimethylacetamide to 25 mL.

*Sensitivity solution III*—Transfer 5.0 mL of *Sensitivity solution I* and 1.0 mL of *Sensitivity solution II* to a 50-mL volumetric flask, dilute with dimethylacetamide to volume, and mix well. [NOTE—This solution contains 100 ppm (m/m) of methanol, isopropyl acetate, and heptane and 20 ppm (m/m) of acetonitrile.]

**Chromatographic system** (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and a 0.53-mm  $\times$  25-m fused-silica analytical column coated with a 20- $\mu$ m S3 stationary phase. The carrier gas is

helium with a flow rate of 20 mL per minute. The chromatograph is programmed as follows: the column temperature is increased from 110° at a rate of 5° per minute to 160° and maintained at 160° for 5 minutes. The column temperature is then increased at a rate of 30° per minute to 220° and maintained at 220° for 25 minutes. The injection port temperature is maintained at 200°, and the detector temperature is maintained at 220°. Chromatograph *Sensitivity solution III* and *Standard solution II* as directed for *Procedure*: in the chromatogram obtained from *Sensitivity solution III*, the peaks for methanol, acetonitrile, isopropyl acetate, and heptane are detectable and elute at relative retention times of 1, 2.1, 7.6, and 8.6, respectively. In the chromatogram obtained from *Standard solution II*, the relative standard deviations for the areas of the solvent peaks are not more than 5.0% for six injections.

*Procedure*—Separately inject equal volumes (about 1  $\mu$ L) of *Standard solution II* and the *Test solution*. Reinject *Standard solution II* in duplicate after every six sample injections. The individual values for the area response of the two injections agree within  $\pm 5\%$  of their corresponding average response. Calculate the percentage of each solvent present using the following formula:

$$0.12D(r_U / r_S)$$

in which *D* is the density, in mg per mL, of acetonitrile (0.787), isopropyl acetate (0.870), methanol (0.796), and heptane (0.684); *r<sub>U</sub>* is the solvent peak area in the chromatogram obtained from the *Test solution*; and *r<sub>S</sub>* is the solvent peak area in the chromatogram obtained from *Standard solution II*. Not more than 0.005% of acetonitrile is found, and the sum of all solvents is not more than 0.5%.

**Limit of 8a-oxo-B<sub>1a</sub>**—

*Solution A, Solution B, Diluent, and System suitability solution*—Proceed as directed in the *Assay*.

*System suitability mobile phase*—Use the *Mobile phase* as directed in the *Assay*.

*Mobile phase*—Use a mixture of acetonitrile and *Solution A* (13:7). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard solution*—Use the *Standard preparation*, prepared as directed in the *Assay*.

*Test solution*—Use the *Assay preparation*, prepared as directed in the *Assay*.

*Butylated hydroxytoluene solution*—Transfer 50 mg of butylated hydroxytoluene to a 100-mL volumetric flask, and dilute with methanol to volume. Sonicate, if necessary, and mix well. Dilute 2 mL of the resulting solution with *Diluent* to 100 mL.

*System suitability determination*—Use the conditions as directed for *Chromatographic system* in the *Assay*.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm  $\times$  25-cm column that contains 5- $\mu$ m packing L7. The flow rate is 1.5 mL per minute, and the column temperature is 40°. Chromatograph the *Butylated hydroxytoluene solution* and the *Test solution*, and record the peak responses as directed for *Procedure*: the retention time for the peak corresponding to butylated hydroxytoluene is approximately 12 to 17 minutes, and the relative standard deviation of the peak area is not more than 3.0% for six injections. In the chromatogram obtained from the *Test solution*, the retention time for the peak corresponding to 8a-oxo-B<sub>1a</sub> is approximately 4 to 9 minutes.

*Procedure*—Separately inject equal volumes (about 15  $\mu$ L) of the *Butylated hydroxytoluene solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the con-

tent of 8a-oxo-B<sub>1a</sub>, in mg, on the anhydrous, solvent-free, and antioxidant-free basis taken by the formula:

$$DCPF(r_U / r_S)$$

in which *D* is the dilution factor, in mL, used to prepare the *Test solution*; *C* is the concentration, in mg per mL, of butylated hydroxytoluene in the *Butylated hydroxytoluene solution*; *P* is the purity of butylated hydroxytoluene used to prepare the *Butylated hydroxytoluene solution*; *F* is equal to 0.4 and is the relative response factor for butylated hydroxytoluene with respect to 8a-oxo-B<sub>1a</sub>; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak areas for 8a-oxo-B<sub>1a</sub> and butylated hydroxytoluene in the chromatograms obtained from the *Test solution* and the *Butylated hydroxytoluene solution*, respectively. Not more than 0.5% of 8a-oxo-B<sub>1a</sub> is found.

#### Related compounds—

*Solution A*, *Solution B*, *Mobile phase*, *Diluent*, *System suitability solution*, and *Chromatographic system*—Proceed as directed in the *Assay*.

*Standard solution*—Use the *Standard preparation*, prepared as directed in the *Assay*.

*Test solution*—Use the *Assay preparation*, prepared as directed in the *Assay*.

*Procedure*—Inject a volume (about 15 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak areas. Calculate the percentage of eprinomectin related compounds in the portion of Eprinomectin taken by the formula:

$$100(r_i / r_s)$$

in which *r<sub>i</sub>* is the peak area of each individual related substance obtained from the *Test solution*, and *r<sub>s</sub>* is the sum of the responses of all the peaks: for related compounds with relative retentions of 0.23, 0.93, and 1.16 with respect to the B<sub>1a</sub> peak, not more than 1.0%; for impurity A, not more than 1.0%; for impurity E, not more than 1.0%; for all other known impurities, not more than 0.5%; for total unknown impurities, not more than 1.0%; and for total impurities, not more than 5.0% is found.

#### Assay—

*Solution A*: 0.1% (v/v) solution of perchloric acid in water.

*Solution B*: acetonitrile.

*Mobile phase*—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Diluent*—Prepare a solution of four volumes of methanol and one volume of water.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Eprinomectin RS in *Diluent* to prepare a solution having a known concentration of about 0.500 mg per mL.

*System suitability solution*—Transfer 4 mL of *Standard preparation* to an HPLC vial. Add 2 drops of 1 M sodium hydroxide and let stand for 20 minutes prior to injecting into the chromatograph.

*Assay preparation*—Dissolve an accurately weighed quantity of Eprinomectin in *Diluent* to prepare a solution having a known concentration of about 0.500 mg per mL.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 245-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L7. The flow rate is 1.5 mL per minute, and the column temperature is 40°. The chromatograph is programmed as follows:

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–15	45	55	isocratic
15–25	45→5	55→95	linear gradient
25–30	5→45	95→55	linear gradient
30–35	45	55	isocratic

Chromatograph the *System suitability solution* and the *Standard preparation* as directed for *Procedure*: the relative retention times are about 0.55, 0.77, 1.00, 1.05, and 1.28 for impurity A, component B<sub>1b</sub>, component B<sub>1a</sub>, impurities C + D, and impurity E, respectively; the resolution, *R*, between components B<sub>1b</sub> and B<sub>1a</sub> is not less than 3; the resolution, *R*, between component B<sub>1a</sub> and impurities C + D is at least 1; the symmetry factor for the B<sub>1a</sub> peak is not more than 1.5; and the theoretical plate count for the B<sub>1a</sub> peak is greater than 4,500. In the chromatogram of the *Standard preparation*, the relative standard deviation for the peak corresponding to B<sub>1a</sub> is not more than 1.0% for five injections.

*Procedure*—Separately inject equal volumes (about 15 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of component B<sub>1a</sub> by the formula:

$$100(r_U / r_T)$$

in which *r<sub>U</sub>* is the peak area of component B<sub>1a</sub> in the chromatogram obtained from the *Assay preparation*; and *r<sub>T</sub>* is the sum of the peak areas of components B<sub>1a</sub> and B<sub>1b</sub>.

Calculate the quantity, in mg, of C<sub>50</sub>H<sub>75</sub>NO<sub>14</sub> (component B<sub>1a</sub>) and C<sub>49</sub>H<sub>73</sub>NO<sub>14</sub> (component B<sub>1b</sub>) in the portion of Eprinomectin taken by the formula:

$$DC(r_U / r_S)$$

in which *D* is the dilution factor, in mL, used to prepare the *Assay preparation*; *C* is the concentration, in mg per mL, of component B<sub>1a</sub> or component B<sub>1b</sub> in the *Standard preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak areas of component B<sub>1a</sub> or component B<sub>1b</sub> in the chromatograms obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Equilin

C<sub>18</sub>H<sub>20</sub>O<sub>2</sub> 268.35

Estra-1,3,5(10),7-tetraen-17-one, 3-hydroxy-

3-Hydroxyestra-1,3,5(10),7-tetraen-17-one [474-86-2].

» Equilin contains not less than 97.0 percent and not more than 103.0 percent of C<sub>18</sub>H<sub>20</sub>O<sub>2</sub>, calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Equilin RS

**Clarity of solution**—Add 100 mg to 100 mL of 1 N sodium hydroxide in a 125-mL conical flask, heat on a steam bath until solution is complete, then cool, and transfer to a 100-mL color-comparison tube: the solution is clear.

**Identification—**

**A:** Infrared Absorption (197K).

**B:** Ultraviolet Absorption (197U)—

*Solution:* 50 µg per mL.

*Medium:* alcohol.

**Specific rotation** (781S): between +300° and +316°.

*Test solution:* 20 mg per mL, in dioxane.

**Loss on drying** (731)—Dry it in vacuum at 105° for 1 hour; it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.5%.

**Assay—**

*Mobile phase*—Prepare a suitable and degassed solution containing 35 volumes of acetonitrile and 65 volumes of water.

*Internal standard solution*—Dissolve phenol in acetonitrile to obtain a solution having a concentration of about 35 µg per mL.

*Standard preparation*—Dissolve a suitable quantity of USP Equilin RS, accurately weighed, in *Internal standard solution* to obtain a solution having a known concentration of about 0.2 mg per mL.

*Assay preparation*—Transfer about 10 mg of Equilin, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Internal standard solution* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph five replicate injections of the *Standard preparation*, and record the peak responses as directed under *Procedure*: the relative standard deviation is not more than 2.0%, and the resolution factor between equilin and phenol is not less than 5. Adjust the operating parameters such that the peak obtained from the *Standard preparation* is about 0.7 full-scale.

*Procedure*—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph by means of a suitable microsyringe or sampling valve, record the chromatograms, and measure the responses for the major peaks: the retention times for equilin and phenol are about 14 and 3 minutes, respectively. Calculate the quantity, in mg, of C<sub>18</sub>H<sub>20</sub>O<sub>2</sub> in the portion of Equilin taken by the formula:

$$50C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of USP Equilin RS in the *Standard preparation*, and  $R_U$  and  $R_S$  are the ratios of the peak responses of the equilin peak to the internal standard peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Ergocalciferol**

C<sub>28</sub>H<sub>44</sub>O 396.65  
9,10-Secoergosta-5,7,10 (19),22-tetraen-3-ol, (3β,5Z,7E,  
22E)-;  
Ergocalciferol [50-14-6].

**DEFINITION**

Ergocalciferol contains NLT 97.0% and NMT 103.0% of ergocalciferol (C<sub>28</sub>H<sub>44</sub>O).

**IDENTIFICATION**

• **A. INFRARED ABSORPTION** (197K)

*Wavelength range:* 2–12 µm

• **B. ULTRAVIOLET ABSORPTION** (197U)

*Analytical wavelength:* 265 nm

*Sample solution:* 10 µg/mL in alcohol

*Acceptance criteria:* Meets the requirements in the chapter. Absorptivities do not differ by more than 3.0%.

• **C.**

*Sample solution:* 0.5 mg in 5 mL of chloroform

*Analysis:* Add 0.3 mL of acetic anhydride and 0.1 mL of sulfuric acid to the *Sample solution*, and shake vigorously.

*Acceptance criteria:* A bright red color is produced and rapidly changes through violet and blue to green.

• **D. THIN-LAYER CHROMATOGRAPHY**

[NOTE—For the *Standard solutions* and the *Sample solution*, follow these procedures: use low-actinic glassware, dissolve the samples without heating, and use the solutions immediately.]

*Diluent:* 10 mg/mL of squalane in chloroform

*Standard solution A:* 50 mg/mL of USP Ergocalciferol RS in *Diluent*

*Standard solution B:* 100 µg/mL of USP Ergosterol RS in *Diluent*

*Sample solution:* 50 mg/mL of Ergocalciferol in *Diluent*

*Chromatographic system* (See *Chromatography* (621), *Thin-Layer Chromatography*.)

*Mode:* TLC

*Adsorbent:* 0.25-mm layer of chromatographic silica gel mixture

*Application volume:* 10 µL

*Developing solvent system:* Cyclohexane and ether (1:1)

*Spray reagent:* 20 mg/mL of acetyl chloride in antimony trichloride TS

**Analysis**

*Samples:* *Standard solution A*, *Standard solution B*, and *Sample solution*

[NOTE—Perform the development and subsequent operations in the dark.]

Place the plate in a chamber containing and equilibrated with *Developing solvent system*. Develop until the solvent front has moved about 15 cm above the line of application. Remove the plate, allow the solvent to evaporate, and spray with *Spray reagent*.

*Acceptance criteria:* The *Sample solution* shows a yellowish-orange area (ergocalciferol) having the same  $R_f$  value as the area of *Standard solution A* and may show a violet area below the ergocalciferol area. The color of the violet area is not more intense than that of the violet area from *Standard solution B*.

**ASSAY**

• **PROCEDURE**

*Dehydrated hexane:* Prepare a chromatographic column by packing a chromatographic tube, 8 cm × 60 cm, with 500 g of 50- to 250-µm chromatographic siliceous earth, activated by drying at 150° for 4 h. (See *Chromatography* (621), *Column Chromatography*.) Pass 500 mL of hexane through the column, and collect the eluate in a glass-stoppered flask.

*Mobile phase:* *n*-amyl alcohol in *Dehydrated hexane* (3 in 1000)

*System suitability solution:* 250 mg of USP Vitamin D Assay System Suitability RS in 10 mL of a mixture of toluene and *Mobile phase* (1:1). Heat this solution, under reflux, at 90° for 45 min, and cool. [NOTE—This solution contains cholecalciferol, precholecalciferol, and *trans*-cholecalciferol.]

[NOTE—For the stock solutions, follow these procedures: use low-actinic glassware, dissolve the samples without heating, and prepare the solutions fresh daily.]

**Standard stock solution:** 0.6 mg/mL of USP Ergocalciferol RS in toluene

**Standard solution:** 120 µg/mL of USP Ergocalciferol RS in *Mobile phase*, prepared from *Standard stock solution*

**Sample stock solution:** 0.6 mg/mL of Ergocalciferol in toluene

**Sample solution:** 120 µg/mL of Ergocalciferol in *Mobile phase*, prepared from *Sample stock solution*

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 25-cm; packing L3

**Injection size:** 5–10 µL

#### System suitability

**Sample:** *System suitability solution*

[NOTE—The relative retention times for precholecalciferol, *trans*-cholecalciferol, and cholecalciferol are 0.4, 0.5, and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 1.0 between *trans*-cholecalciferol and precholecalciferol

**Relative standard deviation:** NMT 2.0% for the peak response of cholecalciferol

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of ergocalciferol (C<sub>28</sub>H<sub>44</sub>O) in the portion of Ergocalciferol taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Ergocalciferol RS in the *Standard solution* (µg/mL)

$C_U$  = concentration of Ergocalciferol in the *Sample solution* (µg/mL)

**Acceptance criteria:** 97.0%–103.0%

#### IMPURITIES

##### • REDUCING SUBSTANCES

**Standard solution:** 0.2 µg/mL of hydroquinone in dehydrated alcohol

**Sample solution:** 10 mg/mL of Ergocalciferol in dehydrated alcohol

**Blank:** dehydrated alcohol

#### Analysis

**Samples:** *Standard solution*, *Sample solution*, and *Blank*

To 10 mL each of *Standard solution*, *Sample solution*, and *Blank*, add 0.5 mL of 5 mg/mL blue tetrazolium in methanol. Then add 0.5 mL of tetramethylammonium hydroxide TS in dehydrated alcohol (1 in 10). Allow the mixture to stand for 5 min, accurately timed, then add 1 mL of glacial acetic acid. Determine the absorbance of the solution at 525 nm, with a suitable spectrometer, against the *Blank*.

**Acceptance criteria:** The absorbance of the *Sample solution* is NMT that of the *Standard solution*.

#### SPECIFIC TESTS

##### • MELTING RANGE OR TEMPERATURE, *Class 1b* <741>:

115°–119°

##### • OPTICAL ROTATION, *Specific Rotation* <781S>

**Sample solution:** 15 mg/mL in alcohol. [NOTE—Prepare and use the solution without delay. Use Ergocalciferol from a container opened not longer than 30 min.]

**Acceptance criteria:** +103° to +106°

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in hermetically sealed containers under nitrogen, and store in a cool place protected from light.

#### • USP REFERENCE STANDARDS <11>

USP Ergocalciferol RS

USP Ergosterol RS

C<sub>28</sub>H<sub>44</sub>O 396.66

USP Vitamin D Assay System Suitability RS

## Ergocalciferol Capsules

#### DEFINITION

Ergocalciferol Capsules usually consist of an edible vegetable oil solution of Ergocalciferol, encapsulated with Gelatin.

Ergocalciferol Capsules contain NLT 100.0% and NMT 120.0% of the labeled amount of vitamin D as ergocalciferol (C<sub>28</sub>H<sub>44</sub>O).

#### ASSAY

##### • PROCEDURE

[NOTE—Throughout this Assay, protect solutions containing, and derived from, the test specimen and the Reference Standard from the atmosphere and light, preferably by the use of a blanket of inert gas and low-actinic glassware.]

**Dehydrated hexane:** Prepare a chromatographic column by packing a chromatographic tube, 60-cm × 8-cm in diameter, with 500 g of 50- to 250-µm chromatographic siliceous earth, activated by drying at 150° for 4 h. (See *Chromatography* <621>, *Column Adsorption Chromatography*.) Pass 500 mL of hexanes through the column, and collect the eluate in a glass-stoppered flask.

**Butylated hydroxytoluene solution:** 10 mg/mL of butylated hydroxytoluene in chromatographic hexane

**Aqueous potassium hydroxide solution:** 1 g/mL of potassium hydroxide in freshly boiled water. [NOTE—Prepare this solution fresh daily.]

**Alcoholic potassium hydroxide solution:** 3 g of potassium hydroxide in 50 mL of freshly boiled water. Add 10 mL of alcohol, and dilute with freshly boiled water to 100 mL. [NOTE—Prepare this solution fresh daily.]

**Sodium ascorbate solution:** 175 mg/mL of ascorbic acid in 1 N sodium hydroxide. [NOTE—Prepare this solution fresh daily.]

**Sodium sulfide solution:** 12 g of sodium sulfide in 20 mL of water. Dilute with glycerin to 100 mL.

**Mobile phase:** *Dehydrated hexane* and *n*-amyl alcohol (997:3). The ratio of components and the flow rate may be varied to meet the *System suitability requirements*.

**Standard stock solution:** 0.5 mg/mL of USP Ergocalciferol RS in toluene. [NOTE—Prepare solution fresh daily.]

**Standard solution A:** 20 µg/mL from the *Standard stock solution* in *Mobile phase*. [NOTE—Store this solution at a temperature not above 0°.]

**Standard solution B:** Pipet 4 mL of the *Standard stock solution* into a round-bottomed flask fitted with a reflux condenser, and add 2 or 3 crystals of butylated hydroxytoluene. Displace the air with nitrogen, and heat in a water bath maintained at a temperature of 90° in subdued light under a nitrogen atmosphere for 45 min to obtain a solution containing vitamin D and pre-vitamin D. Cool, transfer with the aid of several portions of *Mobile phase* to a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

**System suitability solution:** 100 mg of USP Vitamin D Assay System Suitability RS to a 10-mL volumetric flask. Add a mixture (1 in 5) of toluene and *Mobile phase* to volume, and mix. Heat a portion of this solution under reflux, at 90° for 45 min, and cool.

**Sample solution:** Reflux NLT 10 Capsules with a mixture of 10 mL of *Sodium ascorbate solution* and 2 drops of *Sodium sulfide solution* on a steam bath for 10 min, crush any remaining solids with a blunt glass rod, and

continue heating for 5 min. Cool, and add 25 mL of alcohol and 3 mL of *Aqueous potassium hydroxide solution*. Reflux the mixture on a steam bath for 30 min. Cool rapidly under running water, and transfer the saponified mixture to a conical separator, rinsing the saponification flask with two 15-mL portions of water, 10 mL of alcohol, and two 50-mL portions of ether. [NOTE—Use ether within 24 h after opening the container.] Shake the combined saponified mixture and rinsings vigorously for 30 s, and allow to stand until both layers are clear. Transfer the aqueous phase to a second conical separator, add a mixture of 10 mL of alcohol and 50 mL of solvent hexane, and shake vigorously. Allow to separate, transfer the aqueous phase to a third conical separator, and transfer the solvent hexane phase to the first separator, rinsing the second separator with two 10-mL portions of solvent hexane and adding the rinsings to the first separator. Shake the aqueous phase in the third separator with 50 mL of solvent hexane, and add the solvent hexane phase to the first separator. Wash the combined ether-solvent hexane extracts by shaking vigorously with three 50-mL portions of *Alcoholic potassium hydroxide solution*, and wash with 50-mL portions of water vigorously until the last washing is neutral to phenolphthalein. Drain any remaining drops of water from the combined ether-solvent hexane extracts, add 2 sheets of 9-cm filter paper, in strips, to the separator, and shake. Transfer the washed ether-solvent hexane extracts to a round-bottomed flask, rinsing the separator and paper with solvent hexane. Combine the solvent hexane rinsings with the ether-solvent hexane extracts, add 100  $\mu$ L of *Butylated hydroxytoluene solution*, and mix. Evaporate in a vacuum to dryness by swirling in a water bath maintained at a temperature not higher than 40°. Cool under running water, and introduce nitrogen sufficient to restore atmospheric pressure. Without delay, dissolve and dilute the residue in an accurately measured volume of a mixture (1 in 5) of toluene and *Mobile phase*, until the concentration of vitamin D is about 25  $\mu$ g/mL.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 25-cm  $\times$  4.6-mm; packing L3

**Injection size:** 20  $\mu$ L

#### System suitability

**Sample:** *System suitability solution*

[NOTE—The relative retention times for pre-cholecalciferol, *trans*-cholecalciferol, and cholecalciferol are 0.4, 0.5, and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 1.0 is between *trans*-cholecalciferol and pre-cholecalciferol

**Relative standard deviation:** NMT 2.0% for the cholecalciferol peak

#### Analysis

**Samples:** *Standard solution A*, *Standard solution B*, and *Sample solution*

#### Ergocalciferol response factor

Calculate the *Ergocalciferol response factor*,  $F_D$ :

$$F_D = C_S/r_S$$

$C_S$  = concentration of USP Ergocalciferol RS in the *Standard solution A* ( $\mu$ g/mL)

$r_S$  = peak response of ergocalciferol from *Standard solution A*

#### Pre-ergocalciferol response factor

Calculate the concentration of ergocalciferol,  $C'_S$ , in  $\mu$ g/mL, in the *Standard solution B*:

$$C'_S = F_D \times r'_S$$

$F_D$  = ergocalciferol response factor

$r'_S$  = peak area of ergocalciferol from *Standard solution B*

Calculate the concentration of pre-ergocalciferol,  $C'_{pre}$ , in  $\mu$ g/mL, in the *Standard solution B*:

$$C'_{pre} = C_S - C'_S$$

$C_S$  = concentration of USP Ergocalciferol RS in the *Standard solution A* ( $\mu$ g/mL)

$C'_S$  = concentration of ergocalciferol in the *Standard solution B* ( $\mu$ g/mL)

Calculate the response factor,  $F_{pre}$ , for pre-ergocalciferol:

$$F_{pre} = C'_{pre}/r'_{pre}$$

$C'_{pre}$  = concentration of pre-ergocalciferol ( $\mu$ g/mL)

$r'_{pre}$  = peak response of pre-ergocalciferol from *Standard solution B*

[NOTE—The value of  $F_{pre}$  determined in duplicate, on different days, can be used during the entire procedure.]

#### Vitamin D content

Calculate the percentage of the labeled amount of vitamin D as ergocalciferol ( $C_{28}H_{44}O$ ) in the portion of Capsules taken:

$$\text{Result} = \{[(F_D \times r_C) + (F_{pre} \times r'_{pre})]/C_U\} \times 100$$

$F_D$  = ergocalciferol response factor

$r_C$  = peak area of ergocalciferol from the *Sample solution*

$F_{pre}$  = pre-ergocalciferol response factor

$r'_{pre}$  = peak area of pre-ergocalciferol from the *Sample solution*

$C_U$  = nominal concentration of ergocalciferol in the *Sample solution* ( $\mu$ g/mL)

**Acceptance criteria:** 100.0%–120.0%

#### PERFORMANCE TESTS

##### • DISINTEGRATION <701>

**Buffer solution:** 0.05 M acetate buffer, prepared by mixing 2.99 g of sodium acetate and 1.66 mL of glacial acetic acid with water to obtain 1000 mL of solution having a pH of  $4.5 \pm 0.05$

**Immersion fluid:** *Buffer solution*

**Time:** 45 min

**Acceptance criteria:** Meet the requirements

##### • UNIFORMITY OF DOSAGE UNITS <905>: Meet the requirements

#### ADDITIONAL REQUIREMENTS

##### • PACKAGING AND STORAGE: Preserve in tight, light-resistant containers.

##### • LABELING: Label the Capsules to indicate the content of ergocalciferol in mg. The activity may be expressed also in terms of USP Units, on the basis that 40 USP Vitamin D Units = 1 $\mu$ g.

##### • USP REFERENCE STANDARDS <11>

USP Ergocalciferol RS

USP Vitamin D Assay System Suitability RS

## Ergocalciferol Oral Solution

#### DEFINITION

Ergocalciferol Oral Solution is a solution of Ergocalciferol in an edible vegetable oil, in Polysorbate 80, or in Propylene Glycol. It contains NLT 100.0% and NMT 120.0% of the labeled amount of vitamin D as ergocalciferol ( $C_{28}H_{44}O$ ).

#### ASSAY

##### • PROCEDURE

**Mobile phase:** Chloroform containing alcohol as a preservative

**Standard stock solution:** 50 µg/mL of USP Ergocalciferol RS in chloroform. [NOTE—Prepare this solution fresh daily.]

**Standard solution A:** 5 µg/mL of USP Ergocalciferol RS from the *Standard stock solution* in chloroform. [NOTE—Store this *Standard solution A* at a temperature not above 0°.]

**Standard solution B:** Transfer 5.0 mL of the *Standard stock solution* into a round-bottomed flask fitted with a reflux condenser. Displace the air with nitrogen, and reflux for 1 h in a water bath under a nitrogen atmosphere to obtain a solution containing ergocalciferol and pre-ergocalciferol. Cool, transfer, with the aid of several portions of chloroform, to a 50-mL volumetric flask, dilute with chloroform to volume, and mix.

**Sample solution:** Equivalent to 5 µg/mL of ergocalciferol from an accurately measured volume of Oral Solution in chloroform

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L3

**Flow rate:** 1 mL/min

**Injection size:** 10–20 µL

#### System suitability

**Sample:** *Standard solution B*

[NOTE—The relative retention times for pre-ergocalciferol and for ergocalciferol are 0.8 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 1.0 between the pre-ergocalciferol peak and the ergocalciferol peak

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution A*, *Standard solution B*, and *Sample solution*

#### Ergocalciferol response factor

Calculate the *Ergocalciferol response factor*,  $F_D$ :

$$F_D = C_S/r_S$$

$C_S$  = concentration of USP Ergocalciferol RS in the *Standard solution A* (µg/mL)

$r_S$  = peak response of ergocalciferol from *Standard solution A*

#### Pre-ergocalciferol response factor

Calculate the concentration,  $C'_S$ , in µg/mL, of ergocalciferol in *Standard solution B*:

$$C'_S = F_D \times r'_S$$

$F_D$  = Ergocalciferol response factor

$r'_S$  = peak area of ergocalciferol from *Standard solution B*

Calculate the concentration,  $C'_{pre}$ , in µg/mL, of pre-ergocalciferol:

$$C'_{pre} = C_S - C'_S$$

$C_S$  = concentration of USP Ergocalciferol RS in the *Standard solution A* (µg/mL)

$C'_S$  = concentration of ergocalciferol in the *Standard solution B* (µg/mL)

Calculate the *Pre-ergocalciferol response factor*,  $F_{pre}$ :

$$F_{pre} = C'_{pre}/r_p$$

$C'_{pre}$  = concentration of pre-ergocalciferol (µg/mL)

$r_p$  = peak response of pre-ergocalciferol from *Standard solution B*

#### Vitamin D content

Calculate the percentage of the labeled amount of vitamin D as ergocalciferol ( $C_{28}H_{44}O$ ) in the portion of Oral Solution taken:

$$\text{Result} = \{[(F_D \times r_C) + (F_{pre} \times r_{pre})]/C_U\} \times 100$$

$F_D$  = ergocalciferol response factor

$r_C$  = peak area of ergocalciferol from the *Sample solution*

$F_{pre}$  = response factor for pre-ergocalciferol

$r_{pre}$  = peak area of pre-ergocalciferol from the *Sample solution*

$C_U$  = nominal concentration of ergocalciferol in the *Sample solution* (µg/mL)

**Acceptance criteria:** 100.0%–120.0%

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

• **LABELING:** Label the Oral Solution to indicate the concentration of ergocalciferol, in mg per dosage unit. The activity may be expressed also in terms of USP Units, on the basis that 40 USP Vitamin D Units = 1 µg.

• **USP REFERENCE STANDARDS** <11>

USP Ergocalciferol RS

## Ergocalciferol Tablets

#### DEFINITION

Ergocalciferol Tablets contain NLT 100.0% and NMT 120.0% of the labeled amount of ergocalciferol ( $C_{28}H_{44}O$ ).

#### IDENTIFICATION

##### A. ULTRAVIOLET ABSORPTION

**Standard solution:** 0.01 mg/mL of USP Ergocalciferol RS in alcohol

**Sample solution:** Evaporate 1 mL of the *Sample solution* obtained from *Identification test B* under a stream of nitrogen to dryness. Dissolve the residue in 50 mL of alcohol.

##### Analysis

**Samples:** *Standard solution* and *Sample solution*

**Acceptance criteria:** The absorption spectrum of the *Sample solution* exhibits maxima and minima at the same wavelengths as that of the *Standard solution*, concomitantly measured.

##### B. COLOR REACTION

**Sample solution:** Triturate a quantity of powdered Tablets, equivalent to 5 mg of ergocalciferol, with 10 mL of chloroform, and filter.

**Analysis:** To 5 mL of the *Sample solution* add 0.3 mL of acetic anhydride and 0.1 mL of sulfuric acid, and shake vigorously.

**Acceptance criteria:** A bright red color is produced and rapidly changes through violet and blue to green.

#### ASSAY

• **PROCEDURE:** Proceed with Tablets as directed in *Vitamin D Assay* <581>, *Chemical Method*.

**Acceptance criteria:** 100.0%–120.0%

#### PERFORMANCE TESTS

##### DISINTEGRATION <701>

Time: 30 min

• **UNIFORMITY OF DOSAGE UNITS** <905>: Meet the requirements

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

• **LABELING:** Label the Tablets to indicate the content of ergocalciferol, in mg. The activity may be expressed also

in terms of USP Units, on the basis that 40 USP Vitamin D Units = 1 µg.

- **USP REFERENCE STANDARDS** (11)  
USP Ergocalciferol RS

## Ergoloid Mesylates

C<sub>31</sub>H<sub>41</sub>N<sub>5</sub>O<sub>5</sub> · CH<sub>4</sub>O<sub>3</sub>S (dihydroergocornine mesylate) 659.79

C<sub>35</sub>H<sub>41</sub>N<sub>5</sub>O<sub>5</sub> · CH<sub>4</sub>O<sub>3</sub>S (dihydroergocristine mesylate) 707.84

C<sub>32</sub>H<sub>43</sub>N<sub>5</sub>O<sub>5</sub> · CH<sub>4</sub>O<sub>3</sub>S (dihydro- $\alpha$ -ergocryptine mesylate) 673.82

C<sub>32</sub>H<sub>43</sub>N<sub>5</sub>O<sub>5</sub> · CH<sub>4</sub>O<sub>3</sub>S (dihydro- $\beta$ -ergocryptine mesylate) 673.82

Ergotaman-3',6',18-trione, 9,10-dihydro-12'-hydroxy-2',5'-bis(1-methylethyl)-, (5' $\alpha$ ,10 $\alpha$ )-, monomethanesulfonate (salt) mixture with 9,10 $\alpha$ -dihydro-12'-hydroxy-2'-(1-methylethyl)-5' $\alpha$ -(phenylmethyl)ergotaman-3',6',18-trione monomethanesulfonate (salt), 9,10 $\alpha$ -dihydro-12'-hydroxy-2'-(1-methylethyl)-5' $\alpha$ -(2-methylpropyl)ergotaman-3',6',18-trione monomethanesulfonate (salt), and 9,10 $\alpha$ -dihydro-12'-hydroxy-2'-(1-methylethyl)-5' $\alpha$ -(1-methylpropyl)ergotaman-3',6',18-trione monomethanesulfonate (salt).

Dihydroergotoxine monomethanesulfonate (salt).

An equiproportional mixture of dihydroergocornine mesylate, dihydroergocristine mesylate, and ratio of dihydro- $\alpha$ -ergocryptine mesylate to dihydro- $\beta$ -ergocryptine mesylate is (1.5-2.5:1) [8067-24-1].

» Ergoloid Mesylates is a mixture of the methanesulfonate salts of the three hydrogenated alkaloids, dihydroergocristine (C<sub>35</sub>H<sub>41</sub>N<sub>5</sub>O<sub>5</sub> · CH<sub>4</sub>O<sub>3</sub>S), dihydroergocornine (C<sub>31</sub>H<sub>41</sub>N<sub>5</sub>O<sub>5</sub> · CH<sub>4</sub>O<sub>3</sub>S), and dihydroergocryptine (C<sub>32</sub>H<sub>43</sub>N<sub>5</sub>O<sub>5</sub> · CH<sub>4</sub>O<sub>3</sub>S), in an approximate weight ratio of 1:1:1. Ergoloid Mesylates contains not less than 97.0 percent and not more than 103.0 percent of the alkaloid methanesulfonate mixture, calculated on the anhydrous basis, and not less than 30.3 percent and not more than 36.3 percent of the methanesulfonate salt of each of the individual alkaloids. Dihydroergocryptine mesylate exists as a mixture of *alpha*- and *beta*- isomers. The ratio of *alpha*- to *beta*- isomers is not less than 1.5:1.0 and not more than 2.5:1.0.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—  
USP Ergoloid Mesylates RS

### Identification—

**A:** The IR absorption spectrum of a potassium bromide dispersion of it exhibits maxima only at the same wave-

lengths as that of a similar, undried preparation of USP Ergoloid Mesylates RS.

**B:** In a suitable chromatographic chamber, arranged for thin-layer chromatography, place a volume of a solvent system consisting of a mixture of acetone, *n*-butyl alcohol, ammonium hydroxide, and water (65:20:10:5) sufficient to develop the chromatogram. Prepare a test solution of Ergoloid Mesylates in a mixture of chloroform and methanol (9:1) containing 40 mg per mL. Apply 10 µL of this solution and 10 µL of a reference solution of methanesulfonic acid containing 0.4 mL in 100 mL of a mixture of chloroform and methanol (9:1) to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel. Develop the chromatogram until the solvent front has moved 10 cm. Remove the plate from the developing chamber, mark the solvent front, and dry in a current of cold air. Spray the plate with a 1 in 1000 solution of bromocresol purple in alcohol that previously has been adjusted to the purple color with 6 N ammonium hydroxide, then place in a stream of warm air until the spots appear: the *R<sub>F</sub>* value of the methanesulfonic acid spot obtained from the test solution corresponds to that obtained from the reference solution.

**Specific rotation** (781S): between +11.0° and +15.0°.

**Test solution:** 10 mg per mL, in dilute alcohol (1 in 2).

**pH** (791): between 4.2 and 5.2 in a solution (1 in 200).

**Water, Method I** (921): not more than 5.0%.

**Limit of ergotamine**—Prepare three solutions in a mixture of chloroform and methanol (9:1) containing 5 mg of Ergoloid Mesylates per mL, 5 mg of USP Ergoloid Mesylates RS per mL, and 5 mg of Ergotamine Tartrate per mL. Apply 5-µL volumes of the solutions at points about 2 cm from the bottom edge of a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture, and allow the spots to dry. Add the solvent system consisting of a mixture of chloroform and methanol (9:1) and a small beaker of ammonium hydroxide to a suitable chamber, seal, and allow to equilibrate for 30 minutes. Develop the chromatogram in the equilibrated chamber until the solvent front has moved about 15 cm from the points of application. Remove the plate, air-dry, and locate the spots, first by viewing under long-wavelength UV light, and then by spraying with a reagent prepared by dissolving 800 mg of *p*-(dimethylamino)-benzaldehyde in a mixture of 80 mL of alcohol and 11 mL of sulfuric acid: the chromatogram from Ergoloid Mesylates shows primary spots that correspond in size and color to the spots obtained from the USP Ergoloid Mesylates RS solution, and shows no spot corresponding to the principal spot in the chromatogram of Ergotamine Tartrate.

**Limit of nonhydrogenated alkaloids**—Prepare a solution in alcohol containing 0.4 mg of Ergoloid Mesylates per mL, and prepare a 1 in 10 dilution of the first solution. Determine the absorbances in 1-cm cells of the first solution at 317.5 nm and the dilution at 280 nm, using alcohol as the blank: the absorbance of the first solution is not more than 0.15 times that of the dilution.

### Assay—

**Mobile phase**—Prepare a degassed solution containing a mixture of water, acetonitrile, and triethylamine (80:20:2.5). Adjust the ratio as necessary.

**Standard preparation**—Transfer about 10 mg of USP Ergoloid Mesylates RS, accurately weighed, to a 10-mL volumetric flask. Dissolve in a mixture of acetonitrile and water (1:1), dilute with the same solvent to volume, and mix. Prepare this solution fresh.

**Assay preparation**—Using about 10 mg of Ergoloid Mesylates, accurately weighed, proceed as directed for *Standard preparation*.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4-mm × 30-cm column that contains packing L1.

Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between dihydro- $\alpha$ -ergocryptine mesylate and dihydroergocristine mesylate is not less than 1.35; the resolution,  $R$ , between dihydroergocristine and dihydro- $\beta$ -ergocryptine is not less than 1.0; the column efficiency determined for the dihydro- $\beta$ -ergocryptine mesylate peak is not less than 950 theoretical plates; the tailing factor for dihydro- $\beta$ -ergocryptine mesylate is not more than 2.5; and the relative standard deviation of the sum of the four peaks for replicate injections is not more than 1.5%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph by means of a suitable microsyringe or sampling valve, record the chromatograms, and measure the responses for the major peaks. The order of elution is dihydroergocornine, dihydro- $\alpha$ -ergocryptine, dihydroergocristine, and dihydro- $\beta$ -ergocryptine. Calculate the total quantity, in mg, of these alkaloids in the portion of Ergoloid Mesylates taken by the formula:

$$10C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Ergoloid Mesylates RS in the *Standard preparation* and  $r_U$  and  $r_S$  are the sums of the responses of the four major peaks obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Calculate the percentage of each alkaloid taken by the formula:

$$100r_i(MW)_i / \Sigma[r_i(MW)_i]$$

in which  $r_i$  is the peak response of an individual alkaloid;  $(MW)_i$  is the molecular weight of that alkaloid; and  $\Sigma[r_i(MW)_i]$  is the summation of the products of peak responses and molecular weights calculated for the four alkaloids.

## Ergoloid Mesylates Capsules

» Ergoloid Mesylates Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ergoloid mesylates, consisting of not less than 30.3 percent and not more than 36.3 percent of the methane-sulfonate salt of each of the individual alkaloids (dihydroergocristine, dihydroergocornine, and dihydroergocryptine). The ratio of *alpha*- to *beta*-dihydroergocryptine mesylate is not less than 1.5:1.0 and not more than 2.5:1.0.

**Packaging and storage**—Preserve in tight, light-resistant containers between 15° and 25°. Do not freeze.

### USP Reference standards (11)—

USP Ergoloid Mesylates RS

### Identification—

**A:** The retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, both relative to the internal standard as obtained in the *Assay*.

**B:** Using a sharp blade, carefully open 1 Capsule and transfer the entire contents into a 250-mL flask. Inspect the encapsulated liquid to ensure that crystallization or agglomeration of the drug substance has not taken place. Add 5 mL of water to the flask, and swirl to dissolve. Add 10 mL of *p*-dimethylaminobenzaldehyde TS: a blue color develops within 2 minutes and persists for not less than 10 minutes.

**Microbial enumeration tests (61) and Tests for specified microorganisms (62)**—The total bacterial count does not exceed 1000 per g, and the total combined molds and yeasts count does not exceed 200 per g. Capsules meet also the requirements of the tests for absence of *Salmonella* species, *Escherichia coli*, *Staphylococcus aureus*, and *Pseudomonas aeruginosa*. The test specimen shows an absence of the members of the *Enterobacteriaceae* family and *Pseudomonadaceae* family at levels greater than 100 per g of each.

### Dissolution (711)—

**Medium:** water; 500 mL.

**Apparatus 2:** 50 rpm.

**Time:** 15 minutes.

**Procedure**—Place 1 Capsule in each vessel, and allow the Capsule to sink to the bottom of the vessel before starting rotation of the blade. Observe the Capsules, and note if there is membrane formation. Record the time that each Capsule ruptures.

**Tolerances**—All of the Capsules tested rupture in not more than 15 minutes. If 1 or 2 Capsules fail to rupture in 15 minutes but rupture in not more than 30 minutes, repeat the test on 12 additional Capsules. Not more than 2 of the total of 18 Capsules tested rupture in more than 15 but not more than 30 minutes.

**Uniformity of dosage units (905):** meet the requirements, chloroform being used as the solvent in the procedure for *Weight Variation*.

### Assay—

**Mobile phase**—Prepare a filtered and degassed mixture of water, acetonitrile, and triethylamine (32:18:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Internal standard solution**—Dissolve an accurately weighed quantity of *m*-chloroacetanilide in acetonitrile to obtain a solution having a known concentration of about 0.12 mg per mL.

**Tartaric acid solution**—Dissolve an accurately weighed quantity of tartaric acid in water to obtain a solution having a known concentration of about 5.6 mg per mL.

**Standard preparation**—Transfer about 25.0 mg of USP Ergoloid Mesylates RS, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Internal standard solution* to volume, and mix. Transfer 40.0 mL of this solution to a 200-mL volumetric flask, add 40.0 mL of *Tartaric acid solution*, and mix.

**Assay preparation**—Pipet 40.0 mL of *Tartaric acid solution* into a 200-mL volumetric flask, and heat in a water bath maintained at 50°. Add 10 Capsules (or the equivalent of 10 mg of ergoloid mesylates), and shake the flask by mechanical means for 10 minutes or until the gelatin has dissolved. Pipet 40.0 mL of *Internal standard solution* into the flask, and shake for an additional 10 minutes. Remove the flask from the bath and cool to room temperature. Transfer about 20 mL of the solution to a 30-mL centrifuge tube, and centrifuge at 10,000 rpm for 60 minutes. Filter a portion of the supernatant through a filter having a porosity of 0.45  $\mu$ m, discarding the first 5 mL of the filtrate. Use the remainder of the filtrate as the *Assay preparation*.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and an 8-mm  $\times$  10-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the relative retention times for *m*-chloroacetanilide, dihydroergocornine, dihydro- $\alpha$ -ergocryptine, dihydroergocristine, and dihydro- $\beta$ -ergocryptine are about 1.0, 1.4, 1.8, 2.2, and 2.8, respectively; the column efficiency determined for the dihydro- $\beta$ -ergocryptine peak is not less than 950 theoretical plates; the tailing factor for dihydro- $\beta$ -ergocryptine is not more than 2.5 and that for dihydroergocornine is not more than 2.0; the resolution,  $R$ ,

between dihydro- $\alpha$ -ergocryptine and dihydroergocristine is not less than 1.35; and the relative standard deviation of the sum of the four ergoloid mesylate peaks for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the total quantity, in mg, of ergoloid mesylates in the portion of Capsules taken by the formula:

$$80C(\Sigma R_U / \Sigma R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Ergoloid Mesylates RS in the *Standard preparation*, and  $\Sigma R_U$  and  $\Sigma R_S$  are sums of the ratios of the peak responses of the individual alkaloids to the peak response of the internal standard obtained from the *Assay preparation* and the *Standard preparation*, respectively. Calculate the percentage of each of the individual alkaloids in the portion of Capsules taken by the formula:

$$100R_U(MW)_U / \Sigma[R_U(MW)_U]$$

in which  $(MW)_U$  is the molecular weight of the individual alkaloid.

### Ergoloid Mesylates Oral Solution

» Ergoloid Mesylates Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of Ergoloid Mesylates, consisting of not less than 30.3 percent and not more than 36.3 percent of the methanesulfonate salt of each of the individual alkaloids (dihydroergocristine, dihydroergocornine, and dihydroergocryptine). The ratio of *alpha*- to *beta*-dihydroergocryptine mesylate is not less than 1.5:1.0 and not more than 2.5:1.0.

**Packaging and storage**—Preserve in tight, light-resistant containers. Store at a temperature not exceeding 30°.

**USP Reference standards** <11>—

USP Ergoloid Mesylates RS

**Identification**—The retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Uniformity of dosage units** <905>—

FOR ORAL SOLUTION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** <698>—

FOR ORAL SOLUTION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

**Alcohol content, Method II** <611>: between 90.0% and 110.0% of the labeled amount of  $C_2H_5OH$ .

**Assay**—

**Mobile phase and Chromatographic system**—Prepare as directed in the *Assay* under *Ergoloid Mesylates*.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Ergoloid Mesylates RS in acetonitrile solution (1 in 5) to obtain a solution having a known concentration of about 0.25 mg per mL.

**Assay preparation**—Transfer an accurately measured volume of Oral Solution, equivalent to about 25 mg of ergoloid mesylates, to a 100-mL volumetric flask. Rinse the pipet with small portions of acetonitrile solution (1 in 5), collect-

ing the rinsings in the volumetric flask. Dilute with acetonitrile solution (1 in 5) to volume, and mix.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Ergoloid Mesylates*, except to inject about 60- $\mu$ L volumes of the *Assay preparation* and the *Standard preparation*. Calculate the quantity, in mg, of ergoloid mesylates in each mL of the Oral Solution taken by the formula:

$$100(C/V)(r_U / r_S)$$

in which  $V$  is the volume, in mL, of Oral Solution taken, and the other terms are as defined therein.

Calculate the percentage of each of the individual alkaloids in the Oral Solution taken by the formula given in the *Assay* under *Ergoloid Mesylates*.

### Ergoloid Mesylates Tablets

» Ergoloid Mesylates Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ergoloid mesylates, consisting of not less than 30.3 percent and not more than 36.3 percent of the methanesulfonate salt of each of the individual alkaloids (dihydroergocristine, dihydroergocornine, and dihydroergocryptine). The ratio of *alpha*- to *beta*-dihydroergocryptine mesylate is not less than 1.5:1.0 and not more than 2.5:1.0.

**Packaging and storage**—Preserve in tight, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

**Labeling**—Label the Tablets to indicate that they are intended for swallowing intact.

**USP Reference standards** <11>—

USP Ergoloid Mesylates RS

**Identification**—Mix a small amount of powdered Tablets, equivalent to about 5 mg of ergoloid mesylates, with 5 mL of water and 5 mL of a mixture of equal volumes of glacial acetic acid and sulfuric acid, and add 1 drop of freshly prepared ferric chloride solution (1 in 20): a violet-blue color develops within 5 minutes.

**Dissolution** <711>—

**Medium:** water; 500 mL.

**Apparatus 2:** 50 rpm, the distance between the paddle blade and the inside bottom of the vessel being maintained at  $4.5 \pm 0.2$  cm during the test.

**Time:** 30 minutes.

Determine the amount of ergoloid mesylates dissolved using the following procedure.

**Mobile phase**—Prepare as directed in the *Assay*.

**Standard solution**—Dissolve an accurately weighed quantity of USP Ergoloid Mesylates RS in water to obtain a solution having a known concentration of about 50  $\mu$ g per mL. Transfer 4 mL of this solution for every 0.5 mg of ergoloid mesylates contained in the Tablets to a 200-mL volumetric flask, add 1 mL of 0.1 N hydrochloric acid and 100 mL of water, mix, and dilute with water to volume.

**Test solution**—Transfer a 20-mL portion of the solution under test to a suitable container, add 100  $\mu$ L of 0.1 N hydrochloric acid, and mix.

**Chromatographic system**—Proceed as directed in the *Assay* except that the sum of the relative standard deviation values for the four ergoloid mesylates peaks for replicate injections is not more than 3.0%.

**Procedure**—Separately inject equal volumes (about 500  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity of ergoloid mesylates as directed in the *Assay*.

**Tolerances**—Not less than 75% (Q) of the labeled amount of ergoloid mesylates is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

#### Assay—

**Mobile phase**—Prepare a filtered and degassed solution containing a mixture of water, acetonitrile, and triethylamine (700:300:9). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Internal standard solution**—Transfer about 113 mg of papaverine hydrochloride to a 1-L flask. Add a mixture of 0.01 M tartaric acid and acetonitrile (2:1) to volume, and mix.

**Standard preparation**—Transfer about 33 mg of USP Ergoloid Mesylates RS, accurately weighed, to a 100-mL volumetric flask. Dissolve in and dilute with *Internal standard solution* to volume, and mix. Use a freshly prepared solution.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 5 mg of ergoloid mesylates, to a 50-mL centrifuge tube. Add 15.0 mL of *Internal standard solution*, insert the stopper into the tube, and shake for about 15 minutes. Centrifuge, filter if necessary, and use the clear supernatant.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm  $\times$  15-cm column that contains packing L1. [NOTE—Use an L1 column capable of handling pH values greater than 11.] The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency determined for the dihydro- $\beta$ -ergocryptine mesylate peak is not less than 1000 theoretical plates; the tailing factor for the dihydro- $\beta$ -ergocryptine mesylate peak is not more than 2.0; the resolution,  $R$ , between the dihydro- $\alpha$ -ergocryptine mesylate and dihydroergocristine mesylate is not less than 2.0, and between dihydroergocristine and dihydro- $\beta$ -ergocryptine peaks is not less than 2.0; and the relative standard deviation of the ratio of the sum of the four peaks to the internal standard for replicate injections is not more than 1.5%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The order of elution is papaverine, dihydroergocornine, dihydro- $\alpha$ -ergocryptine, dihydroergocristine, and dihydro- $\beta$ -ergocryptine. Calculate the quantity, in mg, of ergoloid mesylates in the portion of Tablets taken by the formula:

$$15C(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Ergoloid Mesylates RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the sums of the ratios of responses of the four major peaks to the response of the internal standard peak obtained from the *Assay preparation* and the *Standard preparation*, respectively. Calculate the percentage of each of the individual alkaloids taken by the formula:

$$100R_i(MW)_i / \sum[R_i(MW)_i]$$

in which  $R_i$  is the peak response ratio of the individual alkaloid to the internal standard;  $(MW)_i$  is the molecular weight of the individual alkaloid; and  $\sum[R_i(MW)_i]$  is the summation of the products of peak response ratios and molecular weights for the four alkaloids.

## Ergoloid Mesylates Sublingual Tablets

» Ergoloid Mesylates Sublingual Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ergoloid mesylates, consisting of not less than 30.3 percent and not more than 36.3 percent of the methanesulfonate salt of each of the individual alkaloids (dihydroergocristine, dihydroergocornine, and dihydroergocryptine). The ratio of *alpha*- to *beta*-dihydroergocryptine mesylate is not less than 1.5:1.0 and not more than 2.5:1.0.

**Packaging and storage**—Preserve in tight, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

**Labeling**—Label the Tablets to indicate that they are intended for sublingual administration.

**USP Reference standards** (11)—  
USP Ergoloid Mesylates RS

**Identification**—Mix a small amount of powdered Sublingual Tablets, equivalent to about 5 mg of ergoloid mesylates, with 5 mL of water and 5 mL of a mixture of equal volumes of glacial acetic acid and sulfuric acid, and add 1 drop of freshly prepared ferric chloride solution (1 in 20): a violet-blue color develops within 5 minutes.

**Disintegration** (701): 15 minutes.

**Uniformity of dosage units** (905): meet the requirements.

#### Assay—

**Mobile phase**—Prepare a filtered and degassed solution containing a mixture of water, acetonitrile, and triethylamine (700:300:9). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Internal standard solution**—Transfer about 113 mg of papaverine hydrochloride to a 1-L flask. Add a mixture of 0.01 M tartaric acid and acetonitrile (2:1) to volume, and mix.

**Standard preparation**—Transfer about 33 mg of USP Ergoloid Mesylates RS, accurately weighed, to a 100-mL volumetric flask. Dissolve in and dilute with *Internal standard solution* to volume, and mix. Use a freshly prepared solution.

**Assay preparation**—Weigh and finely powder not fewer than 20 Sublingual Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 5 mg of ergoloid mesylates, to a 50-mL centrifuge tube. Add 15.0 mL of *Internal standard solution*, insert the stopper into the tube, and shake for about 15 minutes. Centrifuge, filter if necessary, and use the clear supernatant.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm  $\times$  15-cm column that contains packing L1. [NOTE—Use an L1 column capable of handling pH values greater than 11.] The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency determined for the dihydro- $\beta$ -ergocryptine mesylate peak is not less than 1000 theoretical plates; the tailing factor for the dihydro- $\beta$ -ergocryptine mesylate peak is not more than 2.0; the resolution,  $R$ , between the dihydro- $\alpha$ -ergocryptine mesylate and dihydroergocristine mesylate peaks is not less than 2.0, and between dihydroergocristine and dihydro- $\beta$ -ergocryptine peaks is not less than 2.0; and the relative standard deviation of the ratio of the sum of the four peaks to the internal standard for replicate injections is not more than 1.5%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The order of elution is papaverine, dihydroergocornine, dihydro- $\alpha$ -ergocryptine, dihydroergocristine, and dihydro- $\beta$ -ergocryptine. Calculate the quantity, in mg, of ergoloid mesylates in the portion of Sublingual Tablets taken by the formula:

$$15C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of USP Ergoloid Mesylates RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the sums of the ratios of responses of the four major peaks to the response of the internal standard peak obtained from the *Assay preparation* and the *Standard preparation*, respectively. Calculate the percentage of each of the individual alkaloids taken by the formula:

$$100R_i(MW)_i / \Sigma[R_i(MW)_i]$$

in which  $R_i$  is the peak response ratio of the individual alkaloid to the internal standard;  $(MW)_i$  is the molecular weight of the individual alkaloid; and  $\Sigma[R_i(MW)_i]$  is the summation of the products of peak response ratios and molecular weights for the four alkaloids.

## Ergonovine Maleate

$C_{19}H_{23}N_3O_2 \cdot C_4H_4O_4$  441.48  
Ergoline-8-carboxamide, 9,10-didehydro-*N*-(2-hydroxy-1-methylethyl)-6-methyl-, 8 $\beta$ (*S*)-, (*Z*)-2-butenedioate (1:1) (salt).  
9,10-Didehydro-*N*-[(*S*)-2-hydroxy-1-methylethyl]-6-methylergoline-8 $\beta$ -carboxamide maleate (1:1) (salt) [129-51-1].

» Ergonovine Maleate contains not less than 97.0 percent and not more than 103.0 percent of  $C_{19}H_{23}N_3O_2 \cdot C_4H_4O_4$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers, in a cold place.

### USP Reference standards (11)—

USP Ergonovine Maleate RS

#### Identification—

**A:** Infrared Absorption (197K).

**B:** Ultraviolet Absorption (197U)—

*Solution:* 20  $\mu$ g per mL.

*Medium:* alcohol.

Absorptivities at 311 nm, calculated on the dried basis, do not differ by more than 3.0%.

**C:** The  $R_f$  value of the principal blue spot obtained from the *Test preparation* corresponds to that obtained from the *Standard preparation* in the chromatogram prepared as directed in the test for *Related alkaloids*.

**Specific rotation** (781S): between +51° and +56°.

*Test solution:* 5 mg per mL, in water.

**Loss on drying** (731)—Dry it in vacuum at 80° for 3 hours; it loses not more than 2.0% of its weight.

**Related alkaloids**—[NOTE—Conduct this test promptly, without exposure to daylight and with minimum exposure to artificial light.]

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture.

**Solvent mixture**—Prepare a mixture of alcohol and ammonium hydroxide (9:1).

**Standard preparation**—Prepare a solution of USP Ergonovine Maleate RS in *Solvent mixture* having a known concentration of about 10 mg per mL.

**Standard dilutions**—Prepare a series of dilutions of the *Standard preparation* in *Solvent mixture* having known concentrations of about 0.20, 0.10, and 0.05 mg per mL. Use immediately after preparation.

**Test preparation**—Immediately prior to use, prepare a solution of Ergonovine Maleate in *Solvent mixture* having a concentration of about 10 mg per mL.

**Application volume:** 5  $\mu$ L.

**Developing solvent system:** a mixture of chloroform, methanol, and water (75:25:3), equilibrated for 30 minutes.

**Procedure**—Apply 5- $\mu$ L portions of the *Standard preparation*, each of the three *Standard dilutions*, and the *Test preparation*, and proceed as directed for *Thin-Layer Chromatography* (621). Locate the spots on the plate by spraying thoroughly and evenly with a solution prepared by dissolving 1 g of *p*-dimethylaminobenzaldehyde in a cooled mixture of 50 mL of alcohol and 50 mL of hydrochloric acid. Immediately dry in a stream of nitrogen for about 2 minutes: the  $R_f$  value of the principal spot obtained from the *Test preparation* corresponds to that obtained from the *Standard preparation*. Estimate the concentration of any other spots observed in the chromatogram of the *Test preparation* by comparison with the *Standard dilutions*. The spots from the 0.20, 0.10, and 0.05 mg per mL dilutions are equivalent to 2.0%, 1.0%, and 0.50% of impurities, respectively. The sum of the impurities is not greater than 2.0%.

#### Assay—

**Standard preparation**—Using a suitable quantity of USP Ergonovine Maleate RS, accurately weighed, prepare a solution in water having a known concentration of about 40  $\mu$ g per mL.

**Assay preparation**—Transfer about 40 mg of Ergonovine Maleate, accurately weighed, to a 100-mL volumetric flask, dilute with water to volume, and mix. Dilute 10.0 mL of this solution with water to 100.0 mL.

**Procedure**—Transfer 5.0 mL each of the *Standard preparation*, the *Assay preparation*, and water to provide a blank, to separate conical flasks. Add 10.0 mL of *p*-dimethylaminobenzaldehyde TS with constant swirling to each, and allow to stand for 20 minutes. Concomitantly determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 555 nm, with a suitable spectrophotometer, against the blank. Calculate the quantity, in mg, of  $C_{19}H_{23}N_3O_2 \cdot C_4H_4O_4$  taken by the formula:

$$C(A_U / A_S)$$

in which C is the concentration, in  $\mu$ g per mL, of USP Ergonovine Maleate RS in the *Standard preparation*, and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

## Ergonovine Maleate Injection

» Ergonovine Maleate Injection is a sterile solution of Ergonovine Maleate in Water for Injection. It contains not less than 90.0 percent and not

more than 110.0 percent of the labeled amount of  $C_{19}H_{23}N_3O_2 \cdot C_4H_4O_4$ .

**Packaging and storage**—Preserve in single-dose, light-resistant containers, preferably of Type I glass, and store in a cold place.

**USP Reference standards** (11)—

USP Ergonovine Maleate RS

USP Endotoxin RS

**Identification**—The  $R_f$  value of the principal blue spot obtained from the *Test preparation* corresponds to that obtained from *Standard preparation A* in the chromatogram prepared as directed in the test for *Related alkaloids*.

**Bacterial endotoxins** (85)—It contains not more than 700.0 USP Endotoxin Units per mg of ergonovine maleate.

**pH** (791): between 2.7 and 3.5.

**Related alkaloids**—[NOTE—Conduct this test promptly, without exposure to daylight and with minimum exposure to artificial light.]

*Solvent mixture*, *Standard preparation*, and *Standard dilutions*—Prepare as directed in the test for *Related alkaloids* under *Ergonovine Maleate*.

*Test preparation*—Immediately prior to use, transfer a volume of Injection, equivalent to about 5 mg of ergonovine maleate, to a separator, and extract with three 5-mL portions of chloroform. Discard the chloroform extracts. Render alkaline to litmus with 6 N ammonium hydroxide, and extract with three 5-mL portions of chloroform. Evaporate the combined extracts with the aid of a stream of nitrogen, but without heat, to dryness. Dissolve the residue so obtained in 0.5 mL of *Solvent mixture*.

*Procedure*—Proceed as directed for *Procedure* in the test for *Related alkaloids* under *Ergonovine Maleate*.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—

*0.05 M Phosphate buffer*—Dissolve 6.8 g of monobasic potassium phosphate in 600 mL of water and adjust with phosphoric acid to a pH of 2.1. Dilute with water to 1000 mL, and mix.

*Mobile phase*—Prepare a suitable and degassed solution of *0.05 M Phosphate buffer* and acetonitrile (80:20) such that the retention time is approximately 3 minutes with a flow rate of 1 mL per minute.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Ergonovine Maleate RS in *Mobile phase*, adding sufficient water to equal 10% of the final volume, to obtain a solution having a known concentration of about 0.02 mg per mL.

*Assay preparation*—Quantitatively dilute an accurately measured volume of the Injection, equivalent to about 2 mg of ergonovine maleate, with *Mobile phase* and water, if necessary, to obtain a solution having a concentration of about 0.02 mg per mL in which the Injection volume plus any added water constitutes 10% of the final volume.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 312-nm detector and a 3-mm  $\times$  30-cm column that contains packing L1. Chromatograph five replicate injections of the *Standard preparation*, and record the peak responses as directed under *Procedure*: the relative standard deviation is not more than 3.0%.

*Procedure*—By means of a suitable sampling valve, introduce equal volumes (about 100  $\mu$ L) of the *Assay preparation* and the *Standard preparation* into the chromatograph. Measure the peak responses of Ergonovine Maleate, at corresponding retention times, obtained from the *Assay preparation* and the *Standard preparation*. Calculate the quantity,

in mg, of  $C_{19}H_{23}N_3O_2 \cdot C_4H_4O_4$  in each mL of the Injection taken by the formula:

$$(CD / V)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Ergonovine Maleate RS in the *Standard preparation*, V is the volume, in mL, of Injection taken, D is the dilution factor, and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Ergonovine Maleate Tablets

» Ergonovine Maleate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{19}H_{23}N_3O_2 \cdot C_4H_4O_4$ .

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Ergonovine Maleate RS

**Identification**—The  $R_f$  value of the principal blue spot obtained from the *Test preparation* corresponds to that obtained from the *Standard preparation* in the chromatogram prepared as directed in the test for *Related alkaloids*.

**Dissolution** (711)—

*Medium*: water; 900 mL.

*Apparatus 1*: 100 rpm.

*Time*: 45 minutes.

*Procedure*—Determine the amount of  $C_{19}H_{23}N_3O_2 \cdot C_4H_4O_4$  dissolved from fluorometric measurements, using 322 nm as the excitation wavelength and 428 nm as the emission wavelength, of filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Ergonovine Maleate RS in the same *Medium*.

*Tolerances*—Not less than 75% (Q) of the labeled amount of  $C_{19}H_{23}N_3O_2 \cdot C_4H_4O_4$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Related alkaloids**—[NOTE—Conduct this test promptly, without exposure to daylight and with minimum exposure to artificial light.]

*Solvent mixture*—Mix 75 volumes of chloroform, 25 volumes of methanol, and 1 volume of ammonium hydroxide.

*Detecting reagent*—Cautiously dissolve 800 mg of *p*-dimethylaminobenzaldehyde in a mixture of alcohol and sulfuric acid (101:11).

*Standard stock solution*—Transfer 25 mg of USP Ergonovine Maleate RS, accurately weighed, to a separator, shake with 10 mL of water, render the mixture alkaline to litmus with 6 N ammonium hydroxide, and extract with three 10-mL portions of chloroform. Evaporate the combined extracts with the aid of a stream of nitrogen, but without heat, to dryness. Dissolve and dilute the residue to 10.0 mL with the *Solvent mixture*.

*Standard preparations A, B, C, and D*—Dilute accurately measured volumes of *Standard stock solution* quantitatively with *Solvent mixture* (designated below as parts by volume of *Standard stock solution* in total parts by volume of the finished *Standard preparation*) to obtain *Standard preparations*, designated below by letter, having the following compositions:

Standard Solution	Dilution	Concentration (μg RS per mL)	Percentage (% for comparison with test specimen)
A	(1 in 20)	125	5.0
B	(1 in 33)	75	3.0
C	(1 in 100)	25	1.0
D	(1 in 200)	12.5	0.5

**Test preparation**—Immediately prior to use, transfer a quantity of finely powdered Tablets, equivalent to about 5 mg of ergonovine maleate, to a separator, shake with 10 mL of water, render the mixture alkaline to litmus with 6 N ammonium hydroxide, and extract with three 10-mL portions of chloroform. Evaporate the combined extracts with the aid of a stream of nitrogen, but without heat, to dryness. Dissolve the residue obtained in 2.0 mL of *Solvent mixture*.

**Procedure**—Apply separately 20 μL of the *Test preparation* and 20 μL of each *Standard preparation* to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Dry the plate with the aid of a current of cool air. Position the plate in a chromatographic chamber, and develop the chromatograms in *Solvent mixture* until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate in a current of cool air. Examine the plate under long-wave-length UV light. Mark the principal and any secondary fluorescent spots. Spray the plate with *Detecting reagent*, and mark the principal and secondary blue spots. Compare the intensities of any secondary spots observed in the chromatogram of the *Test preparation* with those of the principal spots in the chromatograms of the *Standard preparations*: the sum of the intensities of secondary spots obtained from the *Test preparation* corresponds to not more than 5.0% of related compounds.

#### Assay—

**0.05 M Phosphate buffer, Mobile phase, and Chromatographic system**—Proceed as directed in the Assay under *Ergonovine Maleate Injection*.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Ergonovine Maleate RS in *Mobile phase* to obtain a solution having a known concentration of about 0.02 mg per mL.

**Assay preparation**—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 1 mg of ergonovine maleate, to a 50-mL volumetric flask, add 25 mL of *Mobile phase*, place in a sonic bath for 5 minutes, cool to room temperature, dilute with *Mobile phase* to volume, mix, and centrifuge. Use the supernatant as directed in the *Procedure*.

**Procedure**—Proceed as directed for *Procedure* in the Assay under *Ergonovine Maleate Injection*. Calculate the quantity, in mg, of  $C_{19}H_{23}N_3O_2 \cdot C_4H_4O_4$  in the portion of Tablets taken by the formula:

$$(50C)(r_U / r_S)$$

in which the terms are as defined therein.

## Ergotamine Tartrate

$(C_{33}H_{35}N_5O_5)_2 \cdot C_4H_6O_6$  1313.41

Ergotaman-3',6',18-trione, 12'-hydroxy-2'-methyl-5'-(phenylmethyl)-, (5'α)-, [R-(R\*,R\*)]-2,3-dihydroxy-butanedioate (2:1) (salt).

Ergotamine tartrate (2:1) (salt) [379-79-3].

» Ergotamine Tartrate contains not less than 97.0 percent and not more than 100.5 percent of  $(C_{33}H_{35}N_5O_5)_2 \cdot C_4H_6O_6$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed, light-resistant containers in a cold place.

#### USP Reference standards (11)—

USP Ergotamine Tartrate RS

**Identification**—The chromatogram of the test solution prepared as directed in the test for *Related alkaloids* exhibits its principal fluorescent spot and principal blue spot at the same  $R_f$  value as the principal spot of *Standard solution A*.

**Specific rotation** (781S)—[NOTE—For this test, use chloroform from which any alcohol present has been removed by prior washing with water.] Dissolve about 350 mg in 25 mL of tartaric acid solution (1 in 100) contained in a separator, then add 500 mg of sodium bicarbonate, and mix gently but thoroughly. Add 10 mL of chloroform, shake vigorously, and after the layers have separated draw off the chloroform phase through a small filter, previously moistened with chloroform, into a 50-mL volumetric flask. Rapidly continue the extraction with three 10-mL portions of chloroform, passing the extracts through the same filter. Place the flask in a bath at 20° for 10 minutes. Adjust the volume of extract to 50.0 mL at 20° by the addition of chloroform. Mix the solution, and determine the angular rotation at 20°. Determine the concentration of ergotamine in the chloroform solution by evaporating a 25.0-mL aliquot of the solution on a rotary evaporator to dryness, maintaining the temperature of the bath below 45°. Dissolve the residue in 25 mL of glacial acetic acid, add 1 drop of crystal violet TS, and titrate with 0.05 N perchloric acid VS to an emerald-green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.05 N perchloric acid is equivalent to 29.08 mg of  $C_{33}H_{35}N_5O_5$ . From the angular rotation of the solution and the concentration of ergotamine base, calculate the specific rotation of the base: between −155° and −165°.

**Loss on drying** (731)—Dry about 100 mg, accurately weighed, in vacuum at 60° for 4 hours: it loses not more than 5.0% of its weight.

**Related alkaloids**—[NOTE—Conduct this test without exposure to daylight and with the minimum necessary exposure to artificial light.]

**Solvent mixture**—Mix 9 volumes of chloroform with 1 volume of methanol.

**Standard preparation and Standard dilutions**—Prepare a solution of USP Ergotamine Tartrate RS in *Solvent mixture* to contain 10.0 mg per mL (*Standard preparation*). Prepare a series of dilutions of the *Standard preparation* in *Solvent mixture* to contain 0.2 mg, 0.1 mg, 0.05 mg, and 0.025 mg per mL (*Standard dilutions*) corresponding to 2.0%, 1.0%, 0.5%, and 0.25% of the *Standard preparation*, respectively.

**Test preparation**—Dissolve 50.0 mg of Ergotamine Tartrate in 5.0 mL of *Solvent mixture*.

**Procedure**—In a suitable chromatographic chamber arranged for thin-layer chromatography (see *Chromatography* (621)) place a volume of a solvent system consisting of ether, dimethylformamide, chloroform, and dehydrated alcohol (70:15:10:5). Line the chamber with filter paper, and allow it to equilibrate for 15 minutes. Apply 5- $\mu$ L portions of the *Test preparation*, the *Standard preparation*, and each of the *Standard dilutions* to a suitable chromatographic plate coated with a 0.25-mm layer of chromatographic silica gel. Place each spot over an opened bottle of ammonium hydroxide for 20 seconds, then allow the plate to dry in a current of cold air for 20 seconds. Develop the chromatogram until the solvent front has moved about 17 cm. Remove the plate from the developing chamber, allow the solvent to evaporate in a current of cold air for approximately 2 minutes, and spray with a freshly prepared solution of 200 mg of *p*-(dimethylamino)benzaldehyde in a mixture of 5.5 mL of hydrochloric acid and 4.5 mL of water. Dry the plate at 60° for about 5 minutes and compare the chromatograms: the  $R_f$  value of the principal spot obtained from the *Test preparation* corresponds to that obtained from the *Standard preparation*, the sum of the intensities of any secondary spots in the chromatogram from the *Test preparation* is not greater than the intensity of the principal spot from the 2.0% *Standard dilution*, and the intensity of not more than one of the secondary spots is greater than that of the principal spot from the 1.0% *Standard dilution*.

**Assay**—Transfer about 200 mg of Ergotamine Tartrate, accurately weighed, to a small conical flask, and dissolve in 15 mL of a mixture of 6 volumes of acetic anhydride and 100 volumes of glacial acetic acid. Add 1 drop of crystal violet TS, and titrate with 0.05 N perchloric acid VS from a 10-mL buret. Perform a blank determination, and make any necessary correction. Each mL of 0.05 N perchloric acid is equivalent to 32.84 mg of  $(C_{33}H_{35}N_5O_5)_2 \cdot C_4H_6O_6$ .

## Ergotamine Tartrate Inhalation Aerosol

» Ergotamine Tartrate Inhalation Aerosol is a suspension of microfine Ergotamine Tartrate in propellants in a pressurized container. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ergotamine tartrate  $[(C_{33}H_{35}N_5O_5)_2 \cdot C_4H_6O_6]$ .

**Packaging and storage**—Preserve in small, non-reactive, light-resistant aerosol containers equipped with metered-dose valves and provided with oral inhalation actuators.

### USP Reference standards (11)—

USP Ergotamine Tartrate RS

**Identification**—Place 10 mL of water in a small beaker, and deliver 2 sprays from the Inhalation Aerosol under the surface of the water, actuating the valve by pressing the tip against the bottom of the beaker. To one part of the resulting solution in a test tube add 2 parts of *p*-(dimethylamino)-benzaldehyde TS, and mix: a blue color is produced.

**Delivered dose uniformity over the entire contents:** meets the requirements for *Metered-Dose Inhalers* under *Aerosols*, *Nasal Sprays*, *Metered-Dose Inhalers*, and *Dry Powder Inhalers* (601).

### PROCEDURE FOR DOSE UNIFORMITY—

**Standard preparation**—Dissolve an accurately weighed quantity of USP Ergotamine Tartrate RS in a tartaric acid solution (1 in 500), and dilute quantitatively and stepwise with the same tartaric acid solution as necessary to obtain a solution having a known concentration of about 18  $\mu$ g per mL.

**Test preparation**—Discharge the minimum recommended dose into the sampling apparatus and detach the inhaler as directed. Rinse the apparatus (filter and interior) with four 5.0-mL portions of a tartaric acid solution (1 in 500), and transfer the resulting solutions quantitatively to a 50-mL centrifuge tube. Add 10 mL of trichlorotrifluoroethane, insert the stopper, shake vigorously for 1 minute and centrifuge for 5 minutes. Use the clear supernatant as the *Test preparation*.

**Procedure**—Into three separate flasks transfer 6.0 mL each of the *Test preparation*, the *Standard preparation*, and a tartaric acid solution (1 in 500) to provide the blank. To each flask add 10.0 mL of *p*-dimethylaminobenzaldehyde TS, mix, and allow to stand for 30 minutes. Concomitantly determine the absorbances with a suitable spectrophotometer, in 5-cm cells, of the solutions from the *Test preparation* and the *Standard preparation*, at the wavelength of maximum absorbance at about 546 nm, against the blank. Calculate the quantity, in  $\mu$ g, of  $(C_{33}H_{35}N_5O_5)_2 \cdot C_4H_6O_6$  contained in the minimum dose taken by the formula:

$$(20CN)(A_U / A_S)$$

in which C is the concentration, in  $\mu$ g per mL, of USP Ergotamine Tartrate RS in the *Standard preparation*; N is the number of sprays discharged to obtain the minimum recommended dose; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Test preparation* and the *Standard preparation*, respectively.

**Particle size**—Prime the valve of the Inhalation Aerosol by alternately shaking and firing it several times through its oral inhalation actuator, and then actuate one measured spray onto a clean, dry microscope slide held 5 cm from the end of the actuator, perpendicular to the direction of the spray. Carefully rinse the slide with about 2 mL of carbon tetrachloride, and allow to dry. Examine the slide under a microscope, equipped with a calibrated ocular micrometer, using 450 $\times$  magnification. Focus on the particles of 25 fields of view near the center of the test specimen pattern, and note the size of the great majority of individual particles: they are less than 5  $\mu$ m in diameter. Record the number and size of all individual crystalline particles (not agglomerates) more than 10  $\mu$ m in length measured along the longest axis: not more than 10 such particles are observed.

### Assay—

**Standard preparation**—Prepare as directed under *Unit spray content*.

**Assay preparation**—[NOTE—A suitable specimen beaker is one having a small indentation formed on its inside bottom surface having dimensions adequate to accept the aerosol valve stem during actuation, thereby preventing particle entrapment and side-of-stem leakage during the delivery of the specimen.] Place 10 mL of trichlorotrifluoroethane in a suitable 100-mL beaker. Prime the valve of Ergotamine Tartrate Inhalation Aerosol by alternately shaking and firing it 10 times through its oral inhalation actuator. Accurately weigh the Aerosol, shake it, and immediately deliver a single spray under the surface of the trichlorotrifluoroethane, actuating the valve by pressing the tip into the indentation in the bottom of the beaker. Raise the Aerosol above the surface of the trichlorotrifluoroethane, and shake it gently preparatory to delivering another spray similarly under the surface of the trichlorotrifluoroethane. Deliver a total of 2 sprays in this manner. Rinse the valve stem and ferrule with about 2 mL of trichlorotrifluoroethane, collecting the rinsing with the specimen in the beaker. Allow the Aerosol to dry, weigh it, and determine the total weight of the 2 sprays. Transfer the solution to a centrifuge tube with the aid of two 3-mL portions of trichlorotrifluoroethane, and add 10.0 mL of tartaric acid solution (1 in 500). Insert the stopper, shake vigorously for 15 minutes, centrifuge for 5 minutes, and use the clear supernatant as the *Assay preparation*.

**Procedure**—Transfer 5.0 mL each of the *Standard preparation*, the *Assay preparation*, and a blank consisting of tartaric acid solution (1 in 500) to separate test tubes. To each tube add 10.0 mL of *p*-dimethylaminobenzaldehyde TS, mix, and allow to stand for 30 minutes. Concomitantly determine the absorbances of the solutions against the blank in 1-cm cells at the wavelength of maximum absorbance at about 546 nm, with a suitable spectrophotometer. Calculate the quantity, in mg, of  $(C_{33}H_{35}N_5O_5)_2 \cdot C_4H_6O_6$  in each mL of the Aerosol taken by the formula:

$$(0.01Cd / W)(A_U / A_S)$$

in which *C* is the concentration, in  $\mu\text{g}$  per mL, of USP Ergotamine Tartrate RS in the *Standard preparation*; *d* is the density, in g per mL, of Aerosol determined as directed for *d* in the *Procedure* in the *Assay under Isoproterenol Sulfate Inhalation Aerosol*; *W* is the weight, in g, of the specimen taken; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

## Ergotamine Tartrate Injection

» Ergotamine Tartrate Injection is a sterile solution of Ergotamine Tartrate and the tartrates of its epimer, ergotamine, and of other related alkaloids, in Water for Injection to which Tartaric Acid or suitable stabilizers have been added. The total alkaloid content, in each mL, is not less than 450  $\mu\text{g}$  and not more than 550  $\mu\text{g}$ . The content of ergotamine tartrate  $[(C_{33}H_{35}N_5O_5)_2 \cdot C_4H_6O_6]$  is not less than 52.0 percent and not more than 74.0 percent of the content of total alkaloid; the content of ergotamine tartrate is not more than 45.0 percent of the content of total alkaloid.

**Packaging and storage**—Preserve in single-dose, light-resistant containers, preferably of Type I glass.

### USP Reference standards (11)—

USP Endotoxin RS

USP Ergotamine Tartrate RS

**Bacterial endotoxins** (85)—It contains not more than 357.0 USP Endotoxin Units per mg of ergotamine tartrate.

**pH** (791): between 3.5 and 4.0.

**Other requirements**—It meets the requirements under *Injections* (1).

### Assay—

**Chloroform**—Use chloroform that recently has been saturated with water.

**Standard preparation**—Dissolve about 10 mg of USP Ergotamine Tartrate RS, accurately weighed, with warming if necessary, in 50 mL of diluted alcohol and sufficient water to give a concentration of 50.0  $\mu\text{g}$  per mL.

**Ergotamine preparation and Ergotamine preparation**—Pipet a volume of Injection, equivalent to about 5 mg of ergotamine tartrate, into a beaker. Add 5 mL of *Chloroform* and a portion of sodium bicarbonate approximately equivalent in weight to one-tenth that of the portion of Injection taken. Mix, and add sufficient chromatographic siliceous earth to make a fluffy mixture (about 1 g for each mL of the Injection taken plus 3 g in addition). Pack the mixture in a chromatographic tube about 2.5 cm in diameter and about 30 cm in length. Rinse the sides of the beaker with 2 mL of

*Chloroform*. Add sufficient chromatographic siliceous earth to make a fluffy mixture, and transfer it to the column.

Prepare a second column using a mixture of 9 g of the siliceous earth with 7 mL of citric acid solution (1 in 4). Place a mixture of 2 g of the siliceous earth and 2 mL of water on top of the second column. Insert a pledget of glass wool, and mount the tube containing the specimen so that the eluate from it will drain into the tube containing the citric acid solution. Add a total of 90 mL of *Chloroform* to the upper tube, and receive the eluate from the lower tube in a 200-mL volumetric flask. Rinse the tip of the upper tube with *Chloroform*. Pass sufficient *Chloroform* through the lower tube to dilute the eluate to volume. This eluate is the *Ergotamine preparation*.

Extrude the adsorbent from the second column by means of slight air pressure into a 600-mL beaker containing 10 g of sodium bicarbonate, and mix. Cautiously add 50 mL of water, with continuous stirring. Wash the mixture with water into a 250-mL separator, and extract the ergotamine with four 15-mL portions of *Chloroform*. Pass the extracts through a glass wool filter, combining them in a 100-mL volumetric flask, wash the filter, and dilute with *Chloroform* to volume. This is the *Ergotamine preparation*.

Pipet 10 mL of the *Ergotamine preparation* and 20 mL of the *Ergotamine preparation* into separate, small conical flasks, and evaporate with the aid of a current of air to dryness.

**Total alkaloid preparation**—Pipet a volume of Injection, equivalent to about 2.5 mg of ergotamine tartrate, into a 50-mL volumetric flask, add 25 mL of alcohol, then add tartaric acid solution (1 in 100) to volume.

**Procedure**—Pipet 5 mL each of the *Standard preparation* and the *Total alkaloid preparation* into separate, small conical flasks. To the dried residues of *Ergotamine preparation* and *Ergotamine preparation* add 5.0 mL of a freshly prepared solution of equal volumes of alcohol and tartaric acid solution (1 in 100). In turn, place each flask in an ice bath, and swirl continuously while adding, dropwise, 10.0 mL of *p*-dimethylaminobenzaldehyde TS. Allow to stand in subdued light at room temperature for not less than 90 minutes and not more than 2 hours. Concomitantly determine the absorbances of the four solutions at the wavelength of maximum absorbance at about 545 nm, with a suitable spectrophotometer, against a reagent blank.

**Calculation**—Calculate the quantity of total alkaloids in terms of mg of  $(C_{33}H_{35}N_5O_5)_2 \cdot C_4H_6O_6$  in the volume of Injection taken by the formula:

$$0.05C(A_U / A_S)$$

in which *C* is the concentration, in  $\mu\text{g}$  per mL, of *Ergotamine preparation* in the *Standard preparation*, and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Total alkaloid preparation* and the *Standard preparation*, respectively.

Calculate the percentage of ergotamine tartrate taken by the formula:

$$(A' / A_U)50$$

in which *A'* represents the absorbance of the solution from the *Ergotamine preparation* and  $A_U$  is as defined in the preceding paragraph. Calculate the percentage of ergotamine tartrate taken by the formula:

$$(A'' / A_U)50$$

in which *A''* represents the absorbance of the solution from the *Ergotamine preparation*.

## Ergotamine Tartrate Tablets

» Ergotamine Tartrate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $(C_{33}H_{35}N_5O_5)_2 \cdot C_4H_6O_6$ .

**Packaging and storage**—Preserve in well-closed, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

**Labeling**—Label the Tablets to indicate that they are intended for swallowing intact.

**USP Reference standards** (11)—  
USP Ergotamine Tartrate RS

**Identification**—Triturate a quantity of finely powdered Tablets, equivalent to about 5 mg of ergotamine tartrate, with 10 mL of solvent hexane for a few minutes, allow to settle, and discard the solvent hexane extract. Add to the residue 10 mL of chloroform saturated with ammonia (prepared by shaking chloroform with ammonium hydroxide, then drawing off the chloroform layer), triturate for a few minutes, filter, and evaporate the filtrate on a steam bath to dryness. Dissolve the residue in a mixture of 4 mL of glacial acetic acid and 4 mL of ethyl acetate. To 1 mL of this solution add slowly, with continuous agitation and cooling, 1 mL of sulfuric acid: a blue color with a red tinge develops. Add 0.1 mL of ferric chloride TS, previously diluted with an equal volume of water: the red tinge becomes less apparent and the blue color more pronounced.

**Dissolution** (711)—

*Medium*: tartaric acid solution (1 in 100); 1000 mL.

*Apparatus* 2: 75 rpm.

*Time*: 30 minutes.

**Procedure**—Determine the amount of  $(C_{33}H_{35}N_5O_5)_2 \cdot C_4H_6O_6$  dissolved from fluorescence intensities, using the maximum excitation wavelength at about 327 nm and the maximum emission wavelength at about 427 nm, on filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Ergotamine Tartrate RS in the same *Medium*.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $(C_{33}H_{35}N_5O_5)_2 \cdot C_4H_6O_6$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—

**Mobile phase**—Prepare a filtered and degassed mixture of acetonitrile and 0.01 M monobasic potassium phosphate (55:45). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Internal standard solution**—Transfer about 40 mg of ergonovine maleate to a 250-mL volumetric flask, add a mixture of acetonitrile and water (55:45) to volume, and mix.

**Standard preparation**—Transfer about 10 mg of USP Ergotamine Tartrate RS, accurately weighed, to a 50-mL volumetric flask, add a mixture of acetonitrile and water (55:45) to volume, and mix. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, add 5.0 mL of *Internal standard solution*, dilute with the mixture of acetonitrile and water (55:45) to volume, and mix to obtain a solution having a known concentration of about 0.02 mg of USP Ergotamine Tartrate RS per mL.

**Assay preparation**—Transfer a number of whole Tablets, equivalent to about 10 mg of ergotamine tartrate, to a 500-mL volumetric flask. Add 50.0 mL of *Internal standard solution*, 300 mL of a mixture of acetonitrile and water (55:45), and sonicate for about 10 minutes. Dilute with the mixture of acetonitrile and water (55:45) to volume, and

mix. Filter through a 0.45-μm membrane disk, discarding the first 25 mL of the filtrate.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.7 for ergonovine maleate and 1.0 for ergotamine tartrate; the resolution, *R*, between the analyte and internal standard peaks is not less than 3.0; the column efficiency determined from the analyte peak is not less than 3000 theoretical plates; the tailing factor for the analyte peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $(C_{33}H_{35}N_5O_5)_2 \cdot C_4H_6O_6$  in the portion of Ergotamine Tartrate Tablets taken by the formula:

$$500C(R_U / R_S)$$

in which *C* is the concentration, in mg per mL, of USP Ergotamine Tartrate RS in the *Standard preparation*; and *R<sub>U</sub>* and *R<sub>S</sub>* are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Ergotamine Tartrate Sublingual Tablets

» Ergotamine Tartrate Sublingual Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $(C_{33}H_{35}N_5O_5)_2 \cdot C_4H_6O_6$ .

**Packaging and storage**—Preserve in well-closed, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

**Labeling**—Label Tablets to indicate that they are intended for sublingual administration.

**USP Reference standards** (11)—  
USP Ergotamine Tartrate RS

**Identification**—Triturate a quantity of finely powdered Sublingual Tablets, equivalent to about 5 mg of ergotamine tartrate, with 10 mL of solvent hexane for a few minutes, allow to settle, and discard the solvent hexane extract. Add to the residue 10 mL of chloroform saturated with ammonia (prepared by shaking chloroform with ammonium hydroxide, then drawing off the chloroform layer), triturate for a few minutes, filter, and evaporate the filtrate on a steam bath to dryness. Dissolve the residue in a mixture of 4 mL of glacial acetic acid and 4 mL of ethyl acetate. To 1 mL of this solution add slowly, with continuous agitation and cooling, 1 mL of sulfuric acid: a blue color with a red tinge develops. Add 0.1 mL of ferric chloride TS, previously diluted with an equal volume of water: the red tinge becomes less apparent and the blue color more pronounced.

**Disintegration** (701): 5 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—

**Mobile phase**—Prepare a filtered and degassed mixture of acetonitrile and 0.01 M monobasic potassium phosphate (55:45). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Internal standard solution**—Transfer about 40 mg of ergonovine maleate to a 250-mL volumetric flask, add a mixture of acetonitrile and water (55:45) to volume, and mix.

**Standard preparation**—Transfer about 10 mg of USP Ergotamine Tartrate RS, accurately weighed, to a 50-mL volumetric flask, add a mixture of acetonitrile and water (55:45) to volume, and mix. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, add 5.0 mL of *Internal standard solution*, dilute with the mixture of acetonitrile and water (55:45) to volume, and mix to obtain a solution having a known concentration of about 0.02 mg of USP Ergotamine Tartrate RS per mL.

**Assay preparation**—Transfer a number of whole Sublingual Tablets, equivalent to about 10 mg of ergotamine tartrate, to a 500-mL volumetric flask. Add 50.0 mL of *Internal standard solution*, 300 mL of a mixture of acetonitrile and water (55:45), and sonicate for about 10 minutes. Dilute with the mixture of acetonitrile and water (55:45) to volume, and mix. Filter through a 0.45- $\mu$ m membrane disk, discarding the first 25 mL of the filtrate.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.7 for ergonovine maleate and 1.0 for ergotamine tartrate; the resolution, *R*, between the analyte and internal standard peaks is not less than 3.0; the column efficiency determined from the analyte peak is not less than 3000 theoretical plates; the tailing factor for the analyte peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $(C_{33}H_{35}N_5O_5)_2 \cdot C_4H_6O_6$  in the portion of Sublingual Tablets taken by the formula:

$$500C(R_U / R_S)$$

in which *C* is the concentration, in mg per mL, of USP Ergotamine Tartrate RS in the *Standard preparation*, and *R<sub>U</sub>* and *R<sub>S</sub>* are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Ergotamine Tartrate and Caffeine Suppositories

» Ergotamine Tartrate and Caffeine Suppositories contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of ergotamine tartrate  $[(C_{33}H_{35}N_5O_5)_2 \cdot C_4H_6O_6]$  and of caffeine ( $C_8H_{10}N_4O_2$ ).

**Packaging and storage**—Preserve in tight containers, at a temperature not above 25°. Do not expose unwrapped Suppositories to sunlight.

### USP Reference standards <11>—

USP Caffeine RS  
USP Ergotamine Tartrate RS  
USP Ergotaminine RS

**Identification**—Melt 1 Suppository in 10 mL of hot tartaric acid solution (1 in 100), and mix. Chill the mixture until the layer of oil has hardened, then filter, divide the filtrate into two parts, and use this filtrate for the following tests.

**A:** To one part of the filtrate add 10 mL of *p*-dimethylaminobenzaldehyde TS: a blue color develops (*presence of ergotamine*).

**B:** Transfer the remaining part of the filtrate to a small evaporating dish, evaporate on a steam bath to dryness, add 1 mL of hydrochloric acid and 100 mg of potassium chlorate, and evaporate. Invert the dish over a vessel containing ammonium hydroxide: the residue acquires a purple color, which disappears upon the addition of 1 N sodium hydroxide (*presence of caffeine*).

**Assay**—[NOTE—Protect all solutions from light.]

**Mobile phase A**—Prepare a degassed mixture of water, acetonitrile, and triethylamine (850:150:0.5), and adjust by the dropwise addition of fluorometric grade sulfuric acid to a pH of  $3.1 \pm 0.1$ .

**Mobile phase B**—Prepare a degassed mixture of water, acetonitrile, and triethylamine (1380:620:1), and adjust by the dropwise addition of fluorometric grade sulfuric acid to a pH of  $3.1 \pm 0.1$ . Make any necessary adjustments in *pH* to meet relative retention times, and make other adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Solvent mixture**—Mix equal volumes of methanol and tartaric acid solution (1 in 100).

**Ergotamine tartrate standard solution**—Using an accurately weighed amount of USP Ergotamine Tartrate RS, prepare a solution in *Solvent mixture* having a known concentration of about 40  $\mu$ g per mL.

**Mixed standard preparation**—Into a 10-mL volumetric flask pipet 5 mL of *Ergotamine tartrate standard solution*, and add about 10 mg of USP Caffeine RS, accurately weighed. Dilute with *Solvent mixture* to volume, and mix to obtain a solution having known concentrations of about 20  $\mu$ g of USP Ergotamine Tartrate RS per mL and about 1 mg of USP Caffeine RS per mL.

**System suitability preparation**—Pipet 5 mL of the *Mixed standard preparation* and 1 mL of a solution containing about 20  $\mu$ g of USP Ergotaminine RS per mL into a 10-mL volumetric flask. Dilute with *Solvent mixture* to volume, and mix.

**Assay preparation**—Weigh not fewer than 20 Suppositories, and grind to a fine mesh. Transfer a portion of the ground mass, equivalent to about 2 mg of ergotamine tartrate, to a suitable glass-stoppered flask. Add 100.0 mL of *Solvent mixture*, insert the stopper in the flask, and place it in a water bath maintained at 40°. Shake vigorously for 5 minutes, or longer if necessary, until the specimen is completely melted. Sonicate for 30 minutes, and transfer to a freezer for 45 minutes. Pass through a 0.7- $\mu$ m glass fiber filter, discarding the first 5 to 10 mL of the filtrate.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 4.6-mm  $\times$  25-cm column that contains packing L7. The chromatograph is equipped with a 244-nm detector in series with a fluorometric detector operating at an excitation wavelength of 229 nm and an emission wavelength of 435 nm. Equilibrate the system with *Mobile phase A*. The flow rate is about 2 mL per minute. At 3 minutes after injection of a specimen, or after caffeine has eluted, whichever occurs last, switch to *Mobile phase B*, and at 23 minutes after the initial injection, return to *Mobile phase A*. Allow not less than 2 minutes to elapse between injections. Chromatograph the *Mixed standard preparation* and the *System suitability preparation*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between ergotamine and ergotaminine is not less than 3.0, and the relative standard deviation for replicate injections of the *Mixed standard preparation* is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Mixed standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative re-

tention times are about 4 for ergotamine, 4.5 for ergotamine, and 1.0 for caffeine. Calculate the quantity, in mg, of caffeine ( $C_8H_{10}N_4O_2$ ) in the portion of Suppositories taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Caffeine RS in the *Mixed standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Mixed standard preparation*, respectively. Calculate the quantity, in mg, of ergotamine tartrate [ $(C_{33}H_{35}N_5O_5)_2 \cdot C_4H_6O_6$ ] in the portion of Suppositories taken by the formula:

$$0.1C(I_U / I_S)$$

in which C is the concentration, in  $\mu$ g per mL, of USP Ergotamine Tartrate RS in the *Mixed standard preparation*; and  $I_U$  and  $I_S$  are the fluorometric responses obtained from the *Assay preparation* and the *Mixed standard preparation*, respectively.

## Ergotamine Tartrate and Caffeine Tablets

» Ergotamine Tartrate and Caffeine Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of ergotamine tartrate [ $(C_{33}H_{35}N_5O_5)_2 \cdot C_4H_6O_6$ ] and of caffeine ( $C_8H_{10}N_4O_2$ ).

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

### USP Reference standards (11)—

USP Caffeine RS  
USP Ergotamine Tartrate RS  
USP Ergotamine RS

**Identification**—Crush 1 Tablet, shake with 10 mL of chloroform and 3 drops of ammonium hydroxide, and filter. Divide the filtrate into two parts in small evaporating dishes, evaporate on a steam bath to dryness, and use the residues for the following tests.

**A:** Mix one of the residues with 5 mL of tartaric acid solution (1 in 100), and add 10 mL of *p*-dimethylaminobenzaldehyde TS: a blue color develops (*presence of ergotamine*).

**B:** To the other residue add 1 mL of hydrochloric acid and 100 mg of potassium chlorate, and evaporate on a steam bath to dryness. Invert the dish over a vessel containing ammonium hydroxide: the residue acquires a purple color, which disappears upon the addition of 1 N sodium hydroxide (*presence of caffeine*).

### Dissolution (711)—

**Medium:** tartaric acid solution (1 in 100); 900 mL.

**Apparatus 2:** 75 rpm.

**Time:** 30 minutes.

**Standard preparation**—Using suitable quantities of USP Ergotamine Tartrate RS and USP Caffeine RS, accurately weighed, prepare a solution, using the *Medium*, having known concentrations of about 1  $\mu$ g of ergotamine tartrate and 100  $\mu$ g of caffeine in each mL.

**Procedure**—Measure the amount of caffeine in solution on filtered portions of the *Medium*, suitably diluted, at the wavelength of maximum absorbance at about 273 nm, with a suitable spectrophotometer, in comparison with the *Standard preparation*. Similarly, measure the amount of ergotamine tartrate in solution on filtered portions of the *Me-*

*dium*, suitably diluted, in a suitable fluorometer, using 327 nm as the excitation wavelength and 427 nm as the emission wavelength, in comparison with the *Standard preparation*.

**Tolerances**—Not less than 70% (Q) of the labeled amount of ergotamine tartrate [ $(C_{33}H_{35}N_5O_5)_2 \cdot C_4H_6O_6$ ] and not less than 75% (Q) of the labeled amount of caffeine ( $C_8H_{10}N_4O_2$ ) is dissolved in 30 minutes.

**Uniformity of dosage units (905):** meet the requirements.

**Assay**—[NOTE—Protect all solutions from light.]

**Mobile phase A**—Prepare a degassed mixture of water, acetonitrile, and triethylamine (850:150:0.5), and adjust by the dropwise addition of fluorometric grade sulfuric acid to a pH of  $2.7 \pm 0.1$ .

**Mobile phase B**—Prepare a degassed mixture of water, acetonitrile, and triethylamine (1380:620:1), and adjust by the dropwise addition of fluorometric grade sulfuric acid to a pH of  $2.7 \pm 0.1$ . Make necessary adjustments in pH with sodium hydroxide solution (1 in 20) or with fluorometric grade sulfuric acid to meet relative retention times, and make other adjustments if necessary (see *System Suitability under Chromatography (621)*).

**Solvent mixture**—Transfer 10 g of tartaric acid to a 1-L volumetric flask, add 500 mL of water, and mix with shaking. Add 330 mL of alcohol, and mix. Dilute with water to volume, and mix. Use a freshly prepared mixture.

**Ergotamine tartrate standard solution**—Using an accurately weighed amount of USP Ergotamine Tartrate RS, prepare a solution in *Solvent mixture* having a known concentration of about 40  $\mu$ g per mL.

**Caffeine standard solution**—Using an accurately weighed amount of USP Caffeine RS, prepare a solution in *Solvent mixture* having a known concentration of about 4 mg per mL.

**Mixed standard preparation**—Pipet 10 mL of *Ergotamine tartrate standard solution* and 10 mL of *Caffeine standard solution* into a 100-mL volumetric flask. Dilute with *Solvent mixture* to volume, and mix to obtain a solution having known concentrations of 4  $\mu$ g of USP Ergotamine Tartrate RS per mL and 0.4 mg of USP Caffeine RS per mL.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 10 mg of ergotamine tartrate, to a 250-mL volumetric flask. Add 150 mL of *Solvent mixture* and 20 drops of benzalkonium chloride solution (1 in 2). Shake by mechanical means for 45 minutes. [NOTE—Two to 3 mL of methanol may be added, if necessary, to break up bubbles that form during shaking.] Dilute with *Solvent mixture* to volume, and mix. Filter through a 0.5- $\mu$ m membrane, discarding the first 20 mL of the filtrate. Pipet 5 mL of the subsequent filtrate into a 50-mL volumetric flask, dilute with *Solvent mixture* to volume, and mix.

**System suitability preparation**—Pipet 20 mL of *Caffeine standard solution*, 20 mL of *Ergotamine tartrate standard solution*, and 4 mL of a solution containing 20  $\mu$ g of USP Ergotamine RS per mL of *Solvent mixture*, into a 200-mL volumetric flask. Dilute with *Solvent mixture* to volume, and mix.

**Chromatographic system** (see *Chromatography (621)*)—The liquid chromatograph is equipped with a 4.6-mm  $\times$  25-cm column that contains packing L7. The chromatograph is equipped with a 254-nm detector in series with a fluorometric detector operating at an excitation wavelength of 325 nm and an emission wavelength of 435 nm. Equilibrate the system with *Mobile phase A*. The flow rate is about 2 mL per minute. At 3 minutes after injection of a specimen, or after caffeine has eluted, whichever occurs last, switch to *Mobile phase B*, and at 18 minutes after initial injection, return to *Mobile phase A*. Wait not less than 2 minutes between injections. Chromatograph the *Mixed standard preparation* and the *System suitability preparation*, and record the peak responses as directed for *Procedure*: the tailing factor

for the ergotamine peak is not more than 2.0; the resolution,  $R$ , between ergotamine and ergotamine is not less than 3.0; and the relative standard deviation for replicate injections of the *Mixed standard preparation* is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Mixed standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 3.5 for ergotamine, 4 for ergotamine, and 1.0 for caffeine. Calculate the quantity, in mg, of caffeine ( $C_8H_{10}N_4O_2$ ) in the portion of Tablets taken by the formula:

$$2500C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Caffeine RS in the *Mixed standard preparation*; and  $r_U$  and  $r_S$  are the 254-nm peak responses obtained from the *Assay preparation* and the *Mixed standard preparation*, respectively. Calculate the quantity, in mg, of ergotamine tartrate [ $(C_{33}H_{35}N_5O_5)_2 \cdot C_4H_6O_6$ ] in the portion of Tablets taken by the formula:

$$2.5C(I_U / I_S)$$

in which  $C$  is the concentration, in  $\mu$ g per mL, of USP Ergotamine Tartrate RS in the *Mixed standard preparation*; and  $I_U$  and  $I_S$  are the fluorometric responses obtained from the *Assay preparation* and the *Mixed standard preparation*, respectively.

## Erythromycin

Erythromycin	$R_1$	$R_2$
A	OH	OCH <sub>3</sub>
B	H	OCH <sub>3</sub>
C	OH	OH

$C_{37}H_{67}NO_{13}$  733.93

Erythromycin.

(3*R*\*,4*S*\*,5*S*\*,6*R*\*,7*R*\*,9*R*\*,11*R*\*,12*R*\*,13*S*\*,14*R*\*)-4-[(2,6-Dideoxy-3-C-methyl-3-O-methyl- $\alpha$ -L-ribohexopyranosyl)oxy]-14-ethyl-7,12,13-trihydroxy-3,5,7,9,11,13-hexamethyl-6-[[3,4,6-trideoxy-3-(dimethylamino)- $\beta$ -D-xylohexopyranosyl]oxy]oxacyclotetradecane-2,10-dione [114-07-8].

» Erythromycin consists primarily of erythromycin A ( $C_{37}H_{67}NO_{13}$ ). The sum of the percentages of erythromycin A, erythromycin B, and erythromycin C is not less than 85.0 percent and not more than 100.5 percent, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Erythromycin RS

USP Erythromycin B RS

USP Erythromycin C RS

USP Erythromycin Related Compound N RS

N-Demethylerythromycin A.

$C_{36}H_{65}NO_{13}$  719.91

**Identification**—The IR absorption spectrum of a solution of it containing 50 mg per mL, previously dried at a pressure not exceeding 5 mm of mercury at 60° for 3 hours, in chloroform, determined in a 0.1-mm cell, exhibits maxima only at the same wavelengths as that of a similar preparation of USP Erythromycin RS, except in the region between 1980  $cm^{-1}$  and 2050  $cm^{-1}$ .

**Specific rotation** (781S): between  $-71^\circ$  and  $-78^\circ$ , determined after standing for 30 minutes.

**Test solution**: 20 mg per mL, in dehydrated alcohol.

**Crystallinity** (695): meets the requirements.

**Water**, Method I (921): not more than 10.0%, 20 mL of methanol containing 10% of imidazole being used in place of methanol in the titration vessel.

**Residue on ignition** (281): not more than 0.2%.

**Limit of thiocyanate**—

**Standard solutions**—Transfer about 100 mg of potassium thiocyanate, previously dried at 105° for 1 hour, cooled, and accurately weighed, to each of two 50-mL volumetric flasks. Add about 20 mL of methanol to each flask, swirl to dissolve, dilute with methanol to volume, and mix. Transfer 5.0 mL of each of these stock solutions to separate 50-mL volumetric flasks, dilute with methanol to volume, and mix. Transfer 5.0 mL of each of these intermediate solutions to separate 50-mL low-actinic volumetric flasks. To each flask add 1.0 mL of ferric chloride TS, dilute with methanol to volume, and mix. [NOTE—Use these *Standard solutions* within 30 minutes.]

**Test solution**—Transfer about 100 mg of Erythromycin, accurately weighed, to a 50-mL low-actinic volumetric flask. Add 20 mL of methanol, and swirl to dissolve. Add 1.0 mL of ferric chloride TS, dilute with methanol to volume, and mix. [NOTE—Use this *Test solution* within 30 minutes.]

**Blank solution**—Transfer 1.0 mL of ferric chloride TS to a 50-mL low-actinic volumetric flask, dilute with methanol to volume, and mix. [NOTE—Use this *Blank solution* within 30 minutes.]

**Procedure**—Determine the absorbances of each *Standard solution* and the *Test solution* at the wavelength of maximum absorbance at about 492 nm with a spectrophotometer, using the *Blank solution* to zero the instrument. Calculate the suitability value,  $S$ , by the formula:

$$(A_1 / W_1)(W_2 / A_2)$$

in which  $A_1$  and  $A_2$  are the absorbance values obtained from the respective *Standard solutions*; and  $W_1$  and  $W_2$  are the weights, in mg, of the potassium thiocyanate taken to prepare the corresponding *Standard solutions*. In a suitable determination, the value,  $S$ , is not less than 0.985 and not more than 1.015. Calculate the percentage of thiocyanate in the Erythromycin taken by the formula:

$$(58.08/97.18)(A_U / W_U)(0.5)[(W_1 / A_1) + (W_2 / A_2)]$$

in which 58.08 and 97.18 are the molecular weights of the thiocyanate moiety and of potassium thiocyanate, respectively;  $A_U$  is the absorbance of the *Test solution*;  $W_U$  is the weight, in mg, of Erythromycin taken to prepare the *Test solution*; and the other terms are as defined above: not more than 0.3% is found.

**Limit of related substances**—Using the chromatograms of the *Assay preparation* and the *Diluted standard preparation* obtained in the *Assay*, calculate the percentage of any individual related substance observed having the greatest response, other than erythromycin A, erythromycin B, erythromycin C, and erythromycin A enol ether, in the Erythromycin taken by the formula:

$$25(CP / W)(r_i / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Erythromycin RS in the *Diluted standard preparation*;  $P$  is the

designated percentage of erythromycin A in the USP Erythromycin RS;  $W$  is the weight, in mg, of Erythromycin taken to prepare the *Assay preparation*;  $r_i$  is the peak response of an individual related substance, other than erythromycin A, erythromycin B, erythromycin C, or erythromycin A enol ether, observed in the chromatogram obtained from the *Assay preparation*; and  $r_s$  is the erythromycin A peak response in the chromatogram obtained from the *Diluted standard preparation*: not more than 3.0% of any individual related substance is found. Calculate the percentage of erythromycin A enol ether in the Erythromycin taken by the formula:

$$(25 / 11)(CP / W)(r_E / r_s)$$

in which 11 is the response factor for erythromycin A enol ether in relation to that of erythromycin A;  $r_E$  is the peak response of the erythromycin A enol ether peak observed in the chromatogram obtained from the *Assay preparation*; and the other terms are as defined above: not more than 3.0% of erythromycin A enol ether is found. The percentage of erythromycin B obtained in the *Assay* is not more than 12.0%; and the percentage of erythromycin C obtained in the *Assay* is not more than 5.0%.

#### Assay—

**Solution A**—Dissolve 1.75 g of dibasic potassium phosphate in 50 mL of water, adjust with diluted phosphoric acid (1 in 10) or 0.2 N sodium hydroxide to a pH of 9.0, add 400 mL of water, 165 mL of tertiary butyl alcohol, and 30 mL of acetonitrile. Dilute with water to 1000 mL, and mix.

**Mobile phase**—Prepare a mixture of *Solution A*, acetonitrile, and water (5:2:1). Make any necessary adjustments (see *System Suitability under Chromatography* <621>).

**Diluent**—Prepare a mixture of pH 7.0 buffer (see under *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*) and methanol (15:1).

**pH 3.5 Buffer**—Adjust 20 mL of pH 7.0 buffer (see under *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*) with phosphoric acid to a pH of 3.5.

**NOTE**—Use the following solutions promptly, or within 1 day if stored in a refrigerator.

**Standard preparation**—Transfer about 100 mg of USP Erythromycin RS, accurately weighed, to a 25-mL volumetric flask, add 5 mL of methanol, swirl to dissolve, dilute with *Diluent* to volume, and mix.

**Diluted standard preparation**—Transfer 3.0 mL of the *Standard preparation* to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix. This solution contains about 0.12 mg of USP Erythromycin RS per mL.

**Erythromycins B and C standard solution**—Transfer about 5 mg each of USP Erythromycin B RS and USP Erythromycin C RS, both accurately weighed, to a 25-mL volumetric flask, add 5 mL of methanol, swirl to dissolve, dilute with *Diluent* to volume, and mix.

**Resolution solution**—Transfer about 2 mg of USP Erythromycin Related Compound N RS to a 10-mL volumetric flask, add 0.4 mL of *Standard preparation*, dilute with *Erythromycins B and C standard solution* to volume, and mix.

**Erythromycin A enol ether retention time solution**—Dissolve about 10 mg of USP Erythromycin RS in 2 mL of methanol. Add 10 mL of pH 3.5 Buffer, mix, and allow to stand for about 30 minutes.

**Assay preparation**—Transfer about 100 mg of Erythromycin, accurately weighed, to a 25-mL volumetric flask, add 5 mL of methanol, and swirl to dissolve. Dilute with *Diluent* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm × 25-cm column that contains packing L21 (1000 Å) and is maintained at a constant temperature of about 65°. The flow rate is about 2 mL per minute. Chromatograph the *Resolution solution*, and record the peak re-

sponses as directed for *Procedure*: the relative retention times are about 0.56 for erythromycin related compound N (N-demethylethromycin A), 0.61 for erythromycin C, 1.0 for erythromycin A, and 1.6 for erythromycin B; and the resolution,  $R$ , between erythromycin related compound N and erythromycin C is not less than 0.8, and between erythromycin related compound N and erythromycin A not less than 5.5. Chromatograph the *Erythromycin A enol ether retention time solution*, and record the peak responses as directed for *Procedure*: the retention time of the erythromycin A enol ether peak is about 3.2 relative to that of the erythromycin A peak as observed in the chromatogram obtained from the *Resolution solution*. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 100 µL) of the *Standard preparation*, the *Diluted standard preparation*, the *Erythromycins B and C standard solution*, and the *Assay preparation* into the chromatograph, record the chromatograms for a period of time that is adequate to include the erythromycin A enol ether peak, if present, as determined in the chromatogram obtained from the *Erythromycin A enol ether retention time solution* (about five times the retention time of the main erythromycin A peak). Measure the areas of the peak responses. Calculate the percentage of erythromycin A in the portion of Erythromycin taken by the formula:

$$25(C_A P / W)(r_U / r_A)$$

in which  $C_A$  is the concentration, in mg per mL, of USP Erythromycin RS in the *Standard preparation*;  $P$  is the designated percentage of erythromycin A in USP Erythromycin RS;  $W$  is the quantity, in mg, of Erythromycin taken to prepare the *Assay preparation*; and  $r_U$  and  $r_A$  are the erythromycin A peak responses in the chromatograms obtained from the *Assay preparation* and the *Standard preparation*, respectively. Calculate the percentages of erythromycin B and erythromycin C in the portion of Erythromycin taken by the formula:

$$25(C_S P / W)(r_U / r_S)$$

in which  $C_S$  is the concentration, in mg per mL, of the relevant USP Reference Standard in the *Erythromycins B and C standard solution*;  $P$  is the designated percentage of erythromycin B or erythromycin C in the relevant USP Reference Standard;  $W$  is the quantity, in mg, of Erythromycin taken to prepare the *Assay preparation*; and  $r_U$  and  $r_S$  are the peak responses of the relevant analyte in the chromatograms obtained from the *Assay preparation* and the *Erythromycins B and C standard solution*, respectively.

## Erythromycin Delayed-Release Capsules

» Erythromycin Delayed-Release Capsules contain not less than 90.0 percent and not more than 115.0 percent of the labeled amount of erythromycin ( $C_{37}H_{67}NO_{13}$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** <11>—

USP Erythromycin RS

**Identification**—Prepare a test solution by mixing a quantity of finely ground Capsule contents with methanol to obtain a concentration of about 2.5 mg of erythromycin per mL. Prepare a Standard solution of USP Erythromycin RS in methanol containing 2.5 mg per mL. Apply separately 10 µL of each solution to a thin-layer chromatographic plate (see

*Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel. Place the plate in an unlined chromatographic chamber, and develop the chromatogram in a solvent system consisting of a mixture of methanol and chloroform (85:15) until the solvent front has moved about 7 cm. Remove the plate from the chamber, mark the solvent front, and allow the solvent to evaporate. Spray the plate with a mixture of alcohol, *p*-methoxybenzaldehyde, and sulfuric acid (90:5:5). Heat the plate at 100° for 10 minutes, and examine the chromatogram, in which erythromycin appears as a black-to-purple spot: the  $R_f$  value of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution.

**Dissolution** (711)—Proceed as directed for *Procedure for Method B* under *Apparatus 1* and *Apparatus 2*, *Delayed-Release Dosage Forms*.

*Apparatus 1*: 50 rpm.

*Times*: 60 minutes for *Acid Stage*; 60 minutes for *Buffer Stage*.

**Procedure**—Transfer the contents of 1 Capsule to the apparatus. Proceed as directed for *Acid Stage*, 900 mL of 0.06 N hydrochloric acid being placed in the vessel instead of 1000 mL of 0.1 N hydrochloric acid, and the apparatus operated for 60 minutes instead of 2 hours. Do not perform an analysis at the end of the *Acid stage*. Continue as directed for *Buffer Stage*, 900 mL of the pH 6.8 phosphate buffer being used instead of 1000 mL. Determine the amount of  $C_{37}H_{67}NO_{13}$  dissolved after 120 minutes by assaying a filtered portion of the solution under test as directed under *Antibiotics—Microbial Assays* (81).

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_{37}H_{67}NO_{13}$  is dissolved in 120 minutes.

**Water, Method I** (921): not more than 7.5%, 20 mL of methanol containing 10% of imidazole being used in place of methanol in the titration vessel.

**Assay**—Proceed as directed under *Antibiotics—Microbial Assays* (81), using not less than 5 Capsules blended for about 3 minutes in a high-speed glass blender jar containing 200 mL of methanol. Add 300 mL of *Buffer No. 3*, and blend again for about 3 minutes. Dilute an accurately measured volume of this stock solution quantitatively with *Buffer No. 3* to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

## Erythromycin Topical Gel

» Erythromycin Topical Gel is Erythromycin in a suitable gel vehicle. It contains not less than 90.0 percent and not more than 125.0 percent of the labeled amount of  $C_{37}H_{67}NO_{13}$ .

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Erythromycin RS

**Identification**—Prepare a test solution as follows. To 1 g of Topical Gel in a 50-mL screw-capped tube, add 20 mL of 0.01 N hydrochloric acid, and heat in a water bath to reflux. Remove the tube from the water bath and shake it. Place the tube in the water bath again, and heat to reflux. Remove the tube from the water bath, and immediately decant a portion of the hot clear supernatant into a test tube. Allow to cool, add an equal volume of a mixture of methanol, water, and triethylamine (90:9:1), and mix. Concomitantly prepare a Standard solution as directed above, except to use 5 mg of USP Erythromycin RS and 5 mL of 0.01 N hydrochloric acid instead of 1 g of Topical Gel and 20 mL of 0.01 N hydrochloric acid. Separately apply 5  $\mu$ L of the test solution and the Standard solution to a thin-layer chromato-

graphic plate (see *Chromatography* (621)), coated with a 0.25-mm layer of chromatographic silica gel. Place the plate in an unlined chromatographic chamber, and develop the chromatograms in a solvent system consisting of a mixture of methanol, water, and triethylamine (90:9:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chromatographic chamber, mark the solvent front, and allow the solvent to evaporate. Spray the plate with a mixture of alcohol, *p*-methoxybenzaldehyde, and sulfuric acid (90:5:5). Heat the plate at 100° for 10 minutes, and examine the chromatograms. The spots due to erythromycin are black to purple in color: the  $R_f$  value of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution.

**Minimum fill** (755): meets the requirements.

**Assay**—Proceed as directed under *Antibiotics—Microbial Assays* (81), using an accurately weighed quantity of Topical Gel, equivalent to about 20 mg of erythromycin, blended for about 3 minutes in a high-speed glass blender jar containing 200.0 mL of *Buffer No. 3* to which has been added 0.5% of polysorbate 80. Dilute an accurately measured volume of the blended solution quantitatively with *Buffer No. 3* to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

## Erythromycin Intramammary Infusion

» Erythromycin Intramammary Infusion is a solution of Erythromycin in a suitable vegetable oil vehicle. It contains one or more suitable preservatives. It contains not less than 90.0 percent and not more than 120.0 percent of the labeled amount of  $C_{37}H_{67}NO_{13}$ .

**Packaging and storage**—Preserve in single-dose disposable syringes that are well-closed containers.

**Labeling**—Label it to indicate that it is for veterinary use only.

**USP Reference standards** (11)—

USP Erythromycin RS

**Identification**—Transfer a quantity of Intramammary Infusion, equivalent to about 5 mg of erythromycin, to a separator containing 50 mL of solvent hexane. Shake until dissolved. Extract with three separate 20-mL portions of methanol. Combine the methanol extracts in a beaker, and evaporate to dryness. Dissolve the residue in 2 mL of methanol (test solution). Proceed as directed in the *Identification* test under *Erythromycin Delayed-Release Capsules*, beginning with "Prepare a Standard solution of USP Erythromycin RS."

**Minimum fill** (755): meets the requirements.

**Water, Method I** (921): not more than 1.0%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

**Assay**—Transfer the contents of a syringe of Intramammary Infusion to a separator containing 50 mL of solvent hexane. Shake until dissolved. Wash with four separate 20-mL portions of a mixture of methanol and water (4:1). Combine the washings in a 100-mL volumetric flask, dilute with the methanol and water solution to volume, and mix. Proceed as directed for erythromycin under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of this stock solution diluted quantitatively with *Buffer No. 3* to yield a *Test Dilution* having a concentration of erythromycin assumed to be equal to the median dose level of the Reference Standard.

## Erythromycin Injection

» Erythromycin Injection is a sterile solution of Erythromycin in a polyethylene glycol vehicle. It contains not less than 90.0 percent and not more than 120.0 percent of the labeled amount of  $C_{37}H_{67}NO_{13}$ .

**Packaging and storage**—Preserve in multiple-dose containers.

**Labeling**—Label it to indicate that it is for veterinary use only. Label it to state that it is for intramuscular administration only.

**USP Reference standards** (11)—  
USP Erythromycin RS

**Identification**—Transfer a quantity of Injection, equivalent to about 5 mg of erythromycin, to a separator containing 50 mL of solvent hexane. Shake until dissolved. Extract with three separate 20-mL portions of methanol. Combine the methanol extracts in a beaker, and evaporate to dryness. Dissolve the residue in 2 mL of methanol (test solution). Proceed as directed in the *Identification* test under *Erythromycin Delayed-Release Capsules*, beginning with "Prepare a Standard solution of USP Erythromycin RS."

**Water, Method I** (921): not more than 1.0%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

**Sterility** (71)—It meets the requirements when tested as directed for *Direct Inoculation of the Culture Medium* under *Test for Sterility of the Product to be Examined*.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—Transfer an accurately measured volume of Injection, equivalent to about 50 mg of erythromycin, to a separator containing 50 mL of solvent hexane. Shake until dissolved. Wash with four separate 20-mL portions of a mixture of methanol and water (4:1). Combine the washings in a 100-mL volumetric flask, dilute with the methanol and water solution to volume, and mix. Proceed as directed for erythromycin under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of this stock solution diluted quantitatively with *Buffer No. 3* to yield a *Test Dilution* having a concentration of erythromycin assumed to be equal to the median dose level of the Standard.

## Erythromycin Ointment

» Erythromycin Ointment is Erythromycin in a suitable ointment base. It contains not less than 90.0 percent and not more than 125.0 percent of the labeled amount of erythromycin ( $C_{37}H_{67}NO_{13}$ ).

**Packaging and storage**—Preserve in collapsible tubes or in other tight containers, preferably at controlled room temperature.

**USP Reference standards** (11)—

USP Erythromycin RS  
USP Erythromycin B RS  
USP Erythromycin C RS  
USP Erythromycin Related Compound N RS  
N-Demethylerythromycin A.  
 $C_{36}H_{65}NO_{13}$  719.91

### Identification—

**A:** Transfer a quantity of Ointment, equivalent to about 5 mg of erythromycin, to a separator containing 50 mL of solvent hexane. Shake until dissolved. Extract with three separate 20-mL portions of methanol. Combine the methanol extracts in a beaker, and evaporate to dryness. Dissolve the residue in 2 mL of methanol (test solution). Proceed as directed in the *Identification* test under *Erythromycin Delayed-Release Capsules*, beginning with "Prepare a Standard solution of USP Erythromycin RS."

**B:** The retention times of the peaks for erythromycin A, erythromycin B, and erythromycin C in the chromatogram of the *Assay preparation* correspond to those in the chromatograms of the *Standard preparation* and *Erythromycins B and C standard preparation*, as obtained in the *Assay*.

**Minimum fill** (755): meets the requirements.

**Water, Method I** (921): not more than 1.0%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

### Assay—

**Solution A**—Prepare a degassed mixture of acetonitrile and water (90:10). Store in a reservoir protected from air by sparging with helium.

**Solution B**—To 1000 mL of degassed water add 0.5 mL of sodium hydroxide solution (1 in 2), using a suitable syringe and needle to minimize exposure to air. Degas, and store in a reservoir protected from air by sparging with helium.

**Solution C**—Use degassed water, and store in a reservoir protected from air by sparging with helium.

**Mobile phase**—Using a suitable pumping system, pump *Solution A*, *Solution C*, and *Solution B* from the respective reservoirs in the ratio of 56:37:7. Make any necessary adjustments (see *System Suitability* under *Chromatography* (621)).

**Diluent**—Prepare a mixture of methanol and water (50:50).

**Standard preparation**—Quantitatively prepare a solution of USP Erythromycin RS in *Diluent* having a known concentration of about 0.66 mg per mL.

**Erythromycins B and C standard preparation**—Quantitatively prepare a solution in *Diluent* having known concentrations of about 34 µg each of USP Erythromycin B RS and USP Erythromycin C RS per mL.

**System suitability solution**—Transfer about 2 mg of USP Erythromycin Related Compound N RS to a 10-mL volumetric flask, add 0.4 mL of the *Standard preparation* and 6 mL of *Erythromycins B and C standard preparation*, and mix. Dilute with *Erythromycins B and C standard preparation* to volume, and mix.

**Assay preparation**—Transfer an accurately weighed portion of Ointment, equivalent to about 60 mg of erythromycin, to a 125-mL separator. Add 50 mL of solvent hexane, and shake until dissolved. Extract with four separate 20-mL portions of *Diluent*, collecting the extracts in a 100-mL volumetric flask. Dilute the combined extracts with *Diluent* to volume, mix, and pass a portion of the solution through a filter having a 0.45-µm porosity. Use the clear filtrate as the *Assay preparation*.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with an electrochemical detector, a glassy carbon electrode fitted with three gaskets, a 4-mm × 5-cm guard column that contains 8-µm packing L50, and a 4-mm × 25-cm analytical column that contains 8-µm packing L50. The electrochemical detector is used in the pulsed integrated amperometric mode with a range of 10 nC, an output of 1 V full scale, a rise time of 0.6 second, positive polarity,  $E = 0.9$  V;  $t_1 = 400$  ms;  $E_2 = 0.9$  V;  $t_2 = 100$  ms;  $E_3 = -0.9$  V;  $t_3 = 100$  ms. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.4 for erythromycin related compound N, 0.5 for erythromycin C, 1.0 for

erythromycin A, and 1.6 for erythromycin B; the resolution,  $R$ , between erythromycin related compound N and erythromycin C is not less than 0.6, between erythromycin C and erythromycin A not less than 2.5, and between erythromycin A and erythromycin B not less than 2.5. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 2; and the relative standard deviation for replicate injections is not more than 3%. [NOTE—Turn off the electrochemical detector before stopping the flow of the *Mobile phase*.]

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation*, *Erythromycins B and C standard preparation*, and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak areas. Calculate the percentage of erythromycin A in the portion of Ointment taken by the formula:

$$0.1(CP/W)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Erythromycin RS in the *Standard preparation*;  $P$  is the designated percentage of erythromycin A in USP Erythromycin RS;  $W$  is the quantity, in g, of Ointment taken to prepare the *Assay preparation*; and  $r_U$  and  $r_S$  are the erythromycin A peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively. Calculate the percentages of erythromycin B and erythromycin C in the portion of Ointment taken by the formula:

$$0.0001(CP/W)(r_U / r_S)$$

in which  $C$  is the concentration, in  $\mu$ g per mL, of the relevant USP Reference Standard in the *Erythromycins B and C standard preparation*;  $P$  is the designated percentage of erythromycin B or erythromycin C in the relevant USP Reference Standard;  $W$  is the quantity, in g, of Ointment taken to prepare the *Assay preparation*; and  $r_U$  and  $r_S$  are the peak areas for the relevant analyte obtained from the *Assay preparation* and the *Erythromycins B and C standard preparation*, respectively. Calculate the percentage content of erythromycin in the Ointment by adding the percentages of erythromycin A, erythromycin B, and erythromycin C found.

## Erythromycin Ophthalmic Ointment

» Erythromycin Ophthalmic Ointment is a sterile preparation of Erythromycin in a suitable ointment base. It contains not less than 90.0 percent and not more than 120.0 percent of the labeled amount of  $C_{37}H_{67}NO_{13}$ .

**Packaging and storage**—Preserve in collapsible ophthalmic ointment tubes.

**USP Reference standards** (11)—

USP Erythromycin RS

**Identification**—Transfer a quantity of Ophthalmic Ointment, equivalent to about 5 mg of erythromycin, to a separator containing 50 mL of solvent hexane. Shake until dissolved. Extract with three separate 20-mL portions of methanol. Combine the methanol extracts in a beaker, and evaporate to dryness. Dissolve the residue in 2 mL of methanol (test solution). Proceed as directed in the *Identification test under Erythromycin Delayed-Release Capsules*, beginning with "Prepare a Standard solution of USP Erythromycin RS."

**Sterility** (71): It meets the requirements.

**Minimum fill** (755): meets the requirements.

**Metal particles**—It meets the requirements of the test for *Metal Particles in Ophthalmic Ointments* (751).

**Other requirements**—It meets the requirements for *Water and Assay* under *Erythromycin Ointment*.

## Erythromycin Pledgets

» Erythromycin Pledgets are suitable absorbent pads impregnated with Erythromycin Topical Solution. Pledgets contain not less than 90.0 percent of the labeled volume of Erythromycin Topical Solution.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Label Pledgets to indicate that each Pledget is to be used once and then discarded. Label Pledgets also to indicate the volume, in mL, of Erythromycin Topical Solution contained in each Pledget, and the concentration, in mg of erythromycin per mL, of the Erythromycin Topical Solution.

**USP Reference standards** (11)—

USP Erythromycin RS

**Identification**—Prepare a test solution by shaking one Pledget with methanol, and diluting appropriately to obtain a concentration of about 2.5 mg of erythromycin per mL. Prepare a Standard solution of USP Erythromycin RS in methanol containing 2.5 mg per mL. Apply separately 10  $\mu$ L of each solution to a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel. Place the plate in an unlined chromatographic chamber, and develop the chromatogram in a solvent system consisting of a mixture of methanol and chloroform (85:15) until the solvent front has moved about 7 cm. Remove the plate from the chamber, mark the solvent front, and allow the solvent to evaporate. Spray the plate with a mixture of alcohol, *p*-methoxybenzaldehyde, and sulfuric acid (90:5:5). Heat the plate at 100° for 10 minutes, and examine the chromatogram, in which erythromycin appears as a black-to-purple spot: the  $R_f$  value of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution.

**Other requirements**—The Erythromycin Topical Solution expressed from Pledgets meets the requirements for *Water and Alcohol content* under *Erythromycin Topical Solution*.

**Topical solution assay**—Proceed as directed for erythromycin under *Antibiotics—Microbial Assays* (81), using the solution expressed from not less than 10 Pledgets. Dilute an accurately measured volume of this solution quantitatively with *Buffer No. 3* to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

**Assay and minimum volume**—Proceed as directed for erythromycin under *Antibiotics—Microbial Assays* (81), assaying 10 Pledgets individually. Transfer 1 Pledget to a suitable container, add about 50 mL of *Buffer No. 3*, and shake for 2 minutes. Transfer the solution so obtained to a 100-mL volumetric flask. Wash the Pledget with two 20-mL portions of *Buffer No. 3*, add the washings to the 100-mL volumetric flask, dilute with *Buffer No. 3* to volume, and mix. Dilute an accurately measured volume of this solution quantitatively with *Buffer No. 3* to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard. Calculate the volume, in mL, of Erythromycin Topical Solution in each Pledget taken by dividing the number of mg of erythromycin in each individual Pledget by the number of mg of erythromycin in each mL of Erythromycin Topical Solution as obtained in the *Topical Solution assay*. The volume of Erythromycin Topical Solution in each Pledget is not less than 90.0% of the labeled amount. If this requirement is not met, determine the volume of Erythromycin Topical Solution in each of 20 additional Pledgets. The volume of Erythromycin Topical Solution in not more

than 1 of the 30 Pledgets is less than 90.0% of the labeled amount.

## Erythromycin Topical Solution

» Erythromycin Topical Solution is a solution of Erythromycin in a suitable vehicle. It contains not less than 90.0 percent and not more than 125.0 percent of the labeled amount of  $C_{37}H_{67}NO_{13}$ .

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Erythromycin RS

**Identification**—Prepare a test solution by mixing a portion of the Topical Solution with methanol to obtain a concentration of about 2.5 mg of erythromycin per mL. Proceed as directed in the *Identification* test under *Erythromycin Delayed-Release Capsules*, beginning with "Prepare a Standard solution of USP Erythromycin RS."

**Water, Method I** (921): not more than 8.0% if it contains 20 mg per mL, or not more than 5.0% if it contains 15 mg per mL, or not more than 2.0% if it contains acetone, 20 mL of a mixture of pyridine and methanol (1:1) being used in place of methanol in the titration vessel.

**Alcohol content, Method II** (611): between 92.5% and 107.5% of the labeled amount of  $C_2H_5OH$ .

**Assay**—Proceed as directed under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of Topical Solution diluted quantitatively with *Buffer No. 3* to yield a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

## Erythromycin Tablets

» Erythromycin Tablets contain not less than 90.0 percent and not more than 120.0 percent of the labeled amount of  $C_{37}H_{67}NO_{13}$ .

NOTE—Tablets that are enteric-coated meet the requirements for *Erythromycin Delayed-Release Tablets*.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Erythromycin RS

**Identification**—Prepare a test solution by mixing a quantity of finely powdered Tablets with methanol to obtain a concentration of about 2.5 mg of erythromycin per mL. Proceed as directed in the *Identification* test under *Erythromycin Delayed-Release Capsules*, beginning with "Prepare a Standard solution of USP Erythromycin RS."

**Dissolution** (711)—

**Medium:** 0.05 M pH 6.8 phosphate buffer (see *Buffer solutions* in the section *Reagents, Indicators, and Solutions*); 900 mL.

**Apparatus 2:** 50 rpm.

**Time:** 60 minutes.

**Test solution**—If necessary, dilute a filtered portion of the solution under test with *Medium* to obtain a solution having a concentration of about 0.28 mg of erythromycin per mL, and mix.

**Standard solution**—Dissolve an accurately weighed quantity of USP Erythromycin RS in methanol (not more than

1 mL of methanol for each 14 mg of the Reference Standard), and dilute with water, quantitatively and with mixing, to obtain a stock solution containing about 0.56 mg per mL. Immediately prior to use, dilute the stock solution quantitatively with water to obtain a *Standard solution* having a known concentration of about 0.28 mg per mL.

**Procedure**—Transfer 5.0-mL portions of the *Test solution* and the *Standard solution* to separate 25-mL volumetric flasks, and treat each as follows: Add 2.0 mL of water, and allow to stand for 5 minutes with intermittent swirling. Add 15.0 mL of 0.25 N sodium hydroxide, dilute with *Medium* to volume, and mix. Heat to 60° for 5 minutes, and allow to cool. Concomitantly determine the absorbances of these solutions at the wavelength of maximum absorbance at about 236 nm, with a suitable spectrophotometer, using blank solutions similarly prepared, except that 2.0 mL of 0.5 N sulfuric acid is substituted for the 2.0 mL of water. Calculate the amount of  $C_{37}H_{67}NO_{13}$  dissolved.

**Tolerances**—Not less than 70% (Q) of the labeled amount of  $C_{37}H_{67}NO_{13}$  is dissolved in 60 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Loss on drying** (731)—Dry about 100 mg of powdered Tablets in a capillary-stoppered bottle in vacuum at 60° for 3 hours: it loses not more than 5.0% of its weight.

**Assay**—Place not less than 4 Tablets in a high-speed glass blender jar with 200 mL of methanol, and blend for 3 minutes. Add 300 mL of *Buffer No. 3*, and blend for 3 minutes. Proceed as directed under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of this stock test solution diluted quantitatively with *Buffer No. 3* to yield a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

## Erythromycin Delayed-Release Tablets

» Erythromycin Delayed-Release Tablets contain not less than 90.0 percent and not more than 120.0 percent of the labeled amount of erythromycin ( $C_{37}H_{67}NO_{13}$ ).

**Packaging and storage**—Preserve in tight containers.

**Labeling**—The label indicates that the Tablets are enteric-coated. The labeling indicates the *Dissolution Test* with which the product complies.

**USP Reference standards** (11)—

USP Erythromycin RS

**Identification**—Prepare a test solution by mixing a quantity of finely powdered Tablets with methanol to obtain a concentration of about 2.5 mg of erythromycin per mL. Proceed as directed in the *Identification* test under *Erythromycin Delayed-Release Capsules*, beginning with "Prepare a Standard solution of USP Erythromycin RS."

**Dissolution** (711)—Proceed as directed for *Procedure for Method B* under *Apparatus 1 and Apparatus 2, Delayed-Release Dosage Forms*.

**TEST 1**—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 1*.

**Apparatus 1:** 100 rpm.

**Times:** 60 minutes, Stage 1; 60 minutes, Stage 2.

**Acid stage**—Using 900 mL of simulated gastric fluid TS (prepared without pepsin) in place of 0.1 N hydrochloric acid, conduct this stage of the test for 1 hour, and do not perform an analysis of the medium.

**Buffer stage**—Using 900 mL of 0.05 M pH 6.8 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*), conduct this stage of the test for 60 minutes.

**Test solution**—If necessary, dilute a filtered portion of the solution under test with *Dissolution Medium* to obtain a solution having a concentration of about 0.28 mg of erythromycin per mL, and mix.

**Procedure**—Transfer a 2.0-mL portion of the *Test solution* to a suitable separator. Add 6 mL of pH 1.2 buffer (see *Solutions* in the section *Reagents, Indicators, and Solutions*), and 8 mL of a solution of bromocresol purple, prepared by dissolving 1 g of bromocresol purple in 1 L of pH 4.5 phosphate buffer, and mix. Extract with 40.0 mL of chloroform. Determine the amount of  $C_{37}H_{67}NO_{13}$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 410 nm using the chloroform extracts. Similarly prepare a Standard solution, having a known concentration of USP Erythromycin RS, and treat similarly.

**TEST 2**—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*. Proceed as directed under *Test 1*, except to use *Apparatus 2* at 75 rpm.

**Uniformity of dosage units** (905): meet the requirements.

**Water, Method I** (921): not more than 6.0%, 20 mL of methanol containing 10% of imidazole being used in place of methanol in the titration vessel.

**Assay**—Place not fewer than 4 Tablets in a high-speed glass blender jar with 200 mL of methanol, and blend for 3 minutes. Add 300 mL of *Buffer No. 3*, and blend for 3 minutes. Proceed as directed under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of this stock test solution diluted quantitatively with *Buffer No. 3* to yield a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

## Erythromycin and Benzoyl Peroxide Topical Gel

» Erythromycin and Benzoyl Peroxide Topical Gel is a mixture of Erythromycin in a suitable gel vehicle containing benzoyl peroxide and one or more suitable dispersants, stabilizers, and wetting agents. It contains not less than 90.0 percent and not more than 125.0 percent of the labeled amounts of erythromycin ( $C_{37}H_{67}NO_{13}$ ) and benzoyl peroxide ( $C_{14}H_{10}O_4$ ).

**Packaging and storage**—Before mixing, preserve the Erythromycin and the vehicle containing benzoyl peroxide in separate, tight containers. After mixing, preserve the mixture in tight containers.

**USP Reference standards** (11)—  
USP Erythromycin RS

**Identification**—Prepare *Standard preparation* and an *Assay preparation* as directed in the *Assay*, except to omit the *Internal standard solution*, and chromatograph as directed in the *Assay*: the *Assay preparation* exhibits a major peak for benzoyl peroxide, the retention time of which corresponds to that exhibited by the *Standard preparation*.

**Minimum fill** (755): meets the requirements.

**Limit of benzoyl peroxide related substances**—

*Mobile phase A, Mobile phase B, Standard preparation A, Standard preparation B, Standard preparation C, Standard preparation D, Resolution solution, and Chromatographic system*—Proceed as directed in the test for *Related compounds* under *Benzoyl Peroxide Gel*.

*Test preparation*—Transfer an accurately weighed quantity of Topical Gel, equivalent to about 100 mg of benzoyl per-

oxide, to a 50-mL volumetric flask, add 25 mL of acetonitrile, shake vigorously to disperse the specimen, sonicate for 5 minutes, dilute with acetonitrile to volume, mix, and filter.

**Procedure**—Proceed as directed for *Procedure* in the test for *Related compounds* under *Benzoyl Peroxide Gel*: it meets the limits stated.

**Assay for erythromycin**—Proceed as directed for erythromycin under *Antibiotics—Microbial Assays* (81), using an accurately weighed portion of Topical Gel blended for 3 to 5 minutes in a high-speed glass blender jar containing 0.5 mL of polysorbate 80 and an accurately measured volume of *Buffer No. 3* sufficient to obtain a stock solution having a convenient concentration of erythromycin. Dilute an accurately measured volume of this stock solution quantitatively with *Buffer No. 3* to obtain a *Test Dilution* having a concentration of erythromycin assumed to be equal to the median dose level of the Standard.

**Assay for benzoyl peroxide**—

*Mobile phase, Internal standard solution, Standard preparation, and Chromatographic system*—Proceed as directed in the *Assay* under *Benzoyl Peroxide Gel*.

*Assay preparation*—Prepare as directed for *Assay preparation* in the *Assay* under *Benzoyl Peroxide Gel*, using Topical Gel.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Benzoyl Peroxide Gel*. Calculate the quantity, in mg, of benzoyl peroxide ( $C_{14}H_{10}O_4$ ) in the portion of Topical Gel taken by the formula:

$$125C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of benzoyl peroxide in the *Standard preparation*, and  $R_U$  and  $R_S$  are the ratios of benzoyl peroxide peak response to ethyl benzoate peak response obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Erythromycin Estolate

$C_{40}H_{71}NO_{14} \cdot C_{12}H_{25}O_4S$  1056.39

Erythromycin, 2'-propanoate, dodecyl sulfate (salt).

Erythromycin 2'-propionate dodecyl sulfate (salt)  
[3521-62-8].

» Erythromycin Estolate has a potency equivalent to not less than 600 µg of erythromycin ( $C_{37}H_{67}NO_{13}$ ) per mg, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Erythromycin RS

USP Erythromycin Estolate RS

**Identification, Infrared Absorption** (197K).

**Crystallinity** (695): meets the requirements.

**Water, Method I** (921): not more than 4.0%, 20 mL of methanol containing 10% of imidazole being used in place of methanol in the titration vessel.

**Free erythromycin**—Prepare a test solution of it in methanol containing 10.0 mg per mL. Prepare a Standard solution of USP Erythromycin RS in methanol containing 0.3 mg per mL. [NOTE—Prepare these solutions immediately before use.] Prepare a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Before using, place the plate in an unlined developing chamber containing about 100 mL of methanol, and allow the solvent front to move to the top of the plate, marking the direction of travel. Remove the plate, and allow to dry. Apply separate 1-μL volumes of the test solution and the Standard solution on the plate, allow the spots to dry, and develop the chromatograms in a freshly prepared solvent system consisting of a mixture of methanol and chloroform (85:15) until the solvent front has moved about one-half of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the plate to dry. Place the plate under a hood, and spray uniformly with a solution consisting of 150 mg of xanthidol dissolved in a mixture of hydrochloric acid and glacial acetic acid (92.5:7.5). Heat the sprayed plate in an oven at 100° for 5 minutes. [Caution—Avoid exposure to acid fumes when removing the plate from the oven.] Examine the plate for reddish violet spots: free erythromycin has an  $R_F$  value of about 0.3, and erythromycin estolate has an  $R_F$  value of about 0.7. Any spot corresponding to free erythromycin obtained from the test solution does not exceed in size or intensity that of the principal spot obtained from the Standard solution (3.0%).

**Assay**—Proceed with Erythromycin Estolate as directed for erythromycin under *Antibiotics—Microbial Assays* (81), using an accurately weighed quantity of Erythromycin Estolate dissolved in methanol to obtain a solution containing the equivalent of 1.0 mg of erythromycin per mL. Immediately dilute quantitatively with 9 volumes of *Buffer No. 3*, and allow to stand at room temperature for 18 hours. Dilute a portion of this solution quantitatively with *Buffer No. 3* to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

## Erythromycin Estolate Capsules

» Erythromycin Estolate Capsules contain the equivalent of not less than 90.0 percent and not more than 115.0 percent of the labeled amount of erythromycin ( $C_{37}H_{67}NO_{13}$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Erythromycin RS

USP Erythromycin Estolate RS

**Identification**—Prepare a test solution by mixing a quantity of Capsule contents with methanol to obtain a concentration equivalent to about 20 mg of erythromycin per mL. Prepare a Standard solution of USP Erythromycin Estolate RS in methanol containing the equivalent of 20 mg of erythromycin per mL. Apply separately 3 μL of each solution to a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel. Proceed as directed in the *Identification* test under *Erythromycin Delayed-Release Capsules*, beginning with "Place the plate in an unlined chromatographic chamber."

**Disintegration** (701): 30 minutes, proceeding as directed for *Hard Gelatin Capsules*, except to use disks and to

use simulated gastric fluid TS as the immersion fluid instead of water.

**Uniformity of dosage units** (905): meet the requirements.

**Water, Method I** (921): not more than 5.0%, 20 mL of methanol containing 10% of imidazole being used in place of methanol in the titration vessel.

**Assay**—Place not less than 4 Capsules in a high-speed glass blender jar with 200.0 mL of methanol, and blend for 3 minutes. Add 300.0 mL of *Buffer No. 3*, and blend for 3 minutes. Allow this solution to stand at room temperature for 18 hours. Proceed as directed for erythromycin under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of this stock test solution diluted quantitatively with *Buffer No. 3* to yield a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

## Erythromycin Estolate Oral Suspension

» Erythromycin Estolate Oral Suspension contains the equivalent of not less than 90.0 percent and not more than 115.0 percent of the labeled amount of erythromycin ( $C_{37}H_{67}NO_{13}$ ). It contains one or more suitable buffers, colors, diluents, dispersants, and flavors.

**Packaging and storage**—Preserve in tight containers, in a cool place.

**USP Reference standards** (11)—

USP Erythromycin RS

USP Erythromycin Estolate RS

**Identification**—Transfer a quantity of Oral Suspension, equivalent to about 20 mg of erythromycin, to a separator. Add 15 mL of 0.02 N sodium hydroxide, and swirl to mix. Add 2 g of sodium chloride and 25 mL of chloroform, and shake for 3 minutes. Drain the chloroform phase through a small amount of chloroform-washed anhydrous sodium sulfate, and collect the chloroform extract in a beaker, rinsing the sodium sulfate with an additional 10 mL of chloroform. Evaporate the chloroform to dryness. Dissolve the residue in 1 mL of methanol (test solution). Prepare a Standard solution by transferring a quantity of USP Erythromycin Estolate RS, equivalent to 20 mg of erythromycin, to a separator and carrying out the extraction procedure described for preparation of the test solution. Apply separately 3 μL of each solution to a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel. Proceed as directed in the *Identification* test under *Erythromycin Delayed-Release Capsules*, beginning with "Place the plate in an unlined chromatographic chamber."

**Uniformity of dosage units** (905)—

FOR SUSPENSION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** (698): meets the requirements.

**pH** (791): between 3.5 and 6.5.

**Assay**—Dilute an accurately measured volume of Oral Suspension, freshly mixed and free from air bubbles, quantitatively with methanol to obtain a solution containing the equivalent of 2.5 mg of erythromycin per mL. Dilute with 1.5 volumes of *Buffer No. 3*, and allow to stand at room temperature for 18 hours. Proceed as directed for erythromycin under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of this stock test solution diluted quantitatively with *Buffer No. 3* to yield a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

## Erythromycin Estolate for Oral Suspension

» Erythromycin Estolate for Oral Suspension is a dry mixture of Erythromycin Estolate with one or more suitable buffers, colors, diluents, dispersants, and flavors. It contains the equivalent of not less than 90.0 percent and not more than 115.0 percent of the labeled amount of erythromycin ( $C_{37}H_{67}NO_{13}$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Erythromycin RS

USP Erythromycin Estolate RS

**Identification**—Prepare a test solution by mixing a quantity of Erythromycin Estolate for Oral Suspension with methanol to obtain a concentration equivalent to about 20 mg of erythromycin per mL. Prepare a Standard solution of USP Erythromycin Estolate RS in methanol containing the equivalent of 20 mg of erythromycin per mL. Apply separately 3  $\mu$ L of each solution to a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel. Proceed as directed in the *Identification* test under *Erythromycin Delayed-Release Capsules*, beginning with "Place the plate in an unlined chromatographic chamber."

**Uniformity of dosage units** (905)—

FOR SOLID PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** (698): meets the requirements.

**pH** (791): between 5.0 and 7.0 (if pediatric drops, between 5.0 and 5.5), in the suspension constituted as directed in the labeling.

**Water, Method I** (921): not more than 2.0%, 20 mL of methanol containing 10% of imidazole being used in place of methanol in the titration vessel.

**Assay**—Constitute Erythromycin Estolate for Oral Suspension as directed in the labeling, and proceed as directed in the *Assay* under *Erythromycin Estolate Oral Suspension*.

## Erythromycin Estolate Tablets

» Erythromycin Estolate Tablets contain the equivalent of not less than 90.0 percent and not more than 120.0 percent (115.0 percent, if chewable) of the labeled amount of erythromycin ( $C_{37}H_{67}NO_{13}$ ).

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Label the Tablets to indicate whether they are to be chewed before swallowing.

**USP Reference standards** (11)—

USP Erythromycin RS

USP Erythromycin Estolate RS

**Identification**—Prepare a test solution by mixing a quantity of finely powdered Tablets with methanol to obtain a concentration equivalent to about 20 mg of erythromycin per mL. Prepare a Standard solution of USP Erythromycin Estolate RS in methanol containing the equivalent of 20 mg of erythromycin per mL. Apply separately 3  $\mu$ L of each solution to a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel. Proceed as directed in the *Identification*

test under *Erythromycin Delayed-Release Capsules*, beginning with "Place the plate in an unlined chromatographic chamber." [NOTE—Use the following procedure for chewable Tablets. Transfer a quantity of finely powdered Tablets, equivalent to about 20 mg of erythromycin, to a separator, and proceed as directed in the *Identification* test under *Erythromycin Estolate Oral Suspension*, beginning with "Add 15 mL of 0.02 N sodium hydroxide."]

**Disintegration** (701): 30 minutes, proceeding as directed for *Uncoated Tablets*, except to use disks and to use simulated gastric fluid as the immersion fluid instead of water. [NOTE—Chewable tablets are exempt from this requirement.]

**Uniformity of dosage units** (905): meet the requirements.

**Water, Method I** (921): not more than 5.0%; or if chewable tablets, not more than 4.0%, 20 mL of methanol containing 10% of imidazole being used in place of methanol in the titration vessel.

**Assay**—Proceed with Tablets as directed in the *Assay* under *Erythromycin Estolate Capsules*.

## Erythromycin Estolate and Sulfisoxazole Acetyl Oral Suspension

» Erythromycin Estolate and Sulfisoxazole Acetyl Oral Suspension contains the equivalent of not less than 90.0 percent and not more than 120.0 percent of the labeled amount of erythromycin ( $C_{37}H_{67}NO_{13}$ ) and the equivalent of not less than 90.0 percent and not more than 115.0 percent of the labeled amount of sulfisoxazole ( $C_{11}H_{13}N_3O_3S$ ). It contains one or more suitable buffers, colors, diluents, emulsifiers, flavors, preservatives, and suspending agents.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Erythromycin RS

USP Erythromycin Estolate RS

USP Sulfisoxazole Acetyl RS

**Identification**—To a quantity of the Oral Suspension add a volume of methanol sufficient to yield a solution having a concentration equivalent to about 2.5 mg of erythromycin per mL. Shake this mixture by mechanical means for about 30 minutes. Centrifuge a portion of this mixture, and use the clear supernatant as the test solution. Prepare a solution of USP Erythromycin Estolate RS in methanol containing about 3 mg per mL (*Standard solution A*). Prepare a solution of USP Sulfisoxazole Acetyl RS in methanol containing about 8.7 mg per mL (*Standard solution B*). Apply separately 10  $\mu$ L each of the test solution and the two Standard solutions to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture, and allow to dry. Place the plate in an unlined chromatographic chamber, and develop the chromatograms in a solvent system consisting of a mixture of methanol and chloroform (85:15) until the solvent front has moved about 9 cm. Remove the plate from the chamber, mark the solvent front, and allow the solvent to evaporate. Spray the plate with a mixture of dehydrated alcohol, *p*-methoxybenzaldehyde, and sulfuric acid (90:5:5). Heat the plate at 100° for 10 minutes, and examine the chromatograms, in which the erythromycin estolate appears as a black-to-purple spot and the sulfisoxazole acetyl appears as a yellow spot: the  $R_f$  value of the principal black-to-purple spot obtained from the test solution corresponds to that obtained from *Standard solution A*, and the  $R_f$  value of the

principal yellow spot obtained from the test solution corresponds to that obtained from *Standard solution B*.

**Uniformity of dosage units** (905)—

FOR SUSPENSION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** (698): meets the requirements.

**pH** (791): between 3.5 and 6.5.

**Assay for erythromycin**—Dilute an accurately measured volume of Oral Suspension, freshly mixed and free from air bubbles, quantitatively with methanol to obtain a solution containing the equivalent of 2.5 mg of erythromycin per mL. Dilute with 1.5 volumes of *Buffer No. 3*, and allow to stand at room temperature for 18 hours. Proceed as directed for erythromycin under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of this stock test solution diluted quantitatively with *Buffer No. 3* to yield a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard (1.0 µg of erythromycin per mL).

**Assay for sulfisoxazole**—

*Mobile solvent*—Mix 40 volumes of acetonitrile and 60 volumes of water. The acetonitrile concentration may be varied to meet system suitability requirements and to provide a suitable elution time for sulfisoxazole acetyl. Filter the solution through a membrane filter (1-µm or finer porosity).

*Internal standard solution*—Prepare a solution of benzanilide in acetonitrile having a concentration of about 0.33 mg per mL. Filter the solution through a membrane filter (1-µm or finer porosity).

*Standard preparation*—Prepare a solution of USP Sulfisoxazole Acetyl RS in *Internal standard solution* having a known concentration of about 1 mg per mL.

*Assay preparation*—Transfer an accurately measured volume of Oral Suspension, freshly mixed and free from air bubbles, equivalent to about 600 mg of sulfisoxazole, to a 125-mL separator, and extract with three 75-mL portions of chloroform. Collect the chloroform extracts in a 250-mL volumetric flask, dilute with chloroform to volume, and mix. Filter a portion of this solution through a membrane filter (1-µm or finer porosity). Pipet 4 mL of the filtrate into a glass-stoppered, 25-mL conical flask, and evaporate with the aid of a current of dry air to dryness. Add 10.0 mL of *Internal standard solution*, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm × 30-cm column that contains packing L1. The flow rate is about 1.2 mL per minute. Chromatograph replicate injections of the *Standard preparation*, and record the peak responses as directed under *Procedure*; the resolution factor between sulfisoxazole acetyl and benzanilide is not less than 3.0.

*Procedure*—Separately inject equal volumes (about 5 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of sulfisoxazole (C<sub>11</sub>H<sub>13</sub>N<sub>3</sub>O<sub>3</sub>S) in each mL of the Oral Suspension taken by the formula:

$$(267.31 / 309.35)(625C / V)(R_U / R_S)$$

in which 267.31 and 309.35 are the molecular weights of sulfisoxazole and sulfisoxazole acetyl, respectively; *C* is the concentration, in mg, of USP Sulfisoxazole Acetyl RS in each mL of the *Standard preparation*; *V* is the volume, in mL, of Oral Suspension taken; and *R<sub>U</sub>* and *R<sub>S</sub>* are the ratios of peak responses of sulfisoxazole acetyl peak to benzanilide peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Erythromycin Ethylsuccinate

C<sub>43</sub>H<sub>75</sub>NO<sub>16</sub> 862.05

Erythromycin 2'-(ethyl butanedioate).

Erythromycin 2'-(ethyl succinate). [1264-62-6].

» Erythromycin Ethylsuccinate consists primarily of the 2'-ethylsuccinate ester of erythromycin A. The sum of the percentages of erythromycin A, erythromycin B, and erythromycin C is not less than 76.5 percent, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Erythromycin Ethylsuccinate that is noncrystalline is labeled to indicate that it is amorphous. Any preparation containing the amorphous form of Erythromycin Ethylsuccinate is so labeled.

**USP Reference standards** (11)—

USP Erythromycin RS

USP Erythromycin B RS

USP Erythromycin C RS

USP Erythromycin Related Compound N RS

N-demethylethylerythromycin A.

C<sub>36</sub>H<sub>65</sub>NO<sub>13</sub> 719.91

USP Erythromycin Ethylsuccinate RS

**Identification, Infrared Absorption** (197S)—

*Solution:* 1 in 100.

*Medium:* chloroform.

*Cell size:* 1.0-mm.

**Crystallinity** (695): meets the requirements, except that when it is labeled as being in the amorphous state it does not meet the requirements.

**X-ray diffraction** (941)—Where labeled as being in the amorphous state, its X-ray diffraction pattern performed at high sensitivity for angles of diffraction between 2° and 20° exhibits no reflection, and between 7° and 10° exhibits a more intense hachured baseline, creating a halo.

**Water, Method I** (921): not more than 3.0%, 20 mL of methanol containing 10% of imidazole being used in place of methanol in the titration vessel.

**Residue on ignition** (281): not more than 1.0% after ignition at 550 ± 50°, the charred residue being moistened with 2 mL of nitric acid and 5 drops of sulfuric acid.

**Related compounds**—Using the chromatograms obtained for the *Assay preparation* and *Standard preparation 2* in the *Assay*, begin peak integration after the two peaks for succinates that elute just after the solvent front, and calculate the percentage of each related compound having the greatest response, other than erythromycin A, erythromycin B, erythromycin C, erythromycin A enol ether, and erythromycin N-ethylsuccinate (retention time relative to erythromycin A

peak is about 1.3), in the portion of Erythromycin Ethylsuccinate taken by the formula:

$$50(C_{S2}P / W)(r_i / r_{S2})$$

in which  $C_{S2}$  is the concentration, in mg per mL, of USP Erythromycin RS in *Standard preparation 2*;  $P$  is the designated percentage of erythromycin A in USP Erythromycin RS;  $W$  is the quantity, in mg, of Erythromycin Ethylsuccinate taken to prepare the *Assay preparation*;  $r_i$  is the peak response of each related compound, other than erythromycin A, erythromycin B, erythromycin C, erythromycin A enol ether, and erythromycin N-ethylsuccinate, in the chromatogram obtained from the *Assay preparation*; and  $r_{S2}$  is the erythromycin A peak response in the chromatogram obtained from *Standard preparation 2*: not more than 3.0% of any individual related compound is found.

Calculate the percentage of erythromycin A enol ether in the portion of Erythromycin Ethylsuccinate taken by the formula:

$$(50 / 11)(C_{S2}P / W)(r_E / r_{S2})$$

in which 11 is the response factor for erythromycin A enol ether in relation to that of erythromycin A;  $r_E$  is the peak response of the erythromycin A enol ether observed in the chromatogram obtained from the *Assay preparation*; and the other terms are as defined above: not more than 3.0% of erythromycin A enol ether is found.

Calculate the percentage of erythromycin N-ethylsuccinate in the portion of Erythromycin Ethylsuccinate taken by the formula:

$$(50 / 7.4)(C_{S2}P / W)(r_N / r_{S2})$$

in which 7.4 is the response factor for erythromycin N-ethylsuccinate in relation to that of erythromycin A;  $r_N$  is the peak response of the erythromycin N-ethylsuccinate (retention time relative to the erythromycin A peak is about 1.3) observed in the chromatogram obtained from the *Assay preparation*; and the other terms are as defined above: not more than 3.0% of erythromycin N-ethylsuccinate is found.

#### Assay—

*Hydrolysis reagent*—Prepare a solution of dibasic potassium phosphate (2 in 100), and adjust with phosphoric acid to a pH of 8.0.

*pH 8.0 Buffer*—Prepare a solution of dibasic potassium phosphate (3.5 in 100), and adjust with phosphoric acid to a pH of 8.0.

*pH 3.5 Buffer*—Adjust 20 mL of *pH 8.0 Buffer* with phosphoric acid to a pH of 3.5.

*Mobile phase*—Mix 50 mL of *pH 8.0 Buffer* with 400 mL of water, add 175 mL of tertiary butyl alcohol and 30 mL of acetonitrile, dilute with water to 1000 mL, and mix. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

NOTE—Use the following solutions promptly, or within 1 day if stored in a refrigerator.

*Standard preparation 1*—Transfer about 50 mg of USP Erythromycin RS, accurately weighed, to a 25-mL volumetric flask, add 12.5 mL of methanol, and swirl to dissolve. Dilute with *Hydrolysis reagent* to volume, and mix.

*Standard preparation 2*—Transfer about 5 mg each of USP Erythromycin B RS and USP Erythromycin C RS, both accurately weighed, to a 50-mL volumetric flask, add 25.0 mL of methanol, and swirl to dissolve. Add 2.5 mL of *Standard preparation 1*, dilute with *Hydrolysis reagent* to volume, and mix.

*System suitability solution*—Dissolve about 2 mg of USP Erythromycin Related Compound N RS in about 20 mL of *Standard preparation 2*, and mix.

*Erythromycin A enol ether solution*—Dissolve about 10 mg of USP Erythromycin RS in 2 mL of methanol. Add 10 mL of

*pH 3.5 Buffer*, mix, and allow to stand for about 30 minutes. Refrigerate this solution until used, and discard 8 hours after preparation.

*Assay preparation*—Transfer about 115 mg of Erythromycin Ethylsuccinate, accurately weighed, to a 50-mL volumetric flask, add 25.0 mL of methanol, and swirl to dissolve. Add about 20 mL of *Hydrolysis reagent*, mix, and allow to stand at room temperature for about 12 hours to effect hydrolysis. Dilute with *Hydrolysis reagent* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm × 25-cm column that contains packing L21 (1000 Å) and is maintained at a constant temperature of about 70°. The flow rate is about 2 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the order of elution of the components is erythromycin related compound N, erythromycin C, erythromycin A, and erythromycin B; and the resolution,  $R$ , between erythromycin related compound N and erythromycin C is not less than 0.8 and between erythromycin related compound N and erythromycin A not less than 5.5. Chromatograph the *Erythromycin A enol ether solution*, and record the peak responses as directed for *Procedure*: adjust the duration of chromatography to include the erythromycin A enol ether peak, which has a retention time of about 4.3 to 4.7 times that of erythromycin A. Chromatograph *Standard preparation 1*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 1.0%.

*Procedure*—Separately inject equal volumes (about 200 µL) of *Standard preparation 1*, *Standard preparation 2*, and the *Assay preparation* into the chromatograph; record the chromatograms for a period of time that is adequate to include the erythromycin A enol ether peak, if present; and measure the areas of the peak responses. Calculate the percentage of erythromycin A in the portion of Erythromycin Ethylsuccinate taken by the formula:

$$50(C_{S1}P / W)(r_U / r_{S1})$$

in which  $C_{S1}$  is the concentration, in mg per mL, of USP Erythromycin RS in *Standard preparation 1*;  $P$  is the designated percentage of erythromycin A in USP Erythromycin RS;  $W$  is the quantity, in mg, of Erythromycin Ethylsuccinate taken to prepare the *Assay preparation*; and  $r_U$  and  $r_{S1}$  are the erythromycin A peak responses in the chromatograms obtained from the *Assay preparation* and *Standard preparation 1*, respectively.

Calculate the percentage of erythromycin B and erythromycin C in the portion of Erythromycin Ethylsuccinate taken by the formula:

$$50(C_{S2}P / W)(r_U / r_{S2})$$

in which  $C_{S2}$  is the concentration, in mg per mL, of the relevant USP Reference Standard in *Standard preparation 2*;  $P$  is the designated percentage of erythromycin B or erythromycin C in the relevant USP Reference Standard;  $W$  is the quantity, in mg, of Erythromycin Ethylsuccinate taken to prepare the *Assay preparation* and  $r_U$  and  $r_{S2}$  are the peak responses of the relevant analyte in the chromatograms obtained from the *Assay preparation* and *Standard preparation 2*, respectively. The percentage of erythromycin B is not more than 12.0%, and the percentage of erythromycin C is not more than 5.0%.

## Erythromycin Ethylsuccinate Injection

» Erythromycin Ethylsuccinate Injection is a sterile solution of Erythromycin Ethylsuccinate in Poly-

ethylene Glycol 400, and contains 2 percent of butyl aminobenzoate and a suitable preservative. It contains the equivalent of not less than 90.0 percent and not more than 115.0 percent of the labeled amount of erythromycin ( $C_{37}H_{67}NO_{13}$ ).

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass.

**USP Reference standards** (11)—

USP Erythromycin RS

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*, using a membrane filter resistant to the solvent effect of polyethylene glycol 400.

**Water**, *Method I* (921): not more than 1.5%, 20 mL of methanol containing 10% of imidazole being used in place of methanol in the titration vessel.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—Proceed as directed for erythromycin under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of Injection diluted quantitatively with methanol to yield a solution containing the equivalent of about 1 mg of erythromycin per mL. Dilute a portion of this stock solution quantitatively with *Buffer No. 3* to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

## Sterile Erythromycin Ethylsuccinate

» Sterile Erythromycin Ethylsuccinate is Erythromycin Ethylsuccinate suitable for parenteral use. It has a potency equivalent to not less than 765  $\mu$ g of erythromycin ( $C_{37}H_{67}NO_{13}$ ) per mg, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* (1).

**USP Reference standards** (11)—

USP Erythromycin RS

USP Erythromycin Ethylsuccinate RS

**Identification**, *Infrared Absorption* (197S)—

*Solution*: 1 in 100.

*Medium*: chloroform.

*Cell size*: 1.0 mm.

**Sterility** (71)—It meets the requirements when tested as directed for *Direct Inoculation of the Culture Medium* under *Test for Sterility of the Product to be Examined*.

**Heavy metals** (231)—Dissolve 1 g in 25 mL of water, and proceed as directed for *Method I*: the limit is 0.002%.

**Other requirements**—It conforms to the Definition and meets the requirements for *Water*, *Residue on ignition*, *CrySTALLINITY*, and the *Assay* under *Erythromycin Ethylsuccinate*.

## Erythromycin Ethylsuccinate Oral Suspension

» Erythromycin Ethylsuccinate Oral Suspension is a suspension of Erythromycin Ethylsuccinate containing one or more suitable buffers, colors, dispersants, flavors, and preservatives. It contains

the equivalent of not less than 90.0 percent and not more than 120.0 percent of the labeled amount of erythromycin ( $C_{37}H_{67}NO_{13}$ ).

**Packaging and storage**—Preserve in tight containers, and store in a cold place.

**USP Reference standards** (11)—

USP Erythromycin RS

USP Erythromycin Ethylsuccinate RS

**Identification**—To a quantity of the Oral Suspension add a volume of methanol sufficient to yield a solution having a concentration equivalent to about 2.5 mg of erythromycin per mL. Shake this mixture by mechanical means for about 30 minutes. Centrifuge a portion of this mixture, and use the clear supernatant as the test solution. Prepare a Standard solution of USP Erythromycin Ethylsuccinate RS in methanol containing about 3 mg per mL. Apply separately 10  $\mu$ L each of the test solution and the Standard solution to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture, and allow to dry. Place the plate in an unlined chromatographic chamber, and develop the chromatograms in a solvent system consisting of a mixture of methanol and chloroform (85:15) until the solvent front has moved about 9 cm. Remove the plate from the chamber, mark the solvent front, and allow the solvent to evaporate. Spray the plate with a mixture of dehydrated alcohol, *p*-methoxybenzaldehyde, and sulfuric acid (90:5:5). Heat the plate at 100° for 10 minutes, and examine the chromatograms, in which the erythromycin and succinic acid moieties appear as black-to-purple spots: the  $R_f$  values of the principal spots obtained from the test solution correspond to those obtained from the Standard solution.

**Uniformity of dosage units** (905)—

FOR SUSPENSION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** (698): meets the requirements.

**pH** (791): between 6.5 and 8.5.

**Assay**—Proceed as directed for erythromycin under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of Oral Suspension, freshly mixed and free from air bubbles, blended for  $4 \pm 1$  minutes in a high-speed glass blender jar with sufficient methanol to give a stock solution containing the equivalent of about 1 mg of erythromycin per mL. Dilute this stock solution quantitatively with *Buffer No. 3* to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

## Erythromycin Ethylsuccinate for Oral Suspension

» Erythromycin Ethylsuccinate for Oral Suspension is a dry mixture of Erythromycin Ethylsuccinate with one or more suitable buffers, colors, diluents, dispersants, and flavors. It contains the equivalent of not less than 90.0 percent and not more than 120.0 percent of the labeled amount of erythromycin ( $C_{37}H_{67}NO_{13}$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Erythromycin RS

USP Erythromycin Ethylsuccinate RS

**Identification**—To a quantity of Erythromycin Ethylsuccinate for Oral Suspension add a volume of methanol sufficient to yield a solution containing the equivalent of about

2.5 mg of erythromycin per mL, and stir for 30 minutes. Centrifuge a portion of this mixture, and use the clear supernatant as the test solution. Proceed as directed in the Identification test under *Erythromycin Ethylsuccinate Oral Suspension*, beginning with "Prepare a Standard solution."

**Uniformity of dosage units** (905)—

FOR SOLID PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** (698): meets the requirements.

**pH** (791): between 7.0 and 9.0, in the suspension constituted as directed in the labeling.

**Loss on drying** (731)—Dry about 100 mg in a capillary-stoppered bottle in vacuum at 60° for 3 hours: it loses not more than 1.0% of its weight.

**Assay**—Constitute Erythromycin Ethylsuccinate for Oral Suspension as directed in the labeling, and proceed as directed in the Assay under *Erythromycin Ethylsuccinate Oral Suspension*.

## Erythromycin Ethylsuccinate Tablets

» Erythromycin Ethylsuccinate Tablets contain the equivalent of not less than 90.0 percent and not more than 120.0 percent of the labeled amount of erythromycin ( $C_{37}H_{67}NO_{13}$ ).

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Label the chewable Tablets to indicate that they are to be chewed before swallowing.

**USP Reference standards** (11)—

USP Erythromycin RS

USP Erythromycin Ethylsuccinate RS

**Identification**—To a quantity of powdered Tablets add a volume of methanol sufficient to yield a solution containing the equivalent of about 2.5 mg of erythromycin per mL. Shake this mixture by mechanical means for about 30 minutes. Centrifuge a portion of this mixture, and use the clear supernatant as the test solution. Proceed as directed in the Identification test under *Erythromycin Ethylsuccinate Oral Suspension*, beginning with "Prepare a Standard solution."

**Dissolution** (711)—

FOR NONCHEWABLE TABLETS—

**Medium:** 0.01 N hydrochloric acid; 900 mL.

**Apparatus 2:** 50 rpm.

**Time:** 45 minutes.

Determine the amount of  $C_{37}H_{67}NO_{13}$  dissolved by employing the following method.

**Color reagent**—Slowly, and with constant mechanical stirring, add 325 mL of sulfuric acid to 173 mL of cold water. Allow the solution to cool, add 2 mL of ferric chloride solution (1 in 40) and 1 g of *p*-dimethylaminobenzaldehyde, and stir to dissolve. Store in a low actinic flask. [NOTE—Prepare this *Color reagent* on the day of use.]

**Standard solution**—Dissolve an accurately weighed quantity of USP Erythromycin RS in *Medium* to obtain a solution having a known concentration of about 0.44 mg per mL, using sonication if necessary to dissolve. [NOTE—Use this *Standard solution* within 5.5 hours.]

**Test solution**—Pass a portion of the solution under test through a filter having a porosity of 0.5  $\mu$ m or less, discarding the first 5 mL of the filtrate.

**Procedure**—To three separate 50-mL glass-stoppered conical flasks add 2.0 mL of *Standard solution*, 2.0 mL of *Test solution*, and 2.0 mL of *Medium* (to serve as the *Blank*), respectively. Place the flasks in an ice bath for about 15 minutes. At precise 1-minute intervals add 10.0 mL of *Color reagent*

to the *Standard solution*, the *Test solution*, and the *Blank*, in turn. Immediately after adding the *Color reagent*, remove each flask from the ice bath, insert the stopper, mix, and allow to stand at room temperature for exactly 30 minutes. Sequentially determine the absorbance at 480 nm of the *Standard solution* and the *Test solution* at precise 1-minute intervals, using the *Blank* to set the spectrophotometer to zero. Calculate the quantity, in mg, of  $C_{37}H_{67}NO_{13}$  equivalent dissolved by the formula:

$$0.9CP(A_U / A_S)$$

in which *C* is the concentration, in mg per mL, of USP Erythromycin RS in the *Standard solution*, *P* is the designated content, in  $\mu$ g per mg, of erythromycin in the USP Erythromycin RS, and  $A_U$  and  $A_S$  are the absorbances of the *Test solution* and the *Standard solution*, respectively.

**Tolerances**—Not less than 75% (*Q*) of the labeled amount of  $C_{37}H_{67}NO_{13}$  equivalent is dissolved in 45 minutes.

FOR TABLETS LABELED AS CHEWABLE—

**Arsenomolybdate stock solution**—Dissolve 100 g of ammonium molybdate in 1.7 liters of water in a 2-liter volumetric flask. Slowly add, with mixing, 84 mL of sulfuric acid. Add 12 g of sodium arsenate dissolved in 100 mL of water. Dilute with water to volume, and mix. Store in an amber bottle for 24 hours before using. [NOTE—This solution should not come in contact with rubber.]

**Arsenomolybdate solution**—Use a mixture of water and *Arsenomolybdate stock solution* (2:1). [NOTE—Prepare fresh on the day of use.]

**pH 4.8 Acetate buffer**—Dissolve 133 g of sodium acetate in about 3.5 liters of water. Adjust with glacial acetic acid to a pH of  $4.8 \pm 0.1$ , dilute with water to 4 liters, and mix.

**4.5 M Sulfuric acid**—[NOTE—This reagent is called out in the *Diagram of Dissolution Test Method for Erythromycin Ethylsuccinate Tablets Labeled as Chewable under Automated Methods of Analysis* (16).] Add 1.5 liters of water to a 2-liter volumetric flask, and place the flask in an ice bath. Slowly add, with stirring, 300 mL of sulfuric acid. Allow the solution to cool, dilute with water to volume, and mix. At the time of use, add 0.5 g of sodium dodecyl sulfate to each L.

**Medium:** 0.1 M acetate buffer, pH 5.0; 900 mL.

**Apparatus 2:** 75 rpm.

**Time:** 60 minutes.

Determine the amount of  $C_{37}H_{67}NO_{13}$  dissolved by employing the following method.

**Standard stock solution**—Dissolve an accurately weighed quantity of USP Erythromycin RS in *pH 4.8 Acetate buffer* to obtain a solution having a known concentration of about 0.5 mg per mL.

**Standard solutions**—Transfer 8.0-, 4.0-, and 1.0-mL volumes of the *Standard stock solution* to separate 100-mL volumetric flasks, add 6.0 mL of pH 7.6 phosphate buffer (see *Solutions* under *Reagents, Indicators, and Solutions*) and 6.0 mL of *Medium* to each flask, dilute with *pH 4.8 Acetate buffer* to volume, and mix to obtain solutions having known concentrations of about 40, 20, and 5  $\mu$ g per mL of USP Erythromycin RS, respectively.

**Procedure**—Transfer 6.0 mL of the solution under test to a 50-mL volumetric flask, add 6.0 mL of pH 7.6 phosphate buffer, and heat in boiling water for 30 minutes. Cool to room temperature, and dilute with *pH 4.8 Acetate buffer* to volume. To determine the absorbance values, use an automated analyzer (illustrated in the *Diagram of Dissolution Test Method for Erythromycin Ethylsuccinate Tablets Labeled as Chewable under Automated Methods of Analysis* (16)) consisting of a liquid sampler; a proportioning pump; a manifold; and a spectrophotometer equipped with matched flow cells, suitable recording devices, and analysis capability at 660 nm. Adjust the system until a steady baseline is achieved. Start the sampler, and conduct determinations at a rate of about 40 to 60 per hour with a 3:1 (sample/wash)

ratio. [NOTE—Adjust the analyzer flow rates if necessary to optimize system performance.] Determine the amount of  $C_{37}H_{67}NO_{13}$  dissolved from the absorbance values of the *Test solution* and the *Standard solutions*.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_{37}H_{67}NO_{13}$  is dissolved in 60 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Loss on drying** (731)—[NOTE—Chewable Tablets are exempt from this requirement.] Dry about 100 mg in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 4.0% of its weight.

**Water**, Method I (921) (*Chewable Tablets only*): not more than 5.0%.

**Assay**—Proceed with Tablets as directed under *Antibiotics—Microbial Assays* (81), using not less than 4 Tablets, accurately counted, blended for  $4 \pm 1$  minutes in a high-speed glass blender jar with a sufficient accurately measured volume of methanol to give a stock solution containing the equivalent of not more than 5 mg of erythromycin per mL. Dilute this stock solution quantitatively with *Buffer No. 3* to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

## Erythromycin Ethylsuccinate and Sulfisoxazole Acetyl for Oral Suspension

» Erythromycin Ethylsuccinate and Sulfisoxazole Acetyl for Oral Suspension is a dry mixture of Erythromycin Ethylsuccinate and Sulfisoxazole Acetyl with one or more suitable buffers, colors, flavors, surfactants, and suspending agents. It contains the equivalent of not less than 90.0 percent and not more than 120.0 percent of the labeled amount of erythromycin ( $C_{37}H_{67}NO_{13}$ ) and the equivalent of not less than 90.0 percent and not more than 115.0 percent of the labeled amount of sulfisoxazole ( $C_{11}H_{13}N_3O_3S$ ).

NOTE—Where Erythromycin Ethylsuccinate and Sulfisoxazole Acetyl for Oral Suspension is prescribed, without reference to the quantity of erythromycin or sulfisoxazole contained therein, a product containing 40 mg of erythromycin and 120 mg of sulfisoxazole per mL when constituted as directed in the labeling shall be dispensed.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Erythromycin RS

USP Erythromycin Ethylsuccinate RS

USP Sulfisoxazole Acetyl RS

**Identification**—To a quantity of the Erythromycin Ethylsuccinate and Sulfisoxazole Acetyl for Oral Suspension add a volume of methanol sufficient to yield a solution having a concentration equivalent to about 2.5 mg of erythromycin per mL. Shake this mixture by mechanical means for about 30 minutes. Centrifuge a portion of this mixture, and use the clear supernatant as the test solution. Prepare a solution of USP Erythromycin Ethylsuccinate RS in methanol containing about 3 mg per mL (*Standard solution A*). Prepare a solution of USP Sulfisoxazole Acetyl RS in methanol containing about 8.7 mg per mL (*Standard solution B*). Apply separately 10  $\mu$ L each of the test solution and the two Standard solutions to a suitable thin-layer chromatographic plate (see

*Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture, and allow to dry. Place the plate in an unlined chromatographic chamber, and develop the chromatograms in a solvent system consisting of a mixture of methanol and chloroform (85:15) until the solvent front has moved about 9 cm. Remove the plate from the chamber, mark the solvent front, and allow the solvent to evaporate. Spray the plate with a mixture of dehydrated alcohol, *p*-methoxybenzaldehyde, and sulfuric acid (90:5:5). Heat the plate at 100° for 10 minutes, and examine the chromatograms, in which the erythromycin and succinic acid moieties appear as black-to-purple spots and the sulfisoxazole acetyl appears as a yellow spot: the  $R_f$  values of the principal black-to-purple spots obtained from the test solution correspond to those obtained from *Standard solution A*; and the  $R_f$  value of the principal yellow spot obtained from the test solution corresponds to that obtained from *Standard solution B*.

**Uniformity of dosage units** (905)—

FOR SOLID PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements for *Content Uniformity* with respect to erythromycin and sulfisoxazole.

**Deliverable volume** (698): meets the requirements.

**pH** (791): between 5.0 and 7.2, in the suspension constituted as directed in the labeling.

**Loss on drying** (731): Dry about 100 mg in a capillary-stoppered bottle in vacuum at 60° for 3 hours: it loses not more than 1.0% of its weight.

**Assay for erythromycin**—Constitute Erythromycin Ethylsuccinate and Sulfisoxazole Acetyl for Oral Suspension as directed in the labeling, and allow to stand for 1 hour. Gently shake the suspension, transfer 5.0 mL to a high-speed blender jar containing 195.0 mL of methanol, and blend for  $4 \pm 1$  minutes. Proceed as directed under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of this stock test solution diluted quantitatively and stepwise with *Buffer No. 3* to yield a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard (1.0  $\mu$ g of erythromycin per mL).

**Assay for sulfisoxazole**—

**Mobile solvent**—Mix 40 volumes of acetonitrile and 60 volumes of water. The acetonitrile concentration may be varied to meet system suitability requirements and to provide a suitable elution time for sulfisoxazole acetyl. Pass the solution through a membrane filter having a 1- $\mu$ m or finer porosity.

**Internal standard solution**—Prepare a solution of benzanilide in acetonitrile having a concentration of about 0.33 mg per mL. Pass the solution through a membrane filter having a 1- $\mu$ m or finer porosity.

**Standard preparation**—Prepare a solution of USP Sulfisoxazole Acetyl RS in *Internal standard solution* having a known concentration of about 1 mg per mL.

**Assay preparation**—Constitute Erythromycin Ethylsuccinate and Sulfisoxazole Acetyl for Oral Suspension as directed in the labeling, and allow to stand for 1 hour. Gently shake the suspension, transfer to a 125-mL separator an accurately measured volume of it, equivalent to about 600 mg of sulfisoxazole, and extract with three 75-mL portions of chloroform. Collect the chloroform extracts in a 250-mL volumetric flask, dilute with chloroform to volume, and mix. Pass a portion of this solution through a membrane filter having a 1- $\mu$ m or finer porosity. Pipet 4 mL of the filtrate into a glass-stoppered, 25-mL conical flask, and evaporate with the aid of a current of dry air to dryness. Add 10.0 mL of *Internal standard solution*, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 1.2 mL per minute. Chromatograph replicate injections of the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution fac-

tor between sulfoxazole acetyl and benzanilide is not less than 3.0.

**Procedure**—Separately inject equal volumes (about 5  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of sulfoxazole ( $C_{11}H_{13}N_3O_3S$ ) in each mL of the constituted suspension taken by the formula:

$$(267.31/309.35)(625C/V)(R_U / R_S)$$

in which 267.31 and 309.35 are the molecular weights of sulfoxazole and sulfoxazole acetyl, respectively; C is the concentration, in mg, of USP Sulfoxazole Acetyl RS in each mL of the *Standard preparation*; V is the volume, in mL of constituted suspension taken; and  $R_U$  and  $R_S$  are the ratios of peak responses of sulfoxazole acetyl peak to benzanilide peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

### Sterile Erythromycin Gluceptate

$C_{37}H_{67}NO_{13} \cdot C_7H_{14}O_8$  960.11

Erythromycin monoglucuheptonate (salt).

Erythromycin gluceptate (1:1) (salt). [23067-13-2].

» Sterile Erythromycin Gluceptate is erythromycin gluceptate suitable for parenteral use. It has a potency equivalent to not less than 600  $\mu$ g of erythromycin ( $C_{37}H_{67}NO_{13}$ ) per mg, calculated on the anhydrous basis. In addition, where packaged for dispensing, it contains the equivalent of not less than 90.0 percent and not more than 115.0 percent of the labeled amount of erythromycin ( $C_{37}H_{67}NO_{13}$ ).

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* (1).

**USP Reference standards** (11)—

USP Endotoxin RS

USP Erythromycin RS

USP Erythromycin Gluceptate RS

**Identification, Infrared Absorption** (197M).

**Bacterial endotoxins** (85)—It contains not more than 1.0 USP Endotoxin Unit per mg of erythromycin.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** (791): between 6.0 and 8.0, in a solution containing 25 mg per mL.

**Water, Method I** (921): not more than 5.0%.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Other requirements**—Where packaged for dispensing it meets the requirements for *Uniformity of Dosage Units* (905) and *Constituted Solutions and Labeling* under *Injections* (1).

**Assay**—Proceed as directed for erythromycin under *Antibiotics—Microbial Assays* (81), using an accurately weighed quantity of Sterile Erythromycin Gluceptate dissolved in methanol to yield a solution containing the equivalent of about 10 mg of erythromycin per mL. Dilute this solution quantitatively with 9 volumes of *Buffer No. 3* to obtain a stock solution containing the equivalent of about 1 mg of erythromycin per mL. Where it is packaged for dispensing, constitute Sterile Erythromycin Gluceptate as directed in the labeling. Withdraw all of the withdrawable contents where

the package is represented as being a single-dose container; or where the labeling specifies the amount of potency in a given volume of the resultant preparation, withdraw an accurately measured volume. Dilute quantitatively with *Buffer No. 3* to obtain a stock solution having a convenient concentration. Dilute a portion of the stock solution quantitatively with *Buffer No. 3* to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

### Erythromycin Lactobionate for Injection

$C_{37}H_{67}NO_{13} \cdot C_{12}H_{22}O_{12}$  1092.22

Erythromycin mono(4-O- $\beta$ -D-galactopyranosyl-D-gluconate) (salt).

Erythromycin lactobionate (1:1) (salt) [3847-29-8].

» Erythromycin Lactobionate for Injection is a sterile, dry mixture of erythromycin lactobionate and a suitable preservative. It contains the equivalent of not less than 90.0 percent and not more than 120.0 percent of the labeled amount of erythromycin ( $C_{37}H_{67}NO_{13}$ ).

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* (1).

**USP Reference standards** (11)—

USP Endotoxin RS

USP Erythromycin RS

USP Erythromycin Lactobionate RS

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* (1).

**Identification, Infrared Absorption** (197M): the specimen and the Reference Standard being previously dried in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours.

**Bacterial endotoxins** (85)—It contains not more than 1.0 USP Endotoxin Unit per mg of erythromycin.

**pH** (791): between 6.5 and 7.5, in a solution containing the equivalent of 50 mg of erythromycin per mL.

**Water, Method I** (921): not more than 5.0%.

**Particulate matter** (788): meets the requirements for small-volume injections when the constituted solution is diluted with filtered water to a concentration of not more than 5 mg of erythromycin base per mL before the test is performed.

**Heavy metals, Method II** (231): 0.005%.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—Proceed as directed for erythromycin under *Antibiotics—Microbial Assays* (81), using Erythromycin Lactobionate for Injection constituted as directed in the labeling. Withdraw all of the withdrawable contents where the package is represented as being a single-dose container; or, where the labeling specifies the amount of erythromycin equivalent in a given volume of the resultant preparation, withdraw an accurately measured volume. Dilute quantitatively with water to obtain a stock solution containing the equivalent of about 10 mg of erythromycin per mL. Dilute this stock solution quantitatively with *Buffer No. 3* to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

## Sterile Erythromycin Lactobionate

» Sterile Erythromycin Lactobionate has a potency equivalent to not less than 525 µg of erythromycin ( $C_{37}H_{67}NO_{13}$ ) per mg, calculated on the anhydrous basis. In addition, where packaged for dispensing, it contains the equivalent of not less than 90.0 percent and not more than 120.0 percent of the labeled amount of erythromycin ( $C_{37}H_{67}NO_{13}$ ).

**Packaging and storage**—Preserve in Containers for Sterile Solids as described under *Injections* (1).

**USP Reference standards** (11)—

USP Endotoxin RS

USP Erythromycin RS

USP Erythromycin Lactobionate RS

**Identification, Infrared Absorption** (197M): the specimen and the Reference Standard being previously dried in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours.

**Bacterial endotoxins** (85)—It contains not more than 1.0 USP Endotoxin Unit per mg of erythromycin.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** (791): between 6.5 and 7.5, in a solution containing the equivalent of 50 mg of erythromycin per mL.

**Water, Method I** (921): not more than 5.0%.

**Particulate matter** (788): meets the requirements for small-volume injections when it is diluted with filtered water to a concentration of not more than 5 mg of erythromycin per mL before the test is performed.

**Residue on ignition** (281): not more than 2.0%, the charred residue being moistened with 2 mL of nitric acid and 5 drops of sulfuric acid.

**Heavy metals, Method II** (231): 0.005%.

**Other requirements**—Where packaged for dispensing, it meets the requirements for *Uniformity of Dosage Units* (905) and for *Constituted Solutions and Labeling* under *Injections* (1).

**Assay**—

*Standard preparation*—Prepare as directed for erythromycin under *Antibiotics—Microbial Assays* (81).

*Assay preparation 1*—Dissolve an accurately weighed quantity of Sterile Erythromycin Lactobionate quantitatively in methanol to obtain a stock solution containing the equivalent of about 10 mg of erythromycin per mL. Dilute this stock solution quantitatively with *Buffer No. 3* (see *Media and Diluents* under *Antibiotics—Microbial Assays* (81)) to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

*Assay preparation 2* (where it is packaged for dispensing and is represented as being in a single-dose container)—Constitute Sterile Erythromycin Lactobionate in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and dilute quantitatively with *Buffer No. 3* to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

*Assay preparation 3* (where the label states the quantity of erythromycin in a given volume of constituted solution)—Constitute 1 container of Sterile Erythromycin Lactobionate in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Dilute an accurately measured volume of the constituted solution quantitatively with *Buffer No. 3* to obtain a *Test Dilution* hav-

ing a concentration assumed to be equal to the median dose level of the Standard.

*Procedure*—Proceed as directed for erythromycin under *Antibiotics—Microbial Assays* (81).

## Erythromycin Stearate

$C_{37}H_{67}NO_{13} \cdot C_{18}H_{36}O_2$  1018.40

Erythromycin octadecanoate (salt).

Erythromycin stearate (salt). [643-22-1].

» Erythromycin Stearate is the stearic acid salt of Erythromycin, with an excess of Stearic Acid. The sum of the percentages of erythromycin A, erythromycin B, and erythromycin C is not less than 55.0 percent, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Erythromycin RS

USP Erythromycin B RS

USP Erythromycin C RS

USP Erythromycin Related Compound N RS

*N*-demethylethromycin A.

$C_{36}H_{65}NO_{13}$  719.91

USP Erythromycin Stearate RS

**Identification, Infrared Absorption** (197M).

**Crystallinity** (695): meets the requirements.

**Water, Method I** (921): not more than 4.0%, 20 mL of methanol containing 10% of imidazole being used in place of methanol in the titration vessel.

**Residue on ignition** (281): not more than 1.0%, the charred residue being moistened with 2 mL of nitric acid and 5 drops of sulfuric acid.

**Related compounds**—Use the chromatograms of the *Assay preparation* and *Standard preparation 2* as obtained in the *Assay*.

Calculate the percentage of each related compound having the greatest response, other than erythromycin A, erythromycin B, erythromycin C, erythromycin A enol ether, and pseudoerythromycin A enol ether (retention time relative to erythromycin A peak is about 1.5), in the portion of Erythromycin Stearate taken by the formula:

$$30(C_{S2}P/W)(r_i / r_{S2})$$

in which  $C_{S2}$  is the concentration, in mg per mL, of USP Erythromycin RS in *Standard preparation 2*;  $P$  is the designated percentage of erythromycin A in USP Erythromycin RS;  $W$  is the quantity, in mg, of Erythromycin Stearate taken to prepare the *Assay preparation*;  $r_i$  is the peak response of each related compound, other than erythromycin A, erythromycin B, erythromycin C, erythromycin A enol ether, and pseudoerythromycin A enol ether, observed in the chromatogram obtained from the *Assay preparation*; and  $r_{S2}$  is the erythromycin A peak response in the chromatogram obtained from *Standard preparation 2*; not more than 3.0% of any individual related compound is found.

Calculate the percentage of erythromycin A enol ether in the portion of Erythromycin Stearate taken by the formula:

$$(30 / 11)(C_{S2}P / W)(r_E / r_{S2})$$

in which 11 is the response factor for erythromycin A enol ether in relation to that of erythromycin A;  $r_E$  is the peak response of the erythromycin A enol ether observed in the chromatogram obtained from the *Assay preparation*; and the other terms are as defined above: not more than 3.0% of erythromycin A enol ether is found.

Calculate the percentage of pseudoerythromycin A enol ether in the portion of Erythromycin Stearate taken by the formula:

$$(30 / 6.6)(C_{S2}P / W)(r_p / r_{S2})$$

in which 6.6 is the response factor for pseudoerythromycin A enol ether in relation to that of erythromycin A;  $r_p$  is the peak response of the pseudoerythromycin A enol ether (retention time relative to the erythromycin A peak is about 1.5) observed in the chromatogram obtained from the *Assay preparation*; and the other terms are as defined above: not more than 3.0% of pseudoerythromycin A enol ether is found.

#### Assay—

**pH 8.0 Buffer**—Prepare a solution of dibasic potassium phosphate (2 in 100), and adjust with phosphoric acid to a pH of 8.0.

**pH 9.0 Buffer**—Prepare a solution of dibasic potassium phosphate (3.5 in 100), and adjust with potassium hydroxide TS or diluted phosphoric acid (1 in 10), as appropriate, to a pH of 9.0.

**pH 3.5 Buffer**—Adjust 20 mL of pH 8.0 Buffer with phosphoric acid to a pH of 3.5.

**Mobile phase**—Mix 50 mL of pH 9.0 Buffer with 400 mL of water, add 175 mL of tertiary butyl alcohol and 30 mL of acetonitrile, dilute with water to 1000 mL, and mix. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**NOTE**—Use the following solutions promptly, or within 1 day if stored in a refrigerator.

**Standard preparation 1**—Transfer about 40 mg of USP Erythromycin RS, accurately weighed, to a conical flask, add 5.0 mL of methanol, and swirl to dissolve. Add 5.0 mL of pH 8.0 Buffer, and mix.

**Standard preparation 2**—Transfer about 6 mg each of USP Erythromycin RS, USP Erythromycin B RS, USP Erythromycin C RS, and USP Erythromycin Related Compound N RS, all accurately weighed, to a 50-mL conical flask, add 15.0 mL of methanol, and swirl to dissolve. Add 15.0 mL of pH 8.0 Buffer, and mix.

**Erythromycin A enol ether solution**—Dissolve about 5 mg of USP Erythromycin RS in 1 mL of methanol. Add 5 mL of pH 3.5 Buffer, mix, and allow to stand for about 30 minutes.

**Assay preparation**—Transfer about 165 mg of Erythromycin Stearate, accurately weighed, to a 100-mL conical flask, add 15.0 mL of methanol, and swirl to dissolve. Add 15.0 mL of pH 8.0 Buffer, and mix. Allow the resulting suspension to settle, and pass a portion of the supernatant through a filter having a 0.2- $\mu$ m or finer porosity. Use the clear filtrate.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L21 (1000 Å) and is maintained at a constant temperature of about 70°. The flow rate is about 2 mL per minute. Chromatograph *Standard preparation 2*, and record the peak responses as directed for *Procedure*: the order of elution of the components is erythromycin related compound N, erythromycin C, erythromycin A, and erythromycin B; and the resolution,  $R$ , between erythromycin related compound N and erythromycin C is not less than 0.8 and between erythromycin related compound N and erythromycin A not less than 5.5. Chromatograph the *Erythromycin A enol ether solution*, and adjust the duration of chromatography to include the erythromycin A enol ether peak, which has a retention time of about 4.3 to 4.7 times that of erythromycin A. Chromatograph *Standard preparation 1*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 100  $\mu$ L) of *Standard preparation 1*, *Standard preparation 2*,

and the *Assay preparation* into the chromatograph; record the chromatograms for a period of time that is adequate to include the erythromycin A enol ether peak, if present; and measure the areas of the peak responses. Calculate the percentage of erythromycin A in the portion of Erythromycin Stearate taken by the formula:

$$30(C_{S1}P / W)(r_U / r_{S1})$$

in which  $C_{S1}$  is the concentration, in mg per mL, of USP Erythromycin RS in *Standard preparation 1*;  $P$  is the designated percentage of erythromycin A in USP Erythromycin RS;  $W$  is the quantity, in mg, of Erythromycin Stearate taken to prepare the *Assay preparation*; and  $r_U$  and  $r_{S1}$  are the erythromycin A peak responses in the chromatograms obtained from the *Assay preparation* and *Standard preparation 1*, respectively.

Calculate the percentage of erythromycin B and erythromycin C in the portion of Erythromycin Stearate taken by the formula:

$$30(C_{S2}P / W)(r_U / r_{S2})$$

in which  $C_S$  is the concentration, in mg per mL, of the relevant USP Reference Standard in *Standard preparation 2*;  $P$  is the designated percentage of erythromycin B or erythromycin C in the relevant USP Reference Standard;  $W$  is the quantity, in mg, of Erythromycin Stearate taken to prepare the *Assay preparation*; and  $r_U$  and  $r_{S2}$  are the peak responses of the relevant analyte in the chromatograms obtained from the *Assay preparation* and *Standard preparation 2*, respectively. The percentage of erythromycin B is not more than 12.0%; and the percentage of erythromycin C is not more than 5.0%.

## Erythromycin Stearate Tablets

» Erythromycin Stearate Tablets contain the equivalent of not less than 90.0 percent and not more than 120.0 percent of the labeled amount of erythromycin ( $C_{37}H_{67}NO_{13}$ ).

**Packaging and storage**—Preserve in tight containers.

#### USP Reference standards (11)—

USP Erythromycin RS

USP Erythromycin Stearate RS

**Identification**—To a quantity of powdered Tablets add a volume of methanol sufficient to yield a solution containing the equivalent of about 5 mg of erythromycin per mL. Shake this mixture by mechanical means for about 30 minutes. Centrifuge a portion of this mixture, and use the clear supernatant as the test solution. Prepare a Standard solution of USP Erythromycin Stearate RS in methanol containing about 8 mg per mL. Apply separately 20  $\mu$ L each of the test solution and the Standard solution to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture, and allow to dry. Place the plate in an unlined chromatographic chamber, and develop the chromatograms in a solvent system consisting of a mixture of methanol and chloroform (85:15) until the solvent front has moved about 9 cm. Remove the plate from the chamber, mark the solvent front, and allow the solvent to evaporate. Spray the plate with a methanolic solution of 2',7'-dichlorofluorescein (1 in 500), and examine the plate under long-wavelength UV light: the  $R_f$  values of the principal fluorescent spots obtained from the test solution correspond to those obtained from the Standard solution. Then spray the plate with a mixture of dehydrated alcohol, *p*-methoxybenzaldehyde, and sulfuric acid (90:5:5). Heat the plate at 100° for 10 minutes, and

examine the chromatograms, in which the erythromycin appears as a black-to-purple spot: the  $R_f$  value of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution.

#### Dissolution <711>—

**Medium:** 0.05 M pH 6.8 phosphate buffer (see under *Solutions* in the section *Reagents, Indicators, and Solutions*); 900 mL.

**Apparatus 2:** 100 rpm.

**Time:** 120 minutes.

**Stock standard solution**—Dissolve an accurately weighed quantity of USP Erythromycin RS in methanol to obtain a solution containing about 14 mg per mL. Dilute quantitatively with water, and mix to obtain a solution having a known concentration of about 0.56 mg of USP Erythromycin RS per mL.

**Working standard solution**—On the day of use, dilute 25.0 mL of *Stock standard solution* with water to 50.0 mL, and mix.

**Test solution**—After 120 minutes, withdraw a portion of the solution under test, filter, and dilute with *Medium*, if necessary, to obtain a solution having an estimated concentration of about 0.28 mg of erythromycin per mL.

**Procedure**—Transfer 5.0-mL portions of the *Working standard solution* to two 25-mL volumetric flasks, one of which serves as a working standard blank. Similarly, transfer 5.0-mL portions of the *Test solution* to two 25-mL volumetric flasks, one of which serves as a blank for that *Test solution*. To each of the flasks designated as a blank add 2.0 mL of 0.5 N sulfuric acid and to the remaining flasks add 2.0 mL of water. Allow to stand for 5 minutes with intermittent swirling. To all flasks add 15.0 mL of 0.25 N sodium hydroxide, dilute with *Medium* to volume, and mix. Heat the flasks in a water bath at  $60 \pm 0.5^\circ$  for 5 minutes, and allow to cool. Using a suitable spectrophotometer, determine the absorbance of each solution, corrected for its blank solution, at the wavelength of maximum absorbance at about 236 nm. Determine the amount of  $C_{37}H_{67}NO_{13}$  dissolved from the *Test solution* in comparison with the solution obtained from the *Working standard solution*.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_{37}H_{67}NO_{13}$  is dissolved in 120 minutes.

**Uniformity of dosage units** <905>: meet the requirements.

**Loss on drying** <731>—Dry about 100 mg of powdered Tablets in a capillary-stoppered bottle in vacuum at  $60^\circ$  for 3 hours: it loses not more than 5.0% of its weight.

**Assay**—Proceed with Tablets as directed in the Assay under *Erythromycin Tablets*.

## Escitalopram Oxalate

$C_{20}H_{21}FN_2O \cdot C_2H_2O_4$  414.43  
S-(+)-5-Isobenzofurancarboxamide, 1-[3-(dimethylamino)propyl]-1-(4-fluorophenyl)-1,3-dihydro-, oxalate;  
S-(+)-1-[3-(Dimethylamino)propyl]-1-(p-fluorophenyl)-5-phthalanocarboxamide oxalate [219861-08-2].

#### DEFINITION

Escitalopram Oxalate contains NLT 98.0% and NMT 102.0% of escitalopram oxalate ( $C_{20}H_{21}FN_2O \cdot C_2H_2O_4$ ), calculated on the anhydrous basis.

#### IDENTIFICATION

- A. INFRARED ABSORPTION** <197K>
- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

#### ASSAY

##### PROCEDURE

**Buffer:** 3.4 g/L of monobasic potassium phosphate in water. Adjust with phosphoric acid or sodium hydroxide solution to a pH of 3.0 prior to final dilution.

**Solution A:** Acetonitrile and *Buffer* (10:90)

**Solution B:** Acetonitrile and *Buffer* (65:35)

**Mobile phase:** See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)	Flow Rate (mL/min)
0	95	5	1
35	65	35	1
45	0	100	1
45.1	0	100	2
60	0	100	2
60.1	95	5	1
68	95	5	1

[NOTE—The gradient was established on an HPLC system with a dwell volume of approximately 1.6 mL. The injection time can be adjusted relative to the start of a run to accommodate changes in dwell volume from one HPLC system to another to achieve the separation described.]

**System suitability solution:** 2 µg/mL each of USP Escitalopram Oxalate RS and USP Citalopram Related Compound D RS in *Solution A*

**Standard solution:** 0.5 mg/mL of USP Escitalopram Oxalate RS in *Solution A*

**Sample solution:** 0.5 mg/mL of Escitalopram Oxalate in *Solution A*

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 237 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L1

**Column temperature:**  $45^\circ$

**Flow rate:** See *Table 1*.

**Injection volume:** 20 µL

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

#### Suitability requirements

**Resolution:** NLT 1.5 between escitalopram and citalopram related compound D, *System suitability solution*

**Tailing factor:** 0.8–3, *Standard solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of escitalopram oxalate ( $C_{20}H_{21}FN_2O \cdot C_2H_2O_4$ ) in the portion of Escitalopram Oxalate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$C_U$  = concentration of the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the anhydrous basis

**IMPURITIES**

- **RESIDUE ON IGNITION** (281): NMT 0.1%
- **HEAVY METALS**, Method II (231): NMT 20 ppm
- **ENANTIOMERIC PURITY**

**Buffer:** Dissolve 6.8 g of monobasic potassium phosphate in 250 mL of water, add 150 mL of 0.2 N sodium hydroxide, adjust with phosphoric acid or sodium hydroxide solution to a pH of 7.0, and dilute with water to 1 L.

**Mobile phase:** Acetonitrile and Buffer (3:17)

**System suitability solution:** 125 µg/mL each of USP R-Citalopram Oxalate RS and USP Escitalopram Oxalate RS in Mobile phase

**Sample solution:** 125 µg/mL of Escitalopram Oxalate in Mobile phase

**Chromatographic system**

(See Chromatography (621), System Suitability.)

**Mode:** LC

**Detector:** UV 240 nm

**Column:** 4.6-mm × 15-cm; 5-µm packing L57

**Column temperature:** 30°

**Flow rate:** 0.6 mL/min

**Injection volume:** 15 µL

**System suitability**

**Sample:** System suitability solution

**Suitability requirements**

**Resolution:** NLT 1.3 between R-citalopram and escitalopram

**Tailing factor:** 0.8–2.5 for escitalopram

**Analysis**

**Sample:** Sample solution

Calculate the percentage of R-citalopram oxalate in the portion of Escitalopram Oxalate taken:

$$\text{Result} = (r_U/r_S) \times 100$$

$r_U$  = peak response of R-citalopram from the Sample solution

$r_S$  = peak response of escitalopram from the Sample solution

**Acceptance criteria:** NMT 3.0%

**Change to read:**• **ORGANIC IMPURITIES**

**Buffer, Solution A, Solution B, Mobile phase, System suitability solution, Standard solution, Sample solution, and Chromatographic system:** Proceed as directed in the Assay.

**System suitability**

**Samples:** System suitability solution and Standard solution

## Escitalopram Tablets

### DEFINITION

Escitalopram Tablets contain an amount of escitalopram oxalate equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of  $C_{20}H_{21}FN_2O$ .

### IDENTIFICATION

- The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

**Buffer:** 1.5 g of anhydrous sodium acetate and 0.4 mL of glacial acetic acid in 1 L of water. Adjust with 1 M sodium hydroxide to a pH of 5.2.

**Mobile phase:** Methanol, acetonitrile, and *Buffer* (33:7:60)

**System suitability solution:** 6.2 µg/mL of USP Citalopram Hydrobromide RS (equivalent to 5 µg/mL of citalopram) and 1 µg/mL of USP Citalopram Related Compound C RS in *Mobile phase*

**Standard solution:** 0.62 mg/mL of USP Citalopram Hydrobromide RS in *Mobile phase* (equivalent to 0.5 mg/mL of citalopram)

**Sample solution:** Transfer 10 Tablets to a suitable volumetric flask, add *Buffer* to 10% of the final volume, and shake vigorously for 10 min. Add methanol to 50% of the final volume, shake for 1 additional min, sonicate for 10 min, and dilute with *Mobile phase* to volume to obtain a solution having a concentration of about 0.5 mg/mL of escitalopram.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 239 nm

**Column:** 4.6-mm × 10-cm; 3-µm packing L1

**Column temperature:** 45°

**Flow rate:** 1 mL/min

**Injection size:** 10 µL

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

#### Suitability requirements

**Resolution:** NLT 3.0 between citalopram and citalopram related compound C, *System suitability solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of the labeled amount of  $C_{20}H_{21}FN_2O$  in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of the *Sample solution* (mg/mL)

$M_{r1}$  = molecular weight of citalopram, 324.39

$M_{r2}$  = molecular weight of citalopram hydrobromide, 405.30

Acceptance criteria: 90.0–110.0%

### PERFORMANCE TESTS

#### DISSOLUTION <711>

**Medium:** 0.1 N hydrochloric acid; 900 mL

**Apparatus 2:** 50 rpm

**Time:** 30 min

**Standard solution 1:** 3 µg/mL of USP Citalopram Hydrobromide RS in *Medium*

**Standard solution 2:** 15 µg/mL of USP Citalopram Hydrobromide RS in *Medium*

**Standard solution 3:** 30 µg/mL of USP Citalopram Hydrobromide RS in *Medium*

**Sample solution:** Pass a portion of the solution through a suitable filter of 0.45-µm pore size.

#### Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

**Mode:** UV-Vis

**Analytical wavelength:** 239 nm

**Path length:** 0.5 cm

**Blank:** *Medium*

#### System suitability

**Samples:** *Standard solution 1*, *Standard solution 2*, and *Standard solution 3*

#### Suitability requirements

**Correlation coefficient:** NLT 0.995, determined using *Standard solution 1*, *Standard solution 2*, and *Standard solution 3*, three replicates of each solution

**Relative standard deviation:** NMT 2.0%, determined using *Standard solution 3*, six replicates

#### Analysis

**Samples:** *Standard solution 1*, *Standard solution 2*, *Standard solution 3*, and *Sample solution*

Generate a calibration curve using the data from *Standard solution 1*, *Standard solution 2*, and *Standard solution 3*. Determine the concentration,  $C_U$ , in mg/mL, of citalopram hydrobromide in the *Sample solution* using the calibration curve.

Calculate the percentage of citalopram dissolved:

$$\text{Result} = (C_U/L) \times (M_{r1}/M_{r2}) \times V \times 100$$

$C_U$  = concentration of citalopram hydrobromide in the *Sample solution* (mg/mL)

$L$  = label claim (mg/Tablet)

$M_{r1}$  = molecular weight of citalopram, 324.39

$M_{r2}$  = molecular weight of citalopram hydrobromide, 405.30

$V$  = volume of *Medium*, 900 mL

**Tolerances:** NLT 80% (Q) of the labeled amount of escitalopram is dissolved.

- UNIFORMITY OF DOSAGE UNITS <905>:** Meets the requirements

### IMPURITIES

#### ORGANIC IMPURITIES

**Buffer, Mobile phase, System suitability solution, Standard solution, Sample solution, and Chromatographic system:** Proceed as directed in the *Assay*.

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

#### Suitability requirements

**Resolution:** NLT 3.0 between citalopram and citalopram related compound C, *System suitability solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times (M_{r1}/M_{r2}) \times 100$$

- $r_U$  = peak response of each impurity from the *Sample solution*  
 $r_S$  = peak response of citalopram from the *Standard solution*  
 $C_S$  = concentration of USP Citalopram Hydrobromide RS in the *Standard solution*  
 $C_U$  = nominal concentration of the *Sample solution*  
 $F$  = relative response factor (see *Impurity Table 1*)  
 $M_{r1}$  = molecular weight of citalopram, 324.39  
 $M_{r2}$  = molecular weight of citalopram hydrobromide, 405.30

**Acceptance criteria**

**Individual impurities:** See *Impurity Table 1*.

**Total impurities:** NMT 2.0%

**Impurity Table 1**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Citalopram related compound A <sup>a</sup>	0.33	0.84	0.3

Citalopram related compound E <sup>d</sup> (citalopram <i>N</i> -oxide)	1.4	0.94	0.2
Any other individual, unspecified impurity	—	1.0	0.1

<sup>a</sup> 1-(3-Dimethylaminopropyl)-1-(4-fluorophenyl)-1,3-dihydroisobenzofuran-5-carboxamide.

<sup>b</sup> 1-(3-Dimethylaminopropyl)-1-(4-fluorophenyl)-3-hydroxy-1,3-dihydroisobenzofuran-5-carbonitrile; 3-hydroxycitalopram.

<sup>c</sup> 3-(3-Dimethylaminopropyl)-3-(4-fluorophenyl)-6-cyano-1(3*H*)-isobenzofuranone.

<sup>d</sup> 1-(3-Dimethylaminopropyl)-1-(4-fluorophenyl)-1,3-dihydroisobenzofuran-5-carbonitrile-*N*-oxide.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at controlled room temperature.
- **USP REFERENCE STANDARDS (11)**
  - USP Citalopram Hydrobromide RS
  - USP Citalopram Related Compound C RS
  - 3-(3-Dimethylaminopropyl)-3-(4-fluorophenyl)-6-cyano-1(3*H*)-isobenzofuranone.
  - $C_{20}H_{19}FN_2O_2$  338.22

**Esmolol Hydrochloride**

$C_{16}H_{25}NO_4 \cdot HCl$  331.83  
 Benzenepropanoic acid, 4-[2-hydroxy-3-[(1-methylethyl)amino]propoxy]-, methyl ester, hydrochloride, ( $\pm$ );  
 ( $\pm$ )-Methyl *p*-[2-hydroxy-3-(isopropylamino)propoxy]hydrocinnamate hydrochloride [81161-17-3].

**DEFINITION**

Esmolol Hydrochloride contains NLT 98.0% and NMT 102.0% of  $C_{16}H_{25}NO_4 \cdot HCl$ , calculated on the anhydrous basis.

**IDENTIFICATION**

- **A. INFRARED ABSORPTION (197K)**
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY**• **PROCEDURE**

**Buffer:** Dissolve 3.0 g of potassium dihydrogen phosphate in 650 mL of water.

**Mobile phase:** Acetonitrile, methanol, and *Buffer* (15:20:65)

**System suitability stock solution:** 1 mg/mL of esmolol hydrochloride prepared as follows. Transfer a suitable quantity of USP Esmolol Hydrochloride RS to a suitable volumetric flask, and dissolve in and dilute with 1 N hydrochloric acid to volume. Allow the contents to stand for at least 30 min. [NOTE—This results in the partial degradation of the esmolol resulting in the production of esmolol free acid (see *System suitability* for relative retention time).]

**System suitability solution:** 0.2 mg/mL in water from *System suitability stock solution*

**Standard solution:** 200  $\mu$ g/mL of USP Esmolol Hydrochloride RS in water

**Sample solution:** 200  $\mu$ g/mL of Esmolol Hydrochloride in water

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 222 nm

**Column:** 3.9-mm  $\times$  30-cm; 10- $\mu$ m; L1 packing

**Flow rate:** 2 mL/min

**Injection size:** 20  $\mu$ L

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for esmolol free acid and esmolol are 0.41 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 4.0 between esmolol free acid and esmolol, *System suitability solution*

**Tailing factor:** NMT 2.0 for the esmolol peak, *System suitability solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of esmolol hydrochloride ( $C_{16}H_{25}NO_4 \cdot HCl$ ) in the portion of the sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of esmolol from the *Sample solution*  
 $r_S$  = peak response of esmolol from the *Standard solution*

$C_S$  = concentration of USP Esmolol Hydrochloride RS in the *Standard solution* (mg/mL)  
 $C_U$  = concentration of Esmolol Hydrochloride in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the anhydrous basis

**IMPURITIES**• **HEAVY METALS** (231)

**Standard solution:** Into a 50-mL color-comparison tube pipet 2 mL of *Standard Lead Solution* (20 µg of Pb), and dilute with water to 25 mL. Using a pH meter or short-range pH indicator paper as external indicator, adjust with 1 N acetic acid to a pH between 3.0 and 4.0, dilute with water to 40 mL, and mix.

**Sample solution:** Into a 50-mL color-comparison tube dissolve 1 g of the sample in water, and dilute with water to 25 mL. Using a pH meter or short-range pH indicator paper as external indicator, adjust with 1 N acetic acid to a pH between 3.0 and 4.0, dilute with water to 40 mL, and mix.

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

To each of the tubes add 10 mL of hydrogen sulfide TS, and mix. Allow to stand for 2 min. View downward into the tube over a white background.

**Acceptance criteria:** The color of the *Sample solution* is not darker than the color of the *Standard solution* (NMT 20 ppm).

• **RESIDUE ON IGNITION** (281): NMT 0.1%• **ORGANIC IMPURITIES**

**Buffer and System suitability solution:** Prepare as directed in the *Assay*.

**Solution A:** Methanol

**Solution B:** Prepare as directed for *Mobile phase* in the *Assay*.

**Mobile phase:** See *Table 1*.

**Table 1**

Time (min)	Solution A (%)	Solution B (%)
0	0	100
20	0	100
25	25	75
35	25	75
36	0	100
40	0	100

**Sample solution:** 1 mg/mL of Esmolol Hydrochloride in water

**Chromatographic system:** Prepare as directed in the *Assay*.

**Column temperature:** 30°

**System suitability**

**Sample:** *System suitability solution*

**Suitability requirements**

**Resolution:** NLT 4.0 between esmolol free acid and esmolol

**Tailing factor:** NMT 2.0 for the esmolol peak

**Analysis**

**Sample:** *Sample solution*

Calculate the percentage of each individual impurity in the portion of Esmolol Hydrochloride taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response of each individual impurity from the *Sample solution*

$r_T$  = sum of all the peak responses from the *Sample solution*

**Acceptance criteria:** See *Table 2*.

**Table 2**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Esmolol free acid <sup>a</sup>	0.43	0.3
Esmolol aminopentanol analog <sup>b</sup>	0.84	0.10

5-Methoxy-2-[(*S*)-[(4-methoxy-3,5-dimethyl-2-pyridyl)methyl]sulfinyl]benzimidazole, magnesium salt (2:1), trihydrate [217087-09-7].

**DEFINITION**

Esomeprazole Magnesium contains NLT 98.0% and NMT 102.0% of C<sub>34</sub>H<sub>36</sub>MgN<sub>6</sub>O<sub>6</sub>S<sub>2</sub>, calculated on the anhydrous basis.

**IDENTIFICATION**

• **A. INFRARED ABSORPTION** (197K)

• **B.** The *Sample solution*, prepared and tested as directed in the test for *Content of Magnesium*, exhibits a significant absorption at 285.2 nm.

**ASSAY****• PROCEDURE**

**Solution A:** Dissolve 0.725 g of monobasic sodium phosphate and 4.472 g of anhydrous dibasic sodium phosphate in 300 mL of water, and dilute with water to 1000 mL. Dilute 250 mL of this solution with water to 1000 mL. If necessary, adjust with phosphoric acid to a pH of 7.6.

**Solution B:** Mix 11 mL of 0.25 M tribasic sodium phosphate with 22 mL of 0.5 M dibasic sodium phosphate, and dilute with water to 100 mL.

**Mobile phase:** Acetonitrile and *Solution A* (7:13)

**Standard solution:** Transfer 10 mg of USP Omeprazole RS to a 200-mL volumetric flask, and dissolve in about 10 mL of methanol. Add 10 mL of *Solution B*, and dilute with water to volume. [NOTE—This solution contains 0.05 mg/mL of omeprazole.]

**Sample solution:** Transfer 10 mg of Esomeprazole Magnesium to a 200-mL volumetric flask, and dissolve in about 10 mL of methanol. Add 10 mL of *Solution B*, and dilute with water to volume. [NOTE—This solution contains 0.05 mg/mL of esomeprazole magnesium.]

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 280 nm

**Column:** 4.0-mm × 12.5-cm or a 4.6-mm × 15-cm; 5-μm packing L7. [NOTE—Alternatively, a 3.9-mm × 15-cm column that contains 4-μm packing L1 may be used.]

**Flow rate:** 1 mL/min

**Injection size:** 20 μL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Column efficiency:** NLT 2000 theoretical plates

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of C<sub>34</sub>H<sub>36</sub>MgN<sub>6</sub>O<sub>5</sub>S<sub>2</sub> in the portion of Esomeprazole Magnesium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times [M_{r1}/(2 \times M_{r2})] \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of omeprazole in the *Standard solution* (mg/mL)

$C_U$  = concentration of Esomeprazole Magnesium in the *Sample solution* (mg/mL)

$M_{r1}$  = molecular weight of esomeprazole magnesium, 713.12

$M_{r2}$  = molecular weight of omeprazole, 345.42

**Acceptance criteria:** 98.0%–102.0% on the anhydrous basis

**OTHER COMPONENTS****• CONTENT OF MAGNESIUM**

**Lanthanum solution:** Transfer 58.7 g of lanthanum oxide into a 1000-mL volumetric flask, wet the substance with some water, and dissolve by cautious addition of 250 mL of hydrochloric acid in 20- to 30-mL portions, cooling between the additions. Add water while stirring, cool to room temperature, and dilute with water to volume. [NOTE—Store the solution in a plastic bottle.]

**Standard stock solution:** 1000 μg/mL of magnesium in water, from a commercially prepared atomic absorption standard solution. [NOTE—Store the solution in a plastic bottle.]

**Standard solution A:** Transfer 10.0 mL of *Standard stock solution* to a 500-mL volumetric flask, add 50 mL of 1 N hydrochloric acid, and dilute with water to volume. Transfer 20.0 mL of this solution to a 200-mL volumet-

ric flask, and dilute with water to volume. [NOTE—This solution contains 2 μg/mL of magnesium.]

**Standard solution B:** Combine 5.0 mL of *Standard solution A* and 4.0 mL of *Lanthanum solution*, and dilute with water to 100.0 mL (0.1 μg/mL).

**Standard solution C:** Combine 10.0 mL of *Standard solution A* and 4.0 mL of *Lanthanum solution*, and dilute with water to 100.0 mL (0.2 μg/mL).

**Standard solution D:** Combine 15.0 mL of *Standard solution A* and 4.0 mL of *Lanthanum solution*, and dilute with water to 100.0 mL (0.3 μg/mL).

**Standard solution E:** Combine 20.0 mL of *Standard solution A* and 4.0 mL of *Lanthanum solution*, and dilute with water to 100.0 mL (0.4 μg/mL).

**Standard solution F:** Combine 25.0 mL of *Standard solution A* and 4.0 mL of *Lanthanum solution*, and dilute with water to 100.0 mL (0.5 μg/mL). [NOTE—Concentrations of the *Standard solutions* and the *Sample solution* may be modified to fit the linear or working range of the instrument. When using instruments with a linear calibration graph, the number of *Standard solutions* can be reduced.]

**Blank solution:** Transfer 4.0 mL of *Lanthanum solution* to a 100-mL volumetric flask, and dilute with water to volume.

**Sample solution:** Transfer 250 mg of Esomeprazole Magnesium to a 100-mL volumetric flask, add 20 mL of 1 N hydrochloric acid, swirl until dissolved, and dilute with water to volume. Allow to stand for 30 min. Transfer 10.0 mL of this solution to a 200-mL volumetric flask, and dilute with water to volume. Transfer 10.0 mL of the solution to another 100-mL volumetric flask, add 4.0 mL of *Lanthanum solution*, and dilute with water to volume.

**Spectrometric conditions**

(See *Spectrophotometry and Light-Scattering* <851>.)

**Mode:** Atomic absorption spectrophotometer

**Flame:** Air-acetylene

**Analytical wavelength:** 285.2 nm

**Analysis**

**Samples:** *Standard solution B*, *Standard solution C*, *Standard solution D*, *Standard solution E*, *Standard solution F*, *Blank solution*, and *Sample solution*

Determine the concentration,  $C_s$ , in μg/mL, of magnesium in the *Sample solution* using the calibration graph.

Calculate the percentage of magnesium in the portion of Esomeprazole Magnesium taken:

$$\text{Result} = (C_S/C_U) \times (100/(100 - F)) \times 100$$

$C_S$  = content of magnesium in the *Sample solution* as calculated above (μg/mL)

$C_U$  = concentration of Esomeprazole Magnesium in the *Sample solution* (μg/mL)

$F$  = content of water in Esomeprazole Magnesium, as determined in *Specific Tests, Water Determination* (%)

**Acceptance criteria:** 3.30%–3.55%, on anhydrous basis

**IMPURITIES****Organic Impurities****• PROCEDURE 1**

**Solution A:** 0.725 g of monobasic sodium phosphate and 4.472 g of anhydrous dibasic sodium phosphate in 300 mL of water, and dilute with water to 1000 mL. Dilute 250 mL of this solution with water to 1000 mL. If necessary, adjust with phosphoric acid to a pH of 7.6.

**Mobile phase:** Acetonitrile and *Solution A* (11:29).

[NOTE—To improve the resolution, the composition may be changed to 1:3, if necessary.]

**System suitability solution:** 1 mg of USP Omeprazole RS and 1 mg of USP Omeprazole Related Compound A

RS in 25 mL of *Mobile phase*. [NOTE—Omeprazole Related Compound A is omeprazole sulfone.]

**Sample solution:** 4 mg of Esomeprazole Magnesium in 25 mL of *Mobile phase*. [NOTE—Prepare this solution fresh.]

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 280 nm

**Column:** 4.0-mm × 12.5-cm or a 4.6-mm × 15-cm; 5-μm packing L7. [NOTE— Alternatively, a 3.9-mm × 15-cm column that contains 4-μm packing L1 may be used.]

**Flow rate:** 0.8–1 mL/min

**Injection size:** 50 μL

#### System suitability

**Sample:** *System suitability solution*

[NOTE— For relative retention times, see *Impurity Table 1*.]

#### Suitability requirements

**Resolution:** NLT 3 between omeprazole related compound A and omeprazole

#### Analysis

**Sample:** *Sample solution*

Record the chromatogram for at least 4.5 times the retention time of the omeprazole peak, and measure the peak responses. Identify the impurities based on the retention times shown in *Impurity Table 1*.

Calculate the percentage of any individual impurity in the portion of Esomeprazole Magnesium taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response for each impurity

$r_T$  = sum of all peak responses

#### Acceptance criteria

**Individual impurities:** See *Impurity Table 1*.

**Total impurities:** NMT 0.5%

**Impurity Table 1**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Omeprazole <i>N</i> -oxide <sup>a</sup>	0.45	0.1
Omeprazole sulfone <sup>b</sup> (related compound A)	0.8	0.2
Any other individual impurities	—	0.1
Omeprazole	1.0	—

<sup>a</sup> 4-Methoxy-2-[[[(*RS*)-(5-methoxy-1*H*-benzimidazol-2-yl)sulfinyl]methyl]-3,5-dimethylpyridine 1-oxide.

<sup>b</sup> 5-Methoxy-2-[[[(4-methoxy-3,5-dimethylpyridin-2-yl)methyl]sulfonyl]-1*H*-benzimidazole.

#### • PROCEDURE 2: ENANTIOMERIC PURITY

**Solution A:** Mix 70 mL of 1 M monobasic sodium phosphate with 20 mL of 0.5 M dibasic sodium phosphate, and dilute with water to 1000 mL. Dilute 250 mL of this solution with water to 1000 mL.

**Diluent:** Mix 11 mL of 0.25 M tribasic sodium phosphate with 22 mL of 0.5 M dibasic sodium phosphate, and dilute with water to 1000 mL.

**Mobile phase:** Acetonitrile and *Solution A* (3:17)

**System suitability solution:** 2 mg of USP Omeprazole RS in 10 mL of *Diluent*. Dilute 1.0 mL of this solution with *Diluent* to 50 mL.

**Sample solution:** 40 mg of Esomeprazole Magnesium in 5 mL of methanol, and dilute with *Diluent* to 25 mL. Dilute 1 mL of this solution with *Diluent* to 50 mL.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 302 nm

**Column:** 4.0-mm × 10-cm; packing L41

**Flow rate:** 0.6 mL/min

**Injection size:** 20 μL

#### System suitability

**Sample:** *System suitability solution*

#### Suitability requirements

**Resolution:** NLT 3 between the enantiomer peaks.

[NOTE— The elution order is the *R*-enantiomer, followed by the esomeprazole peak, which is the *S*-enantiomer.]

#### Analysis

**Sample:** *Sample solution*

Calculate the percentage of the *R*-enantiomer in the portion of Esomeprazole Magnesium taken:

$$\text{Result} = (r_U/r_S) \times 100$$

$r_U$  = peak response for the *R*-enantiomer

$r_S$  = sum of the peak responses for esomeprazole and *R*-enantiomer

**Acceptance criteria:** NMT 0.2% of the *R*-enantiomer

#### SPECIFIC TESTS

• **WATER DETERMINATION, Method I** <921>: 6.0%–8.0%

#### • COLOR OF SOLUTION

**Sample solution:** 20 mg/mL of Esomeprazole Magnesium in methanol

**Analysis:** Determine the absorbance of this solution at 440 nm, in 1-cm cells, using methanol as the blank.

**Acceptance criteria:** NMT 0.2

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers, protected from light. Store at room temperature.

#### • USP REFERENCE STANDARDS <11>

USP Esomeprazole Magnesium RS

USP Omeprazole RS

USP Omeprazole Related Compound A RS

Omeprazole sulfone, 5-methoxy-2-[[[(4-methoxy-3,5-dimethylpyridin-2-yl)methyl]sulfonyl]-1*H*-benzimidazole.

C<sub>17</sub>H<sub>19</sub>N<sub>3</sub>O<sub>4</sub>S 361.42 [CAS-88546-55-8]

## Esomeprazole Magnesium Delayed-Release Capsules

#### DEFINITION

Esomeprazole Magnesium Delayed-Release Capsules contain an amount of Esomeprazole Magnesium equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of esomeprazole (C<sub>17</sub>H<sub>19</sub>N<sub>3</sub>O<sub>3</sub>S).

#### IDENTIFICATION

##### • A.

**Buffer:** Prepare a pH 6.0 phosphate buffer containing 26.6 g/L of dibasic sodium phosphate dihydrate and 55.2 g/L of monobasic sodium phosphate monohydrate in water.

**Diluent:** Prepare a pH 11.0 diluent as follows. Dissolve 5.24 g of tribasic sodium phosphate dodecahydrate in water. Add 110 mL of 0.5 M dibasic sodium phosphate solution, and dilute with water to 1000 mL.

**Mobile phase:** Transfer 150 mL of acetonitrile and 85 mL of the *Buffer* to a 1000-mL volumetric flask, and dilute with water to volume.

**Standard stock solution:** Prepare a solution containing 0.2 mg/mL of USP Omeprazole RS by dissolving a suitable amount first in alcohol, using 20% of the final volume, and then diluting with *Diluent* to volume.

**Standard solution:** 0.02 mg/mL of USP Omeprazole RS from the *Standard stock solution* in water

**Sample stock solution:** Transfer a portion of the Capsule content, equivalent to 20 mg of esomeprazole, to a 200-mL volumetric flask, add 120 mL of *Diluent*, and shake for 20 min to dissolve the pellets. Sonicate for a few min, if needed, to completely dissolve. Add 40 mL of alcohol, and sonicate for a few min. Cool, and dilute with *Diluent* to volume. Pass a portion of the solution through a filter of 1- $\mu$ m pore size.

**Sample solution:** 0.01 mg/mL of esomeprazole from the *Sample stock solution* in water

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 302 nm

**Column:** 4.0-mm  $\times$  10-cm; 5- $\mu$ m packing L41

**Flow rate:** 1 mL/min

**Injection size:** 20  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

[NOTE—The elution order is the *R*-enantiomer, followed by the esomeprazole peak, which is the *S*-enantiomer.]

#### Suitability requirements

**Resolution:** NLT 1.0 between the enantiomer peaks

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the ratio of the retention times of the esomeprazole peak in the *Standard solution* and the *Sample solution*:

$$\text{Result} = (t_U/t_S)$$

$t_U$  = retention time of esomeprazole from the *Sample solution*

$t_S$  = retention time of esomeprazole from the *Standard solution*

**Acceptance criteria:** 0.98–1.02

### ASSAY

#### • PROCEDURE

**Buffer:** Prepare a pH 7.3 phosphate buffer by mixing 10.5 mL of 1.0 M monobasic sodium phosphate buffer and 60 mL of 0.5 M dibasic sodium phosphate buffer, and diluting with water to 1000 mL.

**Diluent:** Prepare as directed in *Identification test A*.

**Mobile phase:** Mix 350 mL of acetonitrile and 500 mL of the *Buffer*. Dilute with water to 1000 mL.

**Standard solution:** Transfer 10 mg of USP Omeprazole RS to a 250-mL volumetric flask, and dissolve in about 10 mL of methanol. Add 40 mL of *Diluent*, and dilute with water to volume. This solution contains 0.04 mg/mL of USP Omeprazole RS.

**Sample stock solution:** Mix the contents of NLT 20 Capsules. Transfer a portion of the Capsule content, equivalent to 20 mg of esomeprazole, to a 100-mL volumetric flask, add 60 mL of *Diluent*, and shake for 20 min to dissolve the pellets. Sonicate for a few min, if needed, to completely dissolve. Add 20 mL of alcohol, and sonicate for a few min. Cool, and dilute with *Diluent* to volume. Pass a portion of the solution through a filter of 1- $\mu$ m pore size.

**Sample solution:** 0.04 mg/mL of esomeprazole from the *Sample stock solution* in water. Store this solution protected from light.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 302 nm

**Column:** 4.6-mm  $\times$  15-cm; 5- $\mu$ m packing L1

**Flow rate:** 1 mL/min

**Injection size:** 20  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of esomeprazole ( $C_{17}H_{19}N_3O_3S$ ) in the portion of the Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Omeprazole RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of esomeprazole in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

### PERFORMANCE TESTS

#### • DISSOLUTION <711>

**Medium:** 0.1 N hydrochloric acid; 300 mL. After 2 h, continue with a pH 6.8 phosphate buffer as follows. To the vessel, add 700 mL of 0.086 M dibasic sodium phosphate, and adjust with 2 N hydrochloric acid or 2 N sodium, if necessary, to a pH of  $6.8 \pm 0.05$ .

**Apparatus 2:** 100 rpm

**Time:** 30 min in a pH 6.8 phosphate buffer

**Standard solution:** Prepare a solution containing 2 mg/mL of USP Omeprazole RS in alcohol. Dilute this solution with pH 6.8 phosphate buffer to obtain a solution containing ( $L/1000$ ) mg/mL, where  $L$  is the label claim, in mg/Capsule. Immediately add 2.0 mL of 0.25 M sodium hydroxide to 10.0 mL of this solution, and mix. [NOTE—Do not allow the solution to stand before adding the sodium hydroxide solution.]

**Sample solution:** After 30 min in pH 6.8 phosphate buffer, pass a portion of the solution under test through a suitable filter. Transfer 5.0 mL of the filtrate to a suitable glassware containing 1.0 mL of 0.25 M sodium hydroxide. Mix well. Protect from light.

**Buffer, Diluent, Mobile phase, System suitability, and Chromatographic system:** Proceed as directed in the *Assay*.

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of esomeprazole ( $C_{17}H_{19}N_3O_3S$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$L$  = label claim (mg/Capsule)

$V$  = volume of *Medium*, 1000 mL

**Tolerances:** NLT 75% ( $Q$ ) of the labeled amount of esomeprazole ( $C_{17}H_{19}N_3O_3S$ ) is dissolved.

#### • UNIFORMITY OF DOSAGE UNITS <905>: Meet the requirements

### IMPURITIES

#### • ORGANIC IMPURITIES

**Buffer:** Prepare a pH 7.6 phosphate buffer by mixing 5.2 mL of 1.0 M monobasic sodium phosphate buffer and 63 mL of 0.5 M dibasic sodium phosphate buffer, and diluting with water to 1000 mL.

**Solution A:** Mix 100 mL of acetonitrile and 100 mL of the *Buffer*. Dilute with water to 1000 mL.

**Solution B:** Mix 800 mL of acetonitrile and 10 mL of the Buffer. Dilute with water to 1000 mL.

**Mobile phase:** See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
10	80	20
30	0	100
31	100	0
45	100	0

**Diluent:** Prepare as directed in Identification test A.

**System suitability stock solution:** 1 mg/mL each of USP Omeprazole RS and USP Omeprazole Related Compound A RS in methanol

**System suitability solution:** 1 µg/mL each of USP Omeprazole RS and USP Omeprazole Related Compound A RS from System suitability stock solution, in a mixture of Diluent and water (1:4)

**Sample solution:** Transfer a portion of the powdered pellets, from the Capsule content, equivalent to 80–90 mg of esomeprazole, to a 200-mL volumetric flask, add 20 mL of methanol, and shake for 30 s. Add 40 mL of Diluent, shake for 30 s by hand, and sonicate for a few min. Cool, and dilute with water to volume. Pass a portion of the solution through a filter of 0.45-µm pore size. [NOTE—The solution is stable for 3 h if stored protected from light.]

#### Chromatographic system

(See Chromatography <621>, System Suitability.)

**Mode:** LC

**Detector:** UV 302 nm

**Column:** 4.6-mm × 10-cm; 3-µm packing L1

**Flow rate:** 1 mL/min

**Injection size:** 20 µL

#### System suitability

**Sample:** System suitability solution

[NOTE—See Table 2 for the relative retention times.]

#### Suitability requirements

**Resolution:** NLT 2.5 between omeprazole related compound A and omeprazole

#### Analysis

**Sample:** Sample solution

Calculate the percentage of any individual impurity in the portion of the Capsules taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response for each impurity

$r_T$  = sum of all peak responses

**Acceptance criteria:** See Table 2.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Omeprazole sulfone <sup>a</sup>	0.93	0.5
Omeprazole	1.00	—
Any other individual impurity	—	0.2
Total impurities	—	2

<sup>a</sup> Omeprazole related compound A.

#### ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight containers. Store at room temperature.

#### USP REFERENCE STANDARDS <11>

USP Omeprazole RS

USP Omeprazole Related Compound A RS

Omeprazole sulfone; 5-methoxy-2-[[[4-methoxy-3,5-dimethyl-2-pyridinyl)methyl]sulfonyl]-1H-benzimidazole.

**Run time:** 2.5 times the retention time of the estazolam peak

#### System suitability

**Sample:** Standard solution

#### Suitability requirements

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** Standard solution and Sample solution

Calculate the percentage of C<sub>16</sub>H<sub>11</sub>ClN<sub>4</sub> in the portion of Estazolam taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the Sample solution

$r_S$  = peak response from the Standard solution

- $C_s$  = concentration of USP Estazolam RS in the *Standard solution* (mg/mL)  
 $C_u$  = concentration of Estazolam in the *Sample solution* (mg/mL)  
**Acceptance criteria:** 98.0%–102.0% on the dried basis

**IMPURITIES****Inorganic Impurities**

- **RESIDUE ON IGNITION** (281): NMT 0.1%
- **HEAVY METALS**, *Method II* (231): NMT 20 ppm

**SPECIFIC TESTS**

- **LOSS ON DRYING** (731): Dry a sample at 105° for 4 h: it loses NMT 1.0% of its weight.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at controlled room temperature.
- **USP REFERENCE STANDARDS** (11)  
 USP Estazolam RS  
 4*H*-[1,2,4]Triazolo[4,3-*a*][1,4]benzodiazepine, 8-chloro-6-phenyl-  
 8-Chloro-6-phenyl-4*H*-s-triazolo[4,3-*a*]  
 [1,4]benzodiazepine.  
 $C_{16}H_{11}ClN_4$  294.74

**Estazolam Tablets****DEFINITION**

Estazolam Tablets contain an amount of Estazolam equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of estazolam ( $C_{16}H_{11}ClN_4$ ).

**IDENTIFICATION**

- The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY****• PROCEDURE**

**Buffer:** 2.8 g/L of potassium phosphate, monobasic in water. Adjust to a pH of 6.5 with 1 N NaOH.

**Mobile phase:** Acetonitrile, methanol, and *Buffer* (10:35:55)

**Standard solution:** 0.02 mg/mL of USP Estazolam RS in *Mobile phase*

**Sample solution:** 0.02 mg/mL of Estazolam in *Mobile phase*, from NLT 20 finely powdered Tablets. [NOTE—Sonicate for 5 min. Pass a portion through a suitable filter with no glass prefilter.]

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 15-cm; 3-μm packing L11

**Flow rate:** 1 mL/min

**Injection size:** 25 μL

**Run time:** 2.7 times the retention time of the estazolam peak

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{16}H_{11}ClN_4$  in the portion of Tablets taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

$r_u$  = peak response from the *Sample solution*

$r_s$  = peak response from the *Standard solution*

$C_s$  = concentration of USP Estazolam RS in the *Standard solution* (mg/mL)

$C_u$  = nominal concentration of estazolam in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

**PERFORMANCE TESTS****• DISSOLUTION (711)**

**Medium:** Water; 900 mL, deaerated

**Apparatus 2:** 50 rpm

**Time:** 30 min

**Buffer and Mobile phase:** Proceed as directed in the *Assay*.

**Standard stock solution:** 0.1 mg/mL of USP Estazolam RS in methanol

**Standard solution:** Dilute the *Standard stock solution* with *Medium* to obtain a final concentration of about (L/1000) mg/mL, where L is the Tablet label claim in mg.

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45-μm pore size, discarding the first few mL.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

Proceed as directed in the *Assay*, except for the injection size and run time.

**Injection size:** 100 μL

**Run time:** 1.6 times the retention time of estazolam

**System suitability:** Proceed as directed in the *Assay*.

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of estazolam dissolved:

$$\text{Result} = (r_u/r_s) \times (C_s/L) \times V \times 100$$

$r_u$  = peak response of estazolam from the *Sample solution*

$r_s$  = peak response of estazolam from the *Standard solution*

$C_s$  = concentration of USP Estazolam RS in the *Standard solution* (mg/mL)

L = Tablet label claim (mg)

V = volume of *Medium* (mL), 900

**Tolerances:** NLT 80% (Q) of the labeled amount of estazolam is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

**IMPURITIES****Organic Impurities****• PROCEDURE**

**Buffer, Mobile phase, Standard solution, and Sample solution:** Proceed as directed in the *Assay*.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

Proceed as directed in the *Assay*, except for the injection size and run time.

**Injection size:** 25 μL for the *Standard solution* and 50 μL for the *Sample solution*

**Run time:** 4 times the retention time of estazolam

**System suitability:** Proceed as directed in the *Assay*.

**Analysis**

**Sample:** *Sample solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_u/r_T) \times 100$$

$r_u$  = peak response of each individual impurity from the *Sample solution*

$r_T$  = sum of the responses of all peaks from the *Sample solution*

**Acceptance criteria**

Any individual unspecified degradation product: NMT 0.5%

Total impurities: NMT 1.0%

**ADDITIONAL REQUIREMENTS**

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at controlled room temperature.

• **USP REFERENCE STANDARDS** (11)

USP Estazolam RS

4*H*-[1,2,4]Triazolo[4,3-*a*][1,4]benzodiazepine, 8-chloro-6-phenyl-

8-Chloro-6-phenyl-4*H*-s-triazolo[4,3-*a*][1,4]benzodiazepine.

C<sub>16</sub>H<sub>11</sub>ClN<sub>4</sub> 294.74

**Estradiol**

C<sub>18</sub>H<sub>24</sub>O<sub>2</sub> 272.38

Estra-1,3,5(10)-triene-3,17-diol, (17 $\beta$ )-.

Estra-1,3,5(10)-triene-3,17 $\beta$ -diol [50-28-2].

Hemihydrate 281.39 [35380-71-3].

» Estradiol contains not less than 97.0 percent and not more than 103.0 percent of C<sub>18</sub>H<sub>24</sub>O<sub>2</sub>, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

**Labeling**—The hemihydrate form is so labeled.

**USP Reference standards** (11)—

USP Estradiol RS

USP Estrone RS

**Identification**—

**A:** Infrared Absorption (197M).

**B:** Ultraviolet Absorption (197U)—

*Solution:* 50  $\mu$ g per mL.

*Medium:* alcohol.

Absorptivities at 280 nm, calculated on the anhydrous basis, do not differ by more than 3.0%.

**Melting range**, *Class I* (741): between 173° and 179°.

[NOTE—Dry over silica gel for not less than 16 hours prior to testing.]

**Specific rotation** (781S): between +76° and +83°.

*Test solution:* 10 mg per mL, in dioxane.

**Water**, *Method I* (921): not more than 3.5%.

**Chromatographic purity**—[NOTE—Make all solutions fresh daily.]

*Mobile phase*—Prepare a filtered and degassed mixture of 2,2,4-trimethylpentane, *n*-butyl chloride, and methanol (45:4:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Diluting solution*—Prepare a filtered and degassed mixture of *n*-butyl chloride and methanol (5:1).

*Test solution*—Transfer about 70 mg of Estradiol, accurately weighed, to a 10-mL volumetric flask, dissolve in *Diluting solution*, shake vigorously to aid dissolution, dilute with *Diluting solution* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L3. The flow rate is about 2 mL per minute. Chromatograph the *Test solution*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between estradiol and any impurity is not less than 1.0; the column efficiency is not less than 800 theoretical plates; the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Inject a volume (about 10  $\mu$ L) of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each impurity in the portion of Estradiol taken by the formula:

$$100(r_i / r_s)$$

in which *r<sub>i</sub>* is the peak response for each impurity; and *r<sub>s</sub>* is the sum of the responses of all the peaks: not more than 0.5% of any individual impurity is found; and not more than 1.0% of total impurities is found.

**Assay**—

*Mobile phase*—Prepare a filtered and degassed mixture of acetonitrile and water (55:45). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Internal standard solution*—Transfer about 300 mg of ethylparaben to a 500-mL volumetric flask, add methanol to volume, and mix.

*Standard preparation*—Dissolve accurately weighed quantities of USP Estradiol RS and USP Estrone RS in methanol to obtain a solution containing 0.40 mg and 0.24 mg, respectively, in each mL. Pipet 10 mL of this solution and 5 mL of the *Internal standard solution* into a 200-mL volumetric flask. Add 100 mL of methanol, dilute with water to volume, and mix to obtain a solution having a known concentration of about 20  $\mu$ g of USP Estradiol RS per mL.

*Assay preparation*—Transfer about 100 mg of Estradiol, accurately weighed, to a 250-mL volumetric flask, add methanol to volume, and mix. Transfer 10.0 mL of this solution to a 200-mL volumetric flask, add 5.0 mL of *Internal standard solution* and 100 mL of methanol, dilute with water to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 205-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.7 for the internal standard, about 1.3 for estrone, and 1.0 for estradiol; the resolution, *R*, between the analyte and estrone is not less than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 25  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of C<sub>18</sub>H<sub>24</sub>O<sub>2</sub> in the portion of Estradiol taken by the formula:

$$5C(R_U / R_S)$$

in which *C* is the concentration, in  $\mu$ g per mL, of USP Estradiol RS in the *Standard preparation*; and *R<sub>U</sub>* and *R<sub>S</sub>* are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Estradiol Benzoate

$C_{25}H_{28}O_3$  376.49

Estra-1,3,5(10)-triene-3,17-diol, (17 $\beta$ )-, 3-benzoate.

Estradiol 3-benzoate [50-50-0].

» Estradiol Benzoate contains not less than 97.0 percent and not more than 103.0 percent of  $C_{25}H_{28}O_3$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**Labeling**—Label it to indicate that it is for veterinary use only. Label it to indicate whether it is coarse grade or fine grade.

**USP Reference standards** (11)—

USP Estradiol Benzoate RS

**Identification**—

A: Infrared Absorption (197K).

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Specific rotation** (781S): between +57.0° and +63.0°.

*Test solution*: 10 mg per mL, previously dried, in dioxane.

**Loss on drying**—Dry it at 100° to 105° for 3 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.2%, a 250-mg specimen being used.

**Particle size** (786)—

*Suspension fluid*—To a mixture of glycerin and water (60:40, w/w) add a sufficient quantity of polysorbate 20 to obtain a solution having a concentration of 125  $\mu$ L of polysorbate 20 per 100 g of solution.

*Test suspension*—Saturate the *Suspension fluid* by adding about 100 mg of fine Estradiol Benzoate per 100 g of *Suspension fluid*, and sonicate for about 10 minutes. Filter the resulting suspension through a 0.45- $\mu$ m nylon filter. To the filtrate, add about 50 mg of Estradiol Benzoate per mL of the filtered, saturated *Suspension fluid*, and mix on a vortex mixer until dispersed (about 1 minute).

*Procedure*—Using a suitable multi-wavelength particle size analyzer,<sup>1</sup> determine the particle size distribution within the *Test suspension*, analyzing the results in the range from 5  $\mu$ m to 600  $\mu$ m. Not more than 50% of the particles are less than 30  $\mu$ m, and not less than 90% of the particles are less than 450  $\mu$ m. The mean diameter of fine grade Estradiol Benzoate is not more than 100  $\mu$ m, and the mean diameter of coarse grade Estradiol Benzoate is not less than 100  $\mu$ m and not more than 200  $\mu$ m.

**Limit of methanol and dichloromethane**—

*Internal standard solution*—Prepare a solution that contains 0.1% (v/v) ethyl acetate in pyridine. [NOTE—Inject 2  $\mu$ L of the pyridine into the *Chromatographic system* to confirm that it contains no peaks that would interfere with the analysis.]

*Standard solution*—Transfer 50  $\mu$ L of methylene chloride and 50  $\mu$ L of methanol to a 50-mL volumetric flask, and dilute with *Internal standard solution* to volume. Mix well.

<sup>1</sup>A suitable multi-wavelength particle size analyzer is model LS 13 320, obtained from Beckman Coulter, Inc., Fullerton, CA, or equivalent.

*Test solution*—Accurately weigh about 100 mg of Estradiol Benzoate into a low-actinic glass vial. Dissolve in 1.0 mL of *Internal standard solution*, and mix.

*Chromatographic system* (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and a 3.2-mm  $\times$  1.8-m stainless steel column packed with support S3. The injection port temperature is maintained at about 165°, the detector temperature is maintained at about 165°, and the column temperature is maintained at 140° for 20 minutes, programmed thereafter to rise to 250° at a rate of 40° per minute, and then maintained at 250° for 15 minutes. Helium is used as the carrier gas, flowing at a rate of about 40 mL per minute. Chromatograph the *Internal standard solution* and the *Standard solution*, and record the peak responses as directed for *Procedure*: the order of elution is methanol, methylene chloride, and ethyl acetate; no peaks are present within the *Internal standard solution* that would interfere with the integration of either the methanol or the methylene chloride peak; baseline resolution is achieved among the internal standard peak and residual solvent peaks; and the standard deviation for replicate injections of the *Standard solution* is not more than 5.0%.

*Procedure*—Separately inject equal volumes (about 2.0  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak areas for methanol, methylene chloride, and ethyl acetate. Calculate the percentage (w/w) of each residual solvent in the portion of Estradiol Benzoate taken by the formula:

$$100C_i(D_i / C_u)(R_u / R_s)$$

in which  $C_i$  is the concentration, in  $\mu$ L per mL, of the solvent of interest in the *Standard solution*;  $D_i$  is the density, in g per mL, of the solvent of interest;  $C_u$  is the concentration, in mg per mL, of Estradiol Benzoate in the *Test solution*; and  $R_u$  and  $R_s$  are the peak response ratios of the solvent of interest to the internal standard obtained from the *Test solution* and the *Standard solution*, respectively: the sum of the percentages of methanol and methylene chloride is not more than 0.20%.

**Chromatographic purity**—

*Adsorbent*: a 0.25-mm layer of chromatographic silica gel mixture.

*Developing solvent system*—Use a mixture of toluene and ethyl acetate (70:30).

*Ammonium molybdate solution*—Dissolve 5 g of ammonium molybdate in 100 mL of 10% (v/v) sulfuric acid.

*Diluent*—Prepare a solution containing a mixture of methylene chloride and alcohol (2:1).

*Standard solution*—Dissolve an accurately weighed quantity of USP Estradiol Benzoate RS in *Diluent* to obtain a solution containing about 5 mg per mL.

*Test solution 1*—Dissolve an accurately weighed quantity of Estradiol Benzoate in *Diluent* to obtain a solution containing about 5 mg per mL.

*Test solution 2*—Transfer 200  $\mu$ L of *Test solution 1* to a 10-mL volumetric flask, and dilute with *Diluent* to volume.

*Procedure* (see *Thin-Layer Chromatography* under *Chromatography* (621))—Apply to the thin-layer chromatographic plate 20- $\mu$ L aliquots of the *Standard solution* and *Test solution 1* and 20- $\mu$ L, 15- $\mu$ L, 10- $\mu$ L, 5- $\mu$ L, and 2- $\mu$ L aliquots of *Test solution 2*; the volumetric series of *Test solution 2* represents 2.0%, 1.5%, 1.0%, 0.5% and 0.2% of the concentration of Estradiol Benzoate within the *Test solution 1* spot. Allow the spots to dry, and develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate from the plate. Spray the plate thoroughly with the *Ammonium molybdate solution*, and dry. Heat the plate

in a drying oven for about 10 minutes at about 115°. Calculate the relative retardation factor,  $R_{rel}$ , (relative to estradiol benzoate) of all spots within the lanes for *Test solution 1* and *Test solution 2*. Possible estradiol benzoate impurities include, but are not limited to, estradiol [estra-1,3,5(10)-triene-3,17b-diol], 17 $\alpha$ -estradiol benzoate [estra-1,3,5(10)-triene-3,17 $\alpha$ -diol 3-benzoate], and estrone [estra-1,3,5(10)-triene-17-one, 3-hydroxy]; their relative retardation factors,  $R_{rel}$ , are about 0.84, 1.15, and 1.21, respectively. Determine the percentages of each impurity by comparing the intensity of the impurity spots within *Test solution 1* to those of the main spots obtained from the series of *Test solution 2*, ignoring any impurity peak less intense than the main spots found in the *Test solution 2* lane containing 0.2% of the amount of estradiol benzoate of *Test solution 1*. Not more than 1.0% of any individual impurity is found, and not more than 2.0% of total impurities is found.

#### Assay—

**Mobile phase**—Prepare a filtered and degassed mixture of acetonitrile and water (7:3). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**System suitability preparation**—Transfer an accurately weighed quantity of about 20.0 mg each of USP Estradiol Benzoate RS and estradiol 17-acetate into a 100-mL volumetric flask. Add 70 mL of acetonitrile, and sonicate until dissolved. Add 25 mL of water, mix well, and allow to equilibrate to ambient temperature. Dilute with water to volume, and mix.

**Standard preparation**—Transfer an accurately weighed quantity of about 20.0 mg of USP Estradiol Benzoate RS into a 100-mL volumetric flask. Add 70 mL of acetonitrile, and sonicate until dissolved. Add 25 mL of water, mix well, and allow to equilibrate to ambient temperature. Dilute with water to volume, and mix.

**Assay preparation**—Transfer an accurately weighed quantity of about 20.0 mg of Estradiol Benzoate into a 100-mL volumetric flask. Add 70 mL of acetonitrile, and sonicate until dissolved. Add 25 mL of water, mix well, and allow to equilibrate to ambient temperature. Dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 230-nm detector, a 4.6-mm  $\times$  4.5-cm guard column that contains packing L1, and a 4.6-mm  $\times$  25-cm analytical column that contains 5- $\mu$ m packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability preparation* and the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.5 for estradiol 17-acetate and 1.0 for estradiol benzoate; the resolution,  $R$ , between estradiol 17-acetate and estradiol benzoate is not less than 6.0; the column efficiency is not less than 8000 theoretical plates for estradiol benzoate; the tailing factor for estradiol benzoate is not more than 2.0; and, using the *Standard preparation*, the relative standard deviation for replicate injections is not more than 1.5%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{25}H_{28}O_3$  in the portion of Estradiol Benzoate taken by the formula:

$$100C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Estradiol Benzoate RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Estradiol Vaginal Cream

### DEFINITION

Estradiol Vaginal Cream contains NLT 90.0% and NMT 110.0% of the labeled amount of estradiol ( $C_{18}H_{24}O_2$ ) in a suitable cream base.

### IDENTIFICATION

#### • A. THIN-LAYER CHROMATOGRAPHY

**Standard solution:** 0.5 mg/mL of USP Estradiol RS in chloroform

**Sample solution:** Transfer a portion of Vaginal Cream, equivalent to 1 mg of estradiol, to a 150-mL beaker. Add 25 mL of acetonitrile, and gently heat to boiling. Boil for 45 s, and cool to room temperature. Add 25 mL of water, and swirl. Filter with the aid of suction. Transfer the filtrate to a 125-mL separator, add 50 mL of chloroform, and shake. Allow the layers to separate, drain the chloroform layer into a flask, and evaporate in a rotary evaporator to dryness. Dissolve the residue in 2 mL of chloroform.

#### Chromatographic system

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture

**Application volume:** 50  $\mu$ L. Dry the applications with the aid of a stream of nitrogen.

**Developing solvent system:** Toluene and acetone (4:1)

**Spray reagent:** Sulfuric acid and methanol (1:1)

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Spray the plate with a fine mist of *Spray reagent*, then heat the plate for 3–5 min at 90°. Observe the plate under visible light.

**Acceptance criteria:** The  $R_f$  value and color of the principal spot of the *Sample solution* correspond to those of the *Standard solution*.

### ASSAY

#### • PROCEDURE

**Mobile phase:** Acetonitrile and water (1:1)

**Internal standard solution:** 60  $\mu$ g/mL of dydrogesterone in acetonitrile. Use a freshly prepared solution.

**Standard solution:** 10  $\mu$ g/mL of USP Estradiol RS and 7.5  $\mu$ g/mL of USP Estrone RS, prepared as follows.

Transfer 10 mg of USP Estradiol RS and 7.5 mg of USP Estrone RS to a 1000-mL volumetric flask. Add 50.0 mL of *Internal standard solution* and 450 mL of acetonitrile, and mix. Dilute with water to volume.

**Sample solution:** Nominally 10  $\mu$ g/mL of estradiol, prepared as follows. Transfer a portion of Vaginal Cream, equivalent to 0.5 mg of estradiol, to a 150-mL beaker. Add 2.5 mL of *Internal standard solution*, 22.5 mL of acetonitrile, and a few boiling chips. Cover with a watch glass, and heat gently until the Vaginal Cream melts, swirling occasionally. Heat to boiling for about 45 s. Allow to cool to room temperature, add 25.0 mL of water, and mix. Pass first through paper and then through a microdisk filter.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 280 nm

**Column:** 3.9-mm  $\times$  30-cm; packing L1

**Flow rate:** 1 mL/min

**Injection volume:** 50  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for estradiol, estrone, and the internal standard are 1.0, 1.25, and 2.0, respectively.]

**Suitability requirements****Resolution:** NLT 1.9 between estradiol and estrone**Relative standard deviation:** NMT 3.0%**Analysis****Samples:** *Standard solution* and *Sample solution*Calculate the percentage of the labeled amount of estradiol ( $C_{18}H_{24}O_2$ ) in the portion of Vaginal Cream taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

 $R_U$  = peak response ratio of estradiol to the internal standard from the *Sample solution* $R_S$  = peak response ratio of estradiol to the internal standard from the *Standard solution* $C_S$  = concentration of USP Estradiol RS in the *Standard solution* ( $\mu\text{g/mL}$ ) $C_U$  = nominal concentration of estradiol in the *Sample solution* ( $\mu\text{g/mL}$ )**Acceptance criteria:** 90.0%–110.0%**PERFORMANCE TESTS**

- **MINIMUM FILL** <755>: Meets the requirements

**SPECIFIC TESTS**

- **MICROBIAL ENUMERATION TESTS** <61> and **TESTS FOR SPECIFIED MICROORGANISMS** <62>: Meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*
- **PH** <791>: 3.5–6.5

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in collapsible tubes or in tight containers.
- **USP REFERENCE STANDARDS** <11>  
USP Estradiol RS  
USP Estrone RS

---

**Estradiol Vaginal Inserts**

---

**DEFINITION**Estradiol Vaginal Inserts contain NLT 90% and NMT 107% of the labeled amount of estradiol ( $C_{18}H_{24}O_2$ ).**IDENTIFICATION**

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** <201>

[NOTE—When two different concentrations are given for a solution, the lower concentration is for Inserts labeled to contain 0.01 mg of estradiol, and the high value is for Inserts labeled to contain 0.025 mg of estradiol.]

**Standard solution:** 2.5 mg/mL of USP Estradiol RS in absolute alcohol**Sample solution:** Place a number of Inserts, equivalent to 0.38 or 0.95 mg of estradiol, into a vessel. Add 50 mL of isopropyl alcohol, and allow to disintegrate by stirring overnight. Centrifuge the suspension. Evaporate an aliquot of 40 mL of the supernatant to dryness, and dissolve the residue in 3 mL of isopropyl alcohol. Evaporate to dryness, reconstitute with 300  $\mu\text{L}$  of absolute alcohol to obtain a solution containing 1.0 or 2.5 mg/mL of estradiol, and centrifuge.**Adsorbent:** Use a suitable, high-performance thin-layer chromatographic plate.**Application volume:** NLT 5  $\mu\text{L}$  (equivalent to 10  $\mu\text{g}$  of estradiol)**Developing solvent system:** Chloroform and acetone (9:1)**Analysis:** Proceed as directed in the chapter, using the *Developing solvent system* described above. Develop the chromatogram over a path of a minimum of 8 cm, and allow the plate to air-dry. Remove the plate, mark thesolvent front, and allow solvent evaporation as described in the chapter. Heat at 100° for about 15 min. Allow the plate to cool, and then immerse it in a mixture of absolute alcohol and concentrated sulfuric acid (95:5). Remove it immediately, place the plate on absorbing paper, and allow it to air-dry. Heat the plate at 100° until the sulfuric acid has evaporated. Examine under UV light at  $\lambda = 365$  nm.**Acceptance criteria:** The principal spot obtained from the *Sample solution* has the same color and  $R_f$  value as that from the *Standard solution*.

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

**ASSAY**• **PROCEDURE**

[NOTE—When two different concentrations are given for a solution, the lower concentration is for Inserts labeled to contain 0.01 mg of estradiol, and the high value is for Inserts labeled to contain 0.025 mg of estradiol.]

**Mobile phase:** Acetonitrile and water (11:9)**Diluent:** Absolute alcohol and water (1:1)**Estrone standard stock solution:** 0.1 mg/mL of USP Estrone RS in absolute alcohol**Estradiol standard stock solution:** 0.25 mg/mL of USP Estradiol RS in absolute alcohol**System suitability solution:** 0.6 and 2.0  $\mu\text{g/mL}$  of USP Estrone RS and USP Estradiol RS in *Diluent* from *Estrone standard stock solution* and *Estradiol standard stock solution*, respectively**Standard solution:** 1.0 or 2.5  $\mu\text{g/mL}$  of USP Estradiol RS in *Diluent* from *Estradiol standard stock solution***Sample solution:** 1.0 or 2.5  $\mu\text{g/mL}$  of estradiol prepared using 10 Inserts in *Diluent*. Stir the mixture overnight with a magnetic stirrer, shake thoroughly, and centrifuge if necessary.**Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** UV 205 nm**Column:** 3.9-mm  $\times$  30-cm; 4- $\mu\text{m}$  packing L1**Flow rate:** 1 mL/min**Injection size:** 20  $\mu\text{L}$ **System suitability****Sample:** *System suitability solution***Suitability requirements****Resolution:** NLT 2.0 between estradiol and estrone**Relative standard deviation:** NMT 2.0%**Analysis****Samples:** *Standard solution* and *Sample solution*Calculate the percentage of estradiol ( $C_{18}H_{24}O_2$ ) in the portion of Inserts taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 $r_U$  = peak response from the *Sample solution* $r_S$  = peak response from the *Standard solution* $C_S$  = concentration of USP Estradiol RS in the *Standard solution* (mg/mL) $C_U$  = nominal concentration of estradiol in the *Sample solution* (mg/mL)**Acceptance criteria:** 90%–107%**PERFORMANCE TESTS**• **DISSOLUTION** <711>**Medium:** Phosphate buffer pH 4.75  $\pm$  0.05 (100 g of potassium dihydrogen phosphate in 10 L of water, adjusted with 1 N sodium hydroxide to a pH of 4.75  $\pm$  0.05); 500 mL**Apparatus 1:** 40 rpm**Time:** 3, 5, and 10 h**Mobile phase:** Methanol, acetonitrile, and water (27.5:27.5:45)

**Standard stock solution:** 0.1 mg/mL of USP Estradiol RS in absolute alcohol

**Standard solutions:** Quantitatively dilute with water the *Standard stock solution* to obtain solutions with final concentrations equal to approximately 20%, 60%, and 160% of the expected concentration of estradiol in the *Medium* for Inserts containing 0.025 mg, assuming complete dissolution, and approximately 20%, 50%, 150%, and 400% of the expected concentration of estradiol in the *Medium* for Inserts containing 0.01 mg of estradiol, assuming complete dissolution.

**Sample solutions:** Use the solution under test, unfiltered.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** Fluorescence

**Excitation wavelength:** 230 nm

**Emission wavelength:** 310 nm

**Column:** 4.6-mm × 15-cm; 3.5-μm packing L1; or 4.6-mm × 7.5-cm; 5.0-μm packing L1

**Flow rate:** 1 mL/min

**Injection size:** 200 μL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** NMT 1.8

**Relative standard deviation:** NMT 2%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the amount of estradiol (C<sub>18</sub>H<sub>24</sub>O<sub>2</sub>) dissolved:

$$\text{Result} = \{A_n \times V_n + [\sum_{i=1}^{n-1} (\Delta V_{(n-1)} \times A_{(n-1)})]\} / V$$

$A_n$  = percentage of estradiol, at the sample point  $n$  (e.g.,  $A_2$  at the second sampling point)

$V_n$  = volume of *Medium* in the vessel before the sample is taken (mL)

$\Delta V_{(n-1)}$  = volume of sample taken at the sampling point  $(n-1)$

$A_{(n-1)}$  = amount of estradiol (uncorrected) at the sample point  $(n-1)$

$V$  = volume of the medium, 500 mL

**Tolerances:** See *Table 1*.

**Table 1**

Time (h)	Amount Dissolved (%)
3	25–50
5	40–80
10	NLT 80

The percentage of the labeled amount of estradiol dissolved at the specified times conforms to *Acceptance Table 2* in <711>.

#### IMPURITIES

##### • ORGANIC IMPURITIES

[NOTE—When two different concentrations are given for a solution, the lower concentration is for Inserts labeled to contain 0.01 mg of estradiol, and the high value is for Inserts labeled to contain 0.025 mg of estradiol.]

**Solution A:** Acetonitrile

**Solution B:** Water

**Mobile phase:** See *Table 2*.

**Table 2**

Time (min)	Solution A (%)	Solution B (%)
0	16	84

**Table 2** (Continued)

Time (min)	Solution A (%)	Solution B (%)
35	68	32

[NOTE—Before the next injection, run the system at the initial condition until equilibration is achieved.]

**System suitability solution:** 100 μg/mL of USP Estradiol RS, 0.5 μg/mL of USP Estradiol Related Compound B RS, and 0.5 μg/mL of USP Estradiol Related Compound C RS in absolute alcohol

**Sample solution:** Place a number of Inserts into a measured volume of absolute alcohol to obtain a solution having an estradiol concentration of 2.4 or 6.0 μg/mL. Stir for a minimum of 16 h, shake thoroughly, and centrifuge if necessary. Evaporate 10.0 mL of the supernatant to dryness. Dissolve the residue in 1.0 mL of water and add 7.0 mL of a mixture of toluene and acetone (5:2), mix on a whirl mixer, allow to stand for 1 h, and evaporate 5 mL of the organic phase to dryness. The residue is reconstituted in 450 μL of absolute alcohol to obtain a solution containing 38 or 95 μg/mL of estradiol. Centrifuge, and use the supernatant as the *Sample solution*.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 220 nm

**Column:** 4.6-mm × 25-cm; 5-μm packing L1

**Flow rate:** 1 mL/min

**Injection size:** 25 μL

#### System suitability

**Sample:** *System suitability solution*

[NOTE—The relative retention times for estradiol related compound B and estradiol are about 0.96 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 2.0 between estradiol related compound B and estradiol

#### Analysis

**Sample:** *Sample solution*

Calculate the percentage of each impurity in the Inserts taken:

$$\text{Result} = (r_U/r_S) \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_S$  = peak response of estradiol from the *Sample solution*

**Acceptance criteria:** See *Tables 3* and *4*.

Any other individual impurity	—	1.3
Total impurities	—	4.0

<sup>a</sup> 1,3,5(10)-Estratrien-3,17 $\beta$ -diol-6-one.<sup>b</sup> 1,3,5(10),6-Estratetraen-3,17 $\beta$ -diol.**SPECIFIC TESTS**

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total aerobic microbial count does not exceed 100 cfu/g, and the total combined molds and yeasts count does not exceed 10 cfu/g. Inserts meet the requirements of the tests for absence of *Pseudomonas aeruginosa*, *Staphylococcus aureus*, and *Candida albicans*.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in a tight container, and store at controlled room temperature. Do not refrigerate.
- **USP REFERENCE STANDARDS** (11)
  - USP Estradiol RS
  - USP Estradiol Related Compound B RS
  - 6-Dehydroestradiol.
  - USP Estradiol Related Compound C RS
  - 1,3,5(10)-Estratrien-3,17 $\beta$ -diol-6 one.
  - C<sub>18</sub>H<sub>22</sub>O<sub>3</sub>
  - USP Estrone RS

**Estradiol Pellets**

» Estradiol Pellets are sterile pellets composed of Estradiol in compressed form, without the presence of any binder, diluent, or excipient. They contain not less than 97.0 percent and not more than 103.0 percent of C<sub>18</sub>H<sub>24</sub>O<sub>2</sub>.

**Packaging and storage**—Preserve in tight containers, suitable for maintaining sterile contents, that hold 1 Pellet each.

**USP Reference standards** (11)—  
USP Estradiol RS

**Solubility in chloroform**—A solution of 25 mg of Pellets in 10 mL of chloroform is clear and practically free from insoluble residue.

**Weight variation**—Weigh 5 Pellets singly, and calculate the average weight. The average weight is between 95% and 105% of the labeled weight of C<sub>18</sub>H<sub>24</sub>O<sub>2</sub>, and each Pellet weighs between 90% and 110% of the labeled weight of C<sub>18</sub>H<sub>24</sub>O<sub>2</sub>.

**Other requirements**—Pellets meet the requirements under *Estradiol* and under *Sterility Tests* (71).

**Assay**—

**Standard preparation**—Prepare as directed in the Assay under *Estradiol Sterile Suspension*.

**Assay preparation**—Weigh and finely powder not less than 10 Pellets. Transfer a portion of the powder, equivalent to about 100 mg of estradiol, to a suitable container, dissolve in a sufficient quantity of a mixture of equal volumes of alcohol and chloroform to make 5.0 mL, and mix.

**Procedure**—Proceed as directed for *Procedure* in the Assay under *Estradiol Sterile Suspension*. Calculate the quantity, in mg, of C<sub>18</sub>H<sub>24</sub>O<sub>2</sub> in the portion of Pellets taken by the formula:

$$5C(A_U / A_S)$$

in which all terms are as defined therein.

**Delete the following:**

**▲Estradiol Injectable Suspension****DEFINITION**

Estradiol Injectable Suspension is a sterile suspension of Estradiol in Water for Injection. It contains NLT 90.0% and NMT 110.0% of the labeled amount of C<sub>18</sub>H<sub>24</sub>O<sub>2</sub>.

**IDENTIFICATION**• **A. INFRARED ABSORPTION** (197M)

**Sample:** Transfer a volume of well-mixed Injectable Suspension equivalent to 10 mg of estradiol to a flask, render it acid to bromophenol blue TS with dilute hydrochloric acid (1 in 12), and place in an ice bath for 15 min. Filter the acidified suspension with suction through a sintered-glass funnel. Wash the crystals of estradiol so isolated with five successive 5-mL portions of water, and dry the funnel and contents at 105° to constant weight.

**Acceptance criteria:** Meets the requirements.

• **B. MELTING RANGE OR TEMPERATURE, Class I** (741):

**Sample:** Proceed as directed in *Identification* test A. Dry over silica gel for NLT 16 h prior to testing.

**Acceptance criteria:** 173°–179°

**ASSAY**• **PROCEDURE**

[NOTE—The *Standard solution*, *Sample solution*, and the *Blank solution* should be prepared and analyzed concomitantly.]

**Standard stock solution:** 40  $\mu$ g/mL of USP Estradiol RS in methanol

**Standard solution:** Transfer 1.0 mL of the *Standard stock solution* to a glass-stoppered, 16- × 150-mm test tubes, and evaporate with the aid of gentle heat and a current of air to dryness. Using a suitable syringe, add 1.0 mL of iron-phenol TS. Suspend the tube in a vigorously boiling water bath, and mix after heating for 5 min. Remove the tube after heating in the water bath for a total of 35 min, and immediately cool in an ice-water bath. Remove from the ice bath, add 10.0 mL of dilute

sulfuric acid (1 in 3) to obtain a homogeneous solution, and allow to reach room temperature.

**Sample stock solution:** Nominally 40 µg/mL of estradiol, prepared as follows. Transfer an aliquot of well-mixed Injectable Suspension equivalent to 1 mg of estradiol to a 100-mL beaker, and add water, if necessary, to obtain a volume of 5 mL. Add 6 g of purified siliceous earth, mix, and pack the mixture tightly into a 20- × 200-mm chromatographic tube containing in its base a pledget of fine glass wool. Dry-rinse the beaker with 1 g of purified siliceous earth, add the rinsing to the packed column, and wipe out the beaker with a pledget of glass wool used to top the column. Elute the column with 50 mL of ether that previously has been saturated with water, and collect the eluate in a glass-stoppered, 125-mL conical flask. Evaporate with the aid of gentle heat and a current of air to dryness, and add 25.0 mL of methanol to the residue.

**Sample solution:** Transfer 1.0 mL of the *Sample stock solution* to a glass-stoppered, 16- × 150-mm test tubes, and evaporate with the aid of gentle heat and a current of air to dryness. Using a suitable syringe, add 1.0 mL of iron-phenol TS. Suspend the tube in a vigorously boiling water bath, and mix after heating for 5 min. Remove the tube after heating in the water bath for a total of 35 min, and immediately cool in an ice-water bath. Remove from the ice bath, add 10.0 mL of dilute sulfuric acid (1 in 3) to obtain a homogeneous solution, and allow to reach room temperature.

**Blank solution:** Using a suitable syringe, add 1.0 mL of iron-phenol TS to a glass-stoppered, 16- × 150-mm test tubes, and evaporate with the aid of gentle heat and a current of air to dryness. Suspend the tube in a vigorously boiling water bath, and mix after heating for 5 min. Remove the tube after heating in the water bath for a total of 35 min, and immediately cool in an ice-water bath. Remove from the ice bath, add 10.0 mL of dilute sulfuric acid (1 in 3) to obtain a homogeneous solution, and allow to reach room temperature.

#### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

**Mode:** UV-Vis

**Analytical wavelength:** 520 nm

**Cell:** 1 cm

#### Analysis

**Samples:** *Standard solution*, *Sample solution*, and *Blank solution*

Calculate the percentage of estradiol (C<sub>18</sub>H<sub>24</sub>O<sub>2</sub>) in the portion of the Injectable Suspension taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of USP Estradiol RS in the *Standard solution* (µg/mL)

$C_U$  = nominal concentration of the *Sample solution* (µg/mL)

**Acceptance criteria:** 90.0%–110.0%

#### PERFORMANCE TESTS

- **UNIFORMITY OF DOSAGE UNITS** <905>: Meets the requirements

#### SPECIFIC TESTS

- **BACTERIAL ENDOTOXINS TEST** <85>: NMT  $2.5 \times 10^2$  USP Endotoxin Units/mg of estradiol
- **OTHER REQUIREMENTS:** It meets the requirements in *Injections* <1>.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in single-dose or in multiple-dose containers, preferably of Type I glass.
- **USP REFERENCE STANDARDS** <11>
  - USP Endotoxin RS
  - USP Estradiol RS▲<sup>USP36</sup>

### Estradiol Transdermal System

#### DEFINITION

Estradiol Transdermal System contains NLT 85.0% and NMT 120.0% of the labeled amount of estradiol (C<sub>18</sub>H<sub>24</sub>O<sub>2</sub>).

#### IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

#### ASSAY

##### • PROCEDURE

**Diluent:** Acetonitrile and water (1:1)

**Mobile phase:** Acetonitrile and water (55:45)

**Standard solution:** 0.1 mg/mL of USP Estradiol RS in *Diluent*

**Sample solutions:** Equivalent to 0.1 mg/mL of estradiol in *Diluent*, prepared as follows. Cut 10 Transdermal Systems into pieces, and keep the pieces from each system separate. Remove and discard the protective liners, if present, from the strips. Transfer the pieces of each system into separate stoppered flasks of suitable size, and add a measured volume of *Diluent* to each flask to provide the target estradiol concentration. Shake by mechanical means for about 3 h, and sonicate for 15 min.

##### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 280 nm

**Column:** 4.6-mm × 15-cm; packing L1

**Column temperature:** 35°

**Flow rate:** 1 mL/min

**Injection size:** 25 µL

##### System suitability

**Sample:** *Standard solution*

##### Suitability requirements

**Tailing factor:** 0.9–1.6

**Relative standard deviation:** NMT 2.5%

##### Analysis

**Samples:** *Standard solution* and *Sample solutions*

Calculate the percentage of estradiol (C<sub>18</sub>H<sub>24</sub>O<sub>2</sub>) in each Transdermal System taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Estradiol RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of estradiol in the *Sample solution* (mg/mL)

Use the individual assays to determine *Uniformity of Dosage Units*.

**Acceptance criteria:** 85.0%–120.0%

#### OTHER COMPONENTS

- **ALCOHOL CONTENT** (if present)

**Diluent:** Acetonitrile and water (1:1)

**Internal standard solution:** Prepare by diluting 4.0 mL of dehydrated methanol with water to 100 mL.

**Standard stock solution:** 5.0 mg/mL of ethanol in *Diluent*. Prepare by weighing by difference 1.6 mL of dehydrated alcohol into a tared 50-mL volumetric flask containing 15 mL of water, and dilute with *Diluent* to

volume. Pipet 10.0 mL of this solution into a 50-mL volumetric flask, and dilute with *Diluent* to volume.

**Standard solution:** 2.5 mg/mL of ethanol. Prepare by pipeting 25.0 mL of the *Standard stock solution* into a 50-mL volumetric flask. Add 5.0 mL of the *Internal standard solution*, and dilute with water to volume.

**Sample solutions:** Prepare as directed for the *Sample solutions* in the *Assay*, with the following changes. Pipet 25.0 mL of each solution into individual 50-mL volumetric flasks. Add 5.0 mL of the *Internal standard solution*, and dilute with water to volume.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 2-mm  $\times$  2-m glass; support S2

**Temperature**

**Column:** 100°

**Injection port:** 200°

**Detector:** 200°

**Carrier gas:** Helium

**Flow rate:** 30 mL/min

**Injection size:** 2  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for the methanol and alcohol peaks are 0.4 and 1.0, respectively.]

#### Suitability requirements

**Relative standard deviation:** NMT 1.5% from the peak response ratio of alcohol to methanol

#### Analysis

**Samples:** *Standard solution* and *Sample solutions*

Calculate the percentage of alcohol (C<sub>2</sub>H<sub>5</sub>OH) in each Transdermal System taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratio of alcohol to methanol from the *Sample solution*

$R_S$  = peak response ratio of alcohol to methanol from the *Standard solution*

$C_S$  = concentration of dehydrated alcohol in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of alcohol in the *Sample solution* (mg/mL)

Average the percentage of alcohol found in the Transdermal Systems analyzed.

**Acceptance criteria:** 80%–120% of the labeled amount of C<sub>2</sub>H<sub>5</sub>OH

### PERFORMANCE TESTS

#### • DRUG RELEASE <724>

**Test 1:** For products labeled for dosing every 84 h

**Medium:** Water; 900 mL, deaerated

**Apparatus 5:** 50 rpm

**Times:** 24, 48, and 96 h

**Mobile phase:** Water and acetonitrile (3:2)

**Standard solution:** 9  $\mu$ g/mL of USP Estradiol RS in dehydrated alcohol. Dilute this solution with *Medium* to obtain solutions having concentrations of about 0.9, 0.45, and 0.045  $\mu$ g/mL.

**Sample solution:** At each sampling time interval, withdraw a 10-mL aliquot of the solution under test.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** Fluorimetric, with excitation at 220 nm and emission at 270 nm

**Column:** 4.6-mm  $\times$  3-cm; packing L1

**Temperature:** 40°

**Flow rate:** 1.0 mL/min

**Injection size:** 50  $\mu$ L

**System suitability**

**Sample:** *Standard solution*

**Tailing factor:** 0.9–2.5

**Relative standard deviation:** NMT 3.0%, using 0.45  $\mu$ g/mL of the *Standard solution*

**Analysis:** Plot the peak responses of the *Standard solutions* versus concentration, in  $\mu$ g/mL, of estradiol. From the graph determine the amount, in  $\mu$ g/mL, of estradiol released. Calculate the cumulative release rate as percentage of the labeled amount of estradiol: At 24 h:

$$\text{Result} = \{[900(A_1 - b)] / (1000 \times m \times L)\} \times 100$$

At 48 h:

$$\text{Result} = \{[890(A_2 - b) + 10(A_1 - b)] / (1000 \times m \times L)\} \times 100$$

At 96 h:

$$\text{Result} = \{[880(A_3 - b) + 10(A_2 - b) + 10(A_1 - b)] / (1000 \times m \times L)\} \times 100$$

$A_1$  = peak area of estradiol in the *Sample solution* at the first time interval

$A_n$  = peak area of estradiol in the *Sample solution* at the release interval  $n$

$m$  = slope of the calibration curve

$b$  = y-intercept of the calibration curve

$L$  = Transdermal System label claim (mg)

**Tolerances:** The percentage of the labeled amount of estradiol released at the times specified, conforms to *Acceptance Table 1*.

Time (h)	Amount Dissolved (release rate)
24	1.2%–6.0%
48	3.0%–11.4%
96	5.0%–16.3%

**Test 2:** If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 2*.

**Medium:** 0.005 M phosphate buffer, pH 5.5, containing 0.3% sodium lauryl sulfate; 500 mL

**Apparatus 5:** 100 rpm. Use a 76-mm stainless steel disk assembly. Adhere the patch to the disk assembly using transfer tape. [NOTE—A suitable tape is available as 3M adhesive transfer tape 927, www.mmm.com.]

**Times:** 1, 4, 8, and 24 h

**Mobile phase:** Acetonitrile and water (1:1)

**Standard stock solution:** 800  $\mu$ g/mL of USP Estradiol RS in acetone

**Standard solution:** Dilute the *Standard stock solution* with *Medium* to obtain a solution having a known concentration close to that expected in the solution under test, assuming 100% drug release.

**Sample solution:** At each sampling time interval, withdraw a known volume aliquot of the solution under test.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 205 nm

Column: 3.9-mm × 30-cm; packing L1

Flow rate: 1.0 mL/min

Injection size: 100 µL

System suitability

Sample: *Standard solution*

Tailing factor: NMT 2.0

Relative standard deviation: NMT 3.0%

Analysis: Calculate the amount of estradiol released at each sampling time:

$$M_i = (r_U/r_S) \times C_S \times V_i$$

$$m_1 = M_1$$

$$m_2 = M_2 + M_1(V_a/V_1)$$

$$m_3 = M_3 + M_2(V_a/V_2) + M_1(V_a/V_1)$$

$$m_4 = M_4 + M_3(V_a/V_3) + M_2(V_a/V_2) + M_1(V_a/V_1)$$

Calculate the percentage of the labeled amount of estradiol released at each sampling time:

$$\text{Result} = (m_i/L) \times 100$$

- $M_i$  = amount of estradiol released into the *Medium* at a given sampling time (mg)
- $r_U$  = peak response from the *Sample solution*
- $r_S$  = peak response from the *Standard solution*
- $C_S$  = concentration of the *Standard solution* (mg/mL)
- $V_i$  = corrected volume of the *Medium* at a given sampling time (mL)
- $m_1, m_2, m_3, m_4$  = total amounts of estradiol released from the patch at given sampling times (mg)
- $M_1, M_2, M_3, M_4$  = amounts of estradiol released into the *Medium* at given sampling times (mg)
- $V_a$  = volume of the aliquot taken from the dissolution vessel at each sampling time (mL)
- $V_1, V_2, V_3$  = volumes of *Medium* at given sampling times (mL)
- $L$  = Transdermal System label claim (mg)

**Tolerances:** The percentage of the labeled amount of estradiol released at the times specified conforms to *Acceptance Table 1*.

Time (h)	Amount Dissolved (release rate)
1	15%–40%
4	45%–70%
8	70%–90%
24	NLT 80%

**Test 3:** If the product complies with this test, the labeling indicates that it meets *USP Drug Release Test 3*.

**Medium:** 1% (v/v) Polysorbate 40 in water; 900 mL

**Apparatus 5:** 50 rpm

**Times:** 4, 8, and 24 h

**Standard stock solution:** Known concentration (mg/mL) of USP Estradiol RS in methanol

**Standard solution:** Five different concentrations within the range of the expected release amounts of es-

tradiol, prepared as follows. Add 1.0 mL of Polysorbate 40 into a 100-mL volumetric flask, and then add the required amount of *Standard stock solution*. Mix well to dissolve the Polysorbate 40, and dilute with water to volume.

**Sample solution:** At each sampling time interval, withdraw a known volume aliquot of the solution under test.

**Mobile phase:** Acetonitrile and water (2:3)

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 225 nm

Column: 4.6-mm × 15-cm, 5-µm packing L1 for 9-cm<sup>2</sup> systems; 4.6-mm × 12.5-cm, 5-µm packing L1 for 18-, 27-, or 36-cm<sup>2</sup> systems. In any case, a guard column containing packing L1 is used.

Flow rate: 1.0 mL/min

Injection size: 50 µL

System suitability

Sample: *Standard solution*

Relative standard deviation: NMT 2.0%

Analysis: Calculate the cumulative release rate as a percentage of the labeled amount of estradiol:

$$\text{Result} = \{[900(A - b)] / (1000 \times m \times L)\} \times 100$$

$A$  = peak area of estradiol in the *Sample solution* at each time interval

$b$  = y-intercept of the calibration curve

$m$  = slope of the calibration curve

$L$  = Transdermal System label claim (mg)

**Tolerances:** The percentage of the labeled amount of estradiol released at the times specified conforms to the acceptance tables shown below.

L1 (6 units)

Time (h)	Amount Dissolved (individual values)
4	40%–71%
8	58%–94%
24	NLT 75%

L2 (12 units)

Time (h)	Amount Dissolved (average of 12)	Amount Dissolved (individual values)
4	40%–71%	34%–77%
8	58%–94%	50%–102%
24	NLT 75%	NLT 68%

L3 (24 units)

Time (h)	Amount Dissolved (average of 24)	Amount Dissolved (individual for 22 units of 24)	Amount Dissolved (individual for 24)
4	40%–71%	34%–77%	29%–82%
8	58%–94%	50%–102%	43%–109%
24	NLT 75%	NLT 68%	NLT 60%

- UNIFORMITY OF DOSAGE UNITS (905):** The results from the Transdermal Systems used in the *Assay* meet the requirements.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in hermetic, light-resistant, unit-dose pouches.
- **LABELING:** The label states the total amount of estradiol in the Transdermal System and the release rate, in mg/day, for the duration of application of one system.
- **USP REFERENCE STANDARDS** (11)  
USP Estradiol RS

**Estradiol Tablets**

» Estradiol Tablets contain not less than 90.0 percent and not more than 115.0 percent of the labeled amount of  $C_{18}H_{24}O_2$ .

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Estradiol RS

USP Estrone RS

**Identification**—Place a quantity of finely powdered Tablets, equivalent to about 4 mg of estradiol, in a screw-capped, 20-mL vial. Add 10 mL of chloroform, and sonicate for 2 minutes. Filter through medium-porosity filter paper. Apply 20  $\mu$ L each of this solution and a Standard solution of USP Estradiol RS in chloroform containing 0.4 mg per mL to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a lined chamber with a solvent system consisting of a mixture of toluene and acetone (4:1) until the solvent front has moved 10 cm beyond the starting line. Remove the plate from the developing chamber, mark the solvent front, and allow to air-dry. Spray the plate with a mixture of methanol and sulfuric acid (1:1), and heat at 100° for about 5 minutes: the principal spots obtained from the test solution and the Standard solution have the same color and  $R_F$  value.

**Dissolution** (711)—

*Medium:* 0.3% sodium lauryl sulfate in water; 500 mL.

*Apparatus 2:* 100 rpm.

*Time:* 60 minutes.

**Mobile phase**—Prepare a suitable degassed and filtered solution of water and acetonitrile (55:45).

**Standard solution**—Prepare a solution of USP Estradiol RS in methanol having an accurately known concentration of about 0.02 mg per mL. Dilute aliquots of this solution with *Medium* to obtain a final solution having a concentration approximately equal to the expected concentration of drug in the *Medium*, assuming 100% dissolution.

**Test solution**—Use a filtered portion of the solution under test from the dissolution vessel.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 205-nm detector and a 4.6-mm  $\times$  7.5-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph replicate injections of the *Standard preparation*, and record the peak areas as directed for *Procedure*: the tailing factor is not more than 2.0; and the relative standard deviation is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 100  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity of  $C_{18}H_{24}O_2$  dissolved by comparison of the peak areas obtained from the *Test solution* and the *Standard solution*.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_{18}H_{24}O_2$  is dissolved in 60 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Chromatographic purity**—

**Solution A**—Prepare a degassed mixture of water and acetonitrile (8:2).

**Solution B**—Prepare a degassed mixture of acetonitrile and water (8:2).

**Diluent**—Prepare a mixture of water and acetonitrile (6:4).

**Mobile phase**—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**System suitability solution**—Dissolve accurately weighed quantities of USP Estradiol RS and USP Estrone RS in acetonitrile to obtain a solution having concentrations of 0.5 mg per mL and 0.3 mg per mL, respectively. Pipet 2 mL of this solution into a 50-mL volumetric flask, and dilute with *Diluent* to volume.

**Test solution**—Transfer a number of Tablets, containing a combined amount of 4 to 8 mg of estradiol based on the label claim, to a suitable flask, add a volume of *Diluent* equivalent to about 5 mL per each mg of estradiol, swirl until the Tablets are completely disintegrated, then shake for 15 minutes, and allow the solids to settle. Pass a portion of this solution through a 0.45- $\mu$ m PVDF filter, discarding the first 2 mL of the filtrate. This solution contains about 0.2 mg of estradiol per mL.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 200-nm detector and a 4.0-mm  $\times$  12.5-cm column that contains 5- $\mu$ m packing L7. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–5	100→90	0→10	linear gradient
5–15	90→50	10→50	linear gradient
15–25	50→0	50→100	linear gradient
25–35	0	100	isocratic
35–35.1	0→100	100→0	linear gradient
35.1–40	100	0	re-equilibration

Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*. Identify the components based on their relative retention times which are 1.0 for estradiol and about 1.1 for estrone: the resolution,  $R_s$ , between estradiol and estrone is not less than 3.0; the tailing factors for estradiol and estrone peaks are not more than 1.5; and the relative standard deviation for replicate injections is not more than 2% for each peak.

**Procedure**—Inject a volume (about 10  $\mu$ L) of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the peak response for each impurity; and  $r_s$  is the sum of the responses of all the peaks: not more than 5% of total impurities is found. Disregard any peaks observed in the blank.

**Assay**—

**Mobile phase, Internal standard solution, Standard preparation, and Chromatographic system**—Proceed as directed in the Assay under *Estradiol*.

**Assay preparation**—Weigh and finely powder not fewer than 10 Tablets. Transfer a portion of the powder, equivalent to about 8 mg of estradiol, to a 100-mL volumetric flask. Add 4 mL of water, and swirl. Add 10.0 mL of *Internal*

*standard solution* and about 60 mL of methanol. Shake by mechanical means for 15 minutes, dilute with methanol to volume, mix, and allow the solids to settle. Filter a portion, discarding the first 10 mL of the filtrate. Mix 5.0 mL of the subsequent filtrate with 5.0 mL of methanol and 10.0 mL of water.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Estradiol*. Calculate the quantity, in mg, of  $C_{18}H_{24}O_2$  in the portion of Tablets taken by the formula:

$$0.4C(R_U / R_S)$$

in which the terms are as defined therein.

## Estradiol Cypionate

$C_{26}H_{36}O_3$  396.56  
Estra-1,3,5(10)-triene-3,17-diol, (17 $\beta$ )-,  
17-cyclopentanepropionate;  
Estradiol 17-cyclopentanepropionate [313-06-4].

### DEFINITION

Estradiol Cypionate contains NLT 97.0% and NMT 103.0% of estradiol cypionate ( $C_{26}H_{36}O_3$ ), calculated on the dried basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B. ULTRAVIOLET ABSORPTION** (197U)  
*Sample solution:* 100  $\mu$ g/mL of estradiol cypionate in alcohol  
*Analytical wavelength:* 280 nm  
*Acceptance criteria:* Absorptivities, calculated on the dried basis, do not differ by more than 3.0%.

### ASSAY

- **PROCEDURE**  
*Mobile phase:* 0.8 g/L of ammonium nitrate. Dissolve in 300 mL of water, and combine with 700 mL of acetonitrile.  
*Internal standard solution:* 2.0 mg/mL of testosterone benzoate in tetrahydrofuran  
*Standard solution:* 1.0 mg/mL of USP Estradiol Cypionate RS in the *Internal standard solution*  
*Sample solution:* 1.0 mg/mL of Estradiol Cypionate in the *Internal standard solution*  
**Chromatographic system**  
 (See *Chromatography* (621), *System Suitability*).  
*Mode:* LC  
*Detector:* UV 280 nm  
*Column:* 3.9-mm  $\times$  30-cm; 10- $\mu$ m packing L1  
*Flow rate:* 1 mL/min  
*Injection size:* 10  $\mu$ L  
**System suitability**  
*Sample:* *Standard solution*  
**Suitability requirements**  
*Resolution:* NLT 3.0 between the peaks for estradiol cypionate and the internal standard  
*Relative standard deviation:* NMT 1.5%  
**Analysis**  
*Samples:* *Standard solution* and *Sample solution*  
 Calculate the percentage of estradiol cypionate ( $C_{26}H_{36}O_3$ ) in the portion of Estradiol Cypionate taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

- $R_U$  = peak response ratio of estradiol cypionate to the internal standard from the *Sample solution*
- $R_S$  = peak response ratio of estradiol cypionate to the internal standard from the *Standard solution*
- $C_S$  = concentration of USP Estradiol Cypionate RS in the *Standard solution* (mg/mL)
- $C_U$  = concentration of the *Sample solution* (mg/mL)
- Acceptance criteria:** 97.0%–103.0% on the dried basis

### IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.2%

### SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE** (741): 149°–153°
- **OPTICAL ROTATION, Specific Rotation** (781S)  
*Sample solution:* 20 mg/mL in dioxane  
*Acceptance criteria:* +39° to +44°
- **LOSS ON DRYING** (731): Dry a sample at 105° for 4 h: it loses NMT 1.0% of its weight.

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **USP REFERENCE STANDARDS** (11)  
 USP Estradiol Cypionate RS

## Estradiol Cypionate Injection

### DEFINITION

Estradiol Cypionate Injection is a sterile solution of Estradiol Cypionate in a suitable oil. It contains NLT 90.0% and NMT 110.0% of the labeled amount of estradiol cypionate ( $C_{26}H_{36}O_3$ ).

### IDENTIFICATION

- **A.**  
**Sulfanilic acid solution:** Mix 50 mg of sulfanilic acid with 2 mL of 3 N hydrochloric acid, warm the mixture, then cool it in ice water, and slowly add, with agitation, 0.3 mL of sodium nitrite solution (1 in 10).  
**Sample solution:** Transfer a volume of Injection, equivalent to 5 mg of estradiol cypionate, to a glass-stoppered, 50-mL test tube, and add 30 mL of alcohol.  
**Analysis:** Shake the *Sample solution* vigorously for 5 min, centrifuge until the two layers have separated, and transfer the alcohol layer, with the aid of a hypodermic syringe, to a 50-mL beaker. Evaporate on a steam bath to dryness, add 5 mL of potassium hydroxide solution (1 in 10), and heat on the steam bath for 15 min. Add the *Sulfanilic acid solution* to the saponified estradiol cypionate.  
**Acceptance criteria:** A red color is produced.

### ASSAY

- **PROCEDURE**  
*Mobile phase:* 0.8 g/L of ammonium nitrate. Dissolve in 300 mL of water, and combine with 700 mL of acetonitrile.  
*Internal standard solution:* 2.0 mg/mL of testosterone benzoate in tetrahydrofuran  
*Standard solution:* 0.1 mg/mL of USP Estradiol Cypionate RS in tetrahydrofuran, prepared as follows. Transfer 10 mg of USP Estradiol Cypionate RS to a 100-mL volumetric flask, add 10.0 mL of the *Internal standard solution*, and dilute with tetrahydrofuran to volume. Shake vigorously to dissolve.  
*Sample solution:* Using a “to contain” pipet, transfer an accurately measured volume, in mL, of Injection, equivalent to 10 mg of estradiol cypionate, to a 100-mL volumetric flask. Rinse the pipet with small portions of tetrahydrofuran, collecting the washings in the volumetric

flask. Add 10.0 mL of the *Internal standard solution*, and dilute with tetrahydrofuran to volume.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 280 nm

**Column:** 3.9-mm × 30-cm; packing L1

**Flow rate:** 1 mL/min

**Injection size:** 10 µL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Resolution:** NLT 3.0 between the peaks for estradiol cypionate and the internal standard

**Relative standard deviation:** NMT 1.5%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of estradiol cypionate ( $C_{26}H_{36}O_3$ ) in the portion of Injection taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratio of estradiol cypionate to the internal standard from the *Sample solution*

$R_S$  = peak response ratio of estradiol cypionate to the internal standard from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

#### SPECIFIC TESTS

- **INJECTIONS** <1>: Meets the requirements

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in single-dose or in multiple-dose, light-resistant containers, preferably of Type I glass.
- **USP REFERENCE STANDARDS** <11>  
USP Estradiol Cypionate RS

## Estradiol and Norethindrone Acetate Tablets

#### DEFINITION

Estradiol and Norethindrone Acetate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of estradiol ( $C_{18}H_{24}O_2$ ) and NLT 90.0% and NMT 110.0% of the labeled amount of norethindrone acetate ( $C_{22}H_{28}O_3$ ).

#### IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** <201>

**Standard solution:** 0.5 mg/mL of USP Estradiol RS and 0.25 mg/mL of USP Norethindrone Acetate RS in dehydrated alcohol

**Sample solution:** Place 2 Tablets into a 10-mL vial, and add 0.2 mL of water. When the Tablets are partially disintegrated, add a few glass beads, and shake vigorously to disintegrate. Add 4.0 mL of dehydrated alcohol, and shake. [NOTE—Centrifuge until the supernatant is clear before application to the plate.]

**Adsorbent:** 0.25-mm chromatographic silica gel plate

**Application volume:** 2 µL

**Developing solvent system:** Chloroform and acetone (9:1)

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Proceed as directed in the chapter, using the *Developing solvent system*. Apply the *Samples* and develop the plate. After removal of the plate, mark the solvent front, and allow the solvent to evaporate. Place the plate on a heating plate at 100° for 15 min. Allow the plate to cool, and then immerse it in a mixture of dehydrated alcohol and concentrated sulfuric acid (95:5). Place the plate on a piece of thick horizontal paper until it is almost dry. Heat the plate at 100° until it has fully developed. Examine under UV light at 365 nm.

**Acceptance criteria:** The color and  $R_F$  value of the principal spots of the *Sample solution* correspond to those of the *Standard solution*.

- **B.** The retention time of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

#### ASSAY

##### • PROCEDURE

**Mobile phase:** Acetonitrile and water (11:9)

**Diluent:** Dehydrated alcohol and water (1:1)

**Estrone standard stock solution:** 0.12 mg/mL of USP Estrone RS in dehydrated alcohol

**Estradiol standard stock solution:** 0.25 mg/mL of USP Estradiol RS in dehydrated alcohol

**Norethindrone acetate standard stock solution:** 0.15 mg/mL of USP Norethindrone Acetate RS in dehydrated alcohol

**Standard solution:** 20 µg/mL of USP Estradiol RS from the *Estradiol standard stock solution* and 10 µg/mL of USP Norethindrone Acetate RS from the *Norethindrone acetate standard stock solution* in *Diluent*

**System suitability solution:** Combine 800 µL of the *Estradiol standard stock solution*, 600 µL of the *Norethindrone acetate standard stock solution*, 200 µL of the *Estrone standard stock solution*, and 10.0 mL of *Diluent*.

**Sample solution:** Add 12 Tablets into a measured amount of *Diluent* to obtain a solution having an estradiol concentration of 20 µg/mL and a norethindrone acetate concentration of 10 µg/mL.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV Dual wavelength (254 nm/280 nm) or equivalent

[NOTE—The absorption of estradiol at 280 nm and norethindrone acetate at 254 nm can be included in a single run by altering the wavelength.]

**Column:** 4.6-mm × 15-cm; packing L1

**Flow rate:** 1 mL/min

[NOTE—Perform an investigational run to determine the retention times for estradiol and norethindrone acetate.]

**Injection size:** 50 µL

#### System suitability

**Samples:** *Standard solution* and *System suitability solution*

#### Suitability requirements

**Resolution:** NLT 1.8 between estradiol and estrone, *System suitability solution*

**Relative standard deviation:** NMT 3%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

[NOTE—Measure the areas for the estradiol and norethindrone acetate peaks.]

Calculate the quantity, as a percentage, of  $C_{18}H_{24}O_2$  in each of the Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area from the *Sample solution*

- $r_s$  = peak area from the *Standard solution*  
 $C_s$  = concentration of USP Estradiol RS in the *Standard solution* ( $\mu\text{g/mL}$ )  
 $C_u$  = nominal concentration of estradiol in the *Sample solution* ( $\mu\text{g/mL}$ )

Calculate the quantity, as a percentage, of  $\text{C}_{22}\text{H}_{28}\text{O}_3$  in each of the Tablets taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

- $r_u$  = peak area from the *Sample solution*  
 $r_s$  = peak area from the *Standard solution*  
 $C_s$  = concentration of USP Norethindrone Acetate RS in the *Standard solution* ( $\mu\text{g/mL}$ )  
 $C_u$  = nominal concentration of norethindrone acetate in the *Sample solution* ( $\mu\text{g/mL}$ )

**Acceptance criteria:** 90.0%–110.0% of the labeled amount of  $\text{C}_{18}\text{H}_{24}\text{O}_2$  and 90.0%–110.0% of the labeled amount of  $\text{C}_{22}\text{H}_{28}\text{O}_3$

## PERFORMANCE TESTS

### • DISSOLUTION <711>

**Medium:** 0.3% sodium lauryl sulfate; 500 mL

**Apparatus 2:** 50 rpm

**Time:** 30 min for Tablets labeled to contain 1 mg of estradiol and 0.5 mg of norethindrone acetate, and 50 min for Tablets labeled to contain 0.5 mg of estradiol and 0.1 mg of norethindrone acetate

**Mobile phase:** Acetonitrile and water (11:9)

**Standard stock solution A:** 20  $\mu\text{g/mL}$  of USP Estradiol RS in alcohol or in a mixture of alcohol and water

**Standard stock solution B:** 10  $\mu\text{g/mL}$  of USP Norethindrone Acetate RS in alcohol or in a mixture of alcohol and water

**Standard solution:** Dilute suitable quantities of *Standard stock solution A* and *Standard stock solution B* in *Medium* or a mixture of alcohol and water to obtain a final concentration of both analytes similar to the expected concentration of the *Sample solution*.

**Sample solution:** Pass a portion of the solution through a filter of 0.45- $\mu\text{m}$  pore size.

### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 241 nm for norethindrone acetate and 280 nm for estradiol

**Column:** 4.6-mm  $\times$  15-cm; packing L1

**Flow rate:** 1 mL/min

**Injection volume:** 150  $\mu\text{L}$

### System suitability

**Sample:** *Standard solution*

### Suitability requirements

**Tailing factor:** NMT 1.5

**Relative standard deviation:** NMT 2.0%

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $\text{C}_{18}\text{H}_{24}\text{O}_2$  and of  $\text{C}_{22}\text{H}_{28}\text{O}_3$  dissolved:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

- $r_u$  = peak response of estradiol or norethindrone acetate from the *Sample solution*  
 $r_s$  = peak response of estradiol or norethindrone acetate from the *Standard solution*  
 $C_s$  = concentration of USP Estradiol RS or USP Norethindrone Acetate RS in the *Standard solution* (mg/mL)  
 $C_u$  = nominal concentration of estradiol or norethindrone acetate in the *Sample solution* (mg/mL) (based on the label claim)

**Tolerances:** For Tablets labeled to contain 1 mg of estradiol and 0.5 mg of norethindrone acetate: NLT 75% (Q) of the labeled amounts of  $\text{C}_{18}\text{H}_{24}\text{O}_2$  and  $\text{C}_{22}\text{H}_{28}\text{O}_3$  is dissolved in 30 min. For Tablets labeled to contain

0.5 mg of estradiol and 0.1 mg of norethindrone acetate: NLT 75% (Q) of the labeled amounts of  $\text{C}_{18}\text{H}_{24}\text{O}_2$  and  $\text{C}_{22}\text{H}_{28}\text{O}_3$  is dissolved in 50 min.

- **UNIFORMITY OF DOSAGE UNITS <905>:** Meet the requirements

## IMPURITIES

### Organic Impurities

#### • PROCEDURE

**Solution A:** Tetrahydrofuran and water (1:200)

**Solution B:** Acetonitrile, tetrahydrofuran, and water (160:1:40)

**Mobile phase:** See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	80	20
2	65	35
35	20	80
49	20	80
50	80	20
60	80	20

**Diluent:** Dehydrated alcohol and water (1:1)

**System suitability solution:** 240  $\mu\text{g/mL}$  of USP Estradiol RS, 60  $\mu\text{g/mL}$  of USP Norethindrone Acetate RS, and 1  $\mu\text{g/mL}$  of USP Estrone RS in *Diluent*

**Estradiol standard stock solution:** 250  $\mu\text{g/mL}$  of USP Estradiol RS in alcohol

**Norethindrone acetate standard stock solution:** 150  $\mu\text{g/mL}$  of USP Norethindrone Acetate RS in alcohol

**Standard solution:** Combine 250  $\mu\text{L}$  of the *Estradiol standard stock solution* and 100  $\mu\text{L}$  of the *Norethindrone acetate standard stock solution*, and dilute with 50.0 mL of *Diluent*.

**Sample solution:** A quantity equivalent to 240  $\mu\text{g/mL}$  of estradiol and 120  $\mu\text{g/mL}$  of norethindrone acetate from NLT 20 finely ground Tablets in *Diluent*

### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 235 and 254 nm

**Column:** 3.9-mm  $\times$  30-cm; 4- $\mu\text{m}$  packing L1

**Flow rate:** 0.8 mL/min

**Injection size:** 100  $\mu\text{L}$

### System suitability

**Sample:** *System suitability solution*

[NOTE— The relative retention times for estradiol, estrone, and norethindrone acetate are about 1.0, 1.4, and 3.0, respectively.]

### Suitability requirements

**Resolution:** NLT 1.3 between estrone and estradiol, measured at 254 nm

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of any estradiol impurity in the portion of Tablets taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times (1/F) \times 100$$

- $r_u$  = peak response area at 235 nm for each impurity from the *Sample solution*  
 $r_s$  = peak response area at 235 nm from the *Standard solution*  
 $C_s$  = concentration of the *Standard solution* ( $\mu\text{g/mL}$ )  
 $C_u$  = concentration of the *Sample solution* ( $\mu\text{g/mL}$ )  
 $F$  = relative response factor (see *Impurity Table 1* or *Impurity Table 2*)

Calculate the percentage of any norethindrone acetate related impurities in the portion of Tablets taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times (1/F) \times 100$$

- $r_U$  = peak response area at 254 nm for each impurity from the *Sample solution*  
 $r_S$  = peak response area at 254 nm from the *Standard solution*  
 $C_S$  = concentration of the *Standard solution* ( $\mu\text{g/mL}$ )  
 $C_U$  = concentration of the *Sample solution* ( $\mu\text{g/mL}$ )  
 $F$  = relative response factor (see *Impurity Table 1* or *Impurity Table 2*)

**Acceptance criteria:** The Tablets meet the requirements given in either *Impurity Table 1* or *Impurity Table 2*.

**Impurity Table 1. Tablets Labeled as Containing 1 mg of Estradiol and 0.5 mg of Norethindrone Acetate**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Estradiol related impurities			
6 $\alpha$ -Hydroxyestradiol	0.47	1.0	1.0
6 $\beta$ -Hydroxyestradiol	0.51	1.0	1.0
6-Ketoestradiol	0.62	1.0	1.0
6-Dehydroestradiol	0.95	1.0	1.0
Estradiol	1.0	—	—
Any other single estradiol related impurity	—	1.0	0.5
Total estradiol related impurities	—	—	2.0
Norethindrone acetate related impurities			
6 $\beta$ -Hydroxynorethindrone acetate	0.58	1.0	1.0
Norethindrone	0.66	1.0	1.0
6-Ketonorethindrone acetate	0.79	0.56	1.0
6-Dehydronorethindrone acetate	0.97	0.45	1.0
Norethindrone acetate	1.0	—	—
Any other single norethindrone acetate related impurity	—	1.0	0.5
Total norethindrone acetate related impurities	—	—	2.0

**Impurity Table 2. Tablets Labeled as Containing 0.5 mg of Estradiol and 0.1 mg of Norethindrone Acetate**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Estradiol related impurities			
6 $\beta$ -Hydroxy-estradiol	0.51	1.0	1.0
Estradiol	1.0	—	—
Any other single estradiol related impurity	—	1.0	1.0
Total estradiol related impurities	—	—	2.5
Norethindrone acetate related impurities			
6 $\beta$ -Hydroxy-norethindrone acetate	0.58	1.0	1.5
Norethindrone	0.66	1.0	1.0
6-Keto-norethindrone acetate	0.79	0.56	2.5
6-Dehydro-norethindrone acetate	0.97	0.45	1.0

**Impurity Table 2. Tablets Labeled as Containing 0.5 mg of Estradiol and 0.1 mg of Norethindrone Acetate** (Continued)

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Norethindrone acetate	1.0	—	—
Any other single norethindrone acetate related impurity	—	1.0	1.0
Total norethindrone acetate related impurities	—	—	4.0

## SPECIFIC TESTS

- MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total aerobic microbial count does not exceed 1000 cfu/g, and the total combined molds and yeasts count does not exceed 100 cfu/g. The Tablets meet the requirements of the tests for the absence of *Salmonella* species and *Escherichia coli*.

## ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at controlled room temperature.
- USP REFERENCE STANDARDS** (11)
  - USP Estradiol RS
  - USP Estrone RS
  - USP Norethindrone Acetate RS

## Estradiol Valerate

$\text{C}_{23}\text{H}_{32}\text{O}_3$  356.50

Estra-1,3,5(10)-triene-3,17-diol(17 $\beta$ )-, 17-pentanoate.

Estradiol 17-valerate. [979-32-8].

» Estradiol Valerate contains not less than 98.0 percent and not more than 102.0 percent of  $\text{C}_{23}\text{H}_{32}\text{O}_3$ .

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Estradiol Valerate RS

**Identification, Infrared Absorption** (197K).

**Melting range, Class Ia** (741): between 143° and 150°.

**Specific rotation** (781S): between +41° and +47°.

*Test solution:* 25 mg, uncorrected for moisture, per mL, in dioxane.

**Water, Method I** (921): not more than 0.1%.

**Limit of estradiol**—Apply 5  $\mu\text{L}$  of a solution of Estradiol Valerate in acetone, containing 5 mg per mL, and 5  $\mu\text{L}$  of a solution of estradiol in acetone, containing 50  $\mu\text{g}$  per mL, about 2.5 cm from the lower edge of a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel. Develop the chromatogram in a solvent system consisting of a mixture of cyclohexane and ethyl acetate (7:3) in an unlined chamber until the solvent front has moved about 15 cm above the point of application. Remove the plate, dry at 90° for 30 minutes, and spray the plate lightly with a 3 in 10 solution of methanol in sulfuric acid, prepared by cautiously adding sulfuric acid to 30 mL of methanol in a 100-mL volumetric flask, in an ice bath, to volume. Heat the plate at 90° for 30 minutes: any spot in the chromatogram of Estradiol Valerate close to the origin and corresponding to the estradiol spot is not larger nor more intense than that produced by the standard. (The limit is 1.0% of estradiol.)

**Free acid**—Neutralize 25 mL of alcohol, in a conical flask, with 0.01 N sodium hydroxide VS to a faint blue color, using bromothymol blue TS. Accurately weigh 500 mg of Estradiol Valerate, and dissolve it in the neutralized alcohol. Titrate rapidly with 0.01 N sodium hydroxide VS to a faint blue color. Each mL of 0.01 N sodium hydroxide is equivalent to 1.021 mg of valeric acid. The free acid content, expressed as valeric acid, does not exceed 0.5%.

**Ordinary impurities** (466)—

*Test solution:* acetone.

*Standard solution:* acetone.

*Eluent:* a mixture of cyclohexane and ether (4:1).

*Visualization:* 5 followed by 1.

**Assay**—

*Mobile phase*—Dissolve 0.8 g of ammonium nitrate in 300 mL of water, add 700 mL of acetonitrile, and mix. Filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Internal standard solution*—Prepare a solution of testosterone benzoate in tetrahydrofuran having a concentration of about 2.0 mg per mL.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Estradiol Valerate RS in *Internal standard solution*, and dilute quantitatively with *Internal standard solution* to obtain a solution having a known concentration of about 1 mg of USP Estradiol Valerate RS per mL.

*Assay preparation*—Transfer about 25 mg of Estradiol Valerate, accurately weighed, to a 25-mL volumetric flask, add *Internal standard solution* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4-mm × 30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.2 for testosterone benzoate and 1.0 for estradiol valerate; the column efficiency determined from the analyte peak is not less than 1100 theoretical plates; the resolution,  $R$ , between the analyte and internal standard peaks is not less than 3.0; and the relative standard deviation for replicate injections is not more than 1.5%.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{23}H_{32}O_3$  in the portion of Estradiol Valerate taken by the formula:

$$25C(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Estradiol Valerate RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Estradiol Valerate Injection

### DEFINITION

Estradiol Valerate Injection is a sterile solution of Estradiol Valerate in a suitable vegetable oil. It contains NLT 90.0% and NMT 115.0% of the labeled amount of estradiol valerate ( $C_{23}H_{32}O_3$ ).

### IDENTIFICATION

#### • A.

**Phenol reagent** (Folin-Ciocalteu reagent): In a 1500-mL flask connected by a standard taper joint to a reflux

condenser, dissolve 100 g of sodium tungstate and 25 g of sodium molybdate in 700 mL of water. Add 50 mL of phosphoric acid and 100 mL of hydrochloric acid, and reflux gently for 10 h. Cool, and add 150 g of lithium sulfate, 50 mL of water, and 4–6 drops of bromine. Boil the mixture without the condenser for 15 min to remove the excess bromine. Cool, transfer to a 1-L volumetric flask, dilute with water to volume, and filter. The filtrate is golden yellow in color, and has no greenish tint. Store the filtrate in a tight container in a refrigerator. Mix the filtrate with water (1:2) before use as the *Phenol reagent*.

**Analysis:** Transfer 0.5 mL of Injection to a separator containing 10 mL of solvent hexane and 10 mL of 80% methanol. Shake the contents for 2 min, and allow the phases to separate. Add 1 mL of *Phenol reagent* and 3 mL of sodium carbonate solution (1 in 5) to 1 mL of the bottom layer, and mix.

**Acceptance criteria:** A blue color develops.

### ASSAY

#### • PROCEDURE

*Mobile phase:* Dissolve 0.8 g of ammonium nitrate in 300 mL of water, add 700 mL of acetonitrile, and mix.

*Internal standard solution:* 8.0 mg/mL of testosterone benzoate in tetrahydrofuran

*Standard solution:* 0.8 mg/mL of USP Estradiol Valerate RS, prepared as follows. Transfer 20 mg of USP Estradiol Valerate RS to a 25-mL volumetric flask. Add 5.0 mL of the *Internal standard solution*, and dilute with tetrahydrofuran to volume.

*Sample solution:* Nominally 0.8 mg/mL of estradiol valerate, prepared as follows. Using a “to contain” pipet, transfer an accurately measured volume of Injection, equivalent to 20 mg of estradiol valerate, to a 25-mL volumetric flask. Rinse the pipet with small portions of tetrahydrofuran, collecting the washings in the volumetric flask. Add 5.0 mL of *Internal standard solution*, and dilute with tetrahydrofuran to volume.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 280 nm

**Column:** 4-mm × 30-cm; packing L1

**Flow rate:** 2 mL/min

**Injection volume:** 10  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for estradiol valerate and testosterone benzoate are 1.0 and 1.2, respectively.]

#### Suitability requirements

**Resolution:** NLT 3.0 between estradiol valerate and the internal standard

**Column efficiency:** NLT 1100 theoretical plates for estradiol valerate

**Relative standard deviation:** NMT 1.5%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of estradiol valerate ( $C_{23}H_{32}O_3$ ) in the portion of Injection taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratio of estradiol valerate to the internal standard from the *Sample solution*

$R_S$  = peak response ratio of estradiol valerate to the internal standard from the *Standard solution*

- $C_s$  = concentration of USP Estradiol Valerate RS in the *Standard solution* (mg/mL)  
 $C_u$  = nominal concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–115.0%

## IMPURITIES

### • LIMIT OF ESTRADIOL

**Standard solution:** A solution of estradiol in acetone containing 30.0% of the labeled concentration of the Injection. Dilute 1.0 mL of this solution with oil labeled as vehicle for Injection to 10.0 mL.

**Sample solution:** Injection

**Chromatographic system**

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

**Mode:** TLC

**Adsorbent:** 0.25-mm layer of chromatographic silica gel

**Application volume:** 5  $\mu$ L

**Developing solvent system:** Cyclohexane and ethyl acetate (7:3)

**Spray reagent:** A 3-in-10 solution of methanol in sulfuric acid, prepared as follows. To 30 mL of methanol in a 100-mL volumetric flask in an ice bath, cautiously add sulfuric acid to volume.

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Apply the samples at spots 2.5 cm from the bottom edge of the plate. Allow the applications to be absorbed by the layer without air-drying. Develop the chromatogram in an unlined chamber until the solvent front has moved about 15 cm above the point of application. Remove the plate, dry at 90° for 30 min, and spray the plate lightly with *Spray reagent*. Heat the plate at 90° for 30 min.

**Acceptance criteria:** NMT 3.0%; any spot from the *Sample solution* close to the origin and corresponding to the estradiol spot is not larger or more intense than that from the *Standard solution*.

## SPECIFIC TESTS

- **OTHER REQUIREMENTS:** Meets the requirements in *Injections* <1>

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in single-dose or multiple-dose, light-resistant containers, preferably of Type I or Type III glass.
- **USP REFERENCE STANDARDS <11>**  
USP Estradiol Valerate RS

## Estriol

$C_{18}H_{24}O_3$  288.38

Estra-1,3,5(10)-triene-3,16,17-triol, (16 $\alpha$ ,17 $\beta$ )-.

Estriol [50-27-1].

» Estriol contains not less than 97.0 percent and not more than 102.0 percent of  $C_{18}H_{24}O_3$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards <11>**—

USP Estriol RS

**Completeness of solution**—Dissolve 500 mg in 10 mL of pyridine: the solution is clear and free from undissolved solid.

### Identification—

**A:** *Infrared Absorption* <197K>.

**B:** *Ultraviolet Absorption* <197U>—

*Solution:* 100  $\mu$ g per mL.

*Medium:* alcohol.

**Specific rotation** <781S>: between +54° and +62°.

*Test solution:* 4 mg per mL, in dioxane.

**Loss on drying** <731>—Dry it at 105° for 3 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** <281>: not more than 0.1%.

### Chromatographic purity—

**Test preparation**—Prepare a solution of Estriol in a mixture of dioxane and water (9:1) to obtain a solution containing 20.0 mg per mL.

**Standard solution and Standard dilutions**—Prepare a solution of USP Estriol RS in a mixture of dioxane and water (9:1) to obtain a solution containing 20 mg per mL (*Standard solution*). Prepare a series of dilutions of the *Standard solution* in a mixture of dioxane and water (9:1) to obtain solutions containing 0.40, 0.20, 0.10, and 0.05 mg per mL (*Standard dilutions*).

**Chromatography chamber**—Line a suitable chamber (see *Chromatography* <621>) with absorbent paper, and pour into the chamber 200 mL of developing solvent, prepared by mixing, just prior to use, 90 mL of chloroform, 5 mL of methanol, 5 mL of acetone, and 5 mL of acetic acid. Equilibrate the chamber for 15 minutes before using.

**Procedure**—Apply 5- $\mu$ L volumes of the *Test preparation*, *Standard solution*, and each of the four *Standard dilutions* at equidistant points along a line 2.5 cm from one edge of a 20-  $\times$  20-cm thin-layer chromatographic plate (see *Chromatography* <621>) coated with a 0.25-mm layer of chromatographic silica gel mixture. Place the plate in the *Chromatography chamber*, seal the chamber, and allow the chromatogram to develop until the solvent front has moved 15 cm above the line of application. Remove the plate, and allow the solvent to evaporate. Spray the plate with a mixture of methanol and sulfuric acid (7:3), then heat the plate at 100° for 15 minutes. The lane of the *Test preparation* exhibits its principal spot at the same  $R_f$  value as the principal spot of the *Standard solution*. If spots other than the principal spot are observed in the lane of the *Test preparation*, estimate the concentration of each by comparison with the *Standard dilutions*. The spots from the 0.40-, 0.20-, 0.10-, and 0.05-mg-per-mL dilutions are equivalent to 2.0%, 1.0%, 0.5%, and 0.25% of impurities, respectively. The requirements of the test are met if the sum of impurities in the *Test preparation* is not greater than 2.0%.

**Assay**—Dissolve about 50 mg of Estriol, accurately weighed, in alcohol to make 100.0 mL, and mix. Dilute 10.0 mL of this solution with alcohol to 100.0 mL. Similarly, dissolve a suitable quantity of USP Estriol RS, accurately weighed, in alcohol to obtain a *Standard solution* having a known concentration of about 50  $\mu$ g per mL. Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 281 nm. Calculate the quantity, in mg, of  $C_{18}H_{24}O_3$  in the portion of Estriol taken by the formula:

$$C(A_u / A_s)$$

in which C is the concentration, in  $\mu$ g per mL, of USP Estriol RS in the *Standard solution*, and  $A_u$  and  $A_s$  are the absorbances of the solution of Estriol and the *Standard solution*, respectively.

## Conjugated Estrogens

### DEFINITION

Conjugated Estrogens is a mixture of sodium estrone sulfate and sodium equilin sulfate, derived wholly or in part from equine urine or synthetically from estrone and equilin. It contains other conjugated estrogenic substances of the type excreted by pregnant mares. It is a dispersion of the estrogenic substances on a suitable powdered diluent.

Conjugated Estrogens contains NLT 52.5% and NMT 61.5% of sodium estrone sulfate and NLT 22.5% and NMT 30.5% of sodium equilin sulfate, and the total of sodium estrone sulfate and sodium equilin sulfate is NLT 79.5% and NMT 88.0% of the labeled content of Conjugated Estrogens. Conjugated Estrogens contains concomitant components as sodium sulfate conjugates NLT 13.5% and NMT 19.5% of 17 $\alpha$ -dihydroequilin, NLT 2.5% and NMT 9.5% of 17 $\alpha$ -estradiol, and NLT 0.5% and NMT 4.0% of 17 $\beta$ -dihydroequilin of the labeled content of Conjugated Estrogens.

### IDENTIFICATION

- **A.** The relative retention times of the 17 $\alpha$ -dihydroequilin peak, the estrone peak, and the equilin peak from the *Sample solution* correspond to those from the *Standard solution*, as obtained in the *Assay*.
- **B.** The chromatogram of Conjugated Estrogens from the *Sample solution* in the *Assay* exhibits additional peaks or shoulders, corresponding to 17 $\alpha$ -estradiol and 17 $\beta$ -dihydroequilin at retention times of about 0.24 and 0.35, relative to that of 3-O-methylestrone.

### ASSAY

#### • PROCEDURE

**Buffer:** Sodium acetate TS, 1 N acetic acid, and water (79:21:400). Adjust with 1 N acetic acid or sodium acetate TS to a pH of 5.2  $\pm$  0.1, if necessary.

**Internal standard solution:** 150  $\mu$ g/mL of 3-O-methylestrone in methanol

**Standard stock solution:** 160  $\mu$ g/mL, 70  $\mu$ g/mL, and 50  $\mu$ g/mL each of USP Estrone RS, USP Equilin RS, and USP 17 $\alpha$ -Dihydroequilin RS, respectively, in alcohol

**Standard solution:** Pipet 1.0 mL of the *Internal standard solution* and 1.0 mL of the *Standard stock solution* into a suitable centrifuge tube fitted with a tight screw cap or stopper. Evaporate the mixture with the aid of a stream of nitrogen to dryness, maintaining the temperature below 50°. To the dry residue, add 15  $\mu$ L of dried pyridine and 65  $\mu$ L of bis(trimethylsilyl)trifluoroacetamide containing 1% trimethylchlorosilane. Immediately cover the tube tightly, mix, and allow to stand for 15 min. Add 0.5 mL of toluene, and mix.

**System suitability solution:** Pipet 1.0 mL of a 2.0- $\mu$ g/mL solution of USP Estradiol RS (17 $\beta$ -estradiol) in alcohol, 1.0 mL of *Internal standard solution*, and 1.0 mL of *Standard stock solution* into a centrifuge tube fitted with a tight screw cap or stopper. Proceed as directed for *Standard solution*, beginning with "Evaporate the mixture..."

**Sample solution:** Transfer a quantity of Conjugated Estrogens, equivalent to 2 mg of total conjugated estrogens, to a 50-mL centrifuge tube, fitted with a polytetrafluorinated screw cap, containing 15 mL of *Buffer* and 1 g of barium chloride. Cap the tube tightly, and shake for 30 min. If necessary, adjust the solution with 1 N acetic acid or sodium acetate to a pH of 5.0  $\pm$  0.5. Sonicate for 30 s, then shake for an additional 30 min. Add a suitable sulfatase enzyme solution equivalent to 2500 Units, and shake for 20 min in a water bath maintained at 50°. Add 15.0 mL of ethylene dichloride to the warm mixture, cap the tube again, and shake by mechanical means for 15 min. Centrifuge for 10 min or until the lower layer is clear. Transfer as much of the organic phase as possible, and dry by rapidly passing through a

filter consisting of a pledget of dry glass wool and 5 g of anhydrous sodium sulfate in a small funnel. Protect from loss by evaporation. Transfer 3.0 mL of the solution to a suitable centrifuge tube fitted with a tight screw cap or stopper. Add 1.0 mL of *Internal standard solution*. Proceed as directed for *Standard solution*, beginning with "Evaporate the mixture..."

### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 0.25-mm  $\times$  15-m fused silica capillary column, bonded with a 0.25- $\mu$ m layer of phase G19

**Temperature**

**Column:** 208°

**Injector port:** 260°

**Detector:** 260°

**Carrier gas:** Hydrogen

**Flow rate:** 2 mL/min

**Injection mode:** Split

**Split flow rate:** 40–60 mL/min

**Injection size:** 1  $\mu$ L

### System suitability

**Samples:** *Standard solution* and *System suitability solution*

[NOTE—Adjust the operating conditions as necessary to maintain the elution time of the 3-O-methylestrone peak between 17 and 25 min.]

[NOTE—The relative retention times for 17 $\beta$ -estradiol, 17 $\alpha$ -dihydroequilin, estrone, equilin, and 3-O-methylestrone are 0.29, 0.30, 0.80, 0.87, and 1.00, respectively.]

### Suitability requirements

**Resolution:** NLT 1.2 between estrone and equilin, *System suitability solution*

**Tailing factor:** NMT 1.3 for the estrone peak, *System suitability solution*

**Relative standard deviation:** NMT 2.0% for the estrone peak ratios for NLT four injections of the *Standard solution*

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of sodium estrone sulfate and sodium equilin sulfate in the portion of Conjugated Estrogens taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times F \times 100$$

$R_U$  = ratio of the peak response of the appropriate analyte to that of the internal standard from the *Sample solution*

$R_S$  = ratio of the peak response of the appropriate analyte to that of the internal standard from the *Standard solution*

$C_S$  = concentration of USP Estrone RS or USP Equilin RS in the *Standard solution* ( $\mu$ g/mL)

$C_U$  = concentration of the *Sample solution* ( $\mu$ g/mL)

$F$  = conversion factor (ratio of molecular weight of sodium salts to free estrogen), 1.381

**Acceptance criteria:** 52.5%–61.5% of sodium estrone sulfate and 22.5%–30.5% of sodium equilin sulfate

### OTHER COMPONENTS

- **CONTENT OF 17 $\alpha$ -DIHYDROEQUILIN, 17 $\beta$ -DIHYDROEQUILIN, AND 17 $\alpha$ -ESTRADIOL** (concomitant components)

**Buffer, Internal standard solution, Standard stock solution, Standard solution, System suitability solution, Sample solution, and Chromatographic system:** Proceed as directed in the *Assay*.

### Analysis

**Samples:** *Standard solution* and *Sample solution*

[NOTE—The relative retention times for 17 $\alpha$ -estradiol, 17 $\alpha$ -dihydroequilin, and 17 $\beta$ -dihydroequilin are about 0.82, 1.00, and 1.11, respectively.]

Identify the peaks for 17 $\alpha$ -estradiol, 17 $\alpha$ -dihydroequilin, and 17 $\beta$ -dihydroequilin from the *Sample solution*. Calculate the percentages of 17 $\alpha$ -estradiol, 17 $\alpha$ -dihydroequilin, and 17 $\beta$ -dihydroequilin as their sodium sulfate salts in the portion of Conjugated Estrogens taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times F \times 100$$

- $R_U$  = ratio of the peak response of the appropriate analyte to that of the internal standard from the *Sample solution*  
 $R_S$  = ratio of the peak response of 17 $\alpha$ -dihydroequilin to that of the internal standard from the *Standard solution*  
 $C_S$  = concentration of USP 17 $\alpha$ -Dihydroequilin RS in the *Standard solution* ( $\mu\text{g/mL}$ )  
 $C_U$  = concentration of the *Sample solution* ( $\mu\text{g/mL}$ )  
 $F$  = conversion factor (ratio of molecular weight of sodium salts to free estrogen), 1.381  
**Acceptance criteria:** NLT 13.5% and NMT 19.5% of 17 $\alpha$ -dihydroequilin, NLT 2.5% and NMT 9.5% of 17 $\alpha$ -estradiol, and NLT 0.5% and NMT 4.0% of 17 $\beta$ -dihydroequilin, as their sodium sulfate conjugates

## IMPURITIES

- LIMITS OF 17 $\alpha$ -DIHYDROEQUILININ, 17 $\beta$ -DIHYDROEQUILININ, AND EQUILENIN** (signal impurities)  
 Buffer, Internal standard solution, Standard stock solution, Standard solution, System suitability solution, Sample solution, and Chromatographic system: Proceed as directed in the *Assay*.

### Analysis

**Samples:** *Standard solution* and *Sample solution*  
 [NOTE—The relative retention times for dihydroequilenin, 17 $\beta$ -dihydroequilenin, 3-O-methylestrone, and equilenin are 0.56, 0.64, 1.0, and 1.3, respectively.]

Identify any peaks for dihydroequilenin, 17 $\beta$ -dihydroequilenin, 3-O-methylestrone, and equilenin from the *Sample solution*. Calculate the percentages of 17 $\alpha$ -dihydroequilenin, 17 $\beta$ -dihydroequilenin, and equilenin as their sodium sulfate salts in the portion of Conjugated Estrogens taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times F \times 100$$

- $R_U$  = ratio of the peak response of the appropriate analyte to that of the internal standard from the *Sample solution*  
 $R_S$  = ratio of the peak response of estrone to that of the internal standard from the *Standard solution*  
 $C_S$  = concentration of USP Estrone RS in the *Standard solution* ( $\mu\text{g/mL}$ )  
 $C_U$  = concentration of the *Sample solution* ( $\mu\text{g/mL}$ )  
 $F$  = conversion factor (ratio of molecular weight of sodium salts to free estrogen), 1.381

**Acceptance criteria:** NMT 3.25%, NMT 2.75%, and NMT 5.5% of the labeled content of Conjugated Estrogens for 17 $\alpha$ -dihydroequilenin, 17 $\beta$ -dihydroequilenin, and equilenin, respectively, as their sodium sulfate salts

- LIMITS OF 17 $\beta$ -ESTRADIOL AND  $\Delta^{8,9}$ -DEHYDROESTRONE**  
 Buffer, Internal standard solution, Standard stock solution, Standard solution, System suitability solution, Sample solution, and Chromatographic system: Proceed as directed in the *Assay*.

### Analysis

**Samples:** *Standard solution* and *Sample solution*  
 [NOTE—The relative retention times of 17 $\beta$ -estradiol, 3-O-methylestrone, and  $\Delta^{8,9}$ -dehydroestrone are about 0.29, 1.0, and 0.9, respectively.]

Identify any peaks for 17 $\beta$ -estradiol, 3-O-methylestrone, and  $\Delta^{8,9}$ -dehydroestrone from the *Sample solution*.

Calculate the percentages of 17 $\beta$ -estradiol and  $\Delta^{8,9}$ -dehydroestrone as their sodium sulfate salts in the portion of Conjugated Estrogens taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times F \times 100$$

- $R_U$  = ratio of the peak response of the appropriate analyte to that of the internal standard from the *Sample solution*  
 $R_S$  = ratio of the peak response of estrone to that of the internal standard from the *Standard solution*  
 $C_S$  = concentration of USP Estrone RS in the *Standard solution* ( $\mu\text{g/mL}$ )  
 $C_U$  = concentration of the *Sample solution* ( $\mu\text{g/mL}$ )  
 $F$  = conversion factor (ratio of molecular weight of sodium salts to free estrogen), 1.381

**Acceptance criteria:** NMT 2.25% and NMT 6.25% of the labeled content of Conjugated Estrogens for 17 $\beta$ -estradiol and  $\Delta^{8,9}$ -dehydroestrone, respectively, as their sodium sulfate salts

- LIMIT OF ESTRONE, EQUILIN, AND 17 $\alpha$ -DIHYDROEQUILIN** (free steroids)

Buffer, Internal standard solution, Standard stock solution, System suitability solution, and Chromatographic system: Proceed as directed in the *Assay*.

**Free steroids standard solution:** Dilute the *Standard stock solution* tenfold. Pipet 1.0 mL of the resulting solution and 1.0 mL of the *Internal standard solution* into a suitable centrifuge tube fitted with a tight screw cap or stopper. Proceed as directed for *Standard solution* in the *Assay*, beginning with "Evaporate the mixture..."

**Sample solution:** Proceed as directed for *Sample solution* in the *Assay* with the following exceptions: do not add the sulfatase enzyme solution, and transfer 6.0 mL of the solution, instead of 3.0 mL, to the centrifuge tube.

**Blank solution:** Prepare a reagent blank in the same manner as the *Sample solution*.

**System suitability:** Proceed as directed in the *Assay* with the additional requirement that the relative standard deviation for the ratio of the peak response of estrone to that of the internal standard in the *Free steroids standard solution* is NMT 5.5%, from NLT two replicate injections.

### Analysis

**Samples:** *Free steroids standard solution* and *Sample solution*

Calculate the total percentage of estrone, equilin and 17 $\alpha$ -dihydroequilin (free steroids) in the portion of Conjugated Estrogens taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

- $R_U$  = ratio of the sum of the estrone, equilin, and 17 $\alpha$ -dihydroequilin peak areas (corrected for any peaks found in the *Blank solution*) to the internal standard peak area from the *Sample solution*  
 $R_S$  = ratio of the estrone peak area to the internal standard peak area from the *Standard solution*  
 $C_S$  = concentration of USP Estrone RS in the *Standard solution* ( $\mu\text{g/mL}$ )  
 $C_U$  = concentration of the *Sample solution* ( $\mu\text{g/mL}$ )  
**Acceptance criteria:** NMT 1.3% of free steroids

## ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at controlled room temperature, or under refrigeration.
- LABELING:** Label it to state the content of Conjugated Estrogens on a weight-to-weight basis.

• **USP REFERENCE STANDARDS** <11>

## Conjugated Estrogens Tablets

### DEFINITION

Conjugated Estrogens Tablets contain NLT 73.0% and NMT 95.0% of the labeled amount of conjugated estrogens as the total of sodium estrone sulfate and sodium equilin sulfate. The ratio of sodium equilin sulfate to sodium estrone sulfate in the Tablets is NLT 0.35 and NMT 0.65.

### IDENTIFICATION

- **A.** The relative retention times of the 17 $\alpha$ -dihydroequilin peak, the estrone peak, and the equilin peak from the *Sample solution* correspond to those from the *Standard solution*, as obtained in the *Assay*.
- **B.** The chromatogram of the *Sample solution* in the *Assay* exhibits additional peaks or shoulders, corresponding to 17 $\alpha$ -estradiol and 17 $\beta$ -dihydroequilin at retention times of about 0.24 and 0.35, relative to that of 3-O-methylestrone.

### ASSAY

• **PROCEDURE**

**Buffer:** Sodium acetate TS, 1 N acetic acid, and water (79:21:400). Adjust with 1 N acetic acid or sodium acetate TS to a pH of  $5.2 \pm 0.1$ , if necessary.

**Internal standard solution:** 150  $\mu$ g/mL of 3-O-methylestrone in methanol

**Standard stock solution:** 160, 70, and 50  $\mu$ g/mL each of USP Estrone RS, USP Equilin RS, and USP 17 $\alpha$ -Dihydroequilin RS, respectively, in alcohol

**Standard solution:** Pipet 1.0 mL of the *Internal standard solution* and 1.0 mL of the *Standard stock solution* into a suitable centrifuge tube fitted with a tight screw cap or stopper. Evaporate the mixture with the aid of a stream of nitrogen to dryness, maintaining the temperature below 50°. To the dry residue add 15  $\mu$ L of dried pyridine and 65  $\mu$ L of bis(trimethylsilyl)trifluoroacetamide containing 1% trimethylchlorosilane. Immediately cover the tube tightly, mix, and allow to stand for 15 min. Add 0.5 mL of toluene, and mix.

**System suitability solution:** Pipet 1.0 mL of a 2.0- $\mu$ g/mL solution of USP Estradiol RS (17 $\beta$ -estradiol) in alcohol, 1.0 mL of *Internal standard solution*, and 1.0 mL of *Standard stock solution* into a centrifuge tube fitted with a tight screw cap or stopper. Proceed as directed for the *Standard solution*, beginning with "Evaporate the mixture..."

**Sample solution:** If the Tablets are sugar coated, carefully remove the color and sugar coatings with water, leaving the shellac coating intact, and dry under nitrogen. Transfer an equivalent to 2 mg of total conjugated estrogens from NLT 20 finely powdered Tablets, to a 50-mL centrifuge tube fitted with a polytef-lined screw-cap and containing 15 mL of *Buffer* and 1 g of barium chloride. Cap the tube tightly, and shake for 30 min. If necessary, adjust the solution with 1 N acetic acid or sodium acetate to a pH of  $5.0 \pm 0.5$ . Sonicate for 30 s, then shake for an additional 30 min. Add a suitable sulfatase enzyme solution equivalent to 2500 Units, and shake for 20 min in a water bath maintained at 50°. Add 15.0 mL of ethylene dichloride to the warm mixture, cap the tube again, and shake by mechanical means for 15 min. Centrifuge for 10 min or until the

lower layer is clear. Transfer as much of the organic phase as possible, and dry by rapidly passing through a filter consisting of a pledget of dry glass wool and 5 g of anhydrous sodium sulfate in a small funnel. Protect from loss by evaporation. Transfer 3.0 mL of the solution to a suitable centrifuge tube fitted with a tight screw cap or stopper. Add 1.0 mL of *Internal standard solution*. Proceed as directed for the *Standard solution*, beginning with "Evaporate the mixture..."

### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 0.25-mm  $\times$  15-m fused silica capillary; bonded with a 0.25- $\mu$ m layer of phase G19

**Temperatures**

**Column:** 208°

**Detector:** 260°

**Injection port:** 260°

**Carrier gas:** Hydrogen

**Flow rate:** 2 mL/min

**Injection mode:** Split

**Split flow rate:** 40–60 mL/min

**Injection volume:** 1  $\mu$ L

### System suitability

**Samples:** *Standard solution* and *System suitability solution*

[NOTE—Adjust the operating conditions as necessary to maintain the elution time of the 3-O-methylestrone peak at 17–25 min.]

[NOTE—The relative retention times for 17 $\beta$ -estradiol, 17 $\alpha$ -dihydroequilin, estrone, equilin, and 3-O-methylestrone are about 0.29, 0.30, 0.80, 0.87, and 1.00, respectively.]

### Suitability requirements

**Resolution:** NLT 1.2 between estrone and equilin, *System suitability solution*

**Tailing factor:** NMT 1.3 for the estrone peak, *System suitability solution*

**Relative standard deviation:** NMT 2.0% of the estrone peak ratios for NLT four injections of the *Standard solution*

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of sodium estrone sulfate and sodium equilin sulfate in the portion of Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times F \times 100$$

$R_U$  = peak response ratio of the appropriate analyte to that of the internal standard from the *Sample solution*

$R_S$  = peak response ratio of the appropriate analyte to that of the internal standard from the *Standard solution*

$C_S$  = concentration of USP Estrone RS or USP Equilin RS in the *Standard solution* ( $\mu$ g/mL)

$C_U$  = nominal concentration of estrone or equilin in the *Sample solution* ( $\mu$ g/mL)

$F$  = conversion factor (ratio of molecular weight of sodium salts to free estrogen), 1.381

**Acceptance criteria:** 73.0%–95.0% of the labeled amount of conjugated estrogens as the total of sodium estrone sulfate and sodium equilin sulfate. The ratio of sodium equilin sulfate to sodium estrone sulfate is NLT 0.35 and NMT 0.65.

### PERFORMANCE TESTS

- **DISSOLUTION** <711>: Proceed as directed for *Extended-Release* articles.

**Test 1** (for products labeled as 0.3-, 0.45-, and 0.625-mg tablets): If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 1*.

**Medium:** Water; 900 mL

**Apparatus 2:** 50 rpm

**Times:** 2, 5, and 8 h

**Buffer:** 0.025 M monobasic potassium phosphate

**Mobile phase:** Acetonitrile and *Buffer* (1:3)

**Standard solution:** Transfer 10 Tablets to a 1000-mL volumetric flask, dilute with water to volume, and stir vigorously by mechanical means for at least 3 h. Pipet a filtered 100-mL aliquot of the solution into a 900-mL volumetric flask, and dilute with water to volume.

**Sample solution:** Filter a portion of the solution under test. It is recommended that the filters selected be tested for binding affinity.

#### Chromatographic system

(see *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 205 nm

**Column:** 4.6-mm × 3.0-cm; 3-μm packing L1

**Flow rate:** 1.5 mL/min

**Injection volume:** 20–200 μL

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for equilin sulfate and estrone sulfate are about 0.9 and 1.0, respectively. The estrone sulfate peak is the last major peak in the chromatogram. If estrone is present, it may be retained on the column for a period longer than 50 min and interfere in later chromatographic runs.]

#### Suitability requirements

**Resolution:** NLT 1.5 between equilin sulfate and estrone sulfate

**Relative standard deviation:** NMT 1.5% for the estrone sulfate peak

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of estrone sodium sulfate dissolved:

$$\text{Result} = (r_U/r_S) \times 100$$

$r_U$  = estrone sulfate peak response from the *Sample solution*

$r_S$  = estrone sulfate peak response from the *Standard solution*

**Tolerances:** See *Table 1*.

**Table 1**

Time (h)	Amount Dissolved (%)
2	19–49
5	66–96
8	NLT 80

The percentages of the labeled amount of estrone sodium sulfate dissolved at the times specified conform to *Acceptance Table 2* in <711>.

**Test 2** (for products labeled as 0.9-mg tablets): If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

**Medium, Apparatus, Times, Mobile phase, Standard solution, Sample solution, Chromatographic system, System suitability, and Analysis:** Proceed as directed for *Test 1*.

**Tolerances:** See *Table 2*.

**Table 2**

Time (h)	Amount Dissolved (%)
2	12–37
5	57–85
8	NLT 80

The percentages of the labeled amount of estrone sodium sulfate dissolved at the times specified conform to *Acceptance Table 2* in <711>.

**Test 3** (for products labeled as 1.25- and 2.50-mg tablets): If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

**Medium, Apparatus, Mobile phase, Standard solution, Sample solution, Chromatographic system, System suitability, and Analysis:** Proceed as directed for *Test 1*.

**Times:** 2, 5, 8, and 12 h

**Tolerances:** See *Table 3*.

**Table 3**

Time (h)	Amount Dissolved (%)
2	3–22
5	37–67
8	66–96
12	NLT 80

The percentages of the labeled amount of estrone sodium sulfate dissolved at the times specified conform to *Acceptance Table 2* in <711>.

**Test 4** (for products labeled as 1.25-mg tablets): If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4*.

**Medium:** Acetate buffer, pH 4.5; 900 mL

**Apparatus 2:** 50 rpm, with sinkers

**Times:** 2, 4, 8, and 12 h

**Buffer:** 0.025 M monobasic potassium phosphate

**Mobile phase:** Acetonitrile and *Buffer* (22:78)

**Standard solution:** Weigh 20 Tablets and determine the average tablet weight. Grind the Tablets to a uniform fine powder. Weigh a portion of the powdered Tablets equivalent to the average tablet weight, transfer to a 900-mL volumetric flask, and dilute with *Medium* to volume. Stir vigorously by mechanical means for at least 2 h or until the dissolution of the powder is complete. Pass a portion of the extract through a suitable filter of 10-μm pore size.

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 10-μm pore size. It is recommended that the filters selected be tested for binding affinity.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 3.2-mm × 5.0-cm; 5-μm packing L1

**Flow rate:** 0.8 mL/min

**Injection volume:** 20–200 μL

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for equilin sulfate and estrone sulfate are about 0.9 and 1.0, respectively. The estrone sulfate peak is the last major peak in the chromatogram. If estrone is present, it may be retained on the column for a period longer than 50 min and interfere in later chromatographic runs.]

#### Suitability requirements

**Resolution:** NLT 1.2 between equilin sulfate and estrone sulfate

**Relative standard deviation:** NMT 2.0% for the estrone sulfate peak

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of estrone sulfate dissolved:

$$\text{Result} = (r_U/r_S) \times 100$$

$r_U$  = estrone sulfate peak response from the *Sample solution*

$r_s$  = estrone sulfate peak response from the  
Standard solution

Tolerances: See Table 4.

Table 4

Time (h)	Amount Dissolved (%)
2	11–31
4	43–63
8	75–95
12	NLT 87

The percentages of the labeled amount of estrone sodium sulfate dissolved at the times specified conform to *Acceptance Table 2* in <711>.

**Test 5** (for products labeled as 0.3-, 0.45-, and 0.625-mg tablets): If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 5*.

**Medium, Apparatus, Mobile phase, Standard solution, Sample solution, Chromatographic system, System suitability, and Analysis:** Proceed as directed for *Test 4*.

**Times:** 1, 3, and 8 h

**Tolerances:** See Table 5.

Table 5

Time (h)	Amount Dissolved (%)
1	6–26
3	48–68
8	NLT 87

The percentages of the labeled amount of estrone sodium sulfate dissolved at the times specified conform to *Acceptance Table 2* in <711>.

**Test 6** (for products labeled as 0.9-mg tablets): If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 6*.

**Medium, Apparatus, Mobile phase, Standard solution, Sample solution, Chromatographic system, System suitability, and Analysis:** Proceed as directed for *Test 4*.

**Times:** 1, 3, and 8 h

**Tolerances:** See Table 6.

Table 6

Time (h)	Amount Dissolved (%)
1	3–23
3	41–61

The percentages of the labeled amount of estrone sodium sulfate dissolved at the times specified conform to *Acceptance Table 2* in <711>.

#### • UNIFORMITY OF DOSAGE UNITS

**Analysis:** Assay 10 individual Tablets as directed in the *Assay*, and calculate the average content of conjugated estrogens, as the average of the total contents of sodium estrone sulfate and sodium equilin sulfate, in the 10 Tablets.

**Acceptance criteria:** The requirements are met if the content of each of the Tablets is 85.0%–115.0% of the average content of conjugated estrogens. If the content of NMT 2 Tablets falls outside the range of 85.0%–115.0% of the average content but not outside the range of 75.0%–125.0%, assay an additional 20 Tablets. The requirements are met if the content of NMT 2 of the 30 Tablets falls outside the limits of 85.0%–115.0% of that average, and no unit is outside the range of 75.0%–125.0% of the average content.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **LABELING:** The labeling indicates the Tablet strength and states with which in vitro *Dissolution Test* the product complies.
- **USP REFERENCE STANDARDS** <11>
  - USP 17 $\alpha$ -Dihydroequilin RS
  - Estra-1,3,5(10),7-tetraene-3,17 $\alpha$ -diol.
  - C<sub>18</sub>H<sub>22</sub>O<sub>2</sub> 270.37
  - USP Equilin RS
  - USP Estradiol RS
  - USP Estrone RS

### Esterified Estrogens

#### DEFINITION

Esterified Estrogens is a mixture of the sodium salts of the sulfate esters of the estrogenic substances, principally estrone. It is a dispersion of the estrogenic substances on a suitable powdered diluent. The content of total esterified estrogens is NLT 90.0% and NMT 110.0% of the labeled amount.

Esterified Estrogens contains NLT 75.0% and NMT 85.0% of sodium estrone sulfate, and NLT 6.0% and NMT 15.0% of sodium equilin sulfate, in such proportion that the total of these two components is NLT 90.0%, of the labeled amount of esterified estrogens.

#### IDENTIFICATION

- **A.** The *Sample solution* exhibits peaks for estrone and equilin at relative retention times corresponding to those from the *Standard solution*, as obtained in the *Assay*.

#### ASSAY

##### • PROCEDURE

**Internal standard solution:** 150  $\mu$ g/mL of 3-O-methylestrone in methanol

**Standard stock solution:** 160 and 70  $\mu$ g/mL each of USP Estrone RS and USP Equilin RS in alcohol

**Standard solution:** Pipet 1.0 mL of the *Standard stock solution* and 1.0 mL of *Internal standard solution* into a suitable centrifuge tube fitted with a tight screw cap or stopper. Evaporate the mixture with the aid of a stream of nitrogen to dryness, maintaining the temperature below 50°. To the dry residue add 15  $\mu$ L of dried pyridine and 65  $\mu$ L of bis(trimethylsilyl)trifluoroacetamide containing 1% trimethylchlorosilane. Immediately cover the tube tightly, and allow to stand for 15 min. Add 0.5 mL of toluene.

**System suitability stock solution:** 2  $\mu$ g/mL of USP Estradiol RS (17 $\beta$ -estradiol) in alcohol

**System suitability solution:** Pipet 1.0 mL of *System suitability stock solution*, 1.0 mL of *Standard stock solution*, and 1.0 mL of *Internal standard solution* into a centrifuge tube fitted with a tight screw cap or stopper. Proceed as directed for *Standard solution*, beginning with "Evaporate the mixture..."

**Buffer:** Mix 79 mL of sodium acetate TS with 21 mL of 1 N acetic acid, and dilute with water to 500 mL. If necessary, adjust the solution with 1 N acetic acid or sodium acetate TS to a pH of 5.2  $\pm$  0.1.

**Sample solution:** Transfer the equivalent to 2 mg of total esterified estrogens from Esterified Estrogens, to a 50-mL centrifuge tube, fitted with a polytetrafluoroethylene cap, containing 15 mL of *Buffer* and 1 g of barium chloride. Cap the tube tightly, and shake for 30 min. If necessary, adjust the solution with 1 N acetic acid or sodium acetate to a pH of 5.0  $\pm$  0.5. Sonicate for 30 s, then shake for an additional 30 min. Add a suitable sulfatase enzyme solution equivalent to 2500 Units, and shake for 20 min in a water bath maintained at 50°.

Add 15.0 mL of ethylene dichloride to the warm mixture, cap the tube again, and shake by mechanical means for 15 min. Centrifuge for 10 min or until the lower layer is clear. Transfer as much of the organic phase as possible, and dry by passing rapidly through a filter consisting of a pledget of dry glass wool and 5 g of anhydrous sodium sulfate in a small funnel. Protect from loss by evaporation. Transfer 3.0 mL of the solution to a suitable centrifuge tube fitted with a tight screw cap or stopper. Add 1.0 mL of *Internal standard solution*. Proceed as directed under *Standard solution*, beginning with "Evaporate the mixture..."

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 0.25-mm × 15-m fused silica capillary column; with a 0.25-μm layer of phase G19

**Temperature**

**Column:** 208°

**Detector:** 260°

**Injector port:** 260°

**Carrier gas:** Hydrogen

**Flow rate:** 2 mL/min

**Injection mode:** Split

**Split flow rate:** 40–60 mL/min

**Injection size:** 1 μL

#### System suitability

**Samples:** *Standard solution* and *System suitability solution*

[NOTE—Adjust the operating conditions as necessary to maintain the elution time of the 3-O-methylestrone peak at between 17 and 25 min.]

[NOTE—The relative retention times for 17β-estradiol, estrone, equilin, and 3-O-methylestrone are 0.29, 0.80, 0.87, and 1.00, respectively.]

#### Suitability requirements

**Resolution:** NLT 1.2 between estrone and equilin, *System suitability solution*

**Tailing factor:** NMT 1.3 for the estrone peak, *System suitability solution*

**Relative standard deviation:** NMT 2.0% for the estrone peak ratios for NLT 4 injections, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Separately calculate the percentage of the labeled amount of sodium estrone sulfate and sodium equilin sulfate in the portion of Esterified Estrogens taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times F \times 100$$

$R_U$  = ratio of the estrone or equilin peak area to the 3-O-methylestrone peak area from the *Sample solution*

$R_S$  = ratio of the estrone or equilin peak area to the 3-O-methylestrone peak area from the *Standard solution*

$C_S$  = concentration of USP Estrone RS or USP Equilin RS in the *Standard solution* (μg/mL)

$C_U$  = concentration of the *Sample solution* (μg/mL)

$F$  = factor converting free estrogen to the conjugate ester sodium salt, 1.377 for estrone and 1.380 for equilin

**Acceptance criteria:** 90.0%–110.0% of the labeled amount of total esterified estrogens; 75.0%–85.0% of sodium estrone sulfate; 6.0%–15.0% of sodium equilin sulfate, in such proportion that the total of these two components is NLT 90.0%, of the labeled amount of esterified estrogens

#### IMPURITIES

##### • FREE STEROIDS

**Internal standard solution, Buffer, Standard stock solution, Chromatographic system, and System suitability solution:** Proceed as directed in the *Assay*.

**Free steroids standard solution:** Dilute the *Standard stock solution* tenfold. Pipet 1.0 mL of the resulting solution and 1.0 mL of the *Internal standard solution* into a suitable centrifuge tube fitted with a tight screw cap or stopper. Proceed as directed for *Standard solution* in the *Assay*, beginning with "Evaporate the mixture..."

**Sample solution:** Proceed as directed for *Sample solution* in the *Assay* with the following exceptions: do not add the sulfatase enzyme solution, and transfer 6.0 mL of the filtrate instead of 3.0 mL to the *Sample solution*.

**Blank solution:** Prepare a reagent blank in the same manner as the *Sample solution*.

**System suitability:** Proceed as directed in the *Assay* with the additional requirement that the relative standard deviation for the ratio of the peak response of estrone to that of the internal standard in the *Free steroids standard solution* is NMT 5.5%, on the basis of NLT two replicate injections.

#### Analysis

**Samples:** *Free steroids standard solution* and *Sample solution*

Calculate the total percentage of estrone and equilin (free steroids) in the portion of Esterified Estrogens taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = ratio of the sum of the estrone and equilin peak areas (corrected for any peaks found in the *Blank solution*) to the 3-O-methylestrone peak area from the *Sample solution*

$R_S$  = ratio of the estrone peak area to the 3-O-methylestrone peak area from the *Free steroids standard solution*

$C_S$  = concentration of USP Estrone RS in the *Free steroids standard solution* (μg/mL)

$C_U$  = concentration of the *Sample solution* (μg/mL)

**Acceptance criteria:** NMT 3.0% of free steroids

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Label it to state the content of Esterified Estrogens on a weight-to-weight basis.
- **USP REFERENCE STANDARDS** <11>
  - USP Equilin RS
  - USP Estradiol RS
  - USP Estrone RS

## Esterified Estrogens Tablets

#### DEFINITION

Esterified Estrogens Tablets contain NLT 90.0% and NMT 115.0% of the labeled amount of esterified estrogens as the total of sodium estrone sulfate and sodium equilin sulfate. The ratio of sodium equilin sulfate to sodium estrone sulfate is NLT 0.071 and NMT 0.20.

#### IDENTIFICATION

- **A.** The *Sample solution* exhibits peaks for estrone and equilin at relative retention times corresponding to those from the *Standard solution*, as obtained in the *Assay*.

#### ASSAY

##### • PROCEDURE

**Internal standard solution:** 150 μg/mL of 3-O-methylestrone in methanol

**Standard stock solution:** 160 and 70 µg/mL each of USP Estrone RS and USP Equilin RS in alcohol

**Standard solution:** Pipet 1.0 mL of the *Standard stock solution* and 1.0 mL of the *Internal standard solution* into a suitable centrifuge tube fitted with a tight screw cap or stopper. Evaporate the mixture with the aid of a stream of nitrogen to dryness, maintaining the temperature below 50°. To the dry residue add 15 µL of dried pyridine and 65 µL of bis(trimethylsilyl)-trifluoroacetamide containing 1% trimethylchlorosilane. Immediately cover the tube tightly, and allow to stand for 15 min. Add 0.5 mL of toluene.

**System suitability stock solution:** 2 µg/mL of USP Estradiol RS (17β-estradiol) in alcohol

**System suitability solution:** Pipet 1.0 mL of *System suitability stock solution*, 1.0 mL of *Standard stock solution*, and 1.0 mL of *Internal standard solution* into a centrifuge tube fitted with a tight screw cap or stopper. Proceed as directed for *Standard solution*, beginning with "Evaporate the mixture..."

**Buffer:** Mix 79 mL of sodium acetate TS with 21 mL of 1 N acetic acid, and dilute with water to 500 mL. If necessary, adjust the solution with 1 N acetic acid or sodium acetate TS to a pH of 5.2 ± 0.1.

**Sample solution:** Transfer an equivalent to 2 mg of total esterified estrogens from powdered Tablets (NLT 20), to a 50-mL centrifuge tube, fitted with a polytetrafluoroethylene-lined screw cap, containing 15 mL of *Buffer* and 1 g of barium chloride. Cap the tube tightly, and shake for 30 min. If necessary, adjust the solution with 1 N acetic acid or sodium acetate to a pH of 5.0 ± 0.5. Sonicate for 30 s, then shake for an additional 30 min. Add a suitable sulfatase enzyme solution equivalent to 2500 Units, and shake for 20 min in a water bath maintained at 50°. Add 15.0 mL of ethylene dichloride to the warm mixture, cap the tube again, and shake by mechanical means for 15 min. Centrifuge for 10 min or until the lower layer is clear. Transfer as much of the organic phase as possible, and dry by passing rapidly through a filter consisting of a pledget of dry glass wool and 5 g of anhydrous sodium sulfate in a small funnel. Protect from loss by evaporation. Transfer 3.0 mL of the solution to a suitable centrifuge tube fitted with a tight screw cap or stopper. Add 1.0 mL of *Internal standard solution*. Proceed as directed under *Standard solution*, beginning with "Evaporate the mixture..."

#### Chromatographic system

(See Chromatography <621>, *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 0.25-mm × 15-m fused silica capillary column; with a 0.25-µm layer of phase G19

**Temperature**

**Column:** 208°

**Detector:** 260°

**Injector port:** 260°

**Carrier gas:** Hydrogen

**Flow rate:** 2 mL/min

**Injection mode:** Split

**Split flow rate:** 40–60 mL/min

**Injection size:** 1 µL

#### System suitability

**Samples:** *Standard solution* and *System suitability solution*

[NOTE—Adjust the operating conditions as necessary to maintain the elution time of the 3-O-methylestrone peak between 17 and 25 min.]

[NOTE—The relative retention times for 17β-estradiol, estrone, equilin, and 3-O-methylestrone are about 0.29, 0.80, 0.87, and 1.00, respectively.]

#### Suitability requirements

**Resolution:** NLT 1.2 between estrone and equilin, *System suitability solution*

**Tailing factor:** NMT 1.3 for the estrone peak, *System suitability solution*

**Relative standard deviation:** NMT 2.0% for the estrone peak ratios for NLT 4 injections, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Separately calculate the percentage of the labeled amount of sodium estrone sulfate and sodium equilin sulfate in the portion of Esterified Estrogens taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times F \times (100)$$

$R_U$  = ratio of the estrone or equilin peak to the 3-O-methylestrone peak area from the *Sample solution*

$R_S$  = ratio of the estrone or equilin peak to the 3-O-methylestrone peak area from the *Standard solution*

$C_S$  = concentration of USP Estrone RS or USP Equilin RS in the *Standard solution* (µg/mL)

$C_U$  = nominal concentration of estrone or equilin in the *Sample solution* (µg/mL)

$F$  = factor converting free estrogen to the conjugate sodium salt, 1.377 for estrone and 1.380 for equilin

**Acceptance criteria:** 90.0%–115.0%

#### PERFORMANCE TESTS

##### • DISINTEGRATION <701>

**Simulated intestinal fluid:** Dissolve 6.8 g of monobasic potassium phosphate in 250 mL of water, mix, add 190 mL of 0.2 N sodium hydroxide and 400 mL of water. Add 10.0 g of pancreatin, mix, and adjust the resulting solution with 0.2 N sodium hydroxide to a pH of 7.5 ± 0.1. Dilute with water to 1000 mL.

**Analysis:** Place 1 Tablet in each of the six tubes of the basket, and immerse the basket in water at 25 ± 0.5° for 5 min to remove the coating. Add a disk to each tube, and operate the apparatus using simulated gastric fluid TS, maintained at 37 ± 2°, as the immersion fluid. After 30 min in simulated gastric fluid TS, lift the basket from the fluid, and observe the Tablets.

**Acceptance criteria:** All the Tablets have disintegrated. If all the Tablets have not disintegrated completely, substitute *Simulated intestinal fluid*, maintained at 37 ± 2°, as the immersion fluid, and continue the test so that the total period of time, including previous exposure to water and simulated gastric fluid TS, does not exceed 90 min.

##### • UNIFORMITY OF DOSAGE UNITS (905)

**Analysis:** Test 10 individual Tablets as directed in the Assay, and calculate the average content of esterified estrogens, as the average of the total contents of sodium estrone sulfate and sodium equilin sulfate, in the 10 Tablets.

**Acceptance criteria:** The requirements are met if the content of each of the Tablets is 85.0%–115.0% of the average content of esterified estrogens. If the content of NMT 2 Tablets falls outside the range of 85.0%–115.0% of the average content but not outside the range of 75.0%–125.0%, test an additional 20 Tablets. The requirements are met if the content of NMT 2 of the 30 Tablets falls outside the limits of 85.0%–115.0% of the average, and no unit is outside the range of 75.0%–125.0% of the average content.

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

##### • USP REFERENCE STANDARDS <11>

USP Equilin RS  
USP Estradiol RS  
USP Estrone RS

## Estrone

$C_{18}H_{22}O_2$  270.37  
Estra-1,3,5(10)-trien-17-one, 3-hydroxy-.  
3-Hydroxyestra-1,3,5(10)-trien-17-one [53-16-7].

» Estrone contains not less than 97.0 percent and not more than 103.0 percent of  $C_{18}H_{22}O_2$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

**USP Reference standards** (11)—  
USP Estrone RS

**Clarity of solution**—Add 100 mg to 100 mL of 1 N sodium hydroxide in a 125-mL conical flask, heat on a steam bath until solution is complete, then cool, and transfer to a 100-mL color-comparison tube: the solution is clear.

### Identification—

**A:** Infrared Absorption (197K).

**B:** Ultraviolet Absorption (197U)—

*Solution:* 50 µg per mL.

*Medium:* alcohol, heated on a steam bath and cooled to room temperature.

**Specific rotation** (781S): between +158° and +165°.

*Test solution:* 10 mg, previously dried, per mL, in dioxane.

**Loss on drying** (731)—Dry it at 105° for 3 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.5%.

**Limit of equilenin and equilin**—Dissolve 10 mg in sufficient alcohol to make 50 mL. Transfer 5 mL of the solution to a small beaker. Add 5 mL of a buffer solution prepared by dissolving 2 mL of glacial acetic acid and 13.3 g of anhydrous sodium acetate in water to make 100 mL, warm to about 50°, and add 1 mL of a freshly prepared 1 in 200 solution of 2,6-dibromoquinone-chlorimide in alcohol. Mix, and allow to stand for 30 minutes. Transfer the solution to a small separator, add 10 mL of chloroform and 20 mL of 1 N sodium hydroxide, and shake vigorously for 2 minutes. Separate the chloroform layer, and filter rapidly through a dry filter paper into a dry test tube, discarding the first 2 mL of the filtrate. Viewed transversely against a white background, the chloroform filtrate shows no more red color than that produced by similarly treating 5 mL of an alcohol solution containing 20 µg of equilenin.

### Ordinary impurities (466)—

*Test solution:* acetone.

*Standard solution:* acetone.

*Eluant:* a mixture of chloroform and acetone (9:1), in a nonequilibrated chamber.

*Visualization:* 5.

### Assay—

*Mobile phase*—Prepare a filtered and degassed mixture of acetonitrile and 0.05 M monobasic potassium phosphate (1:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Transfer about 20 mg of USP Estrone RS, accurately weighed, to a 100-mL volumetric flask, add methanol to volume, and mix. If necessary, sonicate to aid solution. Transfer 5 mL of this solution to a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix to

obtain a *Standard preparation* having a known concentration of about 40 µg of USP Estrone RS per mL.

*Assay preparation*—Transfer about 20 mg of Estrone, accurately weighed, to a 100-mL volumetric flask, add methanol to volume, and mix. If necessary, sonicate to aid solution. Transfer 5.0 mL of this solution to a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency determined from the analyte peak is not less than 1500 theoretical plates, the tailing factor for the analyte peak is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{18}H_{22}O_2$  in the portion of Estrone taken by the formula:

$$0.5C(r_U / r_S)$$

in which C is the concentration, in µg per mL, of USP Estrone RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Estrone Injectable Suspension

» Estrone Injectable Suspension is a sterile suspension of Estrone in Water for Injection. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of  $C_{18}H_{22}O_2$ .

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass.

**USP Reference standards** (11)—

USP Endotoxin RS

USP Estrone RS

USP Progesterone RS

**Identification**—Transfer a volume of Injectable Suspension, equivalent to about 5 mg of estrone, to a glass-stoppered centrifuge tube, and add 2.5 mL of a mixture of ether and benzene (1:1). Shake for 2 minutes, and allow insoluble matter to settle, centrifuging, if necessary, to obtain a clear supernatant. Apply 5 µL each of this supernatant and a 1 in 500 solution of USP Estrone RS in a mixture of ether and benzene (1:1) to a suitable thin-layer chromatographic plate (see *Chromatography* (621)), coated with a 0.25-mm layer of chromatographic silica gel. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of benzene and acetone (4:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Spray the plate with a mixture of dehydrated alcohol and sulfuric acid (3:1), and heat in an oven at 105° for 10 minutes: the  $R_f$  value and appearance (pale orange to amber by direct observation in daylight, and fluorescing pale yellow-green under long-wavelength UV light) of the principal spot obtained from the test solution correspond to those obtained from the Standard solution.

**Bacterial endotoxins** (85)—It contains not more than 88.0 USP Endotoxin Units per mg of estrone.

**Uniformity of dosage units** (905): meets the requirements.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay—**

*Mobile phase, Standard preparation, and Chromatographic system*—Prepare as directed in the *Assay under Estrone*.

*Assay preparation*—Transfer an accurately measured volume of the well-mixed Injectable Suspension, equivalent to about 10 mg of estrone to a 50-mL volumetric flask. Add 30 mL of methanol and swirl for 5 minutes. Dilute with methanol to volume, and mix. Transfer 5.0 mL of this solution to a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the *Assay under Estrone*. Calculate the quantity, in mg, of  $C_{18}H_{22}O_2$  in each mL of Injectable Suspension taken by the formula:

$$0.25(C/V)(r_U/r_S)$$

in which  $V$  is the volume, in mL, of the Injectable Suspension taken, and the other terms are as defined therein.

## Estropipate

$C_{18}H_{22}O_5S \cdot C_4H_{10}N_2$  436.56

Estra-1,3,5(10)-trien-17-one, 3-(sulfooxy)-, compd. with piperazine (1:1).

Estrone hydrogen sulfate compound with piperazine (1:1) [7280-37-7].

» Estropipate contains not less than 97.0 percent and not more than 103.0 percent of  $C_{18}H_{22}O_5S \cdot C_4H_{10}N_2$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Estrone RS

USP Estropipate RS

**Identification, Infrared Absorption** (197K).

**Loss on drying** (731)—Dry it at 105° for 1 hour: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.5%.

**Free estrone—**

*Stock impurity standard preparation*—Weigh accurately 25.0 mg of USP Estrone RS into a 100-mL volumetric flask, dilute with spectrophotometric-grade methanol to volume, and sonicate to achieve complete solution.

*Impurity standard preparation*—Weigh accurately 25.0 mg of USP Estropipate RS into a 25-mL volumetric flask, add 2.0 mL of *Stock impurity standard preparation*, dilute with spectrophotometric-grade methanol to volume, and sonicate to achieve complete solution.

*Standard preparation*—Weigh accurately 25.0 mg of USP Estropipate RS into a 25-mL volumetric flask, dilute with spectrophotometric-grade methanol to volume, and sonicate to achieve complete solution.

*Test preparation*—Using a portion of Estropipate, accurately weighed, prepare as directed under *Standard preparation*.

*Mobile phase*—Mix 650 mL of 0.025 M potassium dihydrogen phosphate with 350 mL of spectrophotometric-

grade acetonitrile. Filter the solution through a membrane filter having a porosity of 1  $\mu$ m or less, and degas at a pressure of less than 100 mm of mercury until no further bubbles appear. The concentration of acetonitrile may be varied to meet system suitability requirements and to provide a suitable elution time for all components.

*Chromatographic system*—Typically, a high-pressure liquid chromatograph, operated at room temperature, is fitted with a 30-cm  $\times$  3.9-mm stainless steel column that contains packing L1. The mobile phase is maintained at a pressure and flow rate (approximately 1.5 mL per minute) capable of giving the required resolution (see *System suitability test*) and a suitable elution time. An UV detector that monitors absorption at a wavelength of 213 nm is used with a recorder adjusted such that approximately 0.04 absorbance unit gives a full-scale reading.

*System suitability test*—Chromatograph two injections of the *Impurity standard preparation*, and determine that after the injection front the small peak (estrone) after the major peak does not differ in peak response between the duplicate injections by more than 4%. Also determine that the small peak after the major component has a retention time relative to the major component of approximately 5.5. (For a particular column, resolution may be increased by decreasing the amount of acetonitrile in the *Mobile phase*.)

*Procedure*—Inject separately 5.0- $\mu$ L portions of the *Standard preparation*, the *Impurity standard preparation*, and the *Test preparation* into the high-pressure liquid chromatograph by means of a suitable sampling valve or high-pressure microsyringe. Measure the peak responses for the estrone peak relative to the estropipate peak obtained with the *Standard preparation*, the *Impurity standard preparation*, and the *Test preparation*. Calculate the percentage of free estrone taken by the formula:

$$2.5(C/W)(H_U/H_S)$$

in which  $H_U$  and  $H_S$  are the measured peak heights of the impurity (estrone) in the *Test preparation* and the *Impurity standard preparation* corrected for the peak height of estrone in the *Standard preparation*, respectively,  $W$  is the weight, in mg, of estropipate in the *Test preparation*, and  $C$  is the concentration, in  $\mu$ g per mL, of USP Estrone RS in the *Impurity standard preparation*. Not more than 2.0% is found.

**Assay—**

*Standard preparation*—Prepare as directed under *Free estrone*.

*Assay preparation*—Prepare as directed for *Test preparation* under *Free estrone*.

*Chromatographic system*—Use the same system as in test for *Free estrone*. Adjust the recorder so that approximately 0.4 absorbance unit gives a full-scale reading.

*System suitability test*—Chromatograph two injections of the *Standard preparation*, and determine that only one major peak is observed after the injection front. The peak responses between the duplicate injections for the major peak do not differ by more than 3%.

*Procedure*—Inject 5.0  $\mu$ L of the *Assay preparation* and the *Standard preparation* into the high-pressure liquid chromatograph by means of a suitable sampling valve or high-pressure microsyringe. Measure the peak heights for the respective estropipate peak (it is actually an estrone sulfate peak) obtained with the *Assay preparation* and the *Standard preparation*. Calculate the quantity, in mg, of  $C_{18}H_{22}O_5S \cdot C_4H_{10}N_2$  in the portion of Estropipate taken by the formula:

$$25C(H_U/H_S)$$

in which  $H_U$  and  $H_S$  are the peak heights obtained with the *Assay preparation* and the *Standard preparation*, respectively, and  $C$  is the concentration, in mg per mL, of USP Estropipate RS in the *Standard preparation*.

## Estropipate Vaginal Cream

» Estropipate Vaginal Cream contains not less than 90.0 percent and not more than 120.0 percent of the labeled amount of estropipate ( $C_{18}H_{22}O_5S \cdot C_4H_{10}N_2$ ), in a suitable cream base.

**Packaging and storage**—Preserve in collapsible tubes.

**USP Reference standards** (11)—

USP Estropipate RS

**Identification**—

*Arsenomolybdate spray reagent*—Dissolve 25 g of ammonium molybdate in 450 mL of water, add 21 mL of sulfuric acid, and mix. Add 3 g of dibasic sodium arsenate heptahydrate dissolved in 25 mL of water, mix, and incubate at  $37 \pm 2^\circ$  for 24 to 48 hours. Store, protected from light.

*Procedure*—Transfer a portion of Vaginal Cream, equivalent to about 8 mg of estropipate, to a container. Add 20 mL of methanol, stir to obtain a homogeneous mixture, and pass through filter paper. Apply 30  $\mu$ L of the filtrate and 30  $\mu$ L of a Standard solution of USP Estropipate RS in methanol containing about 400  $\mu$ g per mL to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of chloroform and methanol (10:8) until the solvent front has moved about 14 cm from the origin. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots by lightly spraying with *Arsenomolybdate spray reagent* and by heating at  $105^\circ$  for about 20 minutes: the  $R_f$  values of the principal spots obtained from the test solution correspond to those obtained from the Standard solution.

**Minimum fill** (755): meets the requirements.

**Assay**—

**Mobile phase**—Prepare a filtered and degassed mixture of 0.1 M monobasic potassium phosphate, methanol, and acetonitrile (215:59:59). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Diluent*—Prepare a mixture of water and methanol (1:1).

*Resolution solution*—Dissolve a suitable quantity of 4'-nitroacetophenone in methanol to obtain a solution having a known concentration of about 1.0 mg per mL. Transfer 5.0 mL of the solution so obtained to a 200-mL volumetric flask, dilute with *Diluent* to volume, and mix.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Estropipate RS in *Diluent*, and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 1.0 mg per mL. Transfer 5.0 mL of the solution so obtained to a 100-mL volumetric flask, dilute with 0.05 M piperazine to volume, and mix. Transfer 5.0 mL of the solution so obtained to a 25-mL volumetric flask, add 5.0 mL of the *Resolution solution*, dilute with 0.05 M piperazine to volume, mix, and filter.

*Assay preparation*—Transfer an accurately weighed portion of Vaginal Cream, equivalent to about 1.5 mg of estropipate, to a 125-mL separator, add 50 mL of chloroform and 20 mL of 0.05 M piperazine, and extract for 3 minutes. Collect the organic extract in another separator, and extract the aqueous layer with an additional 20-mL portion of chloroform. Combine the organic phases, wash with a 20-mL portion of 0.05 M piperazine for 3 minutes, and collect the aqueous washings. Discard the organic layer. Rinse the separators with 0.05 M piperazine, and add the rinse to the aqueous washings. Transfer the aqueous extract and the aqueous washings to a 100-mL volumetric flask, dilute with 0.05 M piperazine to volume, and mix. Transfer 15.0 mL of

the solution so obtained to a 25-mL volumetric flask, dilute with 0.05 M piperazine to volume, mix, and filter.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 213-nm detector and 4.6-mm  $\times$  25-cm column that contains packing L1. The flow rate is about 1 mL per minute. [NOTE—The injection of a diluted solution of 4'-nitroacetophenone can be used to better identify the peak locus.] Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.8 for 4'-nitroacetophenone and 1.0 for estropipate; the resolution,  $R$ , between 4'-nitroacetophenone and estropipate is not less than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms for not less than 30 minutes for the *Standard preparation* and 90 minutes for the *Assay preparation*, and measure the responses for the major peaks. Calculate the quantity, in mg, of estropipate ( $C_{18}H_{22}O_5S \cdot C_4H_{10}N_2$ ) in the portion of Vaginal Cream taken by the formula:

$$166.67C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Estropipate RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Estropipate Tablets

» Estropipate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of estropipate ( $C_{18}H_{22}O_5S \cdot C_4H_{10}N_2$ ).

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Estropipate RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Dissolution** (711)—

*Medium*: 0.05 M pH 6.8 phosphate buffer; 900 mL.

*Apparatus 2*: 75 rpm.

*Time*: 30 minutes.

Determine the amount of  $C_{18}H_{22}O_5S \cdot C_4H_{10}N_2$  dissolved by employing the following method.

*Diluent* and *Mobile phase*—Proceed as directed in the *Assay*.

*System suitability solution*—Transfer about 100 mg of 4'-nitroacetophenone, accurately weighed, to a 100-mL volumetric flask, and dissolve in methanol, sonicating if necessary. Dilute with methanol to volume, and mix. Pipet 2 mL of this solution into a 250-mL volumetric flask, dilute with water to volume, and mix.

*Standard solution*—Dissolve an accurately weighed quantity of USP Estropipate RS in *Diluent*, sonicating if necessary, and dilute quantitatively with *Diluent* to obtain a solution having a known concentration of about 1 mg per mL. Pipet 2 mL of this solution into a 100-mL volumetric flask, dilute with water to volume, and mix. Pipet 4 mL of the solution so obtained into a second 100-mL volumetric flask, add 8.0 mL of the *System suitability solution*, dilute with water to volume, and mix.

**Test solution**—Transfer an accurately measured volume of a filtered portion of the solution under test, equivalent to about 20 µg of estropipate, to a 25-mL volumetric flask. Dilute with water to volume if the contents are less than the nominal volume of the flask, and mix.

**Chromatographic system** (see *Chromatography* <621>)—Prepare as directed in the Assay. To evaluate the system suitability requirements, use the *Standard solution*.

**Procedure**—Separately inject equal volumes (about 300 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity of  $C_{18}H_{22}O_5S \cdot C_4H_{10}N_2$  dissolved.

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_{18}H_{22}O_5S \cdot C_4H_{10}N_2$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

PROCEDURE FOR CONTENT UNIFORMITY—

**Diluent, Mobile phase, System suitability solution, Standard preparation, and Chromatographic system**—Prepare as directed in the Assay.

**Test preparation**—Transfer 1 Tablet to a 50-mL volumetric flask, add 20 mL of water, insert the stopper, and shake by mechanical means for about 30 minutes or until the Tablet disintegrates. Add 20 mL of methanol, insert the stopper, and shake by mechanical means for about 60 minutes. Dilute with *Diluent* to volume, and mix. Transfer an accurately measured volume of this stock solution, equivalent to about 0.25 mg of estropipate, to a 25-mL volumetric flask, dilute with *Diluent* to volume, and mix. Pass this solution through a solvent-resistant membrane filter having a 1-µm or finer porosity, discarding the first portion of the filtrate.

**Procedure**—Proceed as directed in the Assay, except to use the *Test preparation* instead of the *Assay preparation*.

**Assay**—

**Diluent**—Prepare a mixture of methanol and water (1:1).

**Mobile phase**—Dissolve 13.6 g of monobasic potassium phosphate in 1000 mL of water, and mix. Mix 600 mL of the resulting solution with 200 mL of methanol, add 200 mL of acetonitrile with stirring, and mix. Filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Estropipate RS in *Diluent*, sonicating if necessary, and dilute quantitatively with *Diluent* to obtain a solution having a known concentration of about 1 mg per mL. Pipet 1.0 mL of this solution into a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix.

**System suitability solution**—Transfer about 100 mg of 4'-nitroacetophenone, accurately weighed, to a 100-mL volumetric flask, and dissolve in methanol, sonicating if necessary. Dilute with methanol to volume, and mix. Pipet 5 mL of this solution into a 200-mL volumetric flask, dilute with *Diluent* to volume, and mix. Pipet 5 mL of the solution so obtained into a 25-mL volumetric flask, dilute with *Standard preparation* to volume, and mix.

**Assay preparation**—Transfer 20 Tablets to a 1000-mL volumetric flask, add 200 mL of water, insert the stopper, and shake by mechanical means for about 30 minutes or until the Tablets disintegrate completely. Add 200 mL of methanol, insert the stopper, and shake by mechanical means for about 60 minutes. Dilute with *Diluent* to volume, and mix. Transfer an accurately measured volume of this stock solution, equivalent to about 0.25 mg of estropipate, to a 25-mL volumetric flask, dilute with *Diluent* to volume, and mix. Pass this solution through a solvent-resistant membrane filter having a 1-µm or finer porosity, discarding the first portion of the filtrate.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 213-nm detector and a 4.6-mm × 25-cm column that contains packing L1.

The flow rate is about 2 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.85 for 4'-nitroacetophenone and 1.0 for estropipate; the resolution,  $R$ , between estropipate and 4'-nitroacetophenone is not less than 3.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of estropipate ( $C_{18}H_{22}O_5S \cdot C_4H_{10}N_2$ ) in each Tablet taken by the formula:

$$(25C/V)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Estropipate RS in the *Standard preparation*;  $V$  is the volume, in mL, of the stock solution taken to prepare the *Assay preparation*; and  $r_U$  and  $r_S$  are the peak responses for estropipate obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Ethacrynate Sodium for Injection

$C_{13}H_{11}Cl_2NaO_4$  325.12

Acetic acid, [2,3-dichloro-4-(2-methylene-1-oxobutyl)phenoxy]-, sodium salt.

Sodium [2,3-dichloro-4-(2-methylenebutyryl)phenoxy]acetate [6500-81-8].

» Ethacrynate Sodium for Injection is a sterile, freeze-dried powder prepared by the neutralization of Ethacrynic Acid with the aid of Sodium Hydroxide. It contains an amount of ethacrynate sodium equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{13}H_{12}Cl_2O_4$ .

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* <1>.

**Labeling**—Label it to indicate that it was prepared by freeze-drying, having been filled into its container in the form of a true solution.

**USP Reference standards** <11>—

USP Endotoxin RS

USP Ethacrynic Acid RS

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* <1>.

**Identification, Ultraviolet Absorption** <197U>—

*Solution*: 50 µg per mL.

*Medium*: acidified methanol (prepared by adding 9 mL of hydrochloric acid to 100 mL of methanol).

**Bacterial endotoxins** <85>—It contains not more than 5.0 USP Endotoxin Units per mg of ethacrynate sodium.

**pH** <791>: between 5.0 and 7.0, in a solution containing the equivalent of about 50 mg of ethacrynic acid in 50 mL of Sterile Water for Injection.

**Other requirements**—It meets the requirements for *Sterility Tests* <71> and *Uniformity of Dosage Units* <905> under *Injections* <1>.

**Assay—**

*Triethylamine solution, Solvent mixture, Mobile phase, Standard preparation, and Chromatographic system*—Prepare as directed in the Assay under *Ethacrynic Acid Tablets*.

*Assay preparation*—Select a number of containers of Ethacrynic Acid Sodium for Injection, the combined contents of which, on the basis of the labeled amount, are equivalent to about 500 mg of ethacrynic acid. Add about 5 mL of *Solvent mixture* to each container, mix to dissolve the contents, and combine the resulting solutions in a 200-mL volumetric flask. Rinse each container with two additional 5-mL portions of *Solvent mixture*, add the rinsings to the solution in the volumetric flask, dilute with *Solvent mixture* to volume, and mix. Transfer 20.0 mL of this solution to a 100-mL volumetric flask, dilute with *Solvent mixture* to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the Assay under *Ethacrynic Acid Tablets*. Calculate the quantity, in mg, of  $C_{13}H_{12}Cl_2O_4$  in each container of Ethacrynic Acid Sodium for Injection taken by the formula:

$$(1000C/N)(r_U / r_S)$$

in which *N* is the number of containers selected for the Assay preparation.

---

**Ethacrynic Acid**

---

$C_{13}H_{12}Cl_2O_4$  303.14

Acetic acid, [2,3-dichloro-4-(2-methylene-1-oxobutyl)-phenoxy]-, [2,3-Dichloro-4-(2-methylenebutyryl)phenoxy]acetic acid [58-54-8].

» Ethacrynic Acid contains not less than 97.0 percent and not more than 102.0 percent of  $C_{13}H_{12}Cl_2O_4$ , calculated on the dried basis.

**Caution**—Use care in handling Ethacrynic Acid, since it irritates the skin, eyes, and mucous membranes.

**Packaging and storage**—Preserve in well-closed containers. Store at 25°, excursions permitted between 15° and 30°.

**USP Reference standards** (11)—

USP Ethacrynic Acid RS

**Identification—**

**A:** *Infrared Absorption* (197M).

**B:** *Ultraviolet Absorption* (197U)—

*Solution:* 50 µg per mL.

*Medium:* methanol.

Absorptivities at 271 nm, calculated on the dried basis, do not differ by more than 3.0%.

**C:** Add 2 mL of 1 N sodium hydroxide to about 25 mg of it, and heat for several minutes in a boiling water bath. Cool the solution, acidify with 0.25 mL of 18 N sulfuric acid, add 0.5 mL of chromotropic acid sodium salt solution (1 in 10), then add, cautiously, 2 mL of sulfuric acid TS: a deep violet color is produced.

**Loss on drying** (731)—Dry it at a pressure not exceeding 5 mm of mercury at 60° for 2 hours: it loses not more than 0.25% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Toluene extractives**—Accurately weigh about 1 g into a glass-stoppered, 100-mL cylinder. Add 50 mL of sodium sulfite solution (2 in 25), and agitate until the solid dissolves. Allow to stand for 20 minutes, add 5 mL of hydrochloric acid, and mix. Divide the solution between two centrifuge tubes, each of which contains 15 mL of toluene. Close each tube tightly, using a polyethylene stopper, and shake vigorously during 2 minutes, occasionally relieving the pressure from the sulfur dioxide by loosening the stoppers. Centrifuge the tubes, withdraw most of the upper layer by means of a syringe, avoiding withdrawal of any of the lower, aqueous phase, and transfer the toluene extracts to a tared evaporating dish. Repeat the extraction twice with additional 15-mL portions of toluene, and evaporate the combined extracts on a steam bath to dryness. Dry the residue at a pressure not exceeding 5 mm of mercury at 60° for 2 hours. Cool, and weigh: not more than 2.0% of extractives is found.

**Equivalent weight**—Dissolve about 400 mg, accurately weighed, in 100 mL of methanol, add 5 mL of water, and titrate with 0.1 N sodium hydroxide VS, determining the endpoint potentiometrically, using a calomel-glass electrode system. Perform a blank determination, and make any necessary correction. Calculate the equivalent weight on the dried basis: it is between 294 and 309.

**Heavy metals, Method II** (231): 0.001%.

**Assay**—Dissolve about 100 mg of Ethacrynic Acid, accurately weighed, in 20 mL of glacial acetic acid in an iodine flask. Pipet 20 mL of 0.1 N bromine VS into the flask, add 3 mL of hydrochloric acid, immediately insert the stopper, and seal the flask with a few mL of water in the stopper well. Swirl the flask, and allow to stand in the dark for 1 hour. Add 50 mL of water and 15 mL of potassium iodide TS, and immediately titrate with 0.1 N sodium thiosulfate VS, adding 2.0 mL of starch TS as the endpoint is approached. Perform a blank determination (see *Residual Titrations* under *Titrimetry* (541)). Each mL of 0.1 N bromine is equivalent to 15.16 mg of  $C_{13}H_{12}Cl_2O_4$ .

---

**Ethacrynic Acid Tablets**

---

» Ethacrynic Acid Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ethacrynic acid ( $C_{13}H_{12}Cl_2O_4$ ).

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Ethacrynic Acid RS

**Identification—**

**A:** Weigh a portion of finely powdered Tablets, equivalent to about 50 mg of ethacrynic acid, and transfer to a separator containing 25 mL of 0.1 N hydrochloric acid. Extract with two 40-mL portions of methylene chloride, filter the extracts into a 100-mL volumetric flask, and dilute with methylene chloride to volume. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, evaporate in a gentle current of air to dryness, and promptly dissolve the residue in a portion of a 9 in 1000 mixture of hydrochloric acid in anhydrous methanol, then dilute with the acidic methanol to volume: the UV absorption spectrum of the solution exhibits maxima and minima at the same wavelengths as that of a solution of USP Ethacrynic Acid RS in the acidic methanol containing 50 µg per mL, concomitantly measured.

**B:** A portion of powdered Tablets, equivalent to 25 mg of ethacrynic acid, responds to *Identification* test C under *Ethacrynic Acid*.

**Dissolution** <711>—

**Medium:** 0.1 M phosphate buffer, prepared by mixing 13.6 g of monobasic potassium phosphate and 92.2 mL of 1 N sodium hydroxide with water to obtain 1000 mL of a solution having a pH of  $8.0 \pm 0.05$ ; 900 mL.

**Apparatus 2:** 50 rpm.

**Time:** 45 minutes.

**Procedure**—Determine the amount of  $C_{13}H_{12}Cl_2O_4$  dissolved by employing UV absorption at the wavelength of maximum absorbance at about 277 nm on filtered portions of the solution under test, suitably diluted with *Medium*, in comparison with a Standard solution having a known concentration of USP Ethacrynic Acid RS in the same *Medium*.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_{13}H_{12}Cl_2O_4$  is dissolved in 45 minutes.

**Uniformity of dosage units** <905>: meet the requirements.

**Procedure for content uniformity**—Add 1 Tablet to a 100-mL volumetric flask containing 10 mL of water, and allow to stand for 15 minutes, shaking occasionally until the tablet is disintegrated. Add a 9 in 1000 mixture of hydrochloric acid in methanol to volume, and mix. Filter a portion of the mixture, and pipet a volume of the filtrate, equivalent to 5 mg of ethacrynic acid, into a 100-mL volumetric flask. Dilute with the acidic methanol to volume, and mix. Dissolve an accurately weighed quantity of USP Ethacrynic Acid RS in the acidic methanol, and dilute quantitatively and stepwise with the same solvent to obtain a Standard solution having a known concentration of about 50 µg per mL. Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 269 nm, with a suitable spectrophotometer, using the acidic methanol as the blank. Calculate the quantity, in mg, of  $C_{13}H_{12}Cl_2O_4$  in the Tablet by the formula:

$$(T / D)C(A_U / A_S)$$

in which *T* is the labeled quantity, in mg, of ethacrynic acid in the Tablet; *D* is the concentration, in µg per mL, of ethacrynic acid in the solution from the Tablet, on the basis of the labeled quantity per Tablet and the extent of dilution; *C* is the concentration, in µg per mL, of USP Ethacrynic Acid RS in the Standard solution; and *A<sub>U</sub>* and *A<sub>S</sub>* are the absorbances of the solution from the Tablet and the Standard solution, respectively.

**Assay**—

**Triethylamine solution**—Mix 10 mL of triethylamine and about 900 mL of water in a 1-L volumetric flask. Adjust with phosphoric acid to a pH of  $6.8 \pm 0.1$ , dilute with water to volume, mix, and filter.

**Solvent mixture**—Prepare a mixture of water and acetonitrile (3:2).

**Mobile phase**—Prepare a filtered and degassed mixture of *Triethylamine solution* and acetonitrile (3:2). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Ethacrynic Acid RS in *Solvent mixture*, and dilute quantitatively with *Solvent mixture*, to obtain a solution having a known concentration of about 0.5 mg per mL.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 50 mg of ethacrynic acid, to a 100-mL volumetric flask, add about 80 mL of *Solvent mixture*, and shake or sonicate to dissolve the ethacrynic acid. Dilute with *Solvent mixture* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency determined from

the analyte peak is not less than 1200 theoretical plates; the tailing factor for the analyte peak is not more than 2; the capacity factor, *k'*, is not less than 0.8; and the relative standard deviation for replicate injections is not more than 1.0 %.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of ethacrynic acid ( $C_{13}H_{12}Cl_2O_4$ ) in the portion of Tablets taken by the formula:

$$100C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Ethacrynic Acid RS in the *Standard preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Ethambutol Hydrochloride

$C_{10}H_{24}N_2O_2 \cdot 2HCl$  277.23  
1-Butanol, 2,2'-(1,2-ethanediyldiimino)bis-, dihydrochloride, [S-(R\*,R\*)]-;  
(+)-2,2'-(Ethylenediimino)-di-1-butanol dihydrochloride [1070-11-7].

**DEFINITION**

Ethambutol Hydrochloride contains NLT 98.0% and NMT 100.5% of  $C_{10}H_{24}N_2O_2 \cdot 2HCl$ , calculated on the dried basis.

**IDENTIFICATION**

- A. INFRARED ABSORPTION** <197K>
- B. IDENTIFICATION TESTS—GENERAL, Chloride** <191>: Meets the requirements  
**Sample:** 100 mg/mL in water

**ASSAY****PROCEDURE**

**Sample solution:** 200 mg of Ethambutol Hydrochloride in a mixture of 100 mL of glacial acetic acid and 5 mL of mercuric acetate TS. Add crystal violet TS.

**Analysis:** Titrate with 0.1 N perchloric acid VS (the color change at the endpoint is from blue to blue-green). Perform a blank determination, and make any necessary corrections (see *Titrimetry* <541>). Each mL of 0.1 N perchloric acid is equivalent to 13.86 mg of  $C_{10}H_{24}N_2O_2 \cdot 2HCl$ .

**Acceptance criteria:** 98.0%–100.5% on the dried basis

**IMPURITIES****Inorganic Impurities**

- HEAVY METALS, Method II** <231>: NMT 20 ppm

**Organic Impurities**

- PROCEDURE 1: ORDINARY IMPURITIES** <466>

**Sample solution:** Methanol

**Standard solution:** Methanol

**Eluant:** Methanol and ammonium hydroxide (18:1)

**Visualization:** 16

- PROCEDURE 2: LIMIT OF AMINOBUTANOL**

**Solution A:** 1.24 g of boric acid to a 100-mL volumetric flask. Dissolve in 90 mL of water, adjust with 5 N sodium hydroxide to a pH of 9.0, and dilute with water to volume.

**Fluorescamine solution:** 0.1 mg/mL of fluorescamine in acetone

**Standard solution:** 5.0 µg/mL of USP Aminobutanol RS

**Sample solution:** 0.5 mg/mL of Ethambutol Hydrochloride

**Spectrometric conditions**

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** Fluorometry

**Analytical wavelength:** 485 nm, with the excitation wavelength at about 385 nm

**Cell:** 1 cm

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Pipet a 10-mL portion of the *Sample solution* into a glass-stoppered, 100-mL conical flask, and add 10 mL of water and 20 mL of *Solution A*. To another 100-mL flask, add 10.0 mL of the *Sample solution*, 10.0 mL of the *Standard solution*, and 20 mL of *Solution A*. Place the flasks on a magnetic stirrer, and while the contents are being stirred rapidly, add 10 mL of *Fluorescamine solution* rapidly. Insert the stoppers in the flasks, invert, and shake briefly. After 1 min, accurately timed, determine the relative fluorescence intensities of both solutions in a suitable fluorometer.

**Acceptance criteria:** The fluorescence intensity of the solution from the *Sample solution* is NMT the difference between the intensities of the two solutions (NMT 1.0%).

**SPECIFIC TESTS**

• **LIMIT OF TOTAL STEREOISOMERS**

**Solution A:** 60 mg/mL of (*R*)-(+)-alpha-methylbenzyl isocyanate in acetonitrile

**Solution B:** Acetonitrile and water (1:1)

**Mobile phase:** Methanol and water (13:7)

**Standard solution 1:** Transfer 13 mg of USP Ethambutol Hydrochloride RS to a 10-mL volumetric flask. Add 2.0 mL acetonitrile and 260 µL of triethylamine, and mix for 1 min. Add 650 µL of *Solution A*, and mix for another min. Dilute with *Solution B* to volume.

**Standard solution 2:** Prepare as directed for *Standard solution 1* using USP Ethambutol Related Compound A RS and USP Ethambutol Related Compound B RS.

**System suitability solution:** Mix equal volumes of *Standard solution 1* and *Standard solution 2*.

**Sample solution:** Prepare as directed for *Standard solution 1* using Ethambutol Hydrochloride.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 3.9-mm × 15-cm; packing L1

**Flow rate:** 1.7 mL/min

**Injection size:** 20 µL

**Run time:** 2.3 times the retention time of ethambutol

**System suitability**

**Samples:** *Standard solution 1* and *System suitability solution*

[NOTE—The relative retention times for ethambutol related compound B, ethambutol, and ethambutol related compound A are 0.85, 1.0, and 1.4, respectively.]

**Suitability requirements**

**Resolution:** NLT 3.0 between ethambutol and ethambutol related compound A, *System suitability solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution 1*

**Analysis**

**Sample:** *Sample solution*

Calculate the percentage of stereoisomers in the portion of *Sample* taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response of ethambutol related compound A or ethambutol related compound B from the *Sample solution*

$r_T$  = sum of all peak responses of ethambutol related compound A, ethambutol related compound B and ethambutol from the *Sample solution*

Calculate the percentage of total stereoisomers:

$$\text{Result} = \% \text{ ethambutol related compound A} + \% \text{ ethambutol related compound B}$$

**Acceptance criteria**

**Total impurities:** NMT 4.0%

• **OPTICAL ROTATION, Specific Rotation (781S):** +6.0° to +6.7°

**Sample solution:** 100 mg/mL in water

• **LOSS ON DRYING (731):** Dry a sample at 105° for 2 h: it loses NMT 0.5% of its weight.

**ADDITIONAL REQUIREMENTS**

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• **USP REFERENCE STANDARDS (11)**

USP Aminobutanol RS

$C_4H_{11}NO$  89.14

USP Ethambutol Hydrochloride RS

USP Ethambutol Related Compound A RS

(2*R*,2'*S*)-2,2'-[Ethane-1,2-diylbis(azanediyl)]dibutan-1-ol.  
 $C_{10}H_{24}N_2O_2$  204.31

USP Ethambutol Related Compound B RS

(2*R*,2'*R*)-2,2'-[Ethane-1,2-diylbis(azanediyl)]dibutan-1-ol.  
 $C_{10}H_{24}N_2O_2$  204.31

## Ethambutol Hydrochloride Tablets

**DEFINITION**

Ethambutol Hydrochloride Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of ethambutol hydrochloride ( $C_{10}H_{24}N_2O_2 \cdot 2HCl$ ).

**IDENTIFICATION**

**Sample:** Triturate a quantity equivalent to 100 mg of ethambutol from powdered Tablets, with 3 mL of methanol in a glass mortar. Add 5 mL of methanol to obtain a suspension, then pass through a funnel lined with a suitable filter paper (Whatman No. 42 or equivalent) previously moistened with methanol, and collect the filtrate in a beaker containing 100 mL of acetone. Stir the mixture, and allow crystallization to proceed for 15 min. Decant the liquid, and gently dry the crystals with the aid of a current of air until the odor of methanol is no longer detectable: a portion of the crystals so obtained responds to the following tests.

• **A. INFRARED ABSORPTION (197K)**

• **B. IDENTIFICATION TESTS—GENERAL, Chloride (191)**

**Sample solution:** 100 mg/mL in water

**Acceptance criteria:** Meet the requirement

**ASSAY**

• **PROCEDURE**

**Buffer:** Mix 1.0 mL of triethylamine with 1 L of water, and adjust with phosphoric acid to pH 7.0.

**Mobile phase:** Acetonitrile and *Buffer* (1:1)

**Standard solution:** 0.30 mg/mL of USP Ethambutol Hydrochloride RS

**Sample solution:** Equivalent to 0.30 mg/mL of ethambutol hydrochloride from powdered Tablets (NLT 20). Filter the solution, discarding the first 10-mL portion.

**Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** UV 200 nm**Column:** 4.6-mm × 15-cm base-deactivated; 5-μm packing L10**Flow rate:** 1 mL/min**Injection volume:** 50 μL**System suitability****Sample:** *Standard solution***Suitability requirements****Tailing factor:** NMT 2.0**Relative standard deviation:** NMT 2.0%**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of ethambutol hydrochloride (C<sub>10</sub>H<sub>24</sub>N<sub>2</sub>O<sub>2</sub> · 2HCl) present in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 $r_U$  = peak response from the *Sample solution* $r_S$  = peak response from the *Standard solution* $C_S$  = concentration of USP Ethambutol Hydrochloride RS in the *Standard solution* (mg/mL) $C_U$  = nominal concentration of ethambutol hydrochloride from the *Sample solution* (mg/mL)**Acceptance criteria:** 95.0%–105.0%**PERFORMANCE TESTS**• **DISSOLUTION** <711>**Medium:** Water; 900 mL**Apparatus 1:** 100 rpm**Time:** 45 min**Buffer:** 38.0 g/L of monobasic sodium phosphate and 2.0 g/L of anhydrous dibasic sodium phosphate**Bromocresol green solution:** Dissolve 200 mg of bromocresol green in 30 mL of water and 6.5 mL of 0.1 N sodium hydroxide. Dilute with *Buffer* to 500 mL, and add 0.1 N hydrochloric acid to adjust to a pH of 4.6 ± 0.1.**Standard solution:** 0.1 mg/mL of USP Ethambutol Hydrochloride RS**Sample solution:** Pass a portion of solution under test through a suitable filter.**Instrumental conditions**(See *Spectrophotometry and Light-Scattering* <851>.)**Mode:** Vis**Analytical wavelength:** 415 nm**Analysis****Samples:** *Standard solution*, *Sample solution*, and water (blank)

Into 3 separate, glass-stoppered, 50-mL centrifuge tubes, pipet 1 mL of water to provide the blank, 1 mL of *Standard solution*, and 1 mL of *Sample solution*. Add 5.0 mL of *Bromocresol green solution* to each tube, add 10.0 mL of chloroform to each, insert the stoppers, and shake the mixtures vigorously. Allow the mixtures to separate, discard the upper aqueous layers, and filter the 3 chloroform layers through separate pledgets of cotton.

Determine the percentage of the labeled amount of ethambutol hydrochloride (C<sub>10</sub>H<sub>24</sub>N<sub>2</sub>O<sub>2</sub> · 2HCl) dissolved, using the blank to set the instrument.

**Tolerances:** NLT 75% (Q) of the labeled amount of C<sub>10</sub>H<sub>24</sub>N<sub>2</sub>O<sub>2</sub> · 2HCl is dissolved.• **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements**IMPURITIES**• **LIMIT OF AMINOBUTANOL****Buffer:** 1.24 g of boric acid to a 100-mL volumetric flask. Dissolve in 90 mL of water, adjust with 5 N so-

dium hydroxide to a pH of 9.0, and dilute with water to volume.

**Fluorescamine solution:** 0.1 mg/mL of fluorescamine in acetone**Standard solution:** 5.0 μg/mL of USP Aminobutanol RS in water

**Sample solution:** Place a number of Tablets, equivalent to 400 mg of ethambutol hydrochloride, in a beaker, cover with acetone, and allow to stand for 15 min. Decant the acetone, dry the Tablets, and remove the coating. Grind the Tablet cores in a mortar to a fine powder, moisten with methanol, and triturate to a fine paste. Transfer the mixture with the aid of methanol to a 100-mL volumetric flask, dilute with methanol to volume, and mix. Pass the mixture through a dry, folded filter paper. Pipet 25 mL of the filtrate into a 200-mL volumetric flask, and dilute with water to volume. Allow to stand for 15 min, and pass through a dry, folded filter paper, discarding the first cloudy portions of the filtrate. The clear filtrate is the *Sample solution*.

**Instrumental conditions**(See *Spectrophotometry and Light-Scattering* <851>.)**Mode:** Fluorometry**Analytical wavelength:** Excitation wavelength at about 385 nm; emission wavelength at 485 nm**Cell:** 1 cm**Analysis****Samples:** *Standard solution* and *Sample solution*

Pipet a 10-mL portion of the *Sample solution* into a glass-stoppered, 100-mL conical flask, and add 10 mL of water and 20 mL of *Buffer*. To another 100-mL flask, add 10.0 mL of the *Sample solution*, 10.0 mL of the *Standard solution*, and 20 mL of *Buffer*. Place the flasks on a magnetic stirrer, and while the contents are being stirred rapidly, add 10 mL of *Fluorescamine solution* rapidly. Insert the stoppers in the flasks, invert, and shake briefly. After 1 min, accurately timed, determine the relative fluorescence intensities of both solutions.

**Acceptance criteria:** The fluorescence intensity of the solution from the *Sample solution* is NMT the difference between the intensities of the two solutions; NMT 1.0%.

**ADDITIONAL REQUIREMENTS**• **PACKAGING AND STORAGE:** Preserve in well-closed containers.• **USP REFERENCE STANDARDS** <11>

USP Aminobutanol RS

USP Ethambutol Hydrochloride RS

---

**Ethchlorvynol**

---

C<sub>7</sub>H<sub>9</sub>ClO 144.60

1-Penten-4-yn-3-ol, 1-chloro-3-ethyl-

1-Chloro-3-ethyl-1-penten-4-yn-3-ol [113-18-8].

» Ethchlorvynol contains not less than 98.0 percent and not more than 100.0 percent of *E*-ethchlorvynol (C<sub>7</sub>H<sub>9</sub>ClO), calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight, light-resistant glass or polyethylene containers, using polyethylene-lined closures.

**USP Reference standards** <11>—

USP Ethchlorvynol RS

**Identification—**

**A:** *Infrared Absorption* (197F).

**B:** Dissolve about 1 g in 20 mL of methanol. To 1 mL of the solution, add about 4 drops of 6 N ammonium hydroxide, mix, then add silver nitrate TS, a few drops at a time: a yellowish white precipitate is formed, and it at first redissolves, but becomes insoluble when an excess of silver nitrate TS has been added.

**C:** To 10 mL of the solution prepared in *Identification* test B add 5 mL of freshly prepared *m*-phenylenediamine hydrochloride-oxalic acid solution (prepared by dissolving 1 g of *m*-phenylenediamine hydrochloride and 1 g of oxalic acid in 35 mL of water and filtering, if necessary): a reddish orange color is produced in about 3 minutes.

**Refractive index** (831): between 1.476 and 1.480.

**Acidity**—Dissolve 5.0 mL of Ethchlorvynol in 50 mL of a mixture of equal volumes of water and methanol that has been neutralized to the phenolphthalein endpoint with 0.1 N sodium hydroxide. Add 1 mL of phenolphthalein TS, and titrate with 0.10 N sodium hydroxide to a pink endpoint: not more than 1.7 mL of 0.10 N sodium hydroxide is required for neutralization.

**Water, Method I** (921): not more than 0.2%.

**Chromatographic purity**—Calculate the percentage of each peak, other than the *E*-ethchlorvynol peak, observed in the chromatogram of the Ethchlorvynol obtained as directed in the Assay taken by the same formula:

$$100r_i / r_t$$

in which  $r_i$  is the response of each secondary peak and  $r_t$  is the sum of all of the peaks observed in the chromatogram: not more than 0.2% of toluene, not more than 1.5% of *Z*-ethchlorvynol, and not more than 0.3% of any other impurity is found, and the total of all observed impurities is not more than 2.0%.

**Assay—**

**Resolution solution**—Add 2.5  $\mu$ L of toluene to 0.5 mL of USP Ethchlorvynol RS, and mix.

**Chromatographic system** (see *Chromatography* (621))—The gas chromatograph is equipped with a thermal conductivity detector and a 1.8-m  $\times$  4-mm glass column (pretreated with 10% dimethyldichlorosilane in toluene) packed with 10% phase G16 on 60- to 80-mesh support S1AB. The column is maintained at about 160°, and the injector and the detector are maintained at about 200°. The carrier gas is dry helium, flowing at a rate of about 30 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the relative retention times for toluene,  $\beta$ -chlorovinylethyl ketone (if present), *Z*-ethchlorvynol, and *E*-ethchlorvynol are about 0.1, 0.2, 0.8, and 1.0, respectively; the resolution,  $R$ , between the *Z*- and *E*-ethchlorvynol peaks is not less than 1.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—[NOTE—Use peak areas where peak responses are indicated.] Inject about 3  $\mu$ L of Ethchlorvynol into the chromatograph, record the chromatogram, and measure the responses for all of the peaks. Calculate the percentage of *E*-ethchlorvynol ( $C_7H_9ClO$ ) in the specimen of Ethchlorvynol taken by the formula:

$$100r_e / r_t$$

in which  $r_e$  is the response of the *E*-ethchlorvynol peak obtained in the chromatogram of the Ethchlorvynol and  $r_t$  is the sum of the responses of all of the peaks observed in the chromatogram.

**Ethchlorvynol Capsules**

» Ethchlorvynol Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of *E*-ethchlorvynol ( $C_7H_9ClO$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Ethchlorvynol RS

**Identification—**

**A:** The retention time of the Ethchlorvynol peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**B:** Dissolve an amount of the contents of the Capsules, equivalent to about 1 g of ethchlorvynol, in 20 mL of methanol: the solution responds to *Identification* tests B and C under *Ethchlorvynol*.

**Dissolution** (711)—

**Medium:** water; 500 mL.

**Apparatus 2:** 50 rpm.

**Time:** 15 minutes.

**Procedure**—Place 1 Capsule in each vessel, and allow the Capsule to sink to the bottom of the vessel before starting rotation of the blade. Observe the Capsules, and record the time taken for each capsule shell to rupture.

**Tolerances**—The requirements are met if all of the Capsules tested rupture in not more than 15 minutes. If 1 or 2 of the Capsules rupture in more than 15 but not more than 30 minutes, repeat the test on 12 additional Capsules. Not more than 2 of the total of 18 Capsules tested rupture in more than 15 but not more than 30 minutes.

**Uniformity of dosage units** (905): meet the requirements, chloroform being used as the solvent in the procedure for *Weight Variation*.

**Assay—**

**Methanol solution**—Add 600 mL of methanol to 1400 mL of water in a suitable container, and mix. Allow the solution to equilibrate to room temperature.

**Internal standard solution**—Dissolve a quantity of chlorobutanol in *Methanol solution* to obtain a solution having a known concentration of about 6 mg per mL.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Ethchlorvynol RS in *Methanol solution* to obtain a solution having a known concentration of about 4 mg per mL. Transfer 5.0 mL of this solution to a suitable flask, add 5.0 mL of *Internal standard solution*, and mix to obtain a *Standard preparation* having a known concentration of about 2 mg of USP Ethchlorvynol RS per mL.

**Assay preparation**—Transfer not less than 20 Capsules, accurately counted, to a 500-mL volumetric flask. Add 250 mL of *Methanol solution*, heat at 70° to 80° for not more than 3 hours, and stir until the Capsules burst. Cool the solution to room temperature, add *Methanol solution* to volume, and mix. Quantitatively dilute a portion of this solution if necessary with *Methanol solution* to obtain a solution containing about 4 mg of *E*-ethchlorvynol per mL, and mix. Transfer 5.0 mL of this solution to a suitable flask, add 5.0 mL of *Internal standard solution*, and mix to obtain an *Assay preparation* containing about 2 mg of *E*-ethchlorvynol per mL.

**Chromatographic system** (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and a 1.8-m  $\times$  4-mm glass column (pretreated with 10% dimethyldichlorosilane in toluene) packed with 10% phase G16 on 60- to 80-mesh support S1AB. The column is maintained at about 160°, and the injector and the detector are maintained at about 200°. The carrier gas is dry helium, flowing at a rate of about 30 mL per minute. Chromato-

graph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the resolution,  $R$ , between the ethchlorvynol and chlorobutanol peaks is not less than 4.0, and the relative standard deviation for replicate injections is not more than 1.5%.

**Procedure**—Separately inject equal volumes (about 2  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the gas chromatograph, record the chromatographs, and measure the responses for the major peaks. The relative retention times are about 0.55 for chlorobutanol and 1.0 for *E*-ethchlorvynol. Calculate the quantity, in mg, of *E*-ethchlorvynol ( $C_7H_9ClO$ ) in each Capsule taken by the formula:

$$(CL / D)(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Ethchlorvynol RS in the *Standard preparation*,  $L$  is the labeled quantity, in mg, of ethchlorvynol in each Capsule,  $D$  is the concentration, in mg per mL, of ethchlorvynol in each mL of the *Assay preparation* based on the number of Capsules taken, the labeled quantity, in mg, of ethchlorvynol in each Capsule, and the extent of dilution, and  $R_U$  and  $R_S$  are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Ether

$C_4H_{10}O$  74.12

Ethane, 1,1'-oxybis-

Ethyl ether [60-29-7].

» Ether contains not less than 96.0 percent and not more than 98.0 percent of  $C_4H_{10}O$ , the remainder consisting of alcohol and water.

**Caution**—Ether is highly volatile and flammable. Its vapor, when mixed with air and ignited, may explode.

**NOTE**—Ether to be used for anesthesia must be preserved in tight containers of not more than 3-kg capacity, and is not to be used for anesthesia if it has been removed from the original container longer than 24 hours. Ether to be used for anesthesia may, however, be shipped in larger containers for repackaging in containers as directed above, provided the ether at the time of repackaging meets the requirements of the tests of this Pharmacopeia.

**Packaging and storage**—Preserve in partly filled, tight, light-resistant containers, at a temperature not exceeding 30° remote from fire.

**Labeling**—Where Ether is intended for anesthetic use, the label so states.

**Specific gravity** (841): between 0.713 and 0.716 (indicating 96.0% to 98.0% of  $C_4H_{10}O$ ).

**Acidity**—To 10 mL of water in a glass-stoppered flask, add 0.10 mL of bromothymol blue TS and 0.010 N sodium hydroxide until a blue color persists after vigorous shaking. Add 25 mL of Ether, and shake briskly to mix the two layers.

If no blue color remains, titrate with 0.010 N sodium hydroxide until the blue color is restored and persists for several minutes: not more than 0.80 mL of 0.010 N sodium hydroxide is required (0.003% as  $CH_3COOH$ ). [NOTE—Exercise great care to avoid contamination from carbon dioxide when adding the Ether and titrating.]

**Water**, Method I (921): not more than 0.5%, except where labeled as intended for anesthetic use, it contains not more than 0.2%.

**Limit of nonvolatile residue**—Allow 50 mL to evaporate spontaneously from a tared dish, and dry at 105° for 1 hour: the weight of the residue does not exceed 1 mg (0.003%).

**Aldehyde**—Place 20 mL in a glass-stoppered cylinder, and add 7 mL of a mixture of 1 mL of alkaline mercuric-potassium iodide TS and 17 mL of a saturated solution of sodium chloride. Insert the stopper in the cylinder, shake vigorously for 10 seconds, then set aside for 1 minute: the water layer shows no turbidity.

### Limit of peroxide—

**Titanium tetrachloride solution**—Cool separately, in small beakers surrounded by crushed ice, 10 mL of 6 N hydrochloric acid and 10 mL of titanium tetrachloride. Add the titanium tetrachloride dropwise to the chilled acid. Allow the mixture to stand at ice-bath temperature until all of the yellow solid dissolves, dilute the solution with 6 N hydrochloric acid to 1000 mL, and mix.

**Peroxide standard solution**—Pipet 25 mL of hydrogen peroxide solution into a 1000-mL volumetric flask, dilute with water to volume, and mix. Pipet 15 mL of this solution into a 1000-mL volumetric flask, dilute with water to volume, and mix. Each mL contains 0.011 mg of  $H_2O_2$ .

**Procedure**—To 50 mL of Ether, in a separator, add 5.0 mL of *Titanium tetrachloride solution*. Shake vigorously, allow the layers to separate, and drain the lower layer into a glass-stoppered, 25-mL graduated cylinder. Dilute with water to 10.0 mL, and mix. Any yellow color in the solution does not exceed that of a solution prepared by adding 5.0 mL of *Titanium tetrachloride solution* and 1.0 mL of *Peroxide standard solution* to a glass-stoppered, 25-mL graduated cylinder, diluting with water to 10.0 mL, and mixing, the colors being determined in 1-cm cells, with a suitable spectrophotometer, at a wavelength of 410 nm. The limit is 0.3 ppm.

### Low-boiling hydrocarbons—

**Standard preparation**—Transfer about 50 mL of anhydrous ethyl ether, previously tested for absence of hydrocarbons, as directed under *Procedure*, to a 100-mL volumetric flask. Add 0.20 mL of pentane, dilute with the same anhydrous ethyl ether to volume, and mix.

**Apparatus**—Under typical conditions, a gas chromatograph (see *Chromatography* (621)) is equipped with a flame-ionization detector, and contains a 3.7-m  $\times$  2-mm (ID) stainless steel column packed with 30% phase G22 on 30- to 60-mesh support S1C. The injector port, column, and detector are maintained at temperatures of about 230°, 80°, and 250°, respectively, nitrogen being used as the carrier gas at a flow rate of about 30 mL per minute.

**Procedure**—Inject 1  $\mu$ L of *Standard preparation* and Ether, respectively, into the apparatus, and measure the total area under the hydrocarbon peaks (under typical conditions the retention times are about 2.3 minutes for isopentane, 2.7 minutes for pentane, and 4.3 minutes for 2-methylpentane) in the Ether. The total area of the hydrocarbon peaks does not exceed that of the peak for pentane in the *Standard preparation* (0.2%).

## Ethinyl Estradiol

$C_{20}H_{24}O_2$  296.40  
 19-Norpregna-1,3,5(10)-trien-20-yne-3, 17-diol, (17 $\alpha$ )-;  
 19-Nor-17 $\alpha$ -pregna-1,3,5(10)-trien-20-yne-3,17-diol  
 [57-63-6].

### DEFINITION

Ethinyl Estradiol contains NLT 97.0% and NMT 102.0% of  $C_{20}H_{24}O_2$ , calculated on the dried basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B. ULTRAVIOLET ABSORPTION** (197U)  
*Sample solution:* 50  $\mu$ g/mL in alcohol  
*Wavelength:* 281 nm  
*Acceptance criteria:* Absorptivities, calculated on the dried basis, do not differ by more than 3.0%.

### ASSAY

- **PROCEDURE**  
*Mobile phase:* Acetonitrile and water (1:1)  
*Internal standard solution:* 0.5 mg/mL of ethylparaben in *Mobile phase*  
*Standard solution:* 0.2 mg/mL of USP Ethinyl Estradiol RS in *Mobile phase*, prepared as follows. Transfer 10 mg of USP Ethinyl Estradiol RS to a 50-mL volumetric flask, and add 10 mL of *Mobile phase* and 5.0 mL of *Internal standard solution*. Dilute with *Mobile phase* to volume.  
*Sample stock solution:* 1.0 mg/mL of Ethinyl Estradiol in *Mobile phase*  
*Sample solution:* 0.2 mg/mL of Ethinyl Estradiol, prepared as follows. Combine 10.0 mL of the *Sample stock solution* and 5.0 mL of *Internal standard solution* in a 50-mL volumetric flask. Dilute with *Mobile phase* to volume.  
**Chromatographic system**  
 (See *Chromatography* (621), *System Suitability*.)  
*Mode:* LC  
*Detector:* UV 280 nm  
*Column:* 4.6-mm  $\times$  15-cm; packing L1  
*Flow rate:* 1 mL/min  
*Injection size:* 25  $\mu$ L  
**System suitability**  
*Sample:* *Standard solution*  
 [NOTE—The relative retention times for ethylparaben and ethinyl estradiol are about 0.6 and 1.0, respectively.]  
**Suitability requirements**  
*Resolution:* NLT 4.5 between the ethylparaben and ethinyl estradiol peaks  
*Relative standard deviation:* NMT 2.0%  
**Analysis**  
*Samples:* *Standard solution* and *Sample solution*  
 Calculate the percentage of ethinyl estradiol ( $C_{20}H_{24}O_2$ ) taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratio from the *Sample solution*  
 $R_S$  = peak response ratio from the *Standard solution*

$C_S$  = concentration of USP Ethinyl Estradiol RS in the *Standard solution* (mg/mL)  
 $C_U$  = concentration of Ethinyl Estradiol in the *Sample solution* (mg/mL)

**Acceptance criteria:** 97.0%–102.0% on the dried basis

### IMPURITIES

- **COMPLETENESS OF SOLUTION:** Dissolve 100 mg in 5 mL of alcohol; the solution is clear and free from undissolved solid.

### SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE** (741): 180°–186°. It may exist also in a polymorphic modification, melting at 142°–146°.
- **OPTICAL ROTATION, Specific Rotation** (781S)  
*Sample solution:* 50 mg/mL, using sonication if necessary, in colorless pyridine from a freshly opened container  
*Acceptance criteria:* –28.0° to –29.5°
- **LOSS ON DRYING** (731): Dry a sample at 105° for 3 h: it loses NMT 1.0% of its weight.

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, nonmetallic, light-resistant containers.
- **USP REFERENCE STANDARDS** (11)  
 USP Ethinyl Estradiol RS

## Ethinyl Estradiol Tablets

### DEFINITION

Ethinyl Estradiol Tablets contain NLT 90.0% and NMT 115.0% of the labeled amount of  $C_{20}H_{24}O_2$ .

### IDENTIFICATION

- **THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** (201)  
*Standard solution:* 0.03 mg/mL of USP Ethinyl Estradiol RS in methanol  
*Sample solution:* Transfer 25 Tablets to a suitable container, add 50 mL of water, and sonicate until the Tablets disintegrate (if needed, remove any coating with water before sonication). Place the sample in a separatory funnel, add 25 mL of ether, and shake well to extract the actives. Using a glass pipet, transfer the ether layer to a clean beaker, and evaporate to 10 mL.  
*Spray reagent:* Methanol and sulfuric acid (1:1)  
*Application volume:* 30  $\mu$ L  
*Developing solvent system:* Chloroform and alcohol (24:1)  
**Analysis**  
*Samples:* *Standard solution* and *Sample solution*  
 Proceed as directed under *Chromatography* (621), *Thin-Layer Chromatography*. Spray the plate with *Spray reagent*, place in an oven at 105° for about 5 min, and examine the plate.  
**Acceptance criteria:** Meet the requirements

### ASSAY

- **PROCEDURE**  
*Mobile phase:* Acetonitrile and 20 mM potassium phosphate buffer, pH 6.0 (1:1)  
*Diluent:* Acetonitrile and water (1:1)  
*Standard stock solution:* 0.3 mg/mL of USP Ethinyl Estradiol RS in methanol  
*Standard solution:* 0.12  $\mu$ g/mL of USP Ethinyl Estradiol RS from *Standard stock solution* in *Diluent*  
*Sample solution:* 0.12  $\mu$ g/mL of ethinyl estradiol from NLT 20 Tablets in *Diluent*. [NOTE—Shake for about 30 min before makeup to volume. Centrifuge a portion of the solution, and makeup with *Diluent*.]

**Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** Spectrofluorometric, with an excitation wavelength of 285 nm and an emission wavelength of 310 nm**Column:** 4.6-mm × 15-cm; packing L11**Guard column:** 4.6-mm × 12.5-mm; packing L11**Flow rate:** 2 mL/min**Injection size:** 200 µL**System suitability****Sample:** *Standard solution***Suitability requirements****Tailing factor:** NMT 2.0 for ethinyl estradiol**Relative standard deviation:** NMT 2.0%**Analysis****Samples:** *Standard solution* and *Sample solution*Calculate the percentage of C<sub>20</sub>H<sub>24</sub>O<sub>2</sub> in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 $r_U$  = peak response of ethinyl estradiol from the *Sample solution* $r_S$  = peak response of ethinyl estradiol from the *Standard solution* $C_S$  = concentration of USP Ethinyl Estradiol RS in the *Standard solution* (µg/mL) $C_U$  = nominal concentration of the *Sample solution* (µg/mL)**Acceptance criteria:** 90.0%–115.0%**PERFORMANCE TESTS**

- **DISSOLUTION** [NOTE—Care must be taken not to expose any of the solutions to plastic or rubber. Fluorescent material will leach into the solutions and interfere with the quantitation of ethinyl estradiol. Also, adsorption may occur.]

**Test 1****Medium:** 0.3% sodium lauryl sulfate in water; 500 mL, degassed**Apparatus 2:** 100 rpm**Time:** 30 min**pH 6.0 phosphate buffer:** Transfer 2.7 g of monobasic potassium phosphate to a 1-L volumetric flask. Dissolve in 900 mL of water. Adjust with 1 N sodium hydroxide to a pH of 6.0, and dilute with water to volume.**Mobile phase:** pH 6.0 phosphate buffer and acetonitrile (1:1)**Standard stock solution:** 0.25 mg/mL of USP Ethinyl Estradiol RS in methanol. This solution is stable for 14 days.**Standard solution:** Dilute the *Standard stock solution* with *Medium* to a final concentration of 0.06 µg/mL. Add 1 or 2 drops of methanol to dissipate the bubbles, if necessary. This solution is stable for 24 h.**Sample solution:** Centrifuge the solution under test for 10 min at 2000 rpm. Use the supernatant.**Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** Fluorescence, excitation at 285 nm, emission at 310 nm**Column:** 4.6-mm × 15-cm, 5-µm packing L11**Guard column:** 4.6-mm × 1.25-cm, 5-µm packing L11**Flow rate:** 2.0 mL/min**Injection size:** 200 µL**System suitability****Sample:** *Standard solution***Suitability requirements****Relative standard deviation:** NMT 3.0%**Analysis:** Calculate the percentage of ethinyl estradiol dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

 $r_U$  = peak response from the *Sample solution* $r_S$  = peak response from the *Standard solution* $C_S$  = concentration of the *Standard solution* (mg/mL) $L$  = label claim (mg/Tablet) $V$  = volume of *Medium*, 500 mL**Tolerances:** NLT 80% (Q) of the labeled amount of ethinyl estradiol is dissolved.**Test 2:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.**Medium:** 5 ppm of polysorbate 80 in water; 500 mL, deaerated with helium**Apparatus 2:** 75 rpm**Time:** 45 min**Standard stock solution:** Transfer 10 mg of USP Ethinyl Estradiol RS and 50 mg of USP Norgestrel RS to a 500-mL volumetric flask. Add 250 mL of acetonitrile, and sonicate until dissolved. Cool to room temperature, and dilute with water to volume. The final concentration is about 20 µg/mL of ethinyl estradiol and 100 µg/mL of norgestrel. This solution is stable for 15 days.**Standard solution:** Dilute the *Standard stock solution* with *Medium* to obtain a final concentration of 0.02 µg/mL of ethinyl estradiol. This solution is stable for 6 days.**Sample solution:** Centrifuge the solution under test at about 3000 rpm for 20 min. Use the supernatant. This solution is stable for 12 h.**Mobile phase:** Water, acetonitrile, and methanol (55:40:5)**Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** UV 200 nm**Column:** 4.6-mm × 10-cm, 3-µm packing L1**Column temperature:** 30°**Flow rate:** 1.2 mL/min**Injection size:** 200 µL**System suitability****Sample:** *Standard solution***Suitability requirements****Resolution:** NLT 6.0 between the ethinyl estradiol and norgestrel peaks**Relative standard deviation:** NMT 3.0%, for ethinyl estradiol**Analysis:** Calculate the percentage of ethinyl estradiol dissolved:

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 2.0 for ethinyl estradiol

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Sample solution A* and *Sample solution B*

[NOTE— Measure the peak heights for the major peaks obtained within 20 min. Use the response from *Sample solution A* for estrone and all other impurities. Use *Sample solution B* for 17β-ethinyl estradiol.]

Calculate the percentage of 17β-ethinyl estradiol in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times 100$$

$r_U$  = height of any peak at the relative retention time of 1.16, using the spectrofluorometric detector

$r_S$  = peak height of ethinyl estradiol, using the spectrofluorometric detector

Calculate the percentage of estrone in the portion of Tablets taken:

$$\text{Result} = [(r_U/r_S) \times 100] - E$$

$r_U$  = height of any peak at the relative retention time of 1.2, using the UV detector at 210 nm

$r_S$  = peak height of ethinyl estradiol, using the UV detector at 210 nm

$E$  = percentage of 17β-ethinyl estradiol

Calculate the percentage of any other impurity:

$$\text{Result} = (r_U/r_S) \times 100$$

$r_U$  = height of any peak other than those mentioned above

$r_S$  = peak height of ethinyl estradiol, using the UV detector at 210 nm

**Acceptance criteria**

17β-Ethinyl estradiol: NMT 0.5%

Estrone: NMT 0.5%

Any other impurity: NMT 0.5%

Total impurities: NMT 2.0 %

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

- **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.

- **USP REFERENCE STANDARDS** <11>

USP Ethinyl Estradiol RS

USP Norgestrel RS

**Ethiodized Oil Injection**

» Ethiodized Oil Injection is an iodine addition product of the ethyl ester of the fatty acids of poppyseed oil, containing not less than 35.2 percent and not more than 38.9 percent of organically combined iodine. It is sterile.

**Packaging and storage**—Preserve in well-filled, light-resistant, single-dose or multiple-dose containers.

**Identification**—Place 1 drop in a test tube, and heat directly in a flame: the violet color of iodine vapors is observed.

**Specific gravity** <841>: between 1.280 and 1.293, at 15°.

**Viscosity—Capillary Viscometer Methods** <911> and **Rotational Rheometer Methods** <912>: between 50 centipoises and 100 centipoises, at 15°.

**Sterility** <71>: meets the requirements.

**Acidity**—Dissolve 1.0 mL in 10 mL of chloroform in a glass-stoppered cylinder, add phenolphthalein TS and 0.30 mL of sodium hydroxide solution (1 in 250), insert the stopper, and shake vigorously: a red color is produced.

**Free iodine**—Dissolve 1.0 mL in 5 mL of chloroform, add 20 mL of potassium iodide solution (1 in 20), agitate vigorously, and add 2 drops of starch TS: no blue color is produced.

**Assay**—[Caution—Observe rigorously the precautions set forth for *Procedure under Oxygen Flask Combustion* <471>.] Weigh accurately about 30 mg (1 drop) of Injection in a tared cellulose acetate capsule, and proceed as directed for *Procedure under Oxygen Flask Combustion* <471>, beginning with "Place the specimen," and using a thick-walled, 500-mL combustion flask. Use 10 mL of sodium hydroxide solution (1 in 100) and 1 mL of freshly prepared sodium bisulfite solution (1 in 100) as the absorbing liquid. Pipet 1 mL of bromine-sodium acetate TS into the cup of the flask, loosen the stopper, and allow the solution to be sucked into the flask. Wash down the cup and the ground joint with water, insert the

stopper in the flask, shake it vigorously, then add 5 drops of formic acid, and again shake the flask. Remove the stopper, and rinse the stopper and the specimen holder with water, collecting the rinsings in the flask. Bubble nitrogen through the solution to displace all of the oxygen from the solution and the flask. Add 0.50 g of potassium iodide and 3 mL of 2 N sulfuric acid, allow the mixture to stand for 2 minutes, add 3 mL of starch TS, and titrate the liberated iodine with 0.05 N sodium thiosulfate VS. Each mL of 0.05 N sodium thiosulfate is equivalent to 1.058 mg of iodine (I).

## Ethionamide

$C_8H_{10}N_2S$  166.24

4-Pyridinecarbothioamide, 2-ethyl-

2-Ethylthioisonicotinamide [536-33-4].

» Ethionamide contains not less than 98.0 percent and not more than 102.0 percent of  $C_8H_{10}N_2S$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Ethionamide RS

**Identification**—

**A:** Infrared Absorption (197K).

**B:** Ultraviolet Absorption (197U)—Test solution versus standard solution, prepared as directed in the Assay.

**Melting range:** (741): between 158° and 164°.

**pH** (791): between 6.0 and 7.0, in a 1 in 100 slurry in water.

**Water, Method I** (921): not more than 2.0%.

**Residue on ignition** (281): not more than 0.2%.

**Selenium** (291): 0.003%, a 200-mg test specimen being used.

**Assay**—Transfer about 100 mg of Ethionamide, accurately weighed, to a 250-mL volumetric flask, dissolve in about 100 mL of methanol, dilute with methanol to volume, and mix. Transfer a 5-mL aliquot to a 200-mL volumetric flask, dilute with methanol to volume, and mix (test solution). Dissolve a suitable quantity of USP Ethionamide RS, accurately weighed, in methanol, and dilute quantitatively and stepwise with methanol to obtain a Standard solution having a known concentration of about 10 µg per mL. Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 290 nm, with a suitable spectrophotometer, using methanol as the blank. Calculate the quantity, in mg, of  $C_8H_{10}N_2S$  in the portion of Ethionamide taken by the formula:

$$10C(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Ethionamide RS in the Standard solution, and  $A_U$  and  $A_S$  are the absorbances of the test solution and the Standard solution, respectively.

## Ethionamide Tablets

» Ethionamide Tablets contain not less than 95.0 percent and not more than 110.0 percent of the labeled amount of  $C_8H_{10}N_2S$ .

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Ethionamide RS

**Identification**—

**A:** The solution of Tablets employed for measurement of absorbance in the Assay exhibits an absorbance maximum at  $290 \pm 2$  nm.

**B:** Digest a quantity of powdered Tablets, equivalent to about 1 g of ethionamide, with 50 mL of methanol, and filter through a medium-porosity, sintered-glass funnel. Evaporate the filtrate on a steam bath to dryness: the residue so obtained melts between 155° and 164°.

**Dissolution** (711)—

**Medium:** 0.1 N hydrochloric acid; 900 mL.

**Apparatus 1:** 100 rpm.

**Time:** 45 minutes.

**Procedure**—Determine the amount of  $C_8H_{10}N_2S$  dissolved by employing UV absorption at the wavelength of maximum absorbance at about 274 nm on filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Ethionamide RS in the same *Medium*.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_8H_{10}N_2S$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of ethionamide, to a medium-porosity, sintered-glass funnel that is fitted into a 250-mL suction flask. Extract the specimen by stirring it with successive 10-mL portions of methanol, using a total of about 100 mL of solvent, drawing off each portion of liquid with gentle suction before adding the next portion. Transfer the combined methanol extracts to a 250-mL volumetric flask, dilute with methanol to volume, and mix. Proceed as directed in the Assay under *Ethionamide*, beginning with "Transfer a 5-mL aliquot." Calculate the quantity, in mg, of  $C_8H_{10}N_2S$  in the portion of Tablets taken by the formula:

$$10C(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Ethionamide RS in the Standard solution, calculated on the anhydrous basis, and  $A_U$  and  $A_S$  are the absorbances of the solution of Ethionamide Tablets and the Standard solution, respectively.

## Ethopabate

$C_{12}H_{15}NO_4$  237.25

Benzoic acid, 4-(acetamido)-2-ethoxy-, methyl ester.

Methyl 4-acetamido-2-ethoxybenzoate [59-06-3].

» Ethopabate contains not less than 96.0 percent and not more than 101.0 percent of  $C_{12}H_{15}NO_4$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers, protected from light.

**Labeling**—Label it to indicate that it is for veterinary use only.

**USP Reference standards** (11)—

USP Ethopabate RS

USP Ethopabate Related Compound A RS

Methyl-4-acetamido-2-hydroxybenzoate.

$C_{10}H_{11}NO_4$  209.20

**Identification**—

**A:** Infrared Absorption (197M).

**B:** Ultraviolet Absorption (197U)—

*Solution:* 10 µg per mL.

*Medium:* methanol.

**Loss on drying** (731)—Dry 1.0 g of it in vacuum at 60° for 2 hours: it loses not more than 1.0% of its weight.

**Melting range** (741): between 146° and 151°.

**Residue on ignition** (281): not more than 0.5%.

**Chromatographic purity**—Examine the chromatogram of the *Assay preparation*, as obtained in the *Assay*, for peaks that elute at the following retention times in relation to ethopabate: 0.33, *p*-aminosalicylic acid (ethopabate related compound B); 0.64, methyl 2-ethoxy-4-aminobenzoate (ethopabate related compound C); 0.68, methyl 2-hydroxy-4-aminobenzoate (ethopabate related compound D); 0.9, methyl 4-acetamido-2-hydroxybenzoate (ethopabate related compound A); and 1.6, ethyl 4-acetamido-2-ethoxybenzoate (ethopabate related compound E). Calculate the percentage of diazotizable substances, represented by peaks for ethopabate related compounds B, C, and D, if present, by the formula:

$$(0.72r_B + 0.68r_C + 0.74r_D) / 0.01r_U$$

in which 0.72, 0.68, and 0.74 are the response factors of ethopabate related compounds B, C, and D, respectively, relative to that of ethopabate,  $r_B$ ,  $r_C$ , and  $r_D$  are the responses of the peaks observed for ethopabate related compounds B, C, and D, respectively, and  $r_U$  is the ethopabate peak response obtained from the *Assay preparation*: not more than 0.5% of diazotizable substances is found. Calculate the percentage of any other impurities by the formula:

$$100 - A_E - A_S$$

in which  $A_E$  is the percentage of total peak area represented by the main ethopabate peak in the chromatogram obtained from the *Assay preparation*, and  $A_S$  is the percentage of peak area represented by the sum of the peaks for ethopabate related compounds B, C, and D: not more than 2.0% of other impurities is found. [NOTE—Exclude from the total peak area the responses of any minor peaks that are 0.01% or less than that of the main ethopabate peak.]

**Assay**—

*Mobile phase*—Dissolve 3 g of sodium 1-hexanesulfonate in 1 L of water, and adjust with phosphoric acid to a pH of 2.5. Prepare a filtered and degassed mixture of this solution, methanol, and acetonitrile (450:150:30). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Diluent*—Prepare a mixture of methanol and water (50:50).

*Standard preparation*—Prepare a solution of USP Ethopabate RS in *Diluent* having a known concentration of about 0.4 mg per mL. If necessary, filter this solution through a filter having a porosity of 0.5 µm or finer, and use the fil-

trate as the *Standard preparation*. Use this solution on the day prepared.

*Assay preparation*—Transfer about 40 mg of Ethopabate, accurately weighed, to a 100-mL volumetric flask, add about 80 mL of *Diluent*, and dissolve with the aid of sonication. Mix and dilute to volume with *Mobile phase*. If necessary, filter this solution through a filter having a porosity of 0.5 µm or finer, and use the filtrate as the *Assay preparation*. Use this solution on the day prepared.

*Resolution solution*—Prepare a solution in *Diluent* containing about 0.4 mg of USP Ethopabate RS and 0.1 mg of USP Ethopabate Related Compound A RS per mL.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 268-nm detector and a 3.9-mm × 30-cm column that contains packing L11 and is maintained at about 40°. The flow rate is about 1 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed under *Procedure*: the relative retention times are about 0.9 for methyl 4-acetamido-2-hydroxybenzoate (ethopabate related compound A) and 1.0 for ethopabate, the column efficiency is not less than 4000 theoretical plates, the resolution, *R*, between the ethopabate related compound A peak and the ethopabate peak is not less than 1.2, and the tailing factor is not more than 1.5. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the relative standard deviation for replicate injections is not more than 1.0%.

*Procedure*—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas of the responses for the major peaks. Calculate the quantity, in mg, of  $C_{12}H_{15}NO_4$  in the portion of Ethopabate taken by the formula:

$$100C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Ethopabate RS in the *Standard preparation*, and  $r_U$  and  $r_S$  are the ethopabate peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Ethosuximide

$C_7H_{11}NO_2$  141.17

2,5-Pyrrolidinedione, 3-ethyl-3-methyl-, (±)-.

(±)-2-Ethyl-2-methylsuccinimide. [77-67-8].

» Ethosuximide contains not less than 98.0 percent and not more than 101.0 percent of  $C_7H_{11}NO_2$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Ethosuximide RS

**Identification**—

**A:** Infrared Absorption (197S)—

*Solution:* 1 in 15.

*Medium:* chloroform.

**Melting range** (741): between 47° and 52°.

**Water, Method I** (921): not more than 0.5%.

**Residue on ignition** (281): not more than 0.5%.

**Limit of cyanide**—Dissolve 1 g in 10 mL of alcohol, and add 3 drops of ferrous sulfate TS, 1 mL of 1 N sodium hy-

dioxide, and a few drops of ferric chloride TS. Warm gently, and acidify with 2 N sulfuric acid: no blue precipitate or blue color is formed within 15 minutes.

**Limit of 2-ethyl-2-methylsuccinic acid and other impurities—**

*pH 3.0 Phosphate buffer, Mobile phase, System suitability solution, and Chromatographic system*—Proceed as directed in the Assay.

*Standard solution*—Dissolve accurately weighed quantities of USP Ethosuximide RS and 2-ethyl-2-methylsuccinic acid in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.1 mg of each per mL.

*Test solution*—Transfer about 1 g of Ethosuximide, accurately weighed, into a 10-mL volumetric flask, dissolve in *Mobile phase*, sonicating if necessary, dilute with *Mobile phase* to volume, and mix.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for all the peaks with an area greater than 0.1% of the total area, except the ethosuximide peak. Calculate the percentage of 2-ethyl-2-methylsuccinic acid in the portion of Ethosuximide taken by the formula:

$$(C/W)(r_i/r_s)$$

in which C is the concentration, in mg per mL, of 2-ethyl-2-methylsuccinic acid in the *Standard solution*; W is the weight, in g, of Ethosuximide taken to prepare the *Test solution*; and  $r_i$  and  $r_s$  are the peak responses of 2-ethyl-2-methylsuccinic acid obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.1% is found. Calculate the percentage of any other impurity in the portion of Ethosuximide taken by the formula:

$$(C/W)(r_i/r_s)$$

in which C is the concentration, in mg per mL, of USP Ethosuximide RS in the *Standard solution*; W is the weight, in g, of Ethosuximide taken to prepare the *Test solution*;  $r_i$  is the peak response for each impurity obtained from the *Test solution* other than 2-ethyl-2-methylsuccinic acid; and  $r_s$  is the peak response for ethosuximide obtained from the *Standard solution*: not more than 0.1% of any other impurity is found; and not more than 0.5% of total impurities is found.

**Assay—**

*pH 3.0 Phosphate buffer*—Add 4.1 mL of phosphoric acid to 1000 mL of water, and adjust with sodium hydroxide TS to a pH of 3.0.

*Mobile phase*—Prepare a filtered and degassed mixture of *pH 3.0 Phosphate buffer* and acetonitrile (90:10). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

*System suitability solution*—Dissolve suitable quantities of 2-ethyl-2-methylsuccinic acid and USP Ethosuximide RS in an appropriate volume of *Mobile phase* to obtain a solution containing about 2 mg per mL and 10 mg per mL, respectively.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Ethosuximide RS in *Mobile phase*, and dilute with *Mobile phase* to obtain a solution having a known concentration of about 10.0 mg per mL.

*Assay preparation*—Transfer about 100 mg of Ethosuximide to a 10-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Chromatographic system* (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 220-nm detector and a 3.9-mm  $\times$  30.0-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between 2-ethyl-

2-methylsuccinic acid and ethosuximide is not less than 6.6; the column efficiency determined from ethosuximide is not less than 2900 theoretical plates; the tailing factor for the ethosuximide peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 0.4%.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_7H_{11}NO_2$  in the portion of Ethosuximide taken by the formula:

$$10C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Ethosuximide RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Ethosuximide Capsules

» Ethosuximide Capsules contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of  $C_7H_{11}NO_2$ , present in the form of a solution of Ethosuximide in Polyethylene Glycol 400 or other suitable solvent.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** <11>—

USP Ethosuximide RS

**Identification**—Place a portion of the Capsule contents, equivalent to about 300 mg of ethosuximide, in a separator containing 50 mL of ether. Shake with three 10-mL portions of water, discarding the aqueous extracts. Add about 5 g of anhydrous sodium sulfate, swirl for 3 minutes, and filter through a small pledget of cotton that previously has been washed with ether, into a small flask. Evaporate the ether solution at room temperature in a current of air to dryness, and dissolve the residue in 5 mL of chloroform: the IR absorption spectrum of the solution, in the region between 3000  $cm^{-1}$  and 1650  $cm^{-1}$ , determined in a 0.1-mm cell, exhibits maxima only at the same wavelengths as that of a 1 in 15 solution of USP Ethosuximide RS in chloroform.

**Dissolution, Procedure for a Pooled Sample** <711>—

*Medium*: pH 6.8 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*); 900 mL.

*Apparatus 1*: 50 rpm.

*Time*: 30 minutes.

*Mobile phase*—Prepare a degassed and filtered mixture of water and acetonitrile (80:20).

*Chromatographic system* (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph replicate injections of the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation is not more than 2.0%.

*Procedure*—Inject an accurately measured volume (about 50  $\mu$ L) of a filtered portion of the solution under test into the chromatograph, record the chromatogram, and measure the response for the major peak. Determine the amount of  $C_7H_{11}NO_2$  dissolved by comparison with a *Standard solution*, having a known concentration of USP Ethosuximide RS in the same *Medium*, similarly chromatographed.

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_7H_{11}NO_2$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Limit of 2-ethyl-2-methylsuccinic acid—**

*Mobile phase, System suitability solution, and Chromatographic system*—Proceed as directed in the Assay.

*Standard solution*—Dissolve an accurately weighed quantity of 2-ethyl-2-methylsuccinic acid in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.026 mg per mL.

*Test solution*—Transfer 20 Capsules into a 2-liter volumetric flask, dissolve in 1800 mL of *Mobile phase*, dilute with *Mobile phase* to volume, and mix.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of 2-ethyl-2-methylsuccinic acid in the portion of Capsules taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which  $C_S$  is the concentration, in mg per mL, of 2-ethyl-2-methylsuccinic acid in the *Standard solution*;  $C_U$  is the concentration, in mg per mL, of ethosuximide in the *Test solution*, based on the number of Capsules taken, the labeled quantity, in mg, of ethosuximide in each Capsule, and the extent of dilution; and  $r_U$  and  $r_S$  are the peak responses for 2-ethyl-2-methylsuccinic acid obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.5% is found.

**Assay—**

*Mobile phase*—Prepare a filtered and degassed mixture of water, acetonitrile, and glacial acetic acid (875:125:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*System suitability solution*—Dissolve suitable quantities of USP Ethosuximide RS and 2-ethyl-2-methylsuccinic acid in *Mobile phase* to obtain a solution containing about 0.062 mg per mL and 0.064 mg per mL, respectively.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Ethosuximide RS in *Mobile phase* to obtain a solution having a known concentration of about 0.062 mg per mL.

*Assay preparation*—Transfer 20 Capsules, accurately weighed, into a 2-liter volumetric flask, dissolve in 1800 mL of *Mobile phase*, dilute with *Mobile phase* to volume, and mix. Transfer 5.0 mL into a 200-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 225-nm detector and a 3.9-mm  $\times$  15-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between ethosuximide and 2-ethyl-2-methylsuccinic acid is not less than 3.5; the tailing factor is not more than 1.5; and the relative standard deviations for replicate injections determined from ethosuximide and 2-ethyl-2-methylsuccinic acid are not more than 2.0% and 5.0%, respectively.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of ethosuximide ( $C_7H_{11}NO_2$ ) in the portion of each Capsule taken by the formula:

$$4000C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Ethosuximide RS in the *Standard preparation*; and  $r_U$  and  $r_S$

are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Ethosuximide Oral Solution

» Ethosuximide Oral Solution contains not less than 90.0 percent and not more than 105.0 percent of the labeled amount of ethosuximide ( $C_7H_{11}NO_2$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Ethosuximide RS

**Identification—**

**A: Infrared Absorption** (197S)—

*Spectral range:* 3000  $cm^{-1}$  to 1650  $cm^{-1}$ .

*Test solution*—Transfer a portion of Oral Solution, equivalent to 150 mg of ethosuximide, to a 125-mL separatory funnel, add 50 mL of ether, and shake well. Allow the layers to separate, and retain the ether layer. Wash the ether layer with three 10-mL portions of water. Transfer the ether layer to a suitable beaker, add 5 g of anhydrous sodium sulfate, and swirl. Filter the mixture into a 50-mL volumetric flask through a small pledget of cotton that has been previously washed with ether. Evaporate to dryness. Dissolve the residue in 5 mL of chloroform.

*Standard solution*—Dissolve 150 mg of USP Ethosuximide RS in 5.0 mL of chloroform.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the Assay.

**pH** (791): between 4.5 and 5.8.

**Limit of 2-ethyl-2-methylsuccinic acid—**

*Mobile phase, System suitability solution, and Chromatographic system*—Proceed as directed in the Assay under *Ethosuximide Capsules*.

*Standard solution*—Dissolve an accurately weighed quantity of 2-ethyl-2-methylsuccinic acid in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.05 mg per mL.

*Test solution*—Using a “to contain” pipet, transfer a volume of Oral Solution, equivalent to 250 mg of ethosuximide, to a 100-mL volumetric flask. Rinse the pipet several times with *Mobile phase*, dilute with *Mobile phase* to volume, and mix.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of 2-ethyl-2-methylsuccinic acid, in relation to the quantity of ethosuximide, in the volume of Oral Solution taken by the formula:

$$40C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of 2-ethyl-2-methylsuccinic acid in the *Standard solution*; and  $r_U$  and  $r_S$  are the peak responses for 2-ethyl-2-methylsuccinic acid obtained from the *Test solution* and the *Standard solution*, respectively: not more than 2.0% is found.

**Assay—**

*Mobile phase, System suitability solution, Standard preparation, and Chromatographic system*—Proceed as directed in the Assay under *Ethosuximide Capsules*.

**Assay preparation**—Transfer an accurately measured volume of Oral Solution, equivalent to about 250 mg of ethosuximide, to a 100-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix. Transfer 5.0 mL of this solution to a 200-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of ethosuximide ( $C_7H_{11}NO_2$ ) in the volume of Oral Solution taken by the formula:

$$4000C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Ethosuximide RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the ethosuximide peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Ethotoin

$C_{11}H_{12}N_2O_2$  204.23  
2,4-Imidazolidinedione, 3-ethyl-5-phenyl-, ( $\pm$ )-.  
( $\pm$ )-3-Ethyl-5-phenylhydantoin [86-35-1].

» Ethotoin contains not less than 97.5 percent and not more than 102.0 percent of  $C_{11}H_{12}N_2O_2$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Ethotoin RS

USP 5-Phenylhydantoin RS

**Identification**—

**A:** *Ultraviolet Absorption* (197U)—

*Solution:* 1 mg per mL.

*Medium:* alcohol.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Loss on drying** (731)—Dry it in vacuum at 60° for 4 hours; it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Chloride**—Transfer 1.0 g of Ethotoin to a suitable separator, and dissolve in 50 mL of ether. Extract with three 15-mL portions of water, collect the combined extracts in a beaker, heat on a steam bath to expel any traces of ether, and allow to cool to room temperature. Transfer the solution to a 50-mL color-comparison tube, add 2 N nitric acid until the solution is acidic, add 1 mL of 2 N nitric acid in excess, mix, add 1 mL of silver nitrate TS, dilute with water to 50 mL, and allow to stand for 5 minutes, protected from direct sunlight. The turbidity produced does not exceed that of a solution prepared by mixing 2 mL of freshly prepared 0.002 N

hydrochloric acid, 1 mL of 2 N nitric acid, 1 mL of silver nitrate TS, and 46 mL of water (0.014%).

**Heavy metals, Method II** (231): 0.002%.

**Related compounds**—

**Buffer solution**—Dissolve about 1 g of monobasic sodium phosphate in 1 L of water. Adjust the solution with 1.5 M phosphoric acid to a pH of  $3.5 \pm 0.1$ .

**Diluent**—Prepare a mixture of *Buffer solution* and methanol (65:35).

**Solution A**—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (80:20).

**Solution B**—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (60:40).

**Mobile phase**—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard solution**—Dissolve an accurately weighed quantity of USP Ethotoin RS, and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 2.5  $\mu$ g of ethotoin per mL.

**Test solution**—Transfer about 50 mg of Ethotoin, accurately weighed, to a 200-mL volumetric flask, dissolve in about 100 mL of *Diluent* with sonication, dilute with *Diluent* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm  $\times$  15-cm column that contains 5- $\mu$ m packing L1. The column temperature is maintained at 40°. The flow rate is about 0.8 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0	100	0	equilibration
0–10	100	0	isocratic
10–30	100→0	0→100	linear gradient
30–40	0	100	isocratic
40–42	0→100	100→0	linear gradient
42–55	100	0	re-equilibration

Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 2.0 for ethotoin; and the relative standard deviation for replicate injections is not more than 1.0%.

**Procedure**—Separately inject equal volumes (about 100  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. [NOTE—Discard any peak due to the *Diluent*.] Calculate the percentage of any impurity in the portion of Ethotoin taken by the formula:

$$(20,000/F)(C/W)(r_i / r_S)$$

in which C is the concentration, in mg per mL, of USP Ethotoin RS in the *Standard solution*; F is the response factor for the impurity as shown in the table below; W is the weight, in mg, on the anhydrous basis, of the portion of Ethotoin taken;  $r_i$  is the peak area for any impurity in the *Test solution*; and  $r_S$  is the peak area for ethotoin in the *Standard solution*. The impurities meet the requirements given in the table below.

Compound name	RRT <sup>1</sup>	RRF <sup>2</sup>	Limit (%)
5-Phenylhydantoin	about 0.4	1.0	1.5
3-Methyl-5-phenylhydantoin	about 0.6	1.0	0.9
Ethotoin	1.0	—	—
Ethotoin/5-Phenylhydantoin dimer	about 1.9	1.0	0.3
Ethotoin dimer	about 2.5	0.58	0.4
Unknown impurities	—	1.0	0.1 Individual 1.0 Total Un- known
Total	—	—	2.0

<sup>1</sup>RRT—Relative retention time.<sup>2</sup>RRF—Relative response factor.**Assay—**

**Mobile phase**—Dissolve 0.65 g of monobasic potassium phosphate in 600 mL of water, adjust with phosphoric acid solution (1 in 10) to a pH of  $3.5 \pm 0.1$ , and dilute with water to 650 mL. Add 350 mL of methanol, mix, filter through a membrane filter of 0.5  $\mu$ m or finer porosity, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**5-Phenylhydantoin stock solution**—Dissolve, with the aid of sonication if necessary, an accurately weighed quantity of USP 5-Phenylhydantoin RS in *Mobile phase* to obtain a solution having a known concentration of about 0.37 mg per mL.

**Standard preparation**—Dissolve, with the aid of sonication if necessary, an accurately weighed quantity of USP Ethotoin RS in *Mobile phase* to obtain a solution having a known concentration of about 0.25 mg of ethotoin per mL.

**System suitability solution**—Transfer 25 mg of USP Ethotoin RS, accurately weighed, to a 100-mL volumetric flask, add about 1.0 mL of *5-Phenylhydantoin stock solution*, add *Mobile phase* to volume, and sonicate to dissolve.

**Assay preparation**—Transfer about 50 mg of Ethotoin, accurately weighed, to a 200-mL volumetric flask, dissolve in *Mobile phase*, dilute with *Mobile phase* to volume, and sonicate to dissolve.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between the 5-phenylhydantoin and ethotoin peaks is not less than 6.0. The relative retention times are about 0.4 for 5-phenylhydantoin and 1.0 for ethotoin. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 3.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{11}H_{12}N_2O_2$  in the portion of Ethotoin taken by the formula:

$$200C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Ethotoin RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Ethotoin Tablets**

» Ethotoin Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{11}H_{12}N_2O_2$ .

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** <11>—

USP Ethotoin RS

USP Ethylparaben RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation*, both relative to the internal standard, as obtained in the *Assay*.

**Dissolution** <711>—

**Medium:** 0.1 N hydrochloric acid; 900 mL.

**Apparatus 2:** 100 rpm.

**Time:** 60 minutes.

**Standard solution**—Transfer about 100 mg of USP Ethotoin RS, accurately weighed, to a 25-mL volumetric flask. Dissolve in methanol, dilute with methanol to volume, and mix. Transfer 4.0 mL of this solution to a 50-mL volumetric flask, add *Dissolution Medium* to volume, and mix.

**Procedure**—Determine the amount of  $C_{11}H_{12}N_2O_2$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 257 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with the *Standard solution*.

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_{11}H_{12}N_2O_2$  is dissolved in 60 minutes.

**Uniformity of dosage units** <905>: meet the requirements.

**Assay—**

**Diluent**—Prepare a mixture of water, acetonitrile, and phosphoric acid (750:250:1).

**Mobile phase**—Prepare a filtered and degassed mixture of water and acetonitrile (3:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Internal standard solution**—Prepare a solution of USP Ethylparaben RS in *Diluent* having a concentration of 0.02 mg per mL.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Ethotoin RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 1.0 mg per mL. Immediately transfer 5 mL of this solution and 5 mL of the *Internal standard solution* to a suitable container, and mix well.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of ethotoin, to a 100-mL volumetric flask. Add 75 mL of *Mobile phase*, shake vigorously for 60 minutes, dilute with *Mobile phase* to volume, mix, and immediately filter. Without delay, transfer

5 mL of the filtrate and 5 mL of the *Internal standard solution* to a suitable container, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between the analyte and internal standard peaks is not less than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. [NOTE—For the purpose of identification, the relative retention times are about 0.5 for ethotoin and 1.0 for ethylparaben.] Calculate the quantity, in mg, of ethotoin ( $C_{11}H_{12}N_2O_2$ ) in the portion of Tablets taken by the formula:

$$200C(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Ethotoin RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Ethyl Chloride

$C_2H_5Cl$  64.51  
Ethane, chloro-  
Chloroethane [75-00-3].

» Ethyl Chloride contains not less than 99.5 percent and not more than 100.5 percent of  $C_2H_5Cl$ . [Caution—Ethyl Chloride is highly flammable. Do not use where it may be ignited.]

**Packaging and storage**—Preserve in tight containers, preferably hermetically sealed, and remote from fire.

**Reaction**—Shake 10 mL with 10 mL of water, both having been previously cooled to 0°, and allow the supernatant layer of ethyl chloride to volatilize spontaneously: the remaining liquid is neutral to litmus.

**Limit of nonvolatile residue and odor**—Allow 5 mL to evaporate spontaneously from a tared, shallow dish: no foreign odor is perceptible while the last portions evaporate, and the weight of the residue is negligible.

**Chloride**—Add a few drops of silver nitrate TS to 10 mL of alcohol, cool to 0°, and add to the clear liquid about 500 µL of Ethyl Chloride cooled to the same temperature: no turbidity is produced immediately.

**Assay**—Introduce about 1.5 mL of cold Ethyl Chloride into a tared glass-stoppered pressure bottle containing 25.0 mL of 1 N alcoholic potassium hydroxide VS, rapidly replace the stopper, and weigh accurately. Tie down the stopper, insert the bottle in a wire basket, and immerse in a water bath at room temperature. [Caution—Before raising the bath temperature, take adequate precautions to cover the bottle or erect a suitable safety shield to prevent injury in case the bottle should burst.] Heat the water bath to boiling, maintain at this temperature for 30 minutes, and then cool gradually to room temperature before handling the bottle. Remove the stopper, add phenolphthalein TS, and titrate the excess alkali with 1 N hydrochloric acid VS. Perform a blank determination (see *Residual Titrations* <541>). Each mL of 1 N alcoholic potassium hydroxide is equivalent to 64.51 mg of  $C_2H_5Cl$ .

## Ethylenediamine

$C_2H_8N_2$  60.10  
1,2-Ethanediamine.  
Ethylenediamine [107-15-3].

» Ethylenediamine contains not less than 98.0 percent and not more than 100.5 percent, by weight, of  $C_2H_8N_2$ .

[Caution—Use care in handling Ethylenediamine because of its caustic nature and the irritating properties of its vapor.]

NOTE—Ethylenediamine is strongly alkaline and may readily absorb carbon dioxide from the air to form a nonvolatile carbonate. Protect Ethylenediamine against undue exposure to the atmosphere.

**Packaging and storage**—Preserve in well-filled, tight, glass containers.

**Identification**—To 2 mL of cupric sulfate solution (1 in 100) add 3 drops of a solution of Ethylenediamine (1 in 6), and shake: a purplish blue color is produced.

**Heavy metals, Method I** <231>—Evaporate 5.0 mL on a steam bath to dryness, add to the residue 1 mL of hydrochloric acid and 0.5 mL of nitric acid, and evaporate again to dryness. Dissolve the residue in 20 mL of warm water, cool, dilute with water to 100 mL, mix, and use 20 mL of this solution for the test: the limit is 0.002%.

**Assay**—Weigh accurately about 1 mL of Ethylenediamine in a tared, glass-stoppered flask containing about 25 mL of water. Dilute with water to about 75 mL, add a mixed indicator of bromocresol green TS and methyl red TS (5 in 6), mix, and titrate with 1 N hydrochloric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 1 N hydrochloric acid is equivalent to 30.05 mg of  $C_2H_8N_2$ .

## Ethynodiol Diacetate

$C_{24}H_{32}O_4$  384.51  
19-Norpregn-4-en-20-yne-3,17-diol, diacetate, (3β,17α)-;  
19-Nor-17α-pregn-4-en-20-yne-3β,17-diol diacetate  
[297-76-7].

### DEFINITION

Ethynodiol Diacetate contains NLT 97.0% and NMT 102.0% of ethynodiol diacetate ( $C_{24}H_{32}O_4$ ).

### IDENTIFICATION

- **A. INFRARED ABSORPTION** <197K>

### ASSAY

- **PROCEDURE**

**Mobile phase:** Acetonitrile and water (41:59)

**Standard stock solution:** 2.5 mg/mL of USP Ethynodiol Diacetate RS, prepared as follows. Transfer a sufficient

amount of USP Ethynodiol Diacetate RS into a suitable volumetric flask and dissolve, by sonication, in a volume of acetonitrile equivalent to 50% of the flask volume. Dilute with water to volume.

**Standard solution:** 0.25 mg/mL of USP Ethynodiol Diacetate RS in *Mobile phase* from *Standard stock solution*

**Sample stock solution:** 2.5 mg/mL of Ethynodiol Diacetate, prepared as follows. Transfer a sufficient amount of Ethynodiol Diacetate into a suitable volumetric flask and dissolve, by sonication, in a volume of acetonitrile equivalent to 50% of the flask volume. Dilute with water to volume.

**Sample solution:** 0.25 mg/mL of Ethynodiol Diacetate in *Mobile phase* from *Sample stock solution*

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 200 nm

**Column:** 4.6-mm × 15-cm; packing L11

**Column temperature:** 40°

**Flow rate:** 2 mL/min

**Injection volume:** 20 µL

#### System suitability

**Sample:** *Standard solution*

[NOTE—The retention time for ethynodiol diacetate is NLT 18 min.]

#### Suitability requirements

**Tailing factor:** 0.75–2.0

**Relative standard deviation:** NMT 0.7%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of ethynodiol diacetate (C<sub>24</sub>H<sub>32</sub>O<sub>4</sub>) in the portion of Ethynodiol Diacetate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Ethynodiol Diacetate RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Ethynodiol Diacetate in the *Sample solution* (mg/mL)

**Acceptance criteria:** 97.0%–102.0%

#### IMPURITIES

##### • PROCEDURE 1

**Mobile phase, Sample stock solution, Sample solution, Chromatographic system, and System suitability:** Proceed as directed in the *Assay*.

#### Analysis

**Sample:** *Sample solution*

Calculate the area percentages of the individual impurities in the portion of Ethynodiol Diacetate taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak area of each individual peak between the solvent front and the ethynodiol diacetate peak

$r_T$  = sum of the areas of all peaks appearing after the solvent front

**Acceptance criteria:** See *Table 1*.

**Table 1**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
α-Ethynodiol diacetate	0.87	1.5
Ethynodiol diacetate	1.0	—
Any other individual impurity	—	0.5
Total impurities	—	2.0

##### • PROCEDURE 2: LIMIT OF CONJUGATED DIENE

**Sample solution:** 0.5 mg/mL in methanol

**Blank:** Methanol

#### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

**Mode:** UV

**Analytical wavelength:** about 236 nm

**Cell:** 1 cm

**Acceptance criteria:** Absorbance is NMT 0.500.

#### SPECIFIC TESTS

##### • OPTICAL ROTATION, *Specific Rotation* <781S>

**Sample solution:** 10 mg/mL in chloroform

**Acceptance criteria:** −70° to −76°

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers.

• **USP REFERENCE STANDARDS** <11>  
USP Ethynodiol Diacetate RS

## Ethynodiol Diacetate and Ethinyl Estradiol Tablets

#### DEFINITION

Ethynodiol Diacetate and Ethinyl Estradiol Tablets contain NLT 93.0% and NMT 107.0% of the labeled amount of ethynodiol diacetate (C<sub>24</sub>H<sub>32</sub>O<sub>4</sub>), and NLT 90.0% and NMT 110.0% of the labeled amount of ethinyl estradiol (C<sub>20</sub>H<sub>24</sub>O<sub>2</sub>).

#### IDENTIFICATION

• The retention times of the ethynodiol diacetate and ethinyl estradiol peaks from the *Sample solution* correspond to those from the *Standard solution*, as obtained in the *Assay*.

#### ASSAY

##### • PROCEDURE

**Mobile phase:** Methanol, acetonitrile, and water (3:7:10)

**Standard solution:** Dissolve, with the aid of sonication if necessary, quantities of USP Ethynodiol Diacetate RS and USP Ethinyl Estradiol RS in *Mobile phase*. Dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having known concentrations, in mg/mL, of the Reference Standards, corresponding to about 1/25 of the labeled amounts of ethynodiol diacetate and ethinyl estradiol in the Tablets.

**Sample solution:** Place 10 Tablets in a 250-mL volumetric flask. Add a portion of *Mobile phase*, and sonicate until the Tablets are completely disintegrated. Cool to room temperature, dilute with *Mobile phase* to volume, and filter.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.6-mm × 25-cm; packing L10

**Flow rate:** 2 mL/min

**Injection size:** 50 µL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Column efficiency:** NLT 3000 theoretical plates for ethynodiol diacetate

**Tailing factor:** NMT 1.5 for ethynodiol diacetate

**Relative standard deviation:** NMT 2.0% for each peak due to ethynodiol diacetate and ethinyl estradiol

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of  $C_{24}H_{32}O_4$  in each Tablet taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response of ethynodiol diacetate from the *Sample solution*  
 $r_S$  = peak response of ethynodiol diacetate from the *Standard solution*  
 $C_S$  = concentration of USP Ethynodiol Diacetate RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of ethynodiol diacetate in the *Sample solution*

Calculate the percentage of  $C_{20}H_{24}O_2$  in each Tablet taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response of ethinyl estradiol from the *Sample solution*  
 $r_S$  = peak response of ethinyl estradiol from the *Standard solution*  
 $C_S$  = concentration of USP Ethinyl Estradiol RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of ethinyl estradiol in the *Sample solution*

**Acceptance criteria:** 93.0%–107.0% of the labeled amount of  $C_{24}H_{32}O_4$  and 90.0%–110.0% of the labeled amount of  $C_{20}H_{24}O_2$

**PERFORMANCE TESTS**

- **DISINTEGRATION** <701>: 15 min, the use of disks being omitted
- **UNIFORMITY OF DOSAGE UNITS** <905>: Meet the requirements for *Content Uniformity* with respect to ethynodiol diacetate and to ethinyl estradiol

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** <11>  
USP Ethinyl Estradiol RS  
USP Ethynodiol Diacetate RS

## Ethynodiol Diacetate and Mestranol Tablets

**DEFINITION**

Ethynodiol Diacetate and Mestranol Tablets contain NLT 90.0% and NMT 110.0% of the labeled amounts of ethynodiol diacetate ( $C_{24}H_{32}O_4$ ) and mestranol ( $C_{21}H_{26}O_2$ ).

**IDENTIFICATION**• **A. THIN-LAYER CHROMATOGRAPHY**

**Standard solution A:** 5 mg/mL of USP Ethynodiol Diacetate RS in chloroform

**Standard solution B:** 0.5 mg/mL of USP Mestranol RS in chloroform

**Sample solution:** Transfer an amount equivalent to 10 mg of ethynodiol diacetate from powdered Tablets to a stoppered, 15-mL centrifuge tube. Add 10 mL of acetonitrile, insert the stopper in the tube, and mix by shaking and inversion for 2 min. Centrifuge at 1200 rpm for 10 min, and decant the supernatant through filter paper into a suitable container. Evaporate a 5-mL aliquot of the filtrate on a steam bath with the aid of a stream of nitrogen, and dissolve the residue in 1 mL of chloroform.

**Chromatographic system**

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture

**Application volume:** 5  $\mu$ L

**Developing solvent:** Cyclohexane and ethyl acetate (70:30)

**Spray reagent:** A 1-in-2 solution of sulfuric acid in water

**Analysis**

**Samples:** *Standard solution A*, *Standard solution B*, and *Sample solution*

Remove the plate when the solvent has moved about 15 cm above the initial spots. Spray the plate with *Spray reagent*, and heat it at 80° for 10 min: the ethynodiol diacetate spots appear yellowish tan and the mestranol spots appear pink when viewed under white light.

**Acceptance criteria:** The ethynodiol diacetate and mestranol spots from the *Sample solution* have the same relative positions on the plate as the spots from the respective *Standard solutions*. The  $R_f$  values for ethynodiol diacetate and mestranol are 0.8 and 0.6, respectively.

**ASSAY**• **PROCEDURE**

**Diluent:** Methanol and water (4:1)

**Mobile phase:** Methanol, tetrahydrofuran, and water (63:7:30)

**Standard solution:** 0.2 mg/mL of USP Ethynodiol Diacetate RS and 0.02 mg/mL of USP Mestranol RS in *Diluent*

**Sample solution:** Transfer 10 Tablets to a glass-stoppered flask, and pipet a sufficient volume of *Diluent* into the flask to obtain a solution having a final nominal concentration of 0.2 mg/mL of ethynodiol diacetate and 0.02 mg/mL of mestranol. Agitate vigorously until the Tablets are completely disintegrated. Shake vigorously by mechanical means for 30 min. Allow the solids to settle for 10 min, and pass the solution through a filter of 0.5- $\mu$ m pore size.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 204 nm

**Column:** 4.6-mm  $\times$  25-cm; packing L13

**Flow rate:** 1.2 mL/min

**Injection volume:** 25  $\mu$ L

**System suitability**

**Sample:** *Standard solution*

[NOTE—The relative retention times for mestranol and ethynodiol diacetate are 0.6 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 4.0 between mestranol and ethynodiol diacetate

**Relative standard deviation:** NMT 2.0% for both mestranol and ethynodiol diacetate

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of ethynodiol diacetate ( $C_{24}H_{32}O_4$ ) and mestranol ( $C_{21}H_{26}O_2$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response of the corresponding analyte from the *Sample solution*  
 $r_S$  = peak response of the corresponding analyte from the *Standard solution*  
 $C_S$  = concentration of the appropriate USP Reference Standard in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of the corresponding analyte in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0% of the labeled amount of ethynodiol diacetate ( $C_{24}H_{32}O_4$ ) and mestranol ( $C_{21}H_{26}O_2$ )

**PERFORMANCE TESTS**• **DISINTEGRATION** <701>

**Time:** 15 min, omitting the use of disks

**Acceptance criteria:** Meet the requirements

• **UNIFORMITY OF DOSAGE UNITS** <905>

**Procedure for content uniformity:** Proceed as directed in the *Assay*, except reduce by half the concentrations in the *Standard solution* and the *Sample solution* and inject twice the volume into the chromatograph.

**Acceptance criteria:** Meet the requirements for *Content Uniformity* with respect to ethynodiol diacetate and to mestranol

**ADDITIONAL REQUIREMENTS**• **PACKAGING AND STORAGE:** Preserve in well-closed containers.• **USP REFERENCE STANDARDS** <11>

USP Ethynodiol Diacetate RS

USP Mestranol RS

**Etidronate Disodium**

$C_2H_6Na_2O_7P_2$  249.99

Phosphonic acid, (1-hydroxyethylidene)bis-, disodium salt.  
Disodium dihydrogen (1-hydroxyethylidene)diphosphonate  
[7414-83-7].

» Etidronate Disodium contains not less than 97.0 percent and not more than 101.0 percent of  $C_2H_6Na_2O_7P_2$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** <11>—

USP Etidronate Disodium RS

USP Etidronate Disodium Related Compound A RS

Sodium phosphite dibasic pentahydrate.

$Na_2HPO_3 \cdot 5H_2O$  216.04 [CAS-13708-85-5].

USP Etidronic Acid Monohydrate RS

$C_2H_8O_7P_2 \cdot H_2O$  224.04

**Identification**—

**A: Infrared Absorption** <197>—The spectra of trifluorovinyl chloride polymer and mineral oil dispersions of it, separately prepared from a test specimen recrystallized from water and dried at 105° for 1 hour, exhibit maxima in the regions of 4000 to 1350  $cm^{-1}$  and 1350 to 450  $cm^{-1}$ , respectively, only at the same wavelengths as those of similar preparations of USP Etidronate Disodium RS.

**B:** A solution (1 in 100) meets the requirements of the flame test for *Sodium* <191>.

**pH** <791>: between 4.2 and 5.2, in a solution (1 in 100).

**Water, Method Ic** <921>: not more than 5.0%, determined on a preparation containing 100 mg of finely powdered etidronate disodium in 10 mL of a mixture of acetic acid and formamide (1:1).

**Limit of phosphite**—

**Solution A**—Prepare an aqueous solution containing 0.65 mg per mL of anhydrous sodium carbonate and 0.40 mg per mL of sodium bicarbonate.

**Solution B**—Prepare an aqueous solution containing 4.68 mg per mL of anhydrous sodium carbonate and 2.89 mg per mL of sodium bicarbonate.

**Mobile phase**—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard solution**—Dissolve suitable quantities of USP Etidronate Disodium Related Compound A RS and dibasic sodium phosphate in *Solution A* to obtain a solution having a known concentration of 0.016 mg of dibasic sodium phosphite on the anhydrous basis and 0.015 mg of dibasic sodium phosphate in each mL. [NOTE—Etidronate disodium related compound A is dibasic sodium phosphite pentahydrate.]

**Suppressor regenerant solution**—Use 12.5 mM sulfuric acid. [NOTE—This solution is needed only if the chemical suppression option is used.]

**Test solution**—Transfer approximately 50 mg of Etidronate Disodium, accurately weighed, to a suitable flask. Dissolve in 10.0 mL of *Solution A*.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a conductivity detector, a 4-mm  $\times$  25-cm column and a 4-mm  $\times$  50-mm guard column both containing packing L61, and either a 4-mm anion self-regenerating suppressor or a suitable chemical suppressor. The flow rate is about 1.0 mL per minute for the *Mobile phase*. When a chemical suppressor is used, the flow rate is 3 to 5 mL per minute for the *Suppressor regenerant solution*. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–6.0	100	0	isocratic
6.0–6.1	100→0	0→100	linear gradient
6.1–8.0	0	100	isocratic
8.0–8.1	0→100	100→0	linear gradient
8.1–15	100	0	isocratic

Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the elution order is phosphite, followed by phosphate; the resolution,  $R$ , between phosphite and phosphate is not less than 2.5; and the relative standard deviation for replicate injections is not more than 10% for each peak.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the phosphite peaks. Calculate the percentage of phosphite, determined as monobasic sodium phosphite, in the portion of Etidronate Disodium taken by the formula:

$$100(103.98/125.96)(C/W)(r_U / r_S)$$

in which 103.98 and 125.96 are the molecular weights of monobasic sodium phosphite and dibasic sodium phosphate, respectively;  $C$  is the concentration, in mg per mL, of USP Etidronate Disodium Related Compound A RS on the anhydrous basis in the *Standard solution*;  $W$  is the weight, in mg, of Etidronate Disodium taken to prepare the *Test solution*; and  $r_U$  and  $r_S$  are the phosphite peak responses obtained from the *Test solution* and the *Standard solution*, respectively: not more than 1.0% of phosphite, determined as monobasic sodium phosphite, is found.

**Heavy metals, Method II** <231>—Use 0.5 g of Etidronate Disodium for the *Test Preparation* and 2.5 mL of *Standard Lead Solution* for the *Standard Preparation*. Transfer the *Test Preparation* and the *Standard Preparation* to separate quartz crucibles, add 0.5 g of magnesium oxide to each crucible, and mix. Evaporate the *Standard Preparation* to dryness at 110° for 1 hour, and ignite each crucible over a flame to a light gray color. Ignite at 800° for 1 hour, cool, and dissolve the residues by the dropwise addition of hydrochloric acid, and add 3 mL of water. Adjust with ammonia TS to a pH of 8.5, then adjust with acetic acid to a pH of 4. Make a final pH adjustment to  $3.4 \pm 0.05$ , using dilute hydrochloric acid. Filter into 50-mL color comparison tubes, and dilute with water to 40 mL. The limit is 0.005%.

**Assay—**

**Mobile phase**—Prepare a 35 mM to 40 mM ammonium nitrate solution in water, and adjust with dilute ammonium hydroxide to a pH of 7.0.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Etidronic Acid Monohydrate RS in a mixture of 1 mL of 1 N sodium hydroxide solution and 150 mL of *Mobile phase*, to obtain a solution having a known concentration between 0.73 and 0.75 mg of etidronic acid monohydrate per mL.

**Assay preparation**—Transfer between 42.0 and 43.0 mg of Etidronate Disodium, accurately weighed, to a 50-mL volumetric flask, and dissolve in and dilute with *Mobile phase* to volume.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a refractive index detector and a 4.6- × 150-mm column that contains packing L23. The column and the detector temperatures are maintained at 32°. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 1.5%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of  $C_2H_6Na_2O_7P_2$  in the portion of Etidronate Disodium taken by the formula:

$$100(250.00/224.05)(C_s / C_u)(r_u / r_s)$$

in which 250.00 and 224.05 are the molecular weights of etidronate disodium and etidronic acid monohydrate, respectively;  $C_s$  is the concentration, in mg per mL, of USP Etidronic Acid Monohydrate RS in the *Standard preparation*;  $C_u$  is the concentration, in mg per mL, of Etidronate Disodium in the *Assay preparation*; and  $r_u$  and  $r_s$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## **Etidronate Disodium Tablets**

» Etidronate Disodium Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of etidronate disodium ( $C_2H_6Na_2O_7P_2$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Etidronate Disodium RS

USP Etidronic Acid Monohydrate RS

$C_2H_6O_7P_2 \cdot H_2O$  224.04

**Identification, Infrared Absorption** (197)—The spectra of trifluorovinyl chloride polymer and mineral oil dispersions, separately prepared from finely powdered Tablets recrystallized from water and dried at 105° for 1 hour, exhibit maxima in the regions of 4000 to 1350  $cm^{-1}$  and 1350 to 450  $cm^{-1}$ , respectively, only at the same wavelengths as those of similar preparations of USP Etidronate Disodium RS.

**Dissolution** (711)—

**Medium:** water; 900 mL.

**Apparatus 1:** 100 rpm.

**Time:** 30 minutes.

Determine the amount of  $C_2H_6Na_2O_7P_2$  dissolved by employing the following method.

**Mobile phase and Chromatographic system**—Proceed as directed in the *Assay under Etidronate Disodium*.

**Standard solution**—

FOR PRODUCTS LABELED TO CONTAIN 200 MG OF ETIDRONATE DISODIUM—Transfer approximately 20 mg of USP Etidronic Acid Monohydrate RS to a 100-mL volumetric flask, dissolve in 50 mL of water, add 2.0 mL of 0.1 N sodium hydroxide, dilute with water to volume, and mix.

FOR PRODUCTS LABELED TO CONTAIN 400 MG OF ETIDRONATE DISODIUM—Transfer approximately 20 mg of USP Etidronic Acid Monohydrate RS to a 50-mL volumetric flask, dissolve in 25 mL of water, add 2.0 mL of 0.1 N sodium hydroxide, dilute with water to volume, and mix.

**Test solution**—Transfer a portion of the solution under test to an HPLC vial.

**Procedure**—Separately inject equal volumes (about 100 µL for products labeled to contain 200 mg of Etidronate Disodium, and about 50 µL for products labeled to contain 400 mg of Etidronate Disodium) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantities of  $C_2H_6Na_2O_7P_2$  dissolved, employing the procedure set forth in the *Assay*, making any necessary volumetric adjustments.

**Tolerances**—Not less than 70% (Q) of the labeled amount of  $C_2H_6Na_2O_7P_2$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay—**

**Mobile phase, Standard preparation, and Chromatographic system**—Proceed as directed in the *Assay under Etidronate Disodium*.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to 160 to 170 mg of Etidronate Disodium, to a 200-mL volumetric flask, and dilute with *Mobile phase* to volume. Agitate the solution for at least 5 minutes, and pass through a 0.45-µm nylon filter.

**Procedure**—Proceed as directed for *Procedure* in the *Assay under Etidronate Disodium*. Calculate the quantity, in mg, of etidronate disodium ( $C_2H_6Na_2O_7P_2$ ) in the portion of Tablets taken by the formula:

$$C_s V_u (250.00/224.05)(r_u / r_s)$$

in which 250.00 and 224.05 are the molecular weights of etidronate disodium and etidronic acid monohydrate, respectively;  $C_s$  is the concentration, in mg per mL, of USP Etidronic Acid Monohydrate RS in the *Standard preparation*;  $V_u$  is the volume, in mL, of the *Assay preparation*; and  $r_u$  and  $r_s$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## **Etodolac**

$C_{17}H_{21}NO_3$  287.35

Pyran[3,4-*b*]indole-1-acetic acid, 1,8-diethyl-1,3,4,9-tetrahydro-(±)-.

(±)-1,8-Diethyl-1,3,4,9-tetrahydropyrano [3,4-*b*]indole-1-acetic acid [41340-25-4].

» Etodolac contains not less than 98.0 percent and not more than 102.0 percent of  $C_{17}H_{21}NO_3$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Etodolac RS

USP Etodolac Related Compound A RS

(±)-8-Ethyl-1-methyl-1,3,4,9-tetrahydropyrano [3,4-*b*]-indole-1-acetic acid.

$C_{16}H_{19}NO_3$  273.33

**Identification**, *Infrared Absorption* (197K).

**Water**, *Method I* (921): not more than 0.5%.

**Residue on ignition** (281): not more than 0.1%.

**Limit of chloride**—Dissolve 1.0 g of Etodolac in 60 mL of methanol, dilute with 10 mL of water, add 20 mL of 2 N nitric acid, and titrate with 0.01 N silver nitrate determining the endpoint potentiometrically (see *Titrimetry* (541)): the limit is not more than 0.3 mg per g.

**Heavy metals**, *Method II* (231): 0.001%.

**Limit of alcohol and methanol**—

*Internal standard stock solution*—Dissolve suitable quantities of isopropyl alcohol in dimethylformamide to obtain a solution containing about 2.5  $\mu$ L per mL.

*Internal standard solution*—Pipet 5.0 mL of *Internal standard stock solution* into a 100-mL volumetric flask. Dilute with dimethylformamide to volume, and mix. This solution contains 0.125  $\mu$ L of isopropyl alcohol.

*Standard stock solution*—Transfer 5.0 mL of methanol and 5.0 mL of alcohol to a 200-mL volumetric flask. Dilute with dimethylformamide to volume, and mix. Pipet 5.0 mL of this solution into a 100-mL volumetric flask, dilute with dimethylformamide to volume, and mix.

*Standard solution*—Pipet 10.0 mL of *Standard stock solution* and 5.0 mL of *Internal standard stock solution* into a 100-mL volumetric flask. Dilute with dimethylformamide to volume, and mix. This solution contains 0.101 mg of methanol and 0.099 mg of alcohol per mL.

*Test solution*—Transfer about 0.5 g of Etodolac, accurately weighed, to a 10-mL flask. Pipet 5.0 mL of *Internal standard solution* into the flask. Insert a stopper into the flask, and sonicate to dissolve.

*Chromatographic system* (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and a 0.32-mm  $\times$  25-m fused silica capillary column coated with a 5- $\mu$ m film of phase G36. The carrier gas is helium, with a split flow rate of 50 mL per minute. The injection port temperature is maintained at 200°, and the detector is maintained at 300°. The column temperature is maintained at 45° for 5 minutes, then programmed to increase at the rate of 30° per minute to 280° and to maintain this temperature for 27 minutes. Chromatograph the *Standard solution* and the *Test solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.6 for methanol, 0.8 for alcohol, and 1.0 for isopropyl alcohol; and the resolution, *R*, between peaks is not less than 1.

*Procedure*—Separately inject equal volumes (about 1  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas of the peak responses. Identify by their retention times any peaks present in the chromatogram obtained from the *Test solution* that correspond to those in the chromatogram obtained from the *Standard solution*. Calculate the percentages of  $C_2H_5OH$  and  $CH_3OH$  in the portion of Etodolac taken by the formula:

$$500(C/W)(R_U/R_S)$$

in which *C* is the concentration, in mg per mL, of  $C_2H_5OH$  or  $CH_3OH$  in the *Standard solution*; *W* is the weight, in mg, of Etodolac taken to prepare the *Test solution*; and *R<sub>U</sub>* and *R<sub>S</sub>* are the peak area ratios of the relevant analyte to the internal standard obtained from the *Test solution* and the *Stan-*

*dard solution*, respectively: not more than 0.1% of each is found.

**Chromatographic purity**—

*Solution A*—Mix 0.6 mL of phosphoric acid with 100 mL of water.

*Solution B*—Mix 0.6 mL of phosphoric acid with 100 mL of acetonitrile.

*Mobile phase*—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*System suitability solution*—Dissolve suitable quantities of USP Etodolac Related Compound A RS and USP Etodolac RS in acetonitrile to obtain a solution containing about 0.01 mg per mL and 0.2 mg per mL, respectively.

*Test solution*—Transfer about 25 mg of Etodolac, accurately weighed, to a 250-mL volumetric flask, dissolve in and dilute with acetonitrile to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 214-nm detector and a 4-mm  $\times$  25-cm column that contains packing L7. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0-5	60	40	isocratic
5-35	60→20	40→80	linear gradient
	60	40	re-equilibration

Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.8 for etodolac related compound A and 1.0 for etodolac; the resolution, *R*, between etodolac related compound A and etodolac is not less than 3; the tailing factor is not more than 2; and the relative standard deviation for replicate injections is not more than 3%.

*Procedure*—Inject a volume (about 20  $\mu$ L) of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each impurity in the portion of Etodolac taken by the formula:

$$100(r_i/r_s)$$

in which *r<sub>i</sub>* is the peak response for each impurity; and *r<sub>s</sub>* is the sum of the responses of all of the peaks: not more than 0.5% of any individual impurity is found; and the total of all impurities is not more than 2.0%.

**Assay**—Dissolve about 230 mg of Etodolac in 60 mL of methanol. Titrate with 0.1 N tetrabutylammonium hydroxide VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N tetrabutylammonium hydroxide is equivalent to 28.74 mg of  $C_{17}H_{21}NO_3$ .

## Etodolac Capsules

» Etodolac Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of etodolac ( $C_{17}H_{21}NO_3$ ).

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

**USP Reference standards** (11)—

USP Etodolac RS

USP Etodolac Related Compound A RS

(±)-8-Ethyl-1-methyl-1,3,4,9-tetrahydropyrano [3,4-*b*]-indole-1-acetic acid. $C_{16}H_{19}NO_3$  273.33

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Dissolution** (711)—

*Medium*: pH 6.8 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*); 1000 mL.

*Apparatus 1*: 100 rpm.

*Time*: 30 minutes.

*Procedure*—Determine the amount of  $C_{17}H_{21}NO_3$  dissolved by employing UV absorption at the wavelength of maximum absorbance at about 274 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Etodolac RS in the same *Medium*.

*Tolerances*—Not less than 75% (Q) of the labeled amount of  $C_{17}H_{21}NO_3$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—

*Mobile phase*—Prepare a filtered and degassed mixture of acetonitrile, water, and phosphoric acid (500:500:0.25). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Etodolac RS in *Mobile phase* to obtain a solution having a known concentration of about 0.2 mg per mL. Prepare this solution fresh daily.

*System suitability solution*—Dissolve suitable quantities of USP Etodolac Related Compound A RS and USP Etodolac RS in *Mobile phase* to obtain a solution containing about 0.01 mg of etodolac related compound A and 0.2 mg of etodolac per mL.

*Assay preparation*—Weigh not fewer than 20 Capsules, and transfer the contents as completely as possible to a suitable container. Remove any residual powder from the empty capsules with the aid of a current of air, and weigh the capsule shells, determining the weight of the contents by difference. Mix the contents of the Capsules, and transfer an accurately weighed portion of the powder, equivalent to about 1000 mg of etodolac, to a 500-mL volumetric flask, add 300 mL of *Mobile phase*, shake for 15 minutes, sonicate for 5 minutes, cool, dilute with *Mobile phase* to volume, and mix. Allow to settle for 10 minutes. Pipet 10.0 mL of the solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Pass the solution through a filter having a 0.45- $\mu$ m or finer porosity, prior to use.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 274-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*; the relative retention times are about 0.8 for etodolac related compound A and 1.0 for etodolac; the resolution, *R*, between etodolac related compound A and etodolac is not less than 2; the tailing factor is not more than 2; and the relative standard deviation for replicate injections is not more than 2%.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quan-

tity, in mg, of etodolac ( $C_{17}H_{21}NO_3$ ) in the portion of Capsule contents taken by the formula:

$$5000C(r_u / r_s)$$

in which *C* is the concentration, in mg per mL, of USP Etodolac RS in the *Standard preparation*; and *r<sub>u</sub>* and *r<sub>s</sub>* are the etodolac peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

---

**Etodolac Tablets**

---

» Etodolac Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of etodolac ( $C_{17}H_{21}NO_3$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Etodolac RS

USP Etodolac Related Compound A RS

(±)-8-Ethyl-1-methyl-1,3,4,9-tetrahydropyrano [3,4-*b*]-indole-1-acetic acid. $C_{16}H_{19}NO_3$  273.33

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Uniformity of dosage units** (905): meet the requirements.

**Dissolution** (711)—

*Medium*: pH 6.8 Phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*); 1000 mL.

*Apparatus 1*: 100 rpm.

*Time*: 30 minutes.

*Procedure*—Determine the amount of  $C_{17}H_{21}NO_3$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 274 nm of filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Etodolac RS in the same *Medium*.

*Tolerances*—Not less than 80% (Q) of the labeled amount of  $C_{17}H_{21}NO_3$  is dissolved in 30 minutes.

**Assay**—

*Mobile phase*—Prepare a filtered and degassed mixture of acetonitrile, water, and phosphoric acid (500:500:0.25). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*System suitability solution*—Dissolve suitable quantities of USP Etodolac Related Compound A RS and USP Etodolac RS in *Mobile phase* to obtain a solution containing about 0.01 mg of etodolac related compound A and 0.2 mg of etodolac per mL.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Etodolac RS in *Mobile phase* to obtain a solution having a known concentration of about 0.2 mg per mL. Prepare this solution fresh daily.

*Assay preparation*—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 1000 mg of etodolac, to a 500-mL volumetric flask, add 300 mL of *Mobile phase*, shake for 15 minutes, sonicate for 5 minutes, cool, dilute with *Mobile phase* to volume, and mix. Allow to settle for 10 minutes. Pipet 10.0 mL of the solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Pass the solution through a filter having a porosity of 0.45  $\mu$ m or less.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 274-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.8 for etodolac related compound A and 1.0 for etodolac; the resolution, *R*, between etodolac related compound A and etodolac is not less than 2; the tailing factor is not more than 2; and the relative standard deviation for replicate injections is not more than 2%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of etodolac (C<sub>17</sub>H<sub>21</sub>NO<sub>3</sub>) in the portion of Tablets taken by the formula:

$$5000C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Etodolac RS in the *Standard preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the etodolac peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Etodolac Extended-Release Tablets

» Etodolac Extended-Release Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of etodolac (C<sub>17</sub>H<sub>21</sub>NO<sub>3</sub>).

**Packaging and storage**—Preserve in well-closed containers. Store at controlled room temperature, protected from light.

**Labeling**—When more than one *Dissolution Test* is given, the labeling states the *Dissolution Test* used only if *Test 1* is not used.

### USP Reference standards <11>—

USP Etodolac RS

USP Etodolac Related Compound A RS

(±)-8-Ethyl-1-methyl-1,3,4,9-tetrahydropyrano [3,4-*b*]-indole-1-acetic acid.

C<sub>16</sub>H<sub>19</sub>NO<sub>3</sub> 273.33

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

### Dissolution <711>—

TEST 1—

*Medium*: 0.05 M phosphate buffer, pH 7.4; 1000 mL.

*Apparatus 2*: 75 rpm, with USP sinker.

*Times*: 3, 6, 10, and 16 hours.

**Procedure**—Determine the amount of C<sub>17</sub>H<sub>21</sub>NO<sub>3</sub> dissolved by employing UV absorption at the wavelength of maximum absorbance at about 279 nm on filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a *Standard solution* having a known concentration of USP Etodolac RS in the same *Medium*. Use *Medium* as the blank.

**Tolerances**—The percentages of the labeled amount of C<sub>17</sub>H<sub>21</sub>NO<sub>3</sub> dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
3	between 15% and 40%
6	between 35% and 70%

Time (hours)	Amount dissolved
10	between 60% and 95%
16	not less than 80%

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

*Medium*: 0.05 M phosphate buffer, pH 7.5; 1000 mL.

*Apparatus 2*: 100 rpm.

*Times*: 2, 4, 8, and 14 hours.

**Procedure**—Determine the amount of C<sub>17</sub>H<sub>21</sub>NO<sub>3</sub> dissolved by comparing the difference between the absorbances of the filtered portions of the solution under test determined at 278 nm and 245 nm with the difference between the absorbances of a *Standard solution* having a known concentration of USP Etodolac RS in the same *Medium* determined at the same wavelengths. Use *Medium* as the blank, and use a 0.05-cm silica cell.

**Tolerances**—The percentages of the labeled amount of C<sub>17</sub>H<sub>21</sub>NO<sub>3</sub> dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
2	between 10% and 35%
4	between 30% and 55%
8	between 60% and 90%
14	not less than 85%

TEST 3—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

*Medium*: 0.05 M phosphate buffer, pH 6.8; 1000 mL.

*Apparatus 2*: 75 rpm.

*Times*: 2, 4, 8, and 14 hours.

**Procedure**—Determine the amount of C<sub>17</sub>H<sub>21</sub>NO<sub>3</sub> dissolved by employing UV absorption at the wavelength of maximum absorbance at about 278 nm on portions of the solution under test passed through a 10-µm polyethylene filter, suitably diluted with *Medium*, if necessary, in comparison with a *Standard solution* having a known concentration of USP Etodolac RS in the same *Medium*. Use *Medium* as the blank, and use a 0.05-cm silica cell.

**Tolerances**—The percentages of the labeled amount of C<sub>17</sub>H<sub>21</sub>NO<sub>3</sub> dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
2	between 10% and 30%
4	between 30% and 50%
8	between 55% and 75%
14	not less than 80%

TEST 4—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4*.

*Medium*: 0.05 M phosphate buffer, pH 6.8; 900 mL.

*Apparatus 2*: 75 rpm, with a wire helix sinker.

*Times*: 2, 4, 8, and 18 hours.

**Test solution**—Pass a portion of the solution under test through a suitable 70-µm filter.

**Standard solution**—From a solution containing about 4 mg per mL of USP Etodolac RS in *Mobile phase*, make dilutions with *Medium* to obtain a solution with a final concentration of about *L*/1500 mg per mL, where *L* is the tablet label claim, in mg.

**Mobile phase**—Prepare a filtered and degassed mixture of acetonitrile, water, and concentrated phosphoric acid (500:500:0.25). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 274-nm detector and a 4.6-mm × 25-cm column that contains 5-μm packing L1. The flow rate is about 1.5 mL per minute. The column is maintained at 25°. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 μL) of the *Standard solution* and *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of etodolac dissolved at the times specified.

**Tolerances**—The percentages of the labeled amount of C<sub>17</sub>H<sub>21</sub>NO<sub>3</sub> dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
2	between 10% and 30%
4	between 20% and 45%
8	between 40% and 65%
18	not less than 80%

**Uniformity of dosage units** <905>: meet the requirements.

#### Chromatographic purity—

**Diluent, Mobile phase, and System suitability solution**—Proceed as directed in the *Assay*.

**Test solution**—Use the *Assay preparation*.

**Chromatographic system**—Prepare as directed in the *Assay*. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.8 for etodolac related compound A and 1.0 for etodolac; the resolution, *R*, between etodolac related compound A and etodolac is not less than 2.5; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Inject a volume (about 10 μL) of the *Test solution* into the chromatograph, record the chromatogram, and measure all of the peak areas. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$100(r_i / r_s)$$

in which *r<sub>i</sub>* is the peak area for each impurity, and *r<sub>s</sub>* is the sum of the areas of all the peaks: not more than 0.2% of any individual impurity is found; and not more than 0.75% of total impurities is found.

#### Assay—

**Diluent**—Use acetonitrile.

**Mobile phase**—Prepare a filtered and degassed mixture of acetonitrile, water, and phosphoric acid (500:500:0.25). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**System suitability solution**—Dissolve accurately weighed quantities of USP Etodolac RS and USP Etodolac Related Compound A RS in *Diluent*, and quantitatively dilute with *Diluent* to obtain a solution having known concentrations of about 0.48 mg per mL and 0.05 mg per mL, respectively.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Etodolac RS in *Diluent*, and quantitatively dilute with *Diluent* to obtain a solution having a known concentration of about 0.6 mg per mL.

**Assay preparation**—[NOTE—Do not finely powder Tablets.] Weigh and powder not fewer than 20 Tablets, and transfer an accurately weighed portion of the powder, equivalent to

about 600 mg of etodolac, to a 200-mL volumetric flask. Add about 100 mL of *Diluent*, mix, and shake for 40 minutes by mechanical means. Dilute with *Diluent* to volume, and mix. Pass through a filter having a 0.45-μm porosity, discarding the first 3 mL of the filtrate. Transfer 2.0 mL of the filtrate to a 10-mL volumetric flask, dilute with *Diluent* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 274-nm detector, a 4.0-mm × 4.0-cm guard column that contains 5-μm packing L7, and a 4.0-mm × 25-cm column that contains 5-μm packing L7. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.8 for etodolac related compound A and 1.0 for etodolac; the resolution, *R*, between etodolac related compound A and etodolac is not less than 2.5; and the tailing factor is not more than 2.0. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of etodolac (C<sub>17</sub>H<sub>21</sub>NO<sub>3</sub>) in the portion of Tablets taken by the formula:

$$1000C(r_u / r_s)$$

in which *C* is the concentration, in mg per mL, of USP Etodolac RS in the *Standard preparation*; and *r<sub>u</sub>* and *r<sub>s</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Etomidate

C<sub>14</sub>H<sub>16</sub>N<sub>2</sub>O<sub>2</sub> 244.29  
1*H*-Imidazole-5-carboxylic acid, 1-(1-phenylethyl)-, ethyl ester, (+)-;  
(+)-Ethyl 1-(α-methylbenzyl)imidazole-5-carboxylate  
[33125-97-2].

#### DEFINITION

Etomidate contains NLT 98.0% and NMT 102.0% of C<sub>14</sub>H<sub>16</sub>N<sub>2</sub>O<sub>2</sub>, calculated on the dried basis.

#### IDENTIFICATION

- A. INFRARED ABSORPTION** <197K>
- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

#### ASSAY

##### PROCEDURE

**Buffer:** 0.7 g/L of monobasic sodium phosphate in water

**Mobile phase:** Acetonitrile and *Buffer* (2:3)

**Standard solution:** 0.16 mg/mL of USP Etomidate RS in acetonitrile

**Sample solution:** 0.16 mg/mL of Etomidate in acetonitrile

**Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** UV 254 nm**Column:** 3.9-mm × 30-cm; packing L1**Flow rate:** 2.3 mL/min**Injection size:** 20 µL**System suitability****Sample:** *Standard solution***Suitability requirements****Tailing factor:** NMT 2.0**Relative standard deviation:** NMT 2.0%**Analysis****Samples:** *Standard solution* and *Sample solution*Calculate the percentage of C<sub>14</sub>H<sub>16</sub>N<sub>2</sub>O<sub>2</sub> in the portion of Etomidate taken:

C<sub>13</sub>H<sub>14</sub>N<sub>2</sub>O<sub>2</sub> · HCl 266.72

**Etomidate Injection****DEFINITION**

Etomidate Injection is a sterile, nonpyrogenic solution. It contains NLT 90.0% and NMT 110.0% of the labeled amount of etomidate (C<sub>14</sub>H<sub>16</sub>N<sub>2</sub>O<sub>2</sub>). It may contain suitable buffers and preservatives.

**IDENTIFICATION**

- **A. ULTRAVIOLET ABSORPTION** <197U>  
**Sample solution:** 10 µg/mL of etomidate in isopropyl alcohol  
**Medium:** Isopropyl alcohol
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

**ASSAY****• PROCEDURE**

**Buffer:** 0.7 g/L of monobasic sodium phosphate in water

**Mobile phase:** Acetonitrile and *Buffer* (2:3)

**Standard solution:** 0.16 mg/mL of USP Etomidate RS in acetonitrile

**Sample solution:** 0.16 mg/mL of etomidate, from the Injection, in acetonitrile

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 3.9-mm × 30-cm; packing L1

**Flow rate:** 2.3 mL/min

**Injection size:** 20 µL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of C<sub>14</sub>H<sub>16</sub>N<sub>2</sub>O<sub>2</sub> in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Etomidate RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of etomidate in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

**IMPURITIES****Organic Impurities****• PROCEDURE 1: RELATED COMPOUNDS**

**Solution A:** Dissolve 6 g of sodium citrate dihydrate and 4 g of anhydrous citric acid in 1 L of water.

**Solution B:** Acetonitrile

**Mobile phase:** See the gradient table below.

  - $C_{13}H_{14}N_2O_2 \cdot HCl$  266.72

**Etoposide** $C_{29}H_{32}O_{13}$  588.56

Furo[3',4':6,7]naphtho[2,3-d]-1,3-dioxol-6(5aH)-one-, 9-[(4,6-O-ethylidene-β-D-glucopyranosyl)oxy]5,8,8a,9-tetrahydro-5-(4-hydroxy-3,5-dimethoxyphenyl), [5R-[5α,5aβ,8α,9β(R\*)]]-, 4'-Demethylepipodophyllotoxin 9-[4,6-O-(R)-ethylidene-β-D-glucopyranoside] [33419-42-0].

» Etoposide contains not less than 95.0 percent and not more than 105.0 percent of  $C_{29}H_{32}O_{13}$ , calculated on the anhydrous basis.**Caution**—Etoposide is potentially cytotoxic. Great care should be taken to prevent inhaling particles and exposing the skin to it.**Packaging and storage**—Preserve in tight, light-resistant containers.**USP Reference standards** (11)—

USP Etoposide RS

USP Etoposide Resolution Mixture RS

**Identification**—**A:** *Infrared Absorption* (197K).**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.**Specific rotation** (781S): between  $-110^\circ$  and  $-118^\circ$  ( $t = 20^\circ$ ).**Test solution:** 5 mg per mL, in a mixture of chloroform and methanol (9:1).**Water**, *Method I* (921): not more than 6.0%.**Residue on ignition** (281): not more than 0.1%.**Heavy metals**, *Method II* (231): 0.002%.**Related compounds**—**Buffer solution**—Prepare as directed in the *Assay*.**Solution A**—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (80:20).**Solution B**—Prepare a filtered and degassed mixture of acetonitrile and *Buffer solution* (60:40).**Mobile phase**—Use variable mixtures of *Solution A* and *Solution B* as directed under *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).**Diluting solution**—Prepare a filtered mixture of 0.02 M sodium acetate, previously adjusted with acetic acid to a pH of 4.0, and acetonitrile (70:30).**Standard solution**—Dissolve an accurately weighed quantity of USP Etoposide RS in *Diluting solution* to obtain a *Standard stock solution* having a known concentration of about 2.0 mg per mL. Dilute this *Standard stock solution* quantitatively and stepwise with *Diluting solution* to obtain a *solution* having a known concentration of about 10 μg per mL.**System suitability solution**—Transfer about 20 mg of *n*-propylparaben, accurately weighed, to a 100-mL volumetric flask, and dissolve in and dilute with *Diluting solution* to volume. Transfer 5 mL of this solution and 5 mL of the *Standard stock solution* to a 50-mL volumetric flask, and dilute with *Diluting solution* to volume. Transfer 5.0 mL of this solu-

tion to a 100-mL volumetric flask, dilute with *Diluting solution* to volume, and mix.

**Test solution**—Transfer about 100 mg of Etoposide, accurately weighed, to a 50-mL volumetric flask, and dissolve in and dilute with *Diluting solution* to volume.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm × 15-cm column that contains packing L11 having a diameter of less than 5 μm. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution* using *Solution A*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.20 for lignan P, 1.0 for etoposide, and 1.43 for picroetoposide; and the resolution, *R*, between propylparaben and etoposide is not less than 1.1. The chromatograph is programmed for *Procedure* as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0	100	0	equilibration
0–15	100	0	isocratic
15–30	100→40	0→60	linear gradient
30–40	40	60	isocratic
40–42	40→0	60→100	linear gradient
42–45	0	100	isocratic
45–47	0→100	100→0	linear gradient
47–50	100	0	re-equilibration

**Procedure**—Separately inject equal volumes (about 25 μL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms for at least 40 minutes, and measure the peak responses. Calculate the percentages of lignan P and picroetoposide in the portion of Etoposide taken by the formula:

$$5000(C/W)(r_i / r_s)$$

in which *C* is the concentration, in mg per mL, of USP Etoposide RS in the *Standard solution*; *W* is the weight, in mg, of Etoposide taken to prepare the *Test solution*; *r<sub>i</sub>* is the peak response for each related compound obtained from the *Test solution*; and *r<sub>s</sub>* is the peak response for etoposide obtained from the *Standard solution*: not more than 0.5% of lignan P and 1.0% of picroetoposide is found. Calculate the quantity of any other impurity observed in the chromatogram of the *Test solution* by the same formula: not more than 2.0% of all related compounds and other impurities is found.

#### Assay—

**Buffer solution**—Dissolve 5.44 g of sodium acetate in 2000 mL of water, adjust with glacial acetic acid to a pH of 4.0, and filter.

**Mobile phase**—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (74:26). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Etoposide RS in acetonitrile to obtain a Standard stock solution having a known concentration of about 2.0 mg per mL. Transfer 5.0 mL of this Standard stock solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**System suitability solution**—Dissolve an accurately weighed quantity of USP Etoposide Resolution Mixture RS in *Mobile phase* to obtain a solution having a known concentration of 0.3 mg per mL.

**Assay preparation**—Transfer about 100 mg of Etoposide, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with acetonitrile to volume, and mix. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm × 30-cm column that contains packing L11. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between the etoposide and α-etoposide peaks is not less than 1.35. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, and allow the *Assay preparation* to elute for not less than 1.5 times the retention time of etoposide. Record the chromatograms, and measure the responses for all the peaks. Calculate the quantity, in mg, of C<sub>29</sub>H<sub>32</sub>O<sub>13</sub> in the portion of Etoposide taken by the formula:

$$500C(r_u / r_s)$$

in which *C* is the concentration, in mg per mL, of USP Etoposide RS in the *Standard preparation*; and *r<sub>u</sub>* and *r<sub>s</sub>* are the etoposide peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Etoposide Capsules

» Etoposide Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of etoposide (C<sub>29</sub>H<sub>32</sub>O<sub>13</sub>).

**Caution**—Etoposide is potentially cytotoxic. Great care should be taken to prevent inhaling particles of Etoposide and exposing the skin to it.

**Packaging and storage**—Preserve in tight containers in a cold place. Do not freeze.

#### USP Reference standards <11>—

USP Etoposide RS

USP Etoposide Resolution Mixture RS

#### Identification—

**A: Infrared Absorption** <197K>—

**Test specimen**—Transfer a suitable quantity of the contents of Capsules, equivalent to about 100 mg of etoposide, to a separator containing 100 mL of water. Extract twice with 20-mL portions of chloroform, separate and combine the organic layer, dry over anhydrous sodium sulfate, and filter. Transfer the dried filtrate to a second separator, extract with 30 mL of water, and allow the layers to separate. Drain the chloroform layer through a bed of anhydrous sodium sulfate contained in a filter funnel into a round bottom flask, and evaporate the chloroform at a temperature of 30 ± 5° using a rotary evaporator. Dissolve the oily residue obtained in 5 mL of water, shake gently, and allow to stand for 30 minutes. Filter, collecting the precipitate formed on a glass filter funnel, wash the precipitate with three 20-mL portions of water, and allow the precipitate to dry on the filter for about 90 minutes in a vacuum oven at 40°. Prepare a dispersion of the precipitate in KBr at a ratio 1 in 100.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

#### Dissolution <711>—

**Medium:** pH 4.5 acetate buffer; 900 mL.

**Apparatus 2:** 50 rpm.

**Time:** 30 minutes.

Determine the amount of C<sub>29</sub>H<sub>32</sub>O<sub>13</sub> dissolved by employing the following method.

**Buffer solution**—Dissolve 5.44 g of sodium acetate in 2000 mL of water, adjust with acetic acid to a pH of 4.0, and filter.

**Mobile phase**—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (74:26). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard solution**—Dissolve, with sonication, an accurately weighed quantity of USP Etoposide RS in a volume of methanol equivalent to 2% of the final solution volume. Dilute with *Dissolution Medium* to obtain a solution having a known concentration of about 55 µg per mL, and mix.

**Test solution**—At 30 minutes withdraw a 10-mL aliquot from the dissolution vessel.

**Chromatographic system**—The liquid chromatograph is equipped with a 240-nm detector and a 3.9-mm × 30-cm column that contains packing L11. The flow rate is about 2 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 50 µL) of the filtered portions of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Determine the amount of C<sub>29</sub>H<sub>32</sub>O<sub>13</sub> dissolved.

**Tolerances**—Not less than 80% (Q) of the labeled amount of C<sub>29</sub>H<sub>32</sub>O<sub>13</sub> is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Related compounds**—Proceed as directed in the test for *Related compounds* under *Etoposide*: not more than 2.0% of picroetoposide is found; and not more than 3.0% of total impurities is found.

#### Assay—

*Buffer solution, Mobile phase, Standard preparation, System suitability solution, and Chromatographic system*—Proceed as directed in the *Assay* under *Etoposide*.

**Assay preparation**—Transfer an accurately counted number of Capsules, equivalent to about 500 mg of etoposide, to a 500-mL volumetric flask, add about 400 mL of *Mobile phase*, and stir using a magnetic bar for about 15 minutes, followed by sonication for about 1 hour with occasional shaking. Cool, dilute with *Mobile phase* to volume, stir for an additional 5 minutes, and filter. Transfer 10.0 mL of this solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Procedure**—Proceed as directed in the *Assay* under *Etoposide*. Calculate the quantity, in mg, of etoposide (C<sub>29</sub>H<sub>32</sub>O<sub>13</sub>) per Capsule by the formula:

$$2500(C/N)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Etoposide RS in the *Standard preparation*; N is the number of Capsules taken; and  $r_U$  and  $r_S$  are the etoposide peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Etoposide Injection

» Etoposide Injection contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of etoposide (C<sub>29</sub>H<sub>32</sub>O<sub>13</sub>) in a sterile solution in a nonaqueous medium intended for dilution with a suitable parenteral vehicle prior to intravenous infusion.

**Packaging and storage**—Preserve in single-dose or multiple-dose containers of Type I glass.

**Labeling**—Label it to indicate that it must be diluted with suitable parenteral vehicle prior to intravenous infusion.

#### USP Reference standards (11)—

USP Etoposide RS

USP Etoposide Resolution Mixture RS

USP Endotoxin RS

#### Identification—

**A: Diluting solution**—Prepare a mixture of chloroform and methanol (9:1).

**Spray reagent**—Add 10 mL of sulfuric acid with cooling and stirring to 70 mL of dehydrated alcohol in a 100-mL volumetric flask. Dilute with dehydrated alcohol to volume, and mix.

**Standard solution**—Dissolve USP Etoposide RS in *Diluting solution* to obtain a solution having a known concentration of about 0.8 mg per mL.

**Test solution**—Transfer a volume of Injection, equivalent to about 20 mg of etoposide, to a 25-mL volumetric flask, dilute with *Diluting solution* to volume, and mix.

**Procedure**—Apply separately 10 µL each of the *Standard solution* and the *Test solution* to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the plate in a suitable chromatographic chamber containing a developing solvent consisting of a mixture of chloroform, acetone, alcohol, and water (80:25:2.5:0.5). Allow the chromatogram to develop until the solvent front has moved about 17 cm from the origin. Remove the plate, and allow it to air-dry in a fume hood for 5 minutes. Replace the plate in the tank and develop again to a distance of about 17 cm from the origin. Remove the plate and air-dry it in a fume hood for about 20 minutes. Spray the plate with the *Spray reagent* and heat in a forced-air oven at 120° for about 15 minutes: the principal spot from the *Test solution* corresponds in appearance and  $R_f$  value to that from the *Standard solution*.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**pH** (791): between 3.0 and 4.0 in a solution prepared by diluting 5.0 mL of it with 45 mL of water.

**Bacterial endotoxins** (85)—Use a test solution, prepared by diluting the Injection with Sterile Water for Injection to obtain a concentration of 0.31 mg etoposide activity per mL: it contains not more than 2.0 USP Endotoxin Units per mg of etoposide.

**Alcohol content, Method II** (611) (if present): between 90.0% and 110.0% of the labeled amount of C<sub>2</sub>H<sub>5</sub>OH, *n*-propyl alcohol being used as the internal standard.

#### Benzyl alcohol content (if present)—

*Buffer solution, Mobile phase, System suitability solution, and Chromatographic system*—Proceed as directed in the *Assay* under *Etoposide*.

**Standard preparation**—Transfer 0.75 mL of freshly distilled benzyl alcohol, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. Transfer 1.0 mL of this solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Test preparation**—Use the *Assay preparation*.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Test preparation* into the chromatograph, record the chromatograms, and measure the responses for the benzyl alcohol peaks. Calculate the

quantity, in mg per mL, of benzyl alcohol in the volume of Injection taken by the formula:

$$500(C/V)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of benzyl alcohol in the *Standard preparation*; V is the volume of Injection taken; and  $r_U$  and  $r_S$  are the peak responses of benzyl alcohol obtained from the *Test preparation* and the *Standard preparation*, respectively: between 90.0% and 110.0% of the labeled amount is found.

**Related compounds**—Proceed as directed in the *Related compounds* test under *Etoposide*. Not more than 3.0% total impurities is found.

**Other requirements**—It meets the requirements under *Injections* (1).

#### Assay—

*Buffer solution*, *Mobile phase*, *Standard preparation*, *System suitability solution*, and *Chromatographic system*—Proceed as directed in the *Assay* under *Etoposide*.

*Assay preparation*—Transfer an accurately measured volume of Injection, equivalent to about 100 mg of etoposide, to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Pipet 5.0 mL of this solution into another 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Etoposide*. Calculate the quantity, in mg, of etoposide ( $C_{29}H_{32}O_{13}$ ) in each mL of the Injection taken by the formula:

$$500(C/V)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Etoposide RS in the *Standard preparation*; V is the volume, in mL, of Injection taken; and  $r_U$  and  $r_S$  are the responses of the etoposide peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Eucalyptol

$C_{10}H_{18}O$  154.25  
1,3,3-Trimethyl-2-oxabicyclo[2.2.2]octane;  
1,8-Epoxy-*p*-menthane [470-82-6].

#### DEFINITION

Eucalyptol is obtained from oil of eucalyptus and from other sources. It contains NLT 98.0% and NMT 100.0% of  $C_{10}H_{18}O$ .

#### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197F)
- **B.** Add 1 mL of phosphoric acid to 1 mL of Eucalyptol contained in a test tube maintained in an ice bath. A solid white crystalline mass is formed, from which eucalyptol separates upon addition of warm water.

#### ASSAY

##### • PROCEDURE

**System suitability solution:** 0.2 mg/mL of limonene and 0.9 mg/mL of USP Eucalyptol RS in methanol

**Sample solution:** 0.9 mg/mL of Eucalyptol in methanol

**Blank:** Methanol

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 0.32-mm × 60-m fused-silica capillary column coated with phase G16

**Temperature**

**Injector port:** 250°

**Detector:** 250°

**Column:** See Table 1.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
60	6	200	—

**Split flow rate:** 50 mL/min

**Carrier gas:** Helium

**Column head pressure:** 30 psi

**Injection size:** 1 µL

**System suitability**

**Sample:** *System suitability solution*

**Suitability requirements**

**Resolution:** NLT 2.0 between limonene and eucalyptol

**Column efficiency:** NLT 150,000 theoretical plates, eucalyptol

**Analysis**

**Samples:** *Sample solution* and *Blank*

[NOTE—Identify any peaks from the *Sample solution* that correspond to those in the *Blank* by their retention times.]

Calculate the percentage of eucalyptol ( $C_{10}H_{18}O$ ) in the portion of Eucalyptol taken:

$$\text{Result} = (r_U / r_T) \times 100$$

$r_U$  = peak response of eucalyptol from the *Sample solution*

$r_T$  = sum of all peak responses from the *Sample solution*, other than the responses corresponding to those of the *Blank*

**Acceptance criteria:** 98.0%–100.0%

#### IMPURITIES

##### • LIMIT OF PHENOLS

**Analysis 1:** Shake 5 mL with 5 mL of sodium hydroxide TS.

**Acceptance criteria 1:** The volume of Eucalyptol is not diminished.

**Analysis 2:** Shake 1 mL with 20 mL of water and allow the liquids to separate. To 10 mL of the water layer add 1 drop of ferric chloride TS.

**Acceptance criteria 2:** The mixture develops no violet color.

#### SPECIFIC TESTS

- **SPECIFIC GRAVITY** (841): 0.921–0.924
- **CONGEALING TEMPERATURE** (651): NLT 0°
- **OPTICAL ROTATION**, *Angular Rotation* (781A):  $-0.5^\circ$  to  $+0.5^\circ$
- **DISTILLING RANGE**, *Method I* (721): 174°–177°
- **REFRACTIVE INDEX** (831): 1.455–1.460 at 20°

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS** (11)  
USP Eucalyptol RS

---

**Eugenol**

---

 $C_{10}H_{12}O_2$ 

164.20

Phenol, 2-methoxy-4-(2-propenyl)-;  
4-Allyl-2-methoxyphenol [97-53-0].

**DEFINITION**

Eugenol is obtained from clove oil and from other sources.

**IDENTIFICATION**

- **A. INFRARED ABSORPTION** (197F)

**IMPURITIES**

- **HEAVY METALS**, *Method II* (231): NMT 40 ppm
- **HYDROCARBONS**

**Analysis:** Dissolve 1 mL in 20 mL of 0.5 N sodium hydroxide in a 50-mL stoppered tube, add 18 mL of water, and mix.

**Acceptance criteria:** A clear mixture results immediately, but it may become turbid when exposed to air.

- **LIMIT OF PHENOL**

**Analysis:** Shake 1 mL with 20 mL of water. Filter, and add 1 drop of ferric chloride TS to 5 mL of the clear filtrate.

**Acceptance criteria:** The mixture exhibits a transient grayish-green color but not a blue or violet color.

**SPECIFIC TESTS**

- **SPECIFIC GRAVITY** (841): 1.064–1.070
- **DISTILLING RANGE**, *Method II* (721): NLT 95% distills from 250°–255°
- **REFRACTIVE INDEX** (831): 1.540–1.542 at 20°
- **SOLUBILITY IN 70% ALCOHOL:** One volume dissolves in 2 volumes of 70% alcohol.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **USP REFERENCE STANDARDS** (11)  
USP Eugenol RS

## Factor IX Complex

» Factor IX Complex conforms to the regulations of the federal Food and Drug Administration concerning biologics (see *Biologics* <1041>). It is a sterile, freeze-dried powder consisting of partially purified Factor IX fraction, as well as concentrated Factors II, VII, and X fractions, of venous plasma obtained from healthy human donors. It contains no preservative. It meets the requirements of the test for potency in having not less than 80 percent and not more than 120 percent of the potency stated on the label in Factor IX Units by comparison with the U.S. Factor IX Standard or with a working reference that has been calibrated with it.

**Packaging and storage**—Preserve in hermetic containers in a refrigerator.

**Expiration date**—The expiration date is not later than 2 years from the date of manufacture.

**Labeling**—Label it with a warning that it is to be used within 4 hours after constitution, and to state that it is for intravenous administration and that a filter is to be used in the administration equipment.

## Famotidine

$C_8H_{15}N_7O_2S_3$  337.45

Propanimidamide, *N*'-(aminosulfonyl)-3-[[[2-[(diaminomethylene)amino]-4-thiazolyl]methyl]thio]-; [1-Amino-3-[[[2-[(diaminomethylene)amino]-4-thiazolyl]methyl]thio]propylidene]sulfamide; 3-[[2-(Diaminomethyleneamino)thiazol-4-yl]methylthio]-*N*'-sulfamoylpropanimidamide [76824-35-6].

### DEFINITION

Famotidine contains NLT 98.5% and NMT 101.0% of famotidine ( $C_8H_{15}N_7O_2S_3$ ), calculated on the dried basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION** <197K>

### ASSAY

#### • PROCEDURE

**Sample:** Dissolve 250 mg of Famotidine in 80 mL of glacial acetic acid.

**Analysis:** Titrate with 0.1 N perchloric acid VS (see *Titrimetry* <541>), using a suitable anhydrous electrode system. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 16.87 mg of  $C_8H_{15}N_7O_2S_3$ .

**Acceptance criteria:** 98.5%–101.0% on the dried basis

### IMPURITIES

- **RESIDUE ON IGNITION** <281>: NMT 0.1%
- **HEAVY METALS**, *Method II* <231>: NMT 10 ppm

### Change to read:

#### • ORGANIC IMPURITIES

**Buffer:** 1.882 g/L of sodium 1-hexanesulfonate in water, adjusted with acetic acid to a pH of 3.5

**Solution A:** Acetonitrile, methanol, and *Buffer* (94:6:900)

**Solution B:** Acetonitrile

**Mobile phase:** See *Table 1*. [NOTE—If necessary, adjust the *Mobile phase* to achieve a retention time of 19–23 min for the famotidine peak and a maximum of 48 min for the famotidine related compound E peak.]

Table 1

Time (min)	Solution A (%)	Solution B (%)	Flow Rate (mL/min)
0	100	0	1
23	96	4	1
27	96	4	2
47	78	22	2
48	100	0	2
54	100	0	1

• **Standard stock solution:** 0.5 mg/mL of USP Famotidine RS in *Solution A*

**Standard solution:** 0.5 µg/mL of USP Famotidine RS in *Solution A*

**System suitability stock solution:** 0.25 mg/mL of USP Famotidine Related Compound D RS in methanol

**System suitability solution:** Transfer 1 mL of the *System suitability stock solution* and 0.5 mL of the *Standard stock solution* into a 100-mL volumetric flask, and dilute with *Solution A* to volume. • (ERR 1-Jul-2012)

**Sample solution:** 0.5 mg/mL of Famotidine in *Solution A*

**Identification solution:** 0.5 mg/mL of USP Famotidine RS and 1.5 µg/mL of each of USP Famotidine Related Compound B RS, USP Famotidine Related Compound C RS, USP Famotidine Related Compound D RS, USP Famotidine Related Compound E RS, and USP Famotidine Related Compound F RS in *Solution A*

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 265 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L1

**Column temperature:** 50°

**Flow rate:** See *Table 1*.

**Injection volume:** 20 µL

#### System suitability

**Sample:** *System suitability solution*

#### Suitability requirements

**Resolution:** NLT 3.5 between famotidine and famotidine related compound D

#### Analysis

**Samples:** *Standard solution*, *Sample solution*, and *Identification solution*

Chromatograph the *Identification solution*, and identify the components on the basis of their relative retention times, given in *Table 2*.

Calculate the percentage of each impurity in the portion of Famotidine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_S$  = peak response of famotidine from the *Standard solution*

$C_S$  = concentration of USP Famotidine RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Famotidine in the *Sample solution* (mg/mL)

$F$  = relative response factor (see *Table 2*)

#### Acceptance criteria

Individual impurities: See *Table 2*.

**Table 2**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Famotidine	1.0	—	—
Famotidine related compound D <sup>a</sup>	1.1	1.0	0.3
Famotidine related compound C <sup>b</sup>	1.2	0.53	0.3

## Famotidine Injection

### DEFINITION

Famotidine Injection is a sterile, concentrated solution of Famotidine. It contains NLT 90.0% and NMT 110.0% of the labeled amount of famotidine ( $C_8H_{15}N_7O_2S_3$ ). It may contain suitable preservatives.

### IDENTIFICATION

- **A.** The retention time of the famotidine peak from the *Sample solution* corresponds to that from the *Standard solution*, as obtained in the Assay.

### ASSAY

#### • PROCEDURE

**Buffer:** 13.8 g/L of monobasic sodium phosphate

**Mobile phase:** Methanol, water, and *Buffer* (5:32:3). Adjust with 1 N sodium hydroxide to a pH of 5.3.

**Diluent:** Dissolve 1.36 g of monobasic potassium phosphate in 800 mL of water, adjust with 1 N sodium hydroxide to a pH of 7.0, and dilute with water to 1 L.

#### Standard solution

**If benzyl alcohol is present:** 0.1 mg/mL of USP Famotidine RS and 0.09 mg/mL of USP Benzyl Alcohol RS in *Diluent*

**If benzyl alcohol is not present:** 0.1 mg/mL of USP Famotidine RS in *Diluent*

**Sample solution:** Transfer a volume of Injection, equivalent to 20 mg of famotidine based on the label claim, to a 200-mL volumetric flask, and dilute with *Diluent* to volume.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 25-cm; 5-μm packing L3

**Flow rate:** 1 mL/min

**Injection size:** 30 μL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Relative standard deviation:** NMT 2.0% for the famotidine peak

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of famotidine ( $C_8H_{15}N_7O_2S_3$ ) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of famotidine from the *Sample solution*

$r_S$  = peak response of famotidine from the *Standard solution*

$C_S$  = concentration of USP Famotidine RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of famotidine in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

### OTHER COMPONENTS

#### • CONTENT OF BENZYL ALCOHOL (if present)

**Buffer, Mobile phase, Diluent, Standard solution, Sample solution, and Chromatographic system:** Proceed as directed in the Assay.

**System suitability stock solution:** Proceed as directed in the *Organic Impurities* test.

**System suitability solution:** Transfer 25 mL of *System suitability stock solution* to a 50-mL volumetric flask. Add 1 drop (approximately 20 mg) of USP Benzyl Alcohol RS, and dilute with *Diluent* to volume.

#### System suitability

**Samples:** *Standard solution* and *System suitability solution*

[NOTE—See Table 1 for the relative retention times.]

#### Suitability requirements

**Resolution:** NLT 1.3 between adjacent peaks of benzyl alcohol and famotidine propionic acid; the benzyl alcohol peak is resolved from the solvent front, *System suitability solution*

**Relative standard deviation:** Less than 2.0% for each peak, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of benzyl alcohol in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area of benzyl alcohol from the *Sample solution*

$r_S$  = peak area of benzyl alcohol from the *Standard solution*

$C_S$  = concentration of USP Benzyl Alcohol RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of benzyl alcohol in the *Sample solution* (mg/mL)

**Acceptance criteria:** The content of benzyl alcohol meets the requirements under *Injections* (1), *Added Substances*.

### IMPURITIES

#### • ORGANIC IMPURITIES

**Buffer, Mobile phase, Diluent, Sample solution, and Chromatographic system:** Proceed as directed in the *Assay*.

**System suitability stock solution:** Transfer 10 mg of USP Famotidine RS to a 50-mL volumetric flask. Add 1 mL of 0.1 N hydrochloric acid. Heat at 80° for 30 min. Allow to cool, add 2 mL of 0.1 N sodium hydroxide, and heat at 80° for an additional 30 min. Allow to cool, and neutralize by adding 1 mL of 0.1 N hydrochloric acid. Dilute with *Diluent* to volume (*Solution A*). Transfer 5 mg of USP Famotidine RS to a separate 50-mL volumetric flask, add 8 mL of methanol, and sonicate to dissolve. Add 10 mL of *Solution A*, and dilute with *Diluent* to volume.

#### System suitability solution

**If benzyl alcohol is present:** Transfer 25 mL of *System suitability stock solution* to a 50-mL volumetric flask. Add 1 drop (approximately 20 mg) of USP Benzyl Alcohol RS, and dilute with *Diluent* to volume.

**If benzyl alcohol is not present:** Transfer 25 mL of *System suitability stock solution* to a 50-mL volumetric flask, and dilute with *Diluent* to volume.

#### System suitability

**Sample:** *System suitability solution*

[NOTE—See Table 1 for the relative retention times.]

#### Suitability requirements

**Resolution:** NLT 1.3 between adjacent peaks of famotidine propionic acid, famotidine sulfamoyl propanamide, famotidine, and famotidine propanamide for each pair of peaks

#### Analysis

**Sample:** *Sample solution*

Calculate the percentage of the total of famotidine propionic acid, famotidine sulfamoyl propanamide, and famotidine propanamide in the portion of Injection taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = sum of the peak areas for famotidine propionic acid, famotidine sulfamoyl propanamide, and famotidine propanamide from the *Sample solution*

$r_T$  = sum of the peak areas for famotidine, famotidine propionic acid, famotidine sulfamoyl propanamide, and famotidine propanamide from the *Sample solution*

#### Acceptance criteria

**Total impurities:** NMT 5.0%

Table 1

Name	Relative Retention Time
Benzyl alcohol (if present)	0.4
Famotidine propionic acid (famotidine related compound F) <sup>a</sup>	0.7
Famotidine sulfamoyl propanamide (famotidine related compound C) <sup>b</sup>	0.8
Famotidine	1.0
Famotidine propanamide (famotidine related compound D) <sup>c</sup>	1.3

<sup>a</sup> 3-[[2-(Diaminomethyleneamino)thiazol-4-yl]methylthio]propanoic acid.

<sup>b</sup> 3-[[2-(Diaminomethyleneamino)thiazol-4-yl]methylthio]-N-sulfamoyl-propanamide.

<sup>c</sup> 3-[[2-(Diaminomethyleneamino)thiazol-4-yl]methylthio]propanamide.

### SPECIFIC TESTS

• **STERILITY TESTS** (71): Meets the requirements

• **PH** (791): 5.0–5.6

• **PARTICULATE MATTER IN INJECTIONS** (788): Meets the requirements for small-volume injections

• **BACTERIAL ENDOTOXINS TEST** (85): NMT 16.67 USP Endotoxin Units/mg of famotidine

• **OTHER REQUIREMENTS:** It meets the requirements under *Injections* (1), *Container Content*.

### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in single-dose or multiple-dose containers, preferably of Type I glass. Store in a refrigerator.

• **LABELING:** It meets the requirements under *Injections* (1), *Labeling*. Label it to indicate that the Injection is to be diluted with a suitable parenteral vehicle prior to administration. Label it to indicate the name and the quantity of any added preservative.

• **USP REFERENCE STANDARDS** (11)

USP Benzyl Alcohol RS  
USP Endotoxin RS  
USP Famotidine RS

## Famotidine for Oral Suspension

### DEFINITION

Famotidine for Oral Suspension contains the equivalent of NLT 90.0% and NMT 110.0% of the labeled amount of famotidine (C<sub>8</sub>H<sub>15</sub>N<sub>7</sub>O<sub>2</sub>S<sub>3</sub>) when constituted as directed. It contains one or more suitable buffers, colors, diluents, flavors, and preservatives.

### IDENTIFICATION

• **A.** The retention time of the famotidine peak from the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### • PROCEDURE

**Buffer A:** Dissolve 13.6 g of sodium acetate trihydrate in 900 mL of water, and adjust with glacial acetic acid to a pH of 6.0 ± 0.1, before final dilution to 1 L.

**Buffer B:** Dissolve 13.6 g of monobasic sodium phosphate in 900 mL of water, adjust with 1 M sodium hydroxide to a pH of  $7.0 \pm 0.1$ , and dilute with water to 1 L.

**Solution A:** Acetonitrile and *Buffer A* (7:93)

**Solution B:** Acetonitrile

**Mobile phase:** See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
15	100	0
42	52	48
43	100	0
45	100	0

**Diluent:** Acetonitrile and *Buffer B* (7:93)

**Standard solution:** 0.16 mg/mL of USP Famotidine RS in *Diluent*

**Sample solution:** Transfer to a 100-mL volumetric flask a portion of Famotidine for Oral Suspension, equivalent to about 40 mg of famotidine, freshly mixed and free from air bubbles and constituted as directed in the labeling. Add 10 mL of methanol, sonicate for 5 min, add 70 mL of *Diluent*, sonicate for an additional 5 min, and dilute with *Diluent* to volume. Dilute 10.0 mL of this solution with *Diluent* to 25.0 mL, and filter.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 268 nm

**Column:** 4.6-mm  $\times$  25-cm; 5- $\mu$ m packing L1

**Column temperature:** 35°

**Flow rate:** 1.5 mL/min

**Injection size:** 20  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Column efficiency:** Greater than 2000 theoretical plates

**Tailing factor:** NMT 2

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of famotidine ( $C_8H_{15}N_7O_2S_3$ ) in the portion of Famotidine for Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Famotidine RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of famotidine in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

#### PERFORMANCE TESTS

- UNIFORMITY OF DOSAGE UNITS** <905>: Meets the requirements for *Content Uniformity*. For the product in multi-dose containers, the unit is a 5-mL aliquot of the suspension, constituted as directed in the labeling.

#### IMPURITIES

##### ORGANIC IMPURITIES

**Mobile phase, Diluent, Standard solution, Sample solution and Chromatographic system:** Proceed as directed in the *Assay*.

**System suitability stock solution:** Transfer 16 mg of famotidine to a 50-mL volumetric flask. Dissolve in 1.0 mL of 1 N hydrochloric acid, heat at 80° for 30 min, and cool to room temperature. Add 2.0 mL of 1 N

sodium hydroxide, heat at 80° for 30 min, and cool to room temperature. Add 1.0 mL of 1 N hydrochloric acid to neutralize, and dilute with *Diluent* to volume.

**System suitability solution:** Transfer 16 mg of famotidine to a 50-mL volumetric flask. Add 10 mL of *Diluent*, and sonicate to dissolve. Add 5 drops of hydrogen peroxide solution, heat at 80° for 15 min, and cool to room temperature. Add 20 mL of *System suitability stock solution*, and dilute with *Diluent* to volume.

#### System suitability

**Samples:** *Standard solution* and *System suitability solution*

[NOTE—Identify the components of the *System suitability solution* based on the relative retention times listed in *Table 2*.]

#### Suitability requirements

**Resolution:** Greater than 1.5 between famotidine and famotidine propanamide, *System suitability solution*

**Column efficiency:** Greater than 2000 theoretical plates, *Standard solution*

**Tailing factor:** NMT 2, *Standard solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the total of famotidine sulfamoyl propanamide and famotidine propanamide in the portion of Famotidine for Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = sum of the peak areas for famotidine sulfamoyl propanamide and famotidine propanamide from the *Sample solution*

$r_S$  = peak area of famotidine from the *Standard solution*

$C_S$  = concentration of USP Famotidine RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of famotidine in the *Sample solution* (mg/mL)

#### Acceptance criteria

**Total of famotidine sulfamoyl propanamide and famotidine propanamide:** Less than 2.0%

Table 2

Name	Relative Retention Time
Famotidine sulfoxide <sup>a</sup>	0.3
Famotidine propionic acid (famotidine related compound F) <sup>b</sup>	0.5
Famotidine sulfamoyl propanamide (famotidine related compound C) <sup>c</sup>	0.7
Famotidine	1.0
Famotidine propanamide (famotidine related compound D) <sup>d</sup>	1.2

<sup>a</sup> 3-[[2-(Diaminomethyleneamino)thiazol-4-yl]methylsulfinyl]-N'-sulfamoyl-propanimidamide.

<sup>b</sup> 3-[[2-(Diaminomethyleneamino)thiazol-4-yl]methylthio]propanoic acid.

<sup>c</sup> 3-[[2-(Diaminomethyleneamino)thiazol-4-yl]methylthio]-N-sulfamoyl-propanamide.

<sup>d</sup> 3-[[2-(Diaminomethyleneamino)thiazol-4-yl]methylthio]propanamide.

#### SPECIFIC TESTS

- MICROBIAL ENUMERATION TESTS** <61> and **TESTS FOR SPECIFIED MICROORGANISMS** <62>: The total aerobic microbial count is NMT  $10^2$  cfu/g. The total combined molds and yeasts count is NMT  $10^2$  cfu/g. It meets the requirements of the tests for the absence of *Salmonella* species and *Escherichia coli*.
- pH** <791>: 6.5–7.5, in the suspension constituted as directed in the labeling

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers, protected from light. Store at 25°, excursions permitted between 15° and 30°.
- **USP REFERENCE STANDARDS** (11)  
USP Famotidine RS

**Famotidine Tablets****DEFINITION**

Famotidine Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of famotidine ( $C_8H_{15}N_7O_2S_3$ ).

**IDENTIFICATION**

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** (201)  
**Standard solution:** 4 mg/mL of USP Famotidine RS in glacial acetic acid  
**Sample solution:** Transfer a portion of finely powdered Tablets, equivalent to about 40 mg of famotidine, to a 10-mL volumetric flask. Dissolve in glacial acetic acid with the aid of sonication, dilute with glacial acetic acid to volume, and centrifuge to get a clear liquid.  
**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture  
**Application volume:** 10  $\mu$ L  
**Developing solvent system:** Ethyl acetate, methanol, toluene, and ammonium hydroxide (40:25:20:2)  
**Analysis:** Allow the spots to dry, and develop the plate in a paper-lined chromatographic chamber equilibrated with *Developing solvent system* for about 1 h before use. Allow the chromatogram to develop until the solvent front has moved about 15 cm. Remove the plate, air-dry, and examine the plate under short-wavelength UV light.  
**Acceptance criteria:** The principal spot from the *Sample solution* corresponds in appearance and  $R_f$  value to that of the *Standard solution*.
- **B.** The retention time of the major peak in the *Sample solution* corresponds to that in the *Standard solution*, as obtained in the *Assay*.

**ASSAY**

- **PROCEDURE**  
**Buffer:** Dissolve 13.6 g of sodium acetate trihydrate in 750 mL of water. Add 1 mL of triethylamine, adjust with glacial acetic acid to a pH of 6.0, and dilute with water to 1 L.  
**Mobile phase:** Acetonitrile and *Buffer* (7:93)  
**Diluent:** Dissolve 6.8 g of monobasic potassium phosphate in 750 mL of water, adjust with 1 M potassium hydroxide to a pH of 6.0, and dilute with water to 1 L.  
**System suitability stock solution:** Transfer 10 mg of famotidine to a 50-mL volumetric flask. Add 1 mL of 0.1 N hydrochloric acid, heat at 80° for 30 min, and cool to room temperature. Add 2 mL of 0.1 N sodium hydroxide, heat at 80° for 30 min, cool to room temperature, and neutralize by adding 1 mL of 0.1 N hydrochloric acid. Dilute with *Diluent* to volume. Transfer 10 mL of this solution to a separate 50-mL volumetric flask containing 5 mg of famotidine dissolved in 8 mL of methanol. Dilute with *Diluent* to volume. Transfer 25 mL of this solution to a 50-mL volumetric flask, and dilute with *Diluent* to volume. [NOTE—This solution is stable for up to 1 month.]

**System suitability solution:** Transfer 1–1.5 mL of the *System suitability stock solution* to a suitable container, add 1 drop of hydrogen peroxide solution, and mix well.

[NOTE—Prepare fresh daily.]

**Standard solution:** Transfer 10 mg of USP Famotidine RS to a 100-mL volumetric flask, add 20 mL of methanol, and sonicate for 5 min. Dilute with *Diluent* to volume.

**Sample solution:** Transfer NLT 10 Tablets to a 1-L volumetric flask. Add 200 mL of *Diluent*, and swirl to erode the Tablets. Add 200 mL of methanol, and stir by mechanical means at 300 rpm for 1 h. Dilute with *Diluent* to volume, mix, and filter. Quantitatively dilute a portion of the clear filtrate with *Diluent* to obtain a solution containing about 0.1 mg/mL of famotidine.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 275 nm

**Column:** 4.6-mm  $\times$  15-cm; packing L1

**Column temperature:** 40°

**Flow rate:** 1.4 mL/min

**Injection size:** 50  $\mu$ L

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

**Suitability requirements**

[NOTE—Identify peaks using *Table 1*.]

**Resolution:** NLT 1.3 between the famotidine sulfamoyl propanamide and famotidine peaks, and NLT 1.3 between the famotidine and famotidine propanamide peaks, *System suitability solution*

**Capacity factor:** NLT 2.0 for the famotidine peak, *System suitability solution*

**Relative standard deviation:** Less than 2.0%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of the labeled amount of famotidine ( $C_8H_{15}N_7O_2S_3$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Famotidine RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of famotidine in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

**PERFORMANCE TESTS**• **DISSOLUTION** (711)

**Medium:** pH 4.5, 0.1 M phosphate buffer (13.6 g/L of monobasic potassium phosphate); 900 mL

**Apparatus 2:** 50 rpm

**Time:** 30 min

Determine the amount of  $C_8H_{15}N_7O_2S_3$  dissolved using one of the following methods.

**Spectrophotometric method**

**Standard solution:** USP Famotidine RS in *Medium* in a concentration similar to the one expected in the *Sample solution*

**Sample solution:** Pass a portion of the sample under test through a suitable filter.

**Instrumental conditions**

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: UV

Analytical wavelength: 265 nm

#### Chromatographic method

Buffer, Mobile phase, and Chromatographic system: Proceed as directed in the Assay.

**Standard solution:** 0.14 mg/mL of USP Famotidine RS in *Medium*. Dilute this solution with *Medium* to obtain a solution containing  $(L/900)$  mg/mL, where  $L$  is the Famotidine Tablet label claim, in mg.

**Sample solution:** Pass a portion of the solution under test through a suitable filter.

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Capacity factor:** Greater than 2.0

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the amount of famotidine ( $C_8H_{15}N_7O_2S_3$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Famotidine RS in the *Standard solution* (mg/mL)

$L$  = label claim, mg/Tablet

$V$  = volume of *Medium*, 900 mL

**Tolerances:** NLT 75% (Q) of the labeled amount of famotidine ( $C_8H_{15}N_7O_2S_3$ ) is dissolved.

#### For Tablets labeled as chewable

Proceed as directed for either of the methods specified above, except for the following:

**Time:** 45 min

**Tolerances:** NLT 80% (Q) of the labeled amount of famotidine ( $C_8H_{15}N_7O_2S_3$ ) is dissolved.

#### For Tablets labeled as film-coated

Proceed as directed for either of the methods specified above, except for the following:

**Time:** 30 min

**Tolerances:** NLT 80% (Q) of the labeled amount of famotidine ( $C_8H_{15}N_7O_2S_3$ ) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

#### IMPURITIES

##### • ORGANIC IMPURITIES

Mobile phase, Diluent, System suitability solution, Standard solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the Assay.

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak area of each impurity from the *Sample solution*

$r_S$  = peak area of famotidine from the *Standard solution*

$C_S$  = concentration of USP Famotidine RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of famotidine in the *Sample solution* (mg/mL)

$F$  = relative response factor for each impurity (see Table 1)

Acceptance criteria: See Table 1.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria NMT (%)
Famotidine sulfoxide <sup>a</sup>	0.4	1.0	1.0
Famotidine propionic acid (famotidine related compound F) <sup>b</sup>	0.7	1.0	0.5
Famotidine sulfamoyl propanamide (famotidine related compound C) <sup>c</sup>	0.8	1.0	0.5
Famotidine	1.0	—	—
Famotidine propanamide (famotidine related compound D) <sup>d</sup>	1.2	1.3	0.5
Total impurities	—	—	1.5

<sup>a</sup> 3-[[2-(Diaminomethyleneamino)thiazol-4-yl]methylsulfinyl]-N'-sulfamoylpropanimidamide.

<sup>b</sup> 3-[[2-(Diaminomethyleneamino)thiazol-4-yl]methylthio]propanoic acid.

<sup>c</sup> 3-[[2-(Diaminomethyleneamino)thiazol-4-yl]methylthio]-N-sulfamoylpropanamide.

<sup>d</sup> 3-[[2-(Diaminomethyleneamino)thiazol-4-yl]methylthio]propanamide.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers. Store at controlled room temperature.
- **USP REFERENCE STANDARDS (11)**  
USP Famotidine RS

## Felbamate

$C_{11}H_{14}N_2O_4$  238.24  
1,3-Propanediol, 2-phenyl-, dicarbamate;  
2-Phenyl-1,3-propanediol dicarbamate [25451-15-4].

#### DEFINITION

Felbamate contains NLT 98.0% and NMT 102.0% of felbamate ( $C_{11}H_{14}N_2O_4$ ), calculated on the dried basis.

#### IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

#### ASSAY

##### • PROCEDURE

**Mobile phase:** Acetonitrile, methanol, and water (126:84:790)

**System suitability solution:** 0.05 mg/mL of USP Felbamate Related Compound A RS and 0.2 mg/mL of USP Felbamate RS in *Mobile phase*

**Diluent:** Acetonitrile, methanol, and water (222:148:630)

**Standard stock solution:** 1 mg/mL of USP Felbamate RS in methanol and *Diluent* prepared as follows. Dissolve a suitable quantity of USP Felbamate RS in 10% of the flask volume of methanol. Sonicate and shake to completely dissolve, and dilute with *Diluent*.

**Standard solution:** 0.2 mg/mL of USP Felbamate RS from *Standard stock solution* in *Mobile phase*

**Sample stock solution:** 1.0 mg/mL of Felbamate in methanol and *Diluent* prepared as follows. Dissolve a suitable quantity of Felbamate in 10% of the flask volume of methanol. Sonicate and shake to completely dissolve, and dilute with *Diluent*.

**Sample solution:** 0.2 mg/mL of Felbamate from *Sample stock solution* in *Mobile phase*

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.6-mm × 15-cm; 5-μm packing L1

**Column temperature:** 30°

**Flow rate:** 1.8 mL/min

**Injection size:** 20 μL

**Run time:** 3 times the retention time of felbamate

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

#### Suitability requirements

**Resolution:** NLT 2.0 between felbamate related compound A and felbamate, *System suitability solution*

**Tailing factor:** NMT 2.0, *Standard solution*

**Relative standard deviation:** NMT 1.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of felbamate (C<sub>11</sub>H<sub>14</sub>N<sub>2</sub>O<sub>4</sub>) in the portion of Felbamate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of felbamate from the *Sample solution*

$r_S$  = peak response of felbamate from the *Standard solution*

$C_S$  = concentration of USP Felbamate RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Felbamate in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the dried basis

#### IMPURITIES

• **RESIDUE ON IGNITION** <281>: NMT 0.1%

• **HEAVY METALS**, *Method II* <231>: NMT 20 ppm

#### • ORGANIC IMPURITIES, EARLY ELUTING

**Mobile phase**, **Standard stock solution**, **System suitability solution**, and **Chromatographic system:** Proceed as directed in the *Assay*.

**Standard solution:** 1 μg/mL of USP Felbamate RS in *Mobile phase* from *Standard stock solution*

**Sample solution:** 1000 μg/mL of Felbamate in *Mobile phase*

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

#### Suitability requirements

**Resolution:** NLT 2.0 between felbamate related compound A and felbamate, *System suitability solution*

**Tailing factor:** NMT 2.0, *Standard solution*

**Relative standard deviation:** NMT 10%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Identify the impurities using the relative retention times shown in *Table 1*. Calculate the percentage of each impurity in the portion of Felbamate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_S$  = peak response of felbamate from the *Standard solution*

$C_S$  = concentration of USP Felbamate RS in the *Standard solution* (μg/mL)

$C_U$  = concentration of Felbamate in the *Sample solution* (μg/mL)

$F$  = relative response factor (see *Table 1*)

**Acceptance criteria:** See *Table 1*.

**Table 1**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Phenylpropanediol <sup>a</sup>	0.43	1.7	0.15
Felbamate related compound A <sup>b</sup>	0.65	1.3	0.15
Felbamate	1.0	—	—
N-Aminocarbonyl felbamate <sup>c</sup>	1.43	0.89	0.15
Felbamate related compound B <sup>d</sup>	2.23	—	—
Individual unspecified impurity	—	1.0	0.1

<sup>a</sup> 2-Phenylpropane-1,3-diol.

<sup>b</sup> 3-Hydroxy-2-phenylpropyl carbamate.

<sup>c</sup> 3-Carbamoyloxy-2-phenylpropyl allophanate.

<sup>d</sup> Phenethyl carbamate, which is quantified in the test for *Organic Impurities*, *Late Eluting*.

#### • ORGANIC IMPURITIES, LATE ELUTING

**Mobile phase:** Acetonitrile, methanol, and water (222:148:630)

**System suitability solution:** 1 μg/mL each of USP Felbamate RS and USP Felbamate Related Compound B RS in *Mobile phase*

**Standard solution:** 1 μg/mL of USP Felbamate RS in *Mobile phase*

**Sample solution:** 1000 μg/mL of Felbamate in *Mobile phase*

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.6-mm × 15-cm; 5-μm packing L1

**Column temperature:** 30°

**Flow rate:** 1.8 mL/min

**Injection size:** 20 μL

**Run time:** 10 times the retention time of felbamate

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

#### Suitability requirements

**Resolution:** NLT 3 between felbamate and felbamate related compound B, *System suitability solution*

**Tailing factor:** NMT 2.0, *Standard solution*

**Relative standard deviation:** NMT 10%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Identify the impurities using the relative retention times shown in *Table 2*. Calculate the percentage of each impurity in the portion of Felbamate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_S$  = peak response of felbamate from the *Standard solution*

$C_S$  = concentration of USP Felbamate RS in the *Standard solution* (µg/mL)

$C_U$  = concentration of Felbamate in the *Sample solution* (µg/mL)

$F$  = relative response factor (see *Table 2*)

**Acceptance criteria:** See *Table 2*.

**Table 2**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Felbamate	1.0	—	—
Felbamate related compound B <sup>a</sup>	1.9	1.29	0.15
Felbamate dimer <sup>b</sup>	9.1	1.0	0.15
Individual unspecified impurity	—	1.0	0.1

<sup>a</sup> Phenethyl carbamate.

<sup>b</sup> 3,3'-Carbonylbis(oxy)bis(2-phenylpropane-3,1-diyl) dicarbamate.

**Total impurities:** NMT 0.75% for the sum of all impurities from *Table 1* and *Table 2*

• **LIMIT OF METHYLCARBAMATE**

**Mobile phase:** Water

**Standard solution:** 0.1 mg/mL of methylcarbamate in water

**Sample solution:** Suspend 1 g of Felbamate in 5 mL of water, and mix on a vortex mixer for 1 min followed by sonication for 5 min. Filter the slurry, and use as the *Sample solution*.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 200 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L1

**Column temperature:** 30°

**Flow rate:** 1 mL/min

**Injection size:** 50 µL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 10%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

**Acceptance criteria:** The peak response for methylcarbamate in the *Sample solution* does not exceed the peak response for methylcarbamate in the *Standard solution* (0.05%).

**SPECIFIC TESTS**

- **LOSS ON DRYING** (731): Dry a sample at 105° for 3 h: it loses NMT 0.5% of its weight.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at room temperature.

• **USP REFERENCE STANDARDS** <11>

USP Felbamate RS

USP Felbamate Related Compound A RS

3-Hydroxy-2-phenylpropyl carbamate.

C<sub>10</sub>H<sub>13</sub>NO<sub>3</sub> 195.22

USP Felbamate Related Compound B RS

Phenethyl carbamate.

C<sub>9</sub>H<sub>11</sub>NO<sub>2</sub> 165.19

## Felbamate Oral Suspension

**DEFINITION**

Felbamate Oral Suspension is a viscous liquid containing NLT 90.0% and NMT 110.0% of the labeled amount of felbamate (C<sub>11</sub>H<sub>14</sub>N<sub>2</sub>O<sub>4</sub>). The product may contain suitable preservatives.

**IDENTIFICATION**

- **A.** The retention time of the major peak in the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY**

• **PROCEDURE**

**Buffer:** 28.5 g/L of tribasic sodium phosphate dodecahydrate in water

**Mobile phase:** Acetonitrile and *Buffer* (23:77). Adjust with phosphoric acid to a pH of 9.9.

**Diluent A:** Methanol and water (1:1)

**Diluent B:** Acetonitrile and water (23:77)

**System suitability solution:** 0.16 mg/mL of USP Felbamate RS and 0.02 mg/mL of USP Felbamate Related Compound A RS in *Diluent B* and methanol prepared as follows. Dissolve the required amounts of the Reference Standards in a suitable volumetric flask in 8% of the flask volume of methanol. Dilute with *Diluent B* to volume.

**Standard solution:** 0.16 mg/mL of USP Felbamate RS prepared as follows. Dissolve a weighed quantity in USP Felbamate RS in a suitable volumetric flask containing 16% of the flask volume of *Diluent A*. Add 50% of the flask volume of *Diluent B*. Sonication may be used to aid dissolution. Dilute with *Diluent B* to volume.

**Sample stock solution:** Nominally 1 mg/mL of felbamate in *Diluent A* prepared as follows. Transfer an amount of the Oral Suspension to a suitable volumetric flask. Add 60% of the flask volume of *Diluent A*, and sonicate for 15 min. Shake mechanically for 30 min, and dilute with *Diluent A* to volume.

**Sample solution:** Nominally 0.16 mg/mL of felbamate from *Sample stock solution* in *Diluent B*. Pass through a filter of 45-µm pore size.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.1-mm × 15-cm; 5-µm packing L21

**Column temperature:** 40°

**Flow rate:** 1 mL/min

**Injection size:** 20 µL

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

**Suitability requirements**

**Resolution:** NLT 2.0 between felbamate related compound A and felbamate, *System suitability solution*

**Tailing factor:** NMT 2.0, *Standard solution*

**Relative standard deviation:** NMT 2%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of the labeled amount of felbamate ( $C_{11}H_{14}N_2O_4$ ) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of felbamate from the *Sample solution*  
 $r_S$  = peak response of felbamate from the *Standard solution*  
 $C_S$  = concentration of USP Felbamate RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of felbamate in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

**PERFORMANCE TESTS**• **DISSOLUTION** <711>

**Medium:** Water; 900 mL

**Apparatus 2:** 50 rpm

**Time:** 15 min

**Mobile phase:** Acetonitrile and water (35:65)

**System suitability solution:** Prepare a solution of 0.1 mg/mL of USP Methylparaben RS in methanol. Transfer 10 mL of this solution to a 100-mL volumetric flask containing 40 mg of USP Felbamate RS. Sonicate for 5 min, and dilute with *Medium* to volume.

**Standard solution:** ( $L/1000$ ) mg/mL of USP Felbamate RS in *Medium*, where  $L$  is the Oral Suspension label claim in mg/mL. An amount of methanol, not exceeding 10% of the final volume, can be used to help in solubilizing felbamate.

**Sample solution:** Using a syringe, accurately weigh by difference approximately 5 mL of the well-mixed Oral Suspension. Introduce the sample into the dissolution vessel with the paddles rotating, and avoid getting the sample on the paddle or shaft. At the time specified, withdraw an aliquot of the solution under test, and pass through a suitable filter.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.6-mm  $\times$  25-cm; 10- $\mu$ m packing L7

**Flow rate:** 2 mL/min

**Injection size:** 25  $\mu$ L for *System suitability* and 15  $\mu$ L for *Analysis*

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for methylparaben and felbamate are about 0.5 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 2.0 between methylparaben and felbamate, *System suitability solution*

**Tailing factor:** NMT 2, *Standard solution*

**Relative standard deviation:** NMT 2%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of the labeled amount of felbamate ( $C_{11}H_{14}N_2O_4$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times (D/W) \times V \times 100$$

$r_U$  = peak response of felbamate from the *Sample solution*  
 $r_S$  = peak response of felbamate from the *Standard solution*  
 $C_S$  = concentration of USP Felbamate RS in the *Standard solution* (mg/mL)

$L$  = label claim of the Oral Suspension (mg/mL)  
 $D$  = density of the Oral Suspension (g/mL)  
 $W$  = weight of the Oral Suspension taken (g)  
 $V$  = volume of *Medium*, 900 mL

**Tolerances:** NLT 80% ( $Q$ ) of the labeled amount of felbamate ( $C_{11}H_{14}N_2O_4$ ) is dissolved.

**IMPURITIES**• **ORGANIC IMPURITIES**

**Mobile phase, Diluent A, Diluent B, Sample solution, and Chromatographic system:** Proceed as directed in the *Assay*.

**System suitability solution:** 0.2 mg/mL of USP Felbamate RS and 0.02 mg/mL of USP Felbamate Related Compound A RS in *Diluent B* prepared as follows. Transfer suitable quantities of USP Felbamate RS and USP Felbamate Related Compound A RS into a suitable volumetric flask. Dissolve in 8% of the flask volume of methanol. Dilute with *Diluent B* to volume.

**Standard stock solution:** 0.2 mg/mL of USP Felbamate RS in *Diluent A*

**Standard solution:** 0.2  $\mu$ g/mL of USP Felbamate RS from *Standard stock solution* in *Diluent B* prepared as follows. Transfer a suitable volume of *Standard stock solution* to a suitable volumetric flask containing 0.8% of the flask volume of methanol, and dilute with *Diluent B* to volume.

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—See *Table 1* for relative retention times.]

**Suitability requirements**

**Resolution:** NLT 2.0 between felbamate related compound A and felbamate, *System suitability solution*

**Tailing factor:** NMT 2.0 for the felbamate peak, *Standard solution*

**Relative standard deviation:** NMT 10% for the felbamate peak, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of each impurity in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*  
 $r_S$  = peak response of felbamate from the *Standard solution*  
 $C_S$  = concentration of USP Felbamate RS in the *Standard solution* ( $\mu$ g/mL)  
 $C_U$  = nominal concentration of felbamate in the *Sample solution* ( $\mu$ g/mL)  
 $F$  = relative response factor (see *Table 1*)

**Acceptance criteria:** See *Table 1*.

**Table 1**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Phenylpropanediol <sup>a</sup>	0.63	2.6	0.2
Felbamate related compound A <sup>b</sup>	0.78	1.8	0.2
Felbamate	1.0	—	—

<sup>a</sup> 2-Phenylpropane-1,3-diol.

<sup>b</sup> 3-Hydroxy-2-phenylpropyl carbamate.

Table 1 (Continued)

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Individual unspecified degradation product	—	1.0	0.2
Total impurities	—	—	0.75

<sup>a</sup> 2-Phenylpropane-1,3-diol.<sup>b</sup> 3-Hydroxy-2-phenylpropyl carbamate.**SPECIFIC TESTS**

- **PH** (791): 4.5–6.0, in the well-stirred Oral Suspension
- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total aerobic microbial count is NMT 10<sup>2</sup> cfu/mL. The total yeasts and molds count is NMT 10<sup>1</sup> cfu/mL. It meets the requirements of the test for absence of *Escherichia coli*.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- **USP REFERENCE STANDARDS** (11)
  - USP Felbamate RS
  - USP Felbamate Related Compound A RS
  - 3-Hydroxy-2-phenylpropyl carbamate.
  - C<sub>10</sub>H<sub>13</sub>NO<sub>3</sub> 195.22
  - USP Methylparaben RS

**Felbamate Tablets****DEFINITION**

Felbamate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of felbamate (C<sub>11</sub>H<sub>14</sub>N<sub>2</sub>O<sub>4</sub>).

**IDENTIFICATION**

- **A. INFRARED ABSORPTION** (197)
 

**Sample:** Transfer a weighed quantity of finely powdered Tablets, equivalent to 12 mg of felbamate, to a centrifuge tube. Add 10 mL of methanol, and mix on a vortex mixer for 3 min. Centrifuge, and transfer 1 mL of the clear supernatant to a mortar with 200 mg of potassium bromide. Evaporate at 105° in an oven for 15 min. Cool the dried residue in a desiccator, and blend by grinding. Prepare a pellet with 100 mg of the dried residue.

**Standard:** Transfer 1 mL of 1.2 mg/mL of USP Felbamate RS in methanol to a mortar with 200 mg of potassium bromide. Evaporate at 105° in an oven for 15 min. Cool the dried residue in a desiccator, and blend by grinding. Prepare a pellet with 100 mg of the dried residue.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY****PROCEDURE**

**Diluent:** Methanol and water (80:20)

**Mobile phase:** Acetonitrile, methanol, and water (126:84:790)

**System suitability solution:** 0.05 mg/mL of USP Felbamate Related Compound A RS and 0.2 mg/mL of USP Felbamate RS in *Mobile phase*

**Standard stock solution:** 2 mg/mL of USP Felbamate RS in *Diluent*

**Standard solution:** 0.2 mg/mL of USP Felbamate RS from *Standard stock solution* in *Mobile phase*

**Sample stock solution:** Nominally 2 mg/mL of felbamate from NLT 20 finely powdered Tablets, prepared as

follows. Transfer a weighed quantity of the powder to a suitable volumetric flask. Add 50% of the flask volume of the *Diluent*. Sonicate for 30 min with intermittent shaking. Shake the flask vigorously for NLT 30 min. Dilute with *Diluent* to volume. Pass a portion through a suitable membrane filter.

**Sample solution:** 0.2 mg/mL of felbamate from *Sample stock solution* in *Mobile phase*

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.6-mm × 15-cm; 5-μm packing L1

**Column temperature:** 30°

**Flow rate:** 1.8 mL/min

**Injection size:** 20 μL

**Run time:** 3 times the retention time of felbamate

**System suitability**

**Samples:** *Standard solution* and *System suitability solution*

**Suitability requirements**

**Resolution:** NLT 2 between felbamate related compound A and felbamate, *System suitability solution*

**Tailing factor:** NMT 2.0, *Standard solution*

**Relative standard deviation:** NMT 2%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of felbamate (C<sub>11</sub>H<sub>14</sub>N<sub>2</sub>O<sub>4</sub>) in the portion of the Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of felbamate from the *Sample solution*

$r_S$  = peak response of felbamate from the *Standard solution*

$C_S$  = concentration of USP Felbamate RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of felbamate in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

**PERFORMANCE TESTS****DISSOLUTION** (711)

**Medium:** Water; 900 mL

**Apparatus 2:** 50 rpm

**Time:** 45 min

**Mobile phase:** Prepare as directed in the *Assay*.

**Standard solution:** (L/1000) mg/mL of USP Felbamate RS, where L is the Tablet label claim, in mg. Transfer a suitable weighed quantity of USP Felbamate RS to a suitable volumetric flask. Add 10% of the flask volume of methanol, and sonicate for 5 min to dissolve. Dilute with *Medium* to volume.

**Sample solution:** Pass a portion of the solution under test through a suitable filter.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.0-mm × 15-cm; 5-μm packing L1

**Flow rate:** 2 mL/min

**Injection size:** 50 μL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Relative standard deviation:** NMT 2%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of felbamate (C<sub>11</sub>H<sub>14</sub>N<sub>2</sub>O<sub>4</sub>) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

- $r_U$  = peak response from the *Sample solution*  
 $r_S$  = peak response from the *Standard solution*  
 $C_S$  = concentration of USP Felbamate RS in the *Standard solution* (mg/mL)  
 $L$  = label claim (mg/Tablet)  
 $V$  = volume of *Medium*, 900 mL

**Tolerances:** NLT 65% (Q) of the labeled amount of felbamate ( $C_{11}H_{14}N_2O_4$ ) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

## IMPURITIES

### • ORGANIC IMPURITIES

**Diluent, Mobile phase, Sample solution, and Chromatographic system:** Proceed as directed in the *Assay*.

**System suitability stock solution:** 0.4 mg/mL of USP Felbamate Related Compound A RS and 0.6 mg/mL of USP Felbamate RS in *Diluent*

**System suitability solution:** 0.4 µg/mL of USP Felbamate Related Compound A RS and 0.6 µg/mL of USP Felbamate RS from *System suitability stock solution* in *Mobile phase*

**Standard stock solution:** 0.6 mg/mL of USP Felbamate RS in *Diluent*

**Standard solution:** 0.6 µg/mL of USP Felbamate RS from *Standard stock solution* in *Mobile phase*

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

**Suitability requirements**

**Resolution:** NMT 2 between felbamate related compound A and felbamate, *System suitability solution*

**Tailing factor:** NMT 2.0, *Standard solution*

**Relative standard deviation:** NMT 10%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Identify the impurities using the relative retention times shown in *Table 1*. Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

- $r_U$  = peak response of each impurity from *Sample solution*  
 $r_S$  = peak response of felbamate from the *Standard solution*  
 $C_S$  = concentration of USP Felbamate RS in the *Standard solution* (µg/mL)  
 $C_U$  = nominal concentration of felbamate in the *Sample solution* (µg/mL)  
 $F$  = relative response factor (see *Table 1*)  
**Acceptance criteria:** See *Table 1*.

**Table 1**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Phenylpropanediol <sup>a</sup>	0.43	1.7	0.2
Felbamate related compound A <sup>b</sup>	0.65	1.3	0.2
Felbamate	1.0	—	—
N-Aminocarbonyl-felbamate <sup>c</sup>	1.43	—	—
Felbamate related compound B <sup>d</sup>	2.23	—	—

<sup>a</sup> 2-Phenylpropane-1,3-diol.

<sup>b</sup> 3-Hydroxy-2-phenylpropyl carbamate.

<sup>c</sup> 3-Carbamoyloxy-2-phenylpropyl allophanate.

<sup>d</sup> Phenylethyl carbamate. No limit. This is a process impurity.

**Table 1 (Continued)**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Individual unspecified degradation product	—	1.0	0.2
Total impurities	—	—	0.75

<sup>a</sup> 2-Phenylpropane-1,3-diol.

<sup>b</sup> 3-Hydroxy-2-phenylpropyl carbamate.

<sup>c</sup> 3-Carbamoyloxy-2-phenylpropyl allophanate.

<sup>d</sup> Phenylethyl carbamate. No limit. This is a process impurity.

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at controlled room temperature.

### • USP REFERENCE STANDARDS (11)

USP Felbamate RS

USP Felbamate Related Compound A RS

3-Hydroxy-2-phenylpropyl carbamate.

$C_{10}H_{13}NO_3$  195.22

## Felodipine

$C_{18}H_{19}Cl_2NO_4$  384.25  
 3,5-Pyridinedicarboxylic acid 4-(2,3-dichlorophenyl)-1,4-dihydro-2,6-dimethyl-, ethyl methyl ester, (±)-;  
 (±)-Ethyl methyl 4-(2,3-dichlorophenyl)-1,4-dihydro-2,6-dimethyl-3,5-pyridinedicarboxylate [72509-76-3;  
 86189-69-7].

## DEFINITION

Felodipine contains NLT 98.0% and NMT 101.0% of felodipine ( $C_{18}H_{19}Cl_2NO_4$ ), calculated on the dried basis.

## IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

## ASSAY

### • PROCEDURE

**Buffer:** Dissolve 6.9 g of monobasic sodium phosphate in 400 mL of water, add 8.0 mL of 1 M phosphoric acid, and dilute with water to 1 L.

**Mobile phase:** Acetonitrile, methanol, and *Buffer* (40:20:40)

**System suitability stock solution:** 0.05 mg/mL of USP Felodipine RS and 0.1 mg/mL of felodipine oxidation product in *Mobile phase* prepared as follows. Dissolve 150 mg of Felodipine in a mixture of 50 mL of tertiary butyl alcohol and 1 N perchloric acid (1:1). Add 10 mL of 0.1 M ceric sulfate, and allow to stand for 15 min. Add 3.5 mL of 10 N sodium hydroxide, and neutralize with 2 N sodium hydroxide. Shake the mixture with 25 mL of methylene chloride in a separator. Draw off the lower layer, and evaporate it to dryness under a stream of nitrogen on a water bath. Dissolve and dilute 10 mg of the residue (felodipine oxidation product) and 5 mg of USP Felodipine RS, with *Mobile phase* to 100 mL.

**System suitability solution:** 0.5 µg/mL of USP Felodipine RS and 1 µg/mL of felodipine oxidation product in *Mobile phase* from the *System suitability stock solution*

**Standard solution:** 0.3 mg/mL of USP Felodipine RS in *Mobile phase*. [NOTE—Prepare fresh before analysis.]

**Sample solution:** 0.3 mg/mL of Felodipine in *Mobile phase*. [NOTE—Prepare fresh before analysis.]

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 15-cm; 5-µm packing L1

**Flow rate:** 1 mL/min

**Injection volume:** 20 µL for the *System suitability solution* and 40 µL for the *Standard solution* and the *Sample solution*

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

Adjust the sensitivity of the system so that the heights of the two peaks in the chromatogram are 20% of the recorder full scale.

#### Suitability requirements

**Resolution:** NLT 2.5 between the first peak (felodipine oxidation product) and the second peak (felodipine), *System suitability solution*

**Capacity factor, *k'*:** NLT 5.0, *Standard solution*

**Column efficiency:** NLT 1500 theoretical plates, *Standard solution*

**Tailing factor:** NMT 1.5, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of felodipine (C<sub>18</sub>H<sub>19</sub>Cl<sub>2</sub>NO<sub>4</sub>) in the portion of Felodipine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

*r<sub>U</sub>* = peak response of felodipine from the *Sample solution*

*r<sub>S</sub>* = peak response of felodipine from the *Standard solution*

*C<sub>S</sub>* = concentration of USP Felodipine RS in the *Standard solution* (mg/mL)

*C<sub>U</sub>* = concentration of Felodipine in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–101.0% on the dried basis

#### IMPURITIES

- **RESIDUE ON IGNITION** <281>: NMT 0.1%

- **HEAVY METALS, Method II** <231>: NMT 20 ppm

- **ORGANIC IMPURITIES**

**Buffer, Mobile phase, System suitability solution, and Sample solution:** Prepare as directed in the *Assay*.

**Chromatographic system:** Proceed as directed in the *Assay*, except use a run time of NLT 2 times the retention time of felodipine.

#### Analysis

**Sample:** *Sample solution*

Calculate the percentage of each impurity in the portion of Felodipine taken:

$$\text{Result} = (r_U/r_T) \times 100$$

*r<sub>U</sub>* = peak response for each impurity

*r<sub>T</sub>* = sum of all the peak responses

#### Acceptance criteria

**Individual impurities:** NMT 1.0%

**Total impurities:** NMT 1.5%

#### SPECIFIC TESTS

- **LOSS ON DRYING** <731>

**Analysis:** Dry the sample at 105° for 3 h.

**Acceptance criteria:** NMT 0.5%

- **COLOR OF SOLUTION**

**Sample solution:** 20 mg/mL in methanol

**Instrumental conditions**

**Mode:** Vis

**Cell:** 5 cm

**Analytical wavelength:** 440 nm

**Blank:** Methanol

**Acceptance criteria:** NMT 0.2 absorbance

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at controlled room temperature.

- **USP REFERENCE STANDARDS** <11>

USP Felodipine RS

---

## Felodipine Extended-Release Tablets

---

#### DEFINITION

Felodipine Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of felodipine (C<sub>18</sub>H<sub>19</sub>Cl<sub>2</sub>NO<sub>4</sub>).

#### IDENTIFICATION

- The retention time of the major peak from the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

#### ASSAY

- **PROCEDURE**

**Solution A:** 6.9 mg/mL of monobasic sodium phosphate in water. Adjust with 1 M phosphoric acid to a pH of 3.0 ± 0.05.

**Mobile phase:** Acetonitrile, methanol, and *Solution A* (2:1:2)

**Standard stock solution:** 2 mg/mL of USP Felodipine RS in methanol

**Standard solution:** 0.02 mg/mL from the *Standard stock solution* in *Mobile phase*

**Sample solution:** Dissolve a quantity equivalent to 10 mg of felodipine from powdered Tablets (NLT 10 Tablets), in 40 mL of acetonitrile and 20 mL of methanol in a 100-mL volumetric flask, and sonicate for 5 min. Add about 30 mL of *Solution A*, and shake by mechanical means for 30 min. Allow the solution to cool to room temperature, and dilute with *Solution A* to volume. Centrifuge a portion of the solution at high speed for 15 min. Transfer 10 mL of the supernatant to a 50-mL volumetric flask, and dilute with *Mobile phase* to volume. Pass a portion of this solution through a filter having a 0.5-µm or finer porosity, discarding the first 4 mL of the filtrate.

**Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** UV 362 nm**Column:** 4.6-mm × 15-cm; packing L1**Flow rate:** 1 mL/min**Injection size:** 40 µL**System suitability****Sample:** *Standard solution***Suitability requirements****Column efficiency:** NLT 1500 theoretical plates**Relative standard deviation:** NMT 2.0%**Analysis****Samples:** *Standard solution* and *Sample solution*Calculate the percentage of  $C_{18}H_{19}Cl_2NO_4$  in the portion of Tablets taken:

- $r_U$  = peak response from the *Sample solution*  
 $r_S$  = peak response from the *Standard solution*  
 $C_S$  = concentration of USP Felodipine RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of felodipine in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%**PERFORMANCE TESTS****• DISSOLUTION <711>****Test 1**

**Medium:** pH 6.5 phosphate buffer with 1% sodium lauryl sulfate (Transfer 206 mL of 1 M monobasic sodium phosphate monohydrate, 196 mL of 0.5 M anhydrous dibasic sodium phosphate, and 50.0 g of sodium lauryl sulfate to a 5000-mL volumetric flask. Add about 4000 mL of water, and mix well. If necessary, adjust with 1 N sodium hydroxide to a pH of 6.5. Dilute with water to volume.); 500 mL

**Apparatus 2:** 50 rpm**Times:** 2, 6, and 10 h

**Buffer solution:** 6.9 mg/mL of monobasic sodium phosphate. Adjust with 1 M phosphoric acid to a pH of  $3.0 \pm 0.05$ .

**Mobile phase:** Acetonitrile, methanol, and *Buffer solution* (2.5:1:2)

**Standard stock solution:** 0.25 mg/mL of USP Felodipine RS in alcohol

**NOTES**

1. Rod and Basket with a Tablet cover placed in the horizontal diagonal of the basket.
2. Basket and Tablet cover material; stainless steel.
3. Basket gauze wire size: 8 mesh.

Figure 1. Stationary tablet basket.

**Standard solution:** (0.6 L/500) mg/mL of USP Felodipine RS from the *Standard stock solution* in *Medium*, where L is the label claim in mg/Tablet. [NOTE—L equals Label claim]

**Sample solution:** Place each Tablet in a specially made quadrangular basket of stainless steel wire gauze, soldered in one of its upper, narrow sides to the end of a steel rod (see *Figure 1*). Place the tablet cover in the horizontal diagonal of the basket. Put the rod assembly up through the cover of the dissolution vessel, and fix it by means of two teflon nuts, 3.2 cm from the center of the vessel, or by any other appropriate means. Adjust the lower edge of the bottom of the basket to about 1 cm above the top of the paddle blade (see *Figure 2*). Orient the large side of the basket tangentially to the flow stream with the Tablet standing on its edge. Pass a 10-mL portion of the solution under test, obtained at each time interval, through a suitable filter.

Figure 2. Drug release stationary tablet basket configuration diagram.

**Chromatographic system:** Proceed as directed in the Assay.

**Analysis**

**Injection size:** 100  $\mu$ L

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{18}H_{19}Cl_2NO_4$  dissolved in the *Medium*:

$$\text{Result} = (r_U/r_S) \times C_S \times D \times V \times 100/L$$

- $r_U$  = peak response from the *Sample solution*
- $r_S$  = peak response from the *Standard solution*
- $C_S$  = concentration of USP Felodipine RS in the *Standard solution* (mg/mL)
- $D$  = dilution factor of the *Sample solution*
- $V$  = volume of the *Medium* (mL), 500
- $L$  = Tablet label claim (mg)

**Tolerances:** The percentages of the labeled amount of  $C_{18}H_{19}Cl_2NO_4$  dissolved at the times specified conform to *Acceptance Table 2*.

Time (h)	Amount Dissolved
2	10%–30%
6	42%–68%
10	NLT 75%

**Test 2:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

**Medium:** 1% (w/v) polysorbate 80; 500 mL

**Apparatus 1:** 100 rpm

**Times:** 1, 4, and 8 h

**Buffer solution:** Dissolve 6.9 g of monobasic sodium phosphate in 400 mL of water, add 8.0 mL of 1 M phosphoric acid, and dilute with water to 1000.0 mL.

**Mobile phase:** Acetonitrile, methanol, and *Buffer solution* (2:1:2)

**Standard stock solution:** 0.2 mg/mL of USP Felodipine RS in methanol. Sonicate for 2 min, cool, and dilute with methanol to final concentration.

**Standard solution:** Transfer the appropriate volume of *Standard stock solution* into a suitable volumetric flask according to the following table. Dilute with *Medium* to volume.

Tablet Label Claim (mg)	Volume Transferred (mL)	Volumetric Flask (mL)
10	10	100
5	5	100
2.5	2.5	100

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45- $\mu$ m pore size. Replace the withdrawn amount with *Medium*.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm  $\times$  15-cm; packing L1

**Flow rate:** 1 mL/min

**Injection size:** 20  $\mu$ L

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Capacity factor ( $k'$ ):** NLT 5

**Column efficiency:** NLT 1500 theoretical plates

**Tailing factor:** NMT 1.5

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the quantity, in mg, of  $C_{18}H_{19}Cl_2NO_4$  dissolved:

$$C_U = (r_U/r_S) \times C_S$$

$C_U$  = concentration of felodipine in the sample at each time point

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of felodipine in the *Standard solution* (mg/mL)

Calculate the percentage of  $C_{18}H_{19}Cl_2NO_4$  dissolved, with volume correction:

$$\text{Result} = \frac{[C_N \times (V_M - V_U(n-1))] + [\sum_{i=1}^{n-1} C_i \times V_U]}{L} \times 100$$

$C_N$  = concentration of felodipine in the *Sample solution* at each time point (mg/mL)

$V_M$  = volume of *Medium* (mL), 500

$V_U$  = volume of sample withdrawn at each time point (mL)

$n$  = the time point (at 4 h,  $n + 1$ )

$\sum_{i=1}^{n-1}$  = summation of the concentration of the *Sample solution* from the first to the (n-1)<sup>th</sup> time point (only applicable for n = 2)  
 L = Tablet label claim (mg)

**Tolerances:** The percentages of the labeled amount of felodipine dissolved at the times specified conform to *Acceptance Table 2*.

Time (h)	Amount Dissolved
1	5%–30%
4	45%–70%
8	NLT 80%

**Test 3:** If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 3*.

**Medium:** pH 6.5 phosphate buffer with 1% sodium lauryl sulfate (5.7 g/L of monobasic sodium phosphate monohydrate, 2.8 g/L of dibasic sodium phosphate, and 10 g/L of sodium lauryl sulfate in water, adjusted, if necessary, with diluted sodium hydroxide to a pH of  $6.5 \pm 0.05$ ); 500 mL

**Apparatus 2:** 50 rpm

**Times:** 2, 6, and 10 h

**Buffer solution:** 6.9 g/L of monobasic sodium phosphate monohydrate in water. Adjust with phosphoric acid to a pH of  $3.0 \pm 0.05$ .

**Mobile phase:** *Buffer solution*, acetonitrile, and methanol (30:45:25)

**Standard stock solution:** 0.5 mg/mL of USP Felodipine RS in methanol

**Standard solution:** Transfer 2.0 mL of the *Standard stock solution* to a 100-mL volumetric flask, and dilute to volume with *Medium*. This solution is stable for 5 days at room temperature.

**Sample solution:** Place each Tablet in a specially made quadrangular basket of stainless steel wire gauze, soldered in one of its upper, narrow sides to the end of a steel rod (see *Figure 1*, under *Test 1*). Place the tablet cover in the horizontal diagonal of the basket. Put the rod assembly up through the cover of the dissolution vessel, and fix it by means of two teflon nuts 3.2 cm from the center of the vessel, or by any other appropriate means. Adjust the lower edge of the bottom of the basket to approximately 1 cm above the top of the paddle blade (see *Figure 2*, under *Test 1*). Orient the large side of the basket tangentially to the flow stream with the Tablet standing on its edge. Pass a portion of the solution under test, obtained at each time interval, through a suitable filter, discarding the first few mL.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 362 nm

**Column:** 4.6-mm  $\times$  15-cm; 5- $\mu$ m packing L1

**Flow rate:** 2.0 mL/min

**Injection size:** 40  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Column efficiency:** NLT 1500 theoretical plates

**Relative standard deviation:** NMT 2.0%

Calculate the percentage of felodipine dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$V$  = volume of *Medium* (mL), 500

**Tolerances:** The percentages of the labeled amount of felodipine dissolved at the times specified conform to *Acceptance Table 2*.

Time (h)	Amount Dissolved
2	10%–30%
6	50%–80%
10	NLT 80%

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

#### Procedure for content uniformity

**Solution A:** 6.9 mg/mL of monobasic sodium phosphate. Adjust with 1 M phosphoric acid to a pH of  $3.0 \pm 0.05$ .

**Mobile phase:** Acetonitrile, methanol, and *Solution A* (2:1:2)

**Standard stock solution:** 2 mg/mL of USP Felodipine RS in methanol

**Standard solution:** 20  $\mu$ g/mL from the *Standard stock solution* in *Mobile phase*

**Sample solution:** 20  $\mu$ g/mL of felodipine, prepared by combining one Tablet taken in a 100-mL volumetric flask and, 40 mL of acetonitrile, and sonicating for 20 min with occasional swirling. Add 20 mL of methanol, and shake by mechanical means for 30 min. Allow to cool to room temperature, and dilute with *Solution A* to volume. Centrifuge a portion of the solution at high speed for 15 min. Dilute a portion of the supernatant with *Mobile phase* to obtain a final concentration. Pass this solution through a filter of 0.5- $\mu$ m or finer pore size.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 362 nm

**Column:** 4.6-mm  $\times$  15-cm; packing L1

**Flow rate:** 1 mL/min

**Injection size:** 40  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Column efficiency:** NLT 1500 theoretical plates

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{18}H_{19}Cl_2NO_4$  in the Tablet taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Felodipine RS in the *Standard solution* ( $\mu$ g/mL)

$C_U$  = nominal concentration of felodipine in the *Sample solution* ( $\mu$ g/mL)

## IMPURITIES

### Organic Impurities

#### • PROCEDURE

**Solution A:** 6.9 mg/mL of monobasic sodium phosphate. Adjust with 1 M phosphoric acid to a pH of  $3.0 \pm 0.05$

**Mobile phase:** Acetonitrile, methanol, and *Solution A* (2:1:2)

**Standard stock solution A:** 0.2 mg/mL of USP Felodipine Related Compound A RS in methanol

**Standard solution A:** 0.02 mg/mL of USP Felodipine Related Compound A RS from the *Standard stock solution A* in *Mobile phase*

**Standard solution B:** 2 mg/mL of USP Felodipine RS in methanol

**System suitability solution:** Combine 15.0 mL of *Standard solution A* and 5.0 mL of *Standard solution B*, and dilute with *Mobile phase* to 100.0 mL.

**Standard solution:** Dilute 10.0 mL of *Standard solution A* with *Mobile phase* to 100.0 mL.

**Sample solution:** Dissolve a quantity equivalent to 10 mg of felodipine from powdered Tablets (NLT 10 Tablets) in a 100-mL volumetric flask. Add 40 mL of acetonitrile and 20 mL of methanol, and sonicate for 5 min. Add about 30 mL of *Solution A*, and shake by mechanical means for 30 min. Allow the solution to cool to room temperature, and dilute with *Solution A* to volume. Centrifuge a portion of the solution at high speed for 15 min, and pass a portion of the supernatant through a filter of 0.5-μm or finer pore size, discarding the first 4 mL of the filtrate.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 15-cm; packing L1

**Flow rate:** 1 mL/min

**Injection size:** 40 μL

#### System suitability

**Sample:** *System suitability solution*

[NOTE— The relative retention times for felodipine related compound A and felodipine are about 0.75 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 1.5 between felodipine and felodipine related compound A

**Column efficiency:** NLT 1500 theoretical plates

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of felodipine related compound A in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response of felodipine related compound A from the *Sample solution*  
 $r_S$  = peak response of felodipine related compound A from the *Standard solution*  
 $C_S$  = concentration of USP Felodipine Related Compound A RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of felodipine in the *Sample solution* (mg/mL)

**Acceptance criteria:** NMT 2.0%

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** When more than one test for *Dissolution* is given, the *Labeling* section states the test for *Dissolution* used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS** <11>
  - USP Felodipine RS
  - USP Felodipine Related Compound A RS
  - Ethyl methyl 4-(2,3-dichlorophenyl)-2,6-dimethylpyridine-3,5-dicarboxylate.  
 $C_{18}H_{17}Cl_2NO_4$  382.24

Methyl 5-(phenylthio)-2-benzimidazolecarbamate  
 [43210-67-9].

» Fenbendazole contains not less than 98.0 percent and not more than 101.0 percent of  $C_{15}H_{13}N_3O_2S$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed, light-resistant containers, and store at 25°, excursions permitted between 15° and 30°.

**Labeling**—Label it to indicate that it is for veterinary use only.

#### USP Reference standards <11>—

USP Fenbendazole RS

USP Fenbendazole Related Compound A RS

Methyl (1*H*-benzimidazole-2-yl)carbamate.

$C_9H_9N_3O_2$  191.19

USP Fenbendazole Related Compound B RS

Methyl [5(6)-chlorobenzimidazole-2-yl]carbamate.

$C_9H_8ClN_3O_2$  225.63

USP Mebendazole RS

#### Identification, Infrared Absorption <197K>.

**Loss on drying** <731>—Dry it at 100° to 105° for 3 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** <281>: not more than 0.3%.

**Heavy metals, Method II** <231>: not more than 10 μg per g.

#### Related compounds—

*Solution A*—Prepare a mixture of water, methanol, and acetic acid (70:30:1).

*Solution B*—Prepare a mixture of methanol, water, and acetic acid (70:30:1).

*Mobile phase*—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*.

*Hydrochloric methanol*—Prepare a mixture of methanol and hydrochloric acid (99:1).

*Standard solution 1*—Dissolve an accurately weighed quantity of USP Fenbendazole RS in *Hydrochloric methanol* to obtain a solution having a known concentration of about 5 mg per mL. Dilute 1.0 mL of this solution with methanol to 200.0 mL. Dilute 5.0 mL of this solution with *Hydrochloric methanol* to 10.0 mL. This solution contains about 0.0125 mg of USP Fenbendazole RS per mL.

*Standard solution 2*—Dissolve an accurately weighed quantity of USP Fenbendazole Related Compound A RS in methanol to obtain a solution having a known concentration of about 0.1 mg per mL. Dilute 1.0 mL of this solution with *Hydrochloric methanol* to 10.0 mL, and mix.

*Standard solution 3*—Dissolve an accurately weighed quantity of USP Fenbendazole Related Compound B RS in methanol to obtain a solution having a known concentration of about 0.1 mg per mL. Dilute 1.0 mL of this solution with *Hydrochloric methanol* to 10.0 mL, and mix.

*Resolution solution*—Dissolve 10.0 mg of USP Fenbendazole RS and 10.0 mg of USP Mebendazole RS in 100.0 mL of methanol. Dilute 1.0 mL of this solution with *Hydrochloric methanol* to 10.0 mL, and mix.

*Test solution*—Dissolve 50.0 mg of Fenbendazole in 10.0 mL of *Hydrochloric methanol*.

*Chromatographic system* (see *Chromatography* <621>—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm × 25-cm column that contains 5-μm packing L1. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0	100	0	equilibration
0–10	100→0	0→100	linear gradient

## Fenbendazole

$C_{15}H_{13}N_3O_2S$  299.35

Carbamic acid, [5-(phenylthio)-1*H*-benzimidazol-2-yl]-, methyl ester.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
10–40	0	100	isocratic
40–50	0→100	100→0	linear gradient

Chromatograph the *Resolution solution*, and record the peak area responses as directed for *Procedure*: the retention time for fenbendazole is about 19 minutes; the relative retention time is about 0.85 for mebendazole and 1.0 for fenbendazole; and the resolution,  $R$ , between mebendazole and fenbendazole is not less than 1.5. Chromatograph *Standard solution 2* and *Standard solution 3*, and record the peak area responses as directed for *Procedure*: the relative retention times are about 0.25 for fenbendazole related compound A and 0.65 for fenbendazole related compound B.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of *Standard solution 1*, *Standard solution 2*, *Standard solution 3*, and the *Test solution* into the chromatograph, record the chromatograms, and measure the area responses for all of the peaks. Calculate the percentages of fenbendazole related compound A and of fenbendazole related compound B in the portion of Fenbendazole taken by the formula:

$$0.1(C/W)(r_i / r_{Si})$$

in which  $C$  is the concentration, in mg per mL, of USP Fenbendazole Related Compound A RS or USP Fenbendazole Related Compound B RS in *Standard solution 2* or *Standard solution 3*, as appropriate;  $W$  is the weight, in mg, of Fenbendazole taken to prepare the *Test solution*;  $r_i$  is the peak area response of the relevant related compound obtained from the *Test solution*; and  $r_{Si}$  is the peak area response of the relevant related compound obtained from *Standard solution 2* or *Standard solution 3*, as appropriate. Not more than 0.5% of either related compound is found. Calculate the percentage of any other impurity in the portion of Fenbendazole taken by the formula:

$$0.1(C/W)(r_i / r_s)$$

in which  $C$  is the concentration, in mg per mL, of USP Fenbendazole RS in *Standard solution 1*;  $W$  is as defined above;  $r_i$  is the peak area response of any impurity other than fenbendazole related compound A or fenbendazole related compound B obtained from the *Test solution*; and  $r_s$  is the peak area response of the main peak in the chromatogram obtained from *Standard solution 1*. Disregard any impurity peak with a response that is less than one-fifth that of  $r_s$ . Not more than 0.5% of any other impurity is found. The sum of all impurities found, including fenbendazole related compound A and fenbendazole related compound B, is not more than 1%.

**Assay**—Dissolve about 200 mg of Fenbendazole, accurately weighed, in 30 mL of glacial acetic acid, warming if necessary to effect solution. Cool, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Each mL of 0.1 N perchloric acid is equivalent to 29.94 mg of  $C_{15}H_{13}N_3O_2S$ .

## Fenofibrate

$C_{20}H_{21}ClO_4$  360.83  
Isopropyl 2-[p-(p-chlorobenzoyl)phenoxy]-2-methylpropanoate [49562-28-9].

## DEFINITION

Fenofibrate contains NLT 98.0% and NMT 102.0% of  $C_{20}H_{21}ClO_4$ , calculated on the dried basis.

## IDENTIFICATION

- **INFRARED ABSORPTION** (197K)

## ASSAY

### PROCEDURE

**Mobile phase:** Acetonitrile and water acidified with phosphoric acid to a pH of 2.5 (7:3)

**Standard solution:** 1 mg/mL of USP Fenofibrate RS in *Mobile phase*

**Sample solution:** 1 mg/mL of Fenofibrate in *Mobile phase*

### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 286 nm

**Column:** 4.0-mm  $\times$  25-cm; packing L1

**Flow rate:** 1.0 mL/min

**Injection size:** 5  $\mu$ L

### System suitability

**Sample:** *Standard solution*

### Suitability requirements

**Relative standard deviation:** NMT 1.0% for six replicate injections

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{20}H_{21}ClO_4$  in the portion of Fenofibrate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Fenofibrate RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Fenofibrate in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the dried basis

## IMPURITIES

### Inorganic Impurities

- **RESIDUE ON IGNITION** (281): NMT 0.1%, determined on 1.0 g

- **CHLORIDE AND SULFATE, Chloride** (221)

**Sample solution:** Add 25 mL of water to 5.0 g of Fenofibrate, and heat at 50° for 10 min. Cool, dilute with water to 50.0 mL, filter, and use the filtrate. [NOTE—Retain the remaining portion of the *Sample solution* for the test for *Chloride and Sulfate, Sulfate*.]

**Analysis:** Use 10 mL of the *Sample solution*.

**Acceptance criteria:** It shows no more chloride than corresponds to 0.15 mL of 0.020 N hydrochloric acid (0.01%).

- **CHLORIDE AND SULFATE, Sulfate** (221)

**Sample:** Use the *Sample solution* prepared in the test for *Chloride and Sulfate, Chloride*.

**Analysis:** Use 10 mL of the *Sample*.

**Acceptance criteria:** It shows no more sulfate than corresponds to 0.15 mL of 0.020 N sulfuric acid (0.01%).

- **HEAVY METALS, Method II** (231): NMT 20 ppm

### Organic Impurities

#### PROCEDURE

**Mobile phase:** Acetonitrile and water acidified with phosphoric acid to a pH of 2.5 (7:3)

**Impurity standard solution:** 1  $\mu$ g/mL each of USP Fenofibrate RS, USP Fenofibrate Related Compound A RS, and USP Fenofibrate Related Compound B RS, and 2  $\mu$ g/mL of USP Fenofibrate Related Compound C RS in *Mobile phase*

**Sample solution:** 1 mg/mL of Fenofibrate in *Mobile phase*

### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 286 nm

Column: 4.0-mm × 25-cm; packing L1

Flow rate: 1.0 mL/min

Injection size: 20 µL

#### System suitability

Sample: Impurity standard solution

#### Suitability requirements

Resolution: NLT 1.5 between fenofibrate related compound A and fenofibrate related compound B

#### Analysis

Samples: Impurity standard solution and Sample solution

Identify the fenofibrate peak and the peaks due to the impurities and degradation products listed in Impurity Table 1.

Measure the responses for the major peaks, and calculate the percentage of each of fenofibrate related compound A, fenofibrate related compound B, and fenofibrate related compound C in the portion of Fenofibrate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of appropriate fenofibrate related compound from the Sample solution

$r_S$  = peak response of appropriate fenofibrate related compound from the Impurity standard solution

$C_S$  = concentration of the appropriate fenofibrate related compound in the Impurity standard solution (µg/mL)

$C_U$  = concentration of Fenofibrate in the Sample solution (µg/mL)

Calculate the percentage of any other impurity in the portion of Fenofibrate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of each impurity from the Sample solution

$r_S$  = peak response of fenofibrate from the Impurity standard solution

$C_S$  = concentration of fenofibrate in the Impurity standard solution (µg/mL)

$C_U$  = concentration of Fenofibrate in the Sample solution (µg/mL)

#### Acceptance criteria

Individual impurities: See Impurity Table 1.

Total impurities: NMT 0.5%

Impurity Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
(4-Chlorophenyl)(4-hydroxyphenyl) methanone <sup>a</sup>	0.34	0.1
2-[4-(4-Chlorobenzoyl)phenoxy]-2-methylpropanoic acid (fenofibric acid) <sup>b</sup>	0.36	0.1
(3R)-3-[4-(4-Chlorobenzoyl)phenoxy]butan-2-one	0.50	0.1
Methyl 2-[4-(4-chlorobenzoyl)phenoxy]-2-methyl-propanoate	0.65	0.1
Ethyl 2-[4-(4-chlorobenzoyl)phenoxy]-2-methyl-propanoate	0.80	0.1
(4-Chlorophenyl)[4-(1-methylethoxy)phenyl]methanone	0.85	0.1

<sup>a</sup> Fenofibrate related compound A.

<sup>b</sup> Fenofibrate related compound B.

<sup>c</sup> Fenofibrate related compound C.

Impurity Table 1 (Continued)

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
1-Methylethyl 2-[[2-[4-(4-chlorobenzoyl)phenoxy]-2-methylpropanoyl]oxy]-2-methylpropanoate <sup>c</sup>	1.35	0.2
Any other impurity	—	0.1

<sup>a</sup> Fenofibrate related compound A.

<sup>b</sup> Fenofibrate related compound B.

<sup>c</sup> Fenofibrate related compound C.

#### SPECIFIC TESTS

• **MELTING RANGE OR TEMPERATURE**, Class Ia (741): 79°–82°

• **ACIDITY**

Sample: 1.0 g

Analysis: Dissolve the Sample in 50 mL of alcohol previously neutralized to phenolphthalein TS, and titrate with 0.1 N sodium hydroxide VS.

Acceptance criteria: NMT 0.2 mL is required to change the color of the indicator to pink.

• **LOSS ON DRYING** (731)

Analysis: Dry a sample in a vacuum over phosphorus pentoxide at 60° to constant weight.

Acceptance criteria: NMT 0.5%

• **COLOR AND ACHROMICITY** (631)

Reference solution: Mix 5 mL of Matching Fluid G and 95 mL of dilute hydrochloric acid (1 in 40).

Sample solution: 50 mg/mL of Fenofibrate in acetone

Analysis: Proceed as directed in the chapter.

Acceptance criteria: The Sample solution is not more intensely colored than the Reference solution.

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE**: Preserve in well-closed, light-resistant containers. Store at room temperature.

• **USP REFERENCE STANDARDS** (11)

USP Fenofibrate RS

USP Fenofibrate Related Compound A RS

(4-Chlorophenyl)(4-hydroxyphenyl)methanone.

USP Fenofibrate Related Compound B RS

2-[4-(4-Chlorobenzoyl)phenoxy]-2-methylpropanoic acid, or fenofibric acid.

USP Fenofibrate Related Compound C RS

1-Methylethyl 2-[[2-[4-(4-chlorobenzoyl)phenoxy]-2-methylpropanoyl]oxy]-2-methylpropanoate.

## Fenofibrate Capsules

#### DEFINITION

Fenofibrate Capsules contains NLT 90.0% and NMT 110.0% of the labeled amount of fenofibrate (C<sub>20</sub>H<sub>21</sub>ClO<sub>4</sub>).

#### IDENTIFICATION

• The retention time of the major peak of the Sample solution corresponds to that of the Standard solution, as obtained in the Assay.

#### ASSAY

##### • PROCEDURE

[NOTE—Use Sample stock solution 2 for Capsules labeled to meet the requirements of Dissolution Test 2. For all other products, use Sample stock solution 1.]

**Solution A**: 136 mg/L of monobasic potassium phosphate in water. Adjust with dilute phosphoric acid (1 in 10) to a pH of 2.9 ± 0.05.

**Mobile phase**: Methanol and Solution A (4:1)

**Standard solution**: 67 µg/mL of USP Fenofibrate RS in Mobile phase

**Sample stock solution 1:** Accurately weigh the contents of NLT 20 Capsules. Mix the contents, and transfer a weighed portion of the powder, equivalent to about 67 mg of fenofibrate, to a 100-mL volumetric flask. Add 80 mL of *Mobile phase*, sonicate for 10 min, stir for 15 min, and dilute with *Mobile phase* to volume.

**Sample stock solution 2** (For Capsules labeled to meet the requirements of *Dissolution Test 2*): Weigh the contents of NLT 20 Capsules. Mix the contents, melt in an oven at 80° for NLT 30 min, and homogenize. Allow the sample to solidify. Transfer a weighed portion of the sample, equivalent to about 67 mg of fenofibrate, to a 100-mL volumetric flask, dissolve in 30 mL of methanol with the aid of a mechanical shaker for NLT 4 h, and dilute with *Mobile phase* to volume.

**Sample solution:** 67 µg/mL of fenofibrate from the designated *Sample stock solution*, in *Mobile phase*. Pass a portion of this solution through a PVDF filter of 0.45-µm pore size, discarding the first 5 mL.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 285 nm

**Column:** 4.6-mm × 15-cm; 5-µm packing L1

**Flow rate:** 1 mL/min

**Injection size:** 20 µL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Column efficiency:** NLT 6000 theoretical plates

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of C<sub>20</sub>H<sub>21</sub>ClO<sub>4</sub> in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (µg/mL)

$C_U$  = nominal concentration of the *Sample solution* (µg/mL)

**Acceptance criteria:** 90.0%–110.0%

### PERFORMANCE TESTS

#### • DISSOLUTION <711>

##### Test 1

**Medium:** 0.05 M sodium lauryl sulfate in water; 1000 mL, deaerated

**Apparatus 2:** 75 rpm

**Time:** 40 min

**Solution A and Mobile phase:** Proceed as directed in the Assay.

**Standard solution:** (0.001 × L) mg/mL of USP Fenofibrate RS in *Mobile phase*, where L is the Capsule label claim, in mg

**Sample solution:** Pass a portion of the solution under test through a suitable polyvinylidene difluoride (PVDF) filter of 0.45-µm pore size.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 285 nm

**Column:** 4.6-mm × 15-cm; 5-µm packing L1

**Flow rate:** 1 mL/min

**Injection size:** 10 µL for Capsules labeled to contain 67 mg; 5 µL for Capsules labeled to contain 134 or 200 mg

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Column efficiency:** NLT 4000 theoretical plates

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of C<sub>20</sub>H<sub>21</sub>ClO<sub>4</sub> dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (100/L)$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$V$  = volume of *Medium*, 1000 mL

$L$  = Capsule label claim (mg)

**Tolerances:** NLT 70% (Q) of the labeled amount of C<sub>20</sub>H<sub>21</sub>ClO<sub>4</sub> is dissolved.

**Test 2:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

**Medium:** Phosphate buffer pH 6.8 ± 0.1 containing 0.1% pancreatin and 2% polysorbate 80; 900 mL, deaerated by vacuum

**Apparatus 2:** 75 rpm with sinkers (see *Dissolution* <711>, Figure 2a)

**Time:** 2 h

**Detector:** UV 288 nm

**Standard solution:** (L/1000) mg/mL of USP Fenofibrate RS in *Medium*, where L is the Capsule label claim, in mg. A volume of methanol, not exceeding 10%, can be used in the first dilution to solubilize fenofibrate.

**Sample solution:** Pass 20 mL of the solution under test through a suitable PVDF filter of 0.45-µm pore size, discarding the first 2 mL.

**Path length:** 0.1 cm, flow cell

**Blank:** *Medium*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of C<sub>20</sub>H<sub>21</sub>ClO<sub>4</sub> dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times V \times (100/L)$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$V$  = volume of *Medium*, 900 mL

$L$  = Capsule label claim (mg)

**Tolerances:** NLT 80% (Q) of the labeled amount of C<sub>20</sub>H<sub>21</sub>ClO<sub>4</sub> is dissolved.

**Test 3:** If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 3*.

**Medium:** 0.72% sodium lauryl sulfate in water; 1000 mL, deaerated

**Apparatus 2:** 75 rpm, with sinkers with three prongs

**Time:** 30 min

**Standard solution:** L/10 mg/mL of USP Fenofibrate RS in methanol, where L is the Capsule label claim in mg. Transfer 10.0 mL of this solution to a 1000-mL volumetric flask, and dilute with *Medium* to volume.

**Sample solution:** Pass a portion of the solution under test through a suitable PVDF filter of 0.45-µm pore size. Dilute with *Medium*, if necessary.

**Detection:** UV 290 nm

**Blank:** *Medium*

Calculate the percentage of fenofibrate dissolved:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times D \times V \times 100$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$C_s$  = concentration of the *Standard solution* (mg/mL)

$L$  = Capsule label claim (mg)

$D$  = dilution for the *Sample solution*

$V$  = volume of the *Medium*, 1000 mL

**Tolerances:** NLT 80% (Q) of the labeled amount of fenofibrate is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

#### Procedure for content uniformity

**Solution A, Mobile phase, Standard solution, Chromatographic system, System suitability, and Analysis:** Proceed as directed in the *Assay*, except to prepare the *Sample stock solution* and *Sample solution* as follows.

**Sample stock solution:** Place 1 Capsule in a suitable volumetric flask, add *Solution A* to 10%–20% of the final volume, and stir for 20 min to disintegrate the Capsule. Fill the flask to about 80% with methanol, sonicate for 10 min, stir for 15 min, and dilute with methanol to volume to obtain a solution having a known concentration of about 0.4–0.7 mg/mL of fenofibrate, based on the label claim.

**Sample solution:** 60–70 µg/mL of fenofibrate, from the *Sample stock solution*, in *Mobile phase*. Pass a portion of this solution through a PVDF filter of 0.45-µm pore size, discarding the first 5 mL.

### IMPURITIES

#### Organic Impurities

[NOTE—Use *Sample solution 2* for Capsules labeled to meet the requirements of *Dissolution Test 2*. For all other products, use *Sample solution 1*.]

#### • PROCEDURE

**Solution A:** 136 mg/L of monobasic potassium phosphate. Adjust with dilute phosphoric acid (1 in 10) to a pH of  $2.9 \pm 0.05$ .

**Mobile phase:** Methanol and *Solution A* (4:1)

**Standard solution:** 3.35 µg/mL of USP Fenofibrate RS and 3.35 µg/mL of USP Fenofibrate Related Compound B RS in *Mobile phase*

**System suitability solution:** 0.67 mg/mL of USP Fenofibrate RS and 3.35 µg/mL of USP Fenofibrate Related Compound B RS in *Mobile phase*

**Quantitative limit solution:** 0.67 µg/mL of USP Fenofibrate RS and 0.67 µg/mL of USP Fenofibrate Related Compound B RS in *Mobile phase*, from the *Standard solution*

**Sample solution 1:** Accurately weigh the contents of NLT 20 Capsules. Mix the contents, and transfer a weighed portion of the powder, equivalent to about 67 mg of fenofibrate, to a 100-mL volumetric flask. Add 80 mL of *Mobile phase*, sonicate for 10 min, stir for 15 min, and dilute with *Mobile phase* to volume. Pass a portion of this solution through a PVDF filter of 0.45-µm pore size, discarding the first 5 mL. The final concentration based on the label claim is about 0.67 mg/mL.

**Sample solution 2** (For Capsules labeled to meet the requirements of *Dissolution Test 2*): Weigh the contents of NLT 20 Capsules. Mix the contents, melt in an oven at 80° for NLT 30 min, and homogenize. Allow the sample to solidify. Transfer a weighed portion of the sample, equivalent to about 67 mg of fenofibrate, to a 100-mL volumetric flask, dissolve in 30 mL of methanol with the aid of a mechanical shaker for NLT 4 h, and dilute with *Mobile phase* to volume. Pass through a PVDF filter of 0.45-µm pore size, discarding the first 1–2 mL. The final concentration based on the label claim is about 0.67 mg/mL.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 285 nm

**Column:** 4.6-mm × 15-cm; 5-µm packing L1

**Flow rate:** 1 mL/min

**Injection size:** 20 µL

#### System suitability

**Samples:** *Standard solution*, *System suitability solution*, and *Quantitative limit solution*

#### Suitability requirements

**Resolution:** NLT 3.0 between fenofibrate and fenofibrate related compound B, *System suitability solution*

**Column efficiency:** NLT 3000 theoretical plates for fenofibrate related compound B, *System suitability solution*

**Tailing factor:** NMT 2.0 for fenofibrate related compound B, *System suitability solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

**Signal-to-noise ratio:** NLT 10 for the fenofibrate peak, *Quantitative limit solution*

#### Analysis

**Samples:** *Standard solution* and designated *Sample solution*

Calculate the percentage of fenofibrate related compound B in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of fenofibrate related compound B from the *Sample solution*

$r_S$  = peak response of fenofibrate related compound B from the *Standard solution*

$C_S$  = concentration of fenofibrate related compound B in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of fenofibrate in the *Sample solution* (mg/mL)

Calculate the percentage of any other impurity in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of each individual impurity from the *Sample solution*

$r_S$  = peak response of fenofibrate from the *Standard solution*

$C_S$  = concentration of fenofibrate in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of fenofibrate in the *Sample solution* (mg/mL)

#### Acceptance criteria

**Individual impurities:** NMT 0.5% for fenofibrate related compound B; NMT 0.2% for any other individual impurity

**Total impurities:** NMT 2.0%

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at controlled room temperature.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS (11)**  
USP Fenofibrate RS  
USP Fenofibrate Related Compound B RS  
2-[4-(4-Chlorobenzoyl)phenoxy]-2-methylpropanoic acid, or fenofibric acid.

## Fenofibrate Tablets

### DEFINITION

Fenofibrate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of fenofibrate ( $C_{20}H_{21}ClO_4$ ).

### IDENTIFICATION

- A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

**Acidified water:** Adjust the pH of water with phosphoric acid to  $2.5 \pm 0.1$ .

**Mobile phase:** Acetonitrile and *Acidified water* (70:30)

**System suitability stock solution:** 0.1 mg/mL each of USP Fenofibrate Related Compound A RS and USP Fenofibrate Related Compound B RS in acetonitrile

**System suitability solution:** 0.5 µg/mL each of USP Fenofibrate Related Compound A RS and USP Fenofibrate Related Compound B RS in *Mobile phase* from *System suitability stock solution*

**Standard solution:** 0.05 mg/mL of USP Fenofibrate RS in *Mobile phase*

**Sample stock solution:** Prepare a solution containing approximately 2–4 mg/mL of fenofibrate by disintegrating the appropriate number of Tablets with sonication in *Acidified water*, using 30% of the final volume of the flask. Add acetonitrile to approximately 90% of flask volume, and sonicate with periodic swirling. Dilute with acetonitrile to volume.

**Sample solution:** 0.05 mg/mL of fenofibrate in *Mobile phase*, based on the label claim from the *Sample stock solution*. Filter a portion of this solution, discarding the first few mL of the filtrate.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 286 nm

**Column:** 4.0-mm × 25-cm or 4.6-mm × 25-cm; 5-µm or 4-µm packing L1

**Column temperature:** 35°

**Flow rate:** 1.2 mL/min

**Injection size:** 10 µL

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

#### Suitability requirements

**Resolution:** NLT 2.0 between fenofibrate related compound A and fenofibrate related compound B peaks, *System suitability solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of fenofibrate ( $C_{20}H_{21}ClO_4$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Fenofibrate RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of fenofibrate in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

### PERFORMANCE TESTS

#### DISSOLUTION <711>

##### Test 1

**Medium:** 0.025 M sodium dodecyl sulfate in water; 1000 mL

**Apparatus 2:** 50 rpm

**Time:** 30 min

**Acidified water:** Adjust the pH of water with phosphoric acid to  $2.5 \pm 0.1$ .

**Mobile phase:** Acetonitrile and *Acidified water* (70:30)

**Standard stock solution:** 2.5 mg/mL of USP Fenofibrate RS in acetonitrile

**Standard solution:** Dilute the *Standard stock solution* with *Medium* to obtain a final concentration of about  $(0.001 \times L)$  mg/mL, where  $L$  is the label claim, in mg/Tablet

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size, discarding the first few mL of the filtrate.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 286 nm

**Column:** 2-mm × 3-cm; 3-µm packing L1

**Column temperature:** 35°

**Flow rate:** 1.2 mL/min

**Injection size:** 10 µL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** NLT 0.9 and NMT 1.5

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of fenofibrate ( $C_{20}H_{21}ClO_4$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$L$  = label claim (mg/Tablet)

$V$  = volume of *Medium*, 1000 mL

**Tolerances:** NLT 80% (Q) of the labeled amount of fenofibrate ( $C_{20}H_{21}ClO_4$ ) is dissolved.

**Test 2:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

**Medium:** 0.05 M sodium dodecyl sulfate in water; 1000 mL

**Apparatus 2:** 50 rpm

**Time:** 30 min

**Buffer:** 136 mg/L of monobasic potassium phosphate in water. Adjust with diluted phosphoric acid to a pH of  $2.9 \pm 0.05$ .

**Mobile phase:** Methanol and *Buffer* (80:20)

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size, discarding the first few mL of the filtrate.

**Standard solution:**  $(0.001 \times L)$  mg/mL of USP Fenofibrate RS in *Mobile phase*, where  $L$  is the label claim, in mg/Tablet

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC  
 Detector: UV 286 nm  
 Column: 4.6-mm × 15-cm; 5-μm packing L1  
 Flow rate: 1.0 mL/min  
 Injection size: 10 μL

**System suitability**

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

**Analysis**

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of fenofibrate ( $C_{20}H_{21}ClO_4$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_U$  = peak response from the *Sample solution*  
 $r_S$  = peak response from the *Standard solution*  
 $C_S$  = concentration of the *Standard solution* (mg/mL)  
 $L$  = label claim (mg/Tablet)  
 $V$  = volume of *Medium*, 1000 mL

Tolerances: NLT 80% (Q) of the labeled amount of fenofibrate is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

**IMPURITIES**• **ORGANIC IMPURITIES**

Acidified water, Mobile phase, System suitability solution, Sample stock solution, and Chromatographic system: Proceed as directed in the Assay.

Standard solution: 0.5 μg/mL of USP Fenofibrate RS in *Mobile phase*

Sample solution: 0.5 mg/mL of fenofibrate in *Mobile phase*, based on the label claim from the *Sample stock solution*. Filter a portion of this solution, discarding the first few mL of filtrate.

**System suitability**

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 2.0 between fenofibrate related compound A and fenofibrate related compound B peaks, *System suitability solution*

Relative standard deviation: NMT 5.0%, *Standard solution*

**Analysis**

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*  
 $r_S$  = peak response of fenofibrate from the *Standard solution*  
 $C_S$  = concentration of USP Fenofibrate RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of fenofibrate in the *Sample solution* (mg/mL)  
 $F$  = relative response factor (see Table 1)

Acceptance criteria: See Table 1.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Fenofibrate related compound A	0.34	1.3	0.2
Fenofibrate related compound B	0.36	1.0	0.2
(3 <i>RS</i> )-3-[4-(4-Chlorobenzoyl)phenoxy]butan-2-one	0.50	—	— <sup>a</sup>
Methyl 2-[4-(4-chlorobenzoyl)phenoxy]-2-methylpropanoate	0.65	—	— <sup>a</sup>
Ethyl 2-[4-(4-chlorobenzoyl)phenoxy]-2-methylpropanoate	0.80	—	— <sup>a</sup>
(4-Chlorophenyl)[4-(1-methylethoxy)phenyl]methanone	0.85	—	— <sup>a</sup>
Fenofibrate	1.00	—	—
Fenofibrate related compound C <sup>b</sup>	1.35	—	— <sup>a</sup>
Any unspecified impurity	—	1.0	0.2
Total impurities (includes fenofibrate related compounds A and B, and unspecified impurities)	—	—	0.3

<sup>a</sup> Disregard this impurity. It is a process impurity and is controlled in the drug substance monograph.

<sup>b</sup> 1-Methylethyl 2-[[2-[4-(4-chlorobenzoyl)phenoxy]-2-methylpropanoyl]oxy]-2-methylpropanoate.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at controlled room temperature.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS (11)**
  - USP Fenofibrate RS
  - USP Fenofibrate Related Compound A RS (4-Chlorophenyl)(4-hydroxyphenyl)methanone.  
 $C_{13}H_9ClO_2$  232.66
  - USP Fenofibrate Related Compound B RS 2-[4-(4-Chlorobenzoyl)phenoxy]-2-methylpropanoic acid, or fenofibric acid.  
 $C_{17}H_{15}ClO_4$  318.75

**Fenoldopam Mesylate**

$C_{16}H_{16}ClNO_3 \cdot CH_4SO_3$  401.86

1*H*-3-Benzazepine-7,8-diol, 6-chloro-2,3,4,5-tetrahydro-1-(4-hydroxyphenyl)-, methanesulfonate (salt).

6-Chloro-2,3,4,5-tetrahydro-1-(*p*-hydroxyphenyl)-1*H*-3-benzazepine-7,8-diol methanesulfonate (salt) [67227-57-0].

» Fenoldopam Mesylate contains not less than 98.0 percent and not more than 102.0 percent of  $C_{16}H_{16}ClNO_3 \cdot CH_4SO_3$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers, protected from moisture. Store at 25°, excursions permitted between 15° and 30°.

**USP Reference standards** (11)—

USP Fenoldopam Mesylate RS

USP Fenoldopam Related Compound A RS

1-Methyl-3-benzazepine-7,8-diol, 6-chloro-2,3,4,5-tetrahydro-1-(4-hydroxyphenyl)-, methanesulfonate (salt).  $C_{17}H_{18}ClNO_3 \cdot CH_4SO_3$  415.89

**Identification**—

**A: Infrared Absorption** (197K).

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Water**, *Method I* (921): not more than 1.0%.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals**, *Method II* (231): 0.002%.

**Limit of iodide**—

*Mobile phase*—Prepare a filtered and degassed solution containing about 0.94 g of sodium bicarbonate, 0.952 g of sodium carbonate, 0.38 g of 4-cyanophenol, and 80 mL of acetonitrile in 4 L of water. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard stock solution*—Transfer about 118.1 mg of sodium iodide, accurately weighed, to a 1000-mL volumetric flask. Dissolve in and dilute with water to volume, and mix to obtain a solution containing the equivalent of 100 µg of iodide per mL.

*Standard solutions*—Pipet 2.0 mL, 4.0 mL, 6.0 mL, and 8.0 mL of the *Standard stock solution* into separate 100-mL volumetric flasks, dilute with water to volume, and mix to obtain solutions having known concentrations of about 2 µg, 4 µg, 6 µg, and 8 µg of iodide per mL.

*Test solution*—Transfer about 300 mg of Fenoldopam Mesylate, accurately weighed, to a 100-mL volumetric flask. Dissolve in and dilute with water to volume, and mix.

*Chromatographic system*—The ion chromatograph is equipped with a conductivity detector, a 4-mm × 3.5-cm anion-exchange guard column, a 4-mm × 15-cm anion-exchange analytical column, and a micromembrane anion suppressor column. The flow rate is about 2.0 mL per minute. The regeneration solution for the suppressor column is a 0.050 M sulfuric acid solution, flowing at a rate of 5 mL per minute. Chromatograph the 6 µg per mL *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 5.0%.

*Procedure*—Separately inject equal volumes (about 100 µL) of each of the *Standard solutions* and the *Test solution* into the chromatograph, record the chromatograms, and measure the heights of peak responses. Plot the response of each of the *Standard solutions* versus the concentration, and draw the straight line best fitting the plotted points. From the graph so obtained, determine the quantity of iodide in the portion of Fenoldopam Mesylate taken: not more than 0.2% is found.

**Related compounds**—

*Buffer solution*, *System suitability stock solution*, and *System suitability solution*—Proceed as directed in the *Assay*.

*Solution A*—Use *Mobile phase* as prepared in the *Assay*.

*Solution B*—Use filtered and degassed methanol.

*Mobile phase*—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Test solution*—Use the *System suitability stock solution*.

*Chromatographic system*—Proceed as directed in the *Assay*, except to program the chromatograph as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0	100	0	equilibration
0–30	100	0	isocratic
30–60	100→70	0→30	linear gradient

*Procedure*—Inject a volume (about 20 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each impurity in the portion of Fenoldopam Mesylate taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the peak response for each impurity; and  $r_s$  is the sum of the responses of all the peaks: not more than 0.3% of fenoldopam related compound A is found; not more than 0.1% of any other individual impurity is found; and not more than 1.0% of total impurities is found.

**Limit of residual solvents**—

*Internal standard solution*—Prepare a solution, in organic-free water, containing 10 mg of *n*-butanol per mL. Transfer 100 µL of this solution to a 10-mL volumetric flask, dilute with dimethylsulfoxide to volume, and mix.

*Standard solution*—Prepare a solution, in organic-free water, containing 10 mg each of *n*-propanol, isopropyl alcohol, and dimethylformamide per mL. Transfer 100 µL of this solution to a 10-mL volumetric flask, dilute with *Internal standard solution* to volume, and mix.

*Test solution*—Transfer about 50 mg of Fenoldopam Mesylate, accurately weighed, to a 1-mL volumetric flask. Dilute with *Internal standard solution* to volume, and sonicate to dissolve completely.

*Chromatographic system* (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector, a 0.32-mm × 30-m fused-silica capillary column coated with a 1.8-µm film of stationary phase G43, and a split injection system. The carrier gas is helium, flowing at a rate of about 1 mL per minute through the column and a split ratio of about 50:1. The injection port and the detector temperatures are maintained at 140° and 260°, respectively. The column temperature is programmed as follows. It is maintained for 12 minutes at 40°, then increased at a rate of 8° per minute to 120°, held for 0.1 minute, then increased at a rate of 25° per minute to 180°, and maintained at that temperature for 8 minutes.

*Procedure*—Separately inject equal volumes (about 1 µL) of the *Standard solution*, dimethylsulfoxide, and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak areas. Identify, based on retention time, any peaks present in the chromatogram of the *Test solution*. Calculate the response factor,  $F_r$ , for each solvent in the *Standard solution* by the formula:

$$(W_R / W_i)(r_i / r_R)$$

in which  $W_R$  is the weight, in mg, of the solvent of interest;  $W_i$  is the weight, in mg, of the internal standard taken to prepare the *Internal standard solution*; and  $r_i$  and  $r_R$  are the peak responses for the internal standard and the solvent of interest, respectively, obtained from the *Standard solution*.

Calculate the percentage, by weight, of each solvent found in the *Test solution* by the formula:

$$100FD(r_i / r_s)(W_i / W_D)$$

in which *F* is the average response factor for the solvent of interest obtained from all injections of the *Standard solution*; *D* is the dilution factor for the internal standard in the *Test solution* (i.e., 0.0001); *r<sub>i</sub>* and *r<sub>s</sub>* are the peak responses for the solvent of interest and the internal standard, respectively, obtained from the *Test solution*; *W<sub>i</sub>* is the weight, in mg, of the internal standard taken to prepare the *Internal standard solution*; and *W<sub>D</sub>* is the weight, in mg, of Fenoldopam Mesylate taken to prepare the *Test solution*: not more than 0.2% of total residual solvents is found.

#### Assay—

**Buffer solution**—Transfer about 16.33 g of monobasic potassium phosphate and 2 mL of triethylamine to a 2-L volumetric flask, and dissolve in 1800 mL of water. Adjust with phosphoric acid to a pH of 2.5, dilute with water to volume, and mix.

**Mobile phase**—Prepare a filtered and degassed mixture of *Buffer solution* and methanol (19:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**System suitability stock solution**—Transfer about 50 mg of Fenoldopam Mesylate, accurately weighed, to a 50-mL volumetric flask. With the aid of an ultrasonic bath, dissolve in and dilute with *Mobile phase* to volume, and mix.

**System suitability solution**—Transfer about 5 mg of USP Fenoldopam Related Compound A RS, accurately weighed, to a 50-mL volumetric flask. Add about 25 mL of *Mobile phase*, and sonicate to dissolve. Add 5 mL of the *System suitability stock solution*, dilute with *Mobile phase* to volume, and mix.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Fenoldopam Mesylate RS in *Mobile phase* to obtain a solution having a known concentration of about 0.1 mg per mL.

**Assay preparation**—Transfer 5.0 mL of the *System suitability stock solution*, accurately measured, to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 225-nm detector and a 3.9-mm × 30-cm column that contains packing L11. The flow rate is about 1.7 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution, *R<sub>s</sub>*, between fenoldopam and fenoldopam related compound A is not less than 1.5; the column efficiency is not less than 2000 theoretical plates; the tailing factor is not more than 1.3; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of C<sub>16</sub>H<sub>16</sub>ClNO<sub>3</sub> · CH<sub>4</sub>SO<sub>3</sub> in the portion of Fenoldopam Mesylate taken by the formula:

$$500C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Fenoldopam Mesylate RS in the *Standard preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses for fenoldopam obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Fenoldopam Mesylate Injection

» Fenoldopam Mesylate Injection is a sterile solution of Fenoldopam Mesylate. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of fenoldopam mesylate (C<sub>16</sub>H<sub>16</sub>ClNO<sub>3</sub> · CH<sub>4</sub>SO<sub>3</sub>).

**Packaging and storage**—Preserve in tight, single-dose Containers for Injections as described under *Injections* <1>, preferably of Type I glass. Store in a refrigerator or at controlled room temperature.

#### USP Reference standards <11>—

USP Endotoxin RS

USP Fenoldopam Mesylate RS

USP Fenoldopam Related Compound B RS

1 *H*-3-Benzazepine-7,8-diol, 2,3,4,5-tetrahydro-1-(4-hydroxyphenyl)-, methanesulfonate (salt).  
C<sub>16</sub>H<sub>16</sub>NO<sub>3</sub> · CH<sub>4</sub>SO<sub>3</sub> 366.42

#### Identification—

**A: Thin-Layer Chromatographic Identification Test** <201>—

**Test solution**—Pipet 1.0 mL of Injection into a 10-mL volumetric flask. Dilute with methanol to volume, and mix.

**Standard solution**: 1 mg per mL in methanol.

**Application volume**: 20 μL.

**Developing solvent system**—Prepare a homogeneous mixture of acetone, chloroform, acetic acid, and water (6:2:1:1). Place mixture in a paper-lined chromatographic chamber, and equilibrate for about 15 minutes prior to use.

**Procedure**—Proceed as directed in the chapter, and then dry the plate under a current of warm air until completely dry. Place the plate into a second chromatographic chamber containing iodine crystals, and examine the plate: meets the requirements.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Bacterial endotoxins** <85>—It contains not more than 84 USP Endotoxin Units per mg of fenoldopam mesylate.

**Sterility** <71>: meets the requirements.

**pH** <791>: between 2.8 and 3.8.

**Particulate matter** <788>: meets the requirements for small-volume injections.

#### Related compounds—

**Diluent, Mobile phase, System suitability solution, Standard preparation, Column treatment, and Chromatographic system**—Proceed as directed in the *Assay*.

**Test preparation**—Use the *Assay preparation*.

**Procedure**—Separately inject equal volumes (about 10 μL) of the *Standard preparation* and the *Test preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg per mL, of fenoldopam related compound B (C<sub>16</sub>H<sub>16</sub>NO<sub>3</sub> · CH<sub>4</sub>SO<sub>3</sub>) in the volume of Injection taken by the formula:

$$W_S S(D_S / D_U)(r_U / r_S)$$

in which *W<sub>S</sub>* is the weight, in mg, of USP Fenoldopam Related Compound B RS taken; *S* is the conversion factor from the fenoldopam related compound B to the free base (i.e., 0.77026); *D<sub>S</sub>* and *D<sub>U</sub>* are the dilution factors for the *Standard preparation* and the *Test preparation*, respectively (i.e., 0.0001 and 0.02); and *r<sub>U</sub>* and *r<sub>S</sub>* are the average peak responses for fenoldopam related compound B obtained from the *Test preparation* and the *Standard preparation*, respectively: not more than 0.6% is found.

**Content of sodium metabisulfite**—Transfer 10.0 mL of Injection to a glass-stoppered conical flask containing 5.0 mL of 0.1 N iodine VS, and swirl to dissolve. Allow to stand for exactly 5 minutes, protected from light. Add 0.5 mL of hydrochloric acid, and titrate the excess iodine with 0.05 N sodium thiosulfate VS, adding 0.5 mL of starch TS as the endpoint is approached. Perform a blank determination, and make any necessary correction. Each mL of 0.05 N sodium thiosulfate is equivalent to 2.3763 mg of sodium metabisulfite: not less than 0.25 mg per mL of Injection is found.

**Other requirements**—It meets the requirements under *Injections* (1).

#### Assay—

**Diluent**—Dissolve about 1.38 g of monobasic sodium phosphate monohydrate in 1 L of water, adjust with a phosphoric acid solution (1 in 9) to a pH of 2.5, and mix.

**Mobile phase**—Dissolve about 1.38 g of monobasic sodium phosphate monohydrate and 1.88 g of sodium hexanesulfonate in 1 L of water, adjust with a phosphoric acid solution (1 in 9) to a pH of 2.5, and mix. Prepare a filtered and degassed mixture of this solution and methanol (67:33). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**System suitability solution**—Transfer about 2.74 mg of USP Fenoldopam Related Compound B RS, accurately weighed, to a 100-mL volumetric flask. Dissolve in and dilute with *Diluent* to volume, and mix.

**Standard preparation**—Transfer about 26.3 mg of USP Fenoldopam Mesylate RS, accurately weighed, to a 100-mL volumetric flask, and dissolve in about 75 mL of *Diluent*. Add, by pipetting, 1.0 mL of the *System suitability solution*, dilute with *Diluent* to volume, and mix.

**Assay preparation**—Accurately pipet about 0.5 mL of Injection into a 25-mL volumetric flask, dilute with *Diluent* to volume, and mix.

**Column treatment**—[NOTE—This treatment is required for new columns only.] Pump a solution of cyclam (1 in 1000) through the new column for about 3 hours at a flow rate of about 1 mL per minute, and then pump *Mobile phase* for at least 2 hours at the same flow rate.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 225-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the capacity factor,  $k'$ , is between 1 and 3; the column efficiency is not less than 1800 theoretical plates; and the tailing factor is not more than 2.5. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the capacity factor,  $k'$ , is between 4 and 6; the column efficiency is not less than 1800 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg per mL, of fenoldopam mesylate ( $C_{16}H_{16}ClNO_3 \cdot CH_4SO_3$ ) in the volume of Injection taken by the formula:

$$W_S(D_S / D_U)(r_U / r_S)$$

in which  $W_S$  is the weight, in mg, of USP Fenoldopam Mesylate RS taken;  $S$  is the conversion factor from the fenoldopam mesylate to the free base (i.e., 0.7610);  $D_S$  and  $D_U$  are the dilution factors for the *Standard preparation* and the *Assay preparation*, respectively (i.e., 0.01 and 0.02); and  $r_U$  and  $r_S$  are the fenoldopam peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Fenoprofen Calcium

$C_{30}H_{26}CaO_6 \cdot 2H_2O$  558.63

Benzeneacetic acid,  $\alpha$ -methyl-3-phenoxy-, calcium salt dihydrate, ( $\pm$ )-.

Calcium ( $\pm$ )-*m*-phenoxyhydratropate dihydrate [53746-45-5].

Anhydrous 522.61 [34597-40-5].

» Fenoprofen Calcium contains not less than 97.0 percent and not more than 103.0 percent of  $(C_{15}H_{13}O_3)_2Ca$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Fenoprofen Calcium RS

#### Identification—

**A: Infrared Absorption** (197K).

**B:** Heat a 1 in 50 mixture of it with acetic acid, filter, and add 2 mL of ammonium oxalate TS to the filtrate: a white precipitate, which is soluble in 3 N hydrochloric acid, is formed.

**Water, Method I** (921): between 5.0% and 8.0%.

**Heavy metals, Method II** (231): 0.001%.

#### Chromatographic purity—

**Solution A**—Prepare a filtered and degassed mixture of water and acetic acid (98:2).

**Solution B**—Prepare a filtered and degassed mixture of acetonitrile and acetic acid (98:2).

**Mobile phase**—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Diluent:** a mixture of water and acetonitrile (1:1).

**System suitability solution**—Dissolve accurately weighed quantities of 3-phenoxybenzoic acid and USP Fenoprofen Calcium RS in *Diluent* to obtain a solution containing about 0.02 mg of each per mL.

**Standard solution**—Dissolve an accurately weighed quantity of USP Fenoprofen Calcium RS in *Diluent* to obtain a solution having a known concentration of about 0.02 mg per mL.

**Test solution**—Transfer about 200 mg of Fenoprofen Calcium, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 270-nm detector and a suitable 4.6-mm × 25-cm column<sup>1</sup> that contains 5- $\mu$ m packing L7. The flow rate is 1.5 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0	70	30	equilibration
0–3	70	30	isocratic
3–41	70→10	30→90	linear gradient
41–42	10	90	isocratic
42–43	10→70	90→30	linear gradient
43–55	70	30	re-equilibration

<sup>1</sup> One suitable column brand is the Zorbax Eclipse XDB-C8.

Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.89 for 3-phenoxybenzoic acid and 1.0 for fenopropfen; the resolution, *R*, between 3-phenoxybenzoic acid and fenopropfen is not less than 9.0; and the tailing factor for the fenopropfen peak is not more than 2.0. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the tailing factor for the fenopropfen peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Fenopropfen Calcium taken by the formula:

$$10,000(C/W)(r_i/r_s)$$

in which *C* is the concentration, in mg per mL, of USP Fenopropfen Calcium RS in the *Standard solution*; *W* is the quantity, in mg, of Fenopropfen Calcium taken to prepare the *Test solution*; *r<sub>i</sub>* is the response for each impurity peak obtained from the *Test solution*; and *r<sub>s</sub>* is the response of the fenopropfen peak obtained from the *Standard solution*: not more than 0.5% of any individual impurity is found; and not more than 2.0% of total impurities is found.

#### Content of calcium—

**Test solution**—Transfer about 750 mg of Fenopropfen Calcium, accurately weighed, to a 50-mL volumetric flask, dissolve in alcohol with the aid of heat, if necessary, cool, dilute with alcohol to volume, and mix.

**Procedure**—In a 150-mL beaker, mix 70 mL of water, 2 mL of sodium hydroxide solution (1 in 10), and about 0.3 g of hydroxy naphthol blue. Add about 1 mL of the *Test solution*, and titrate to the blue endpoint with 0.05 M edetate disodium. Transfer 10.0 mL of the *Test solution* to the solution so obtained, and titrate to the blue endpoint with 0.05 M edetate disodium VS. Each mL of 0.05 M edetate disodium is equivalent to 2.004 mg of Ca: not less than 7.3% and not more than 8.0% of Ca, calculated on the anhydrous basis, is found.

#### Assay—

**Mobile phase**—Prepare a suitable degassed mixture of acetonitrile, water, and phosphoric acid (50:49.6:0.4). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Diluting solution**—Prepare a mixture of methanol and water (700:300).

**Resolution solution**—Prepare a solution in *Diluting solution* containing about 1 mg of Fenopropfen Calcium and 1 mg of gemfibrozil per mL.

**Standard preparation**—Transfer about 70 mg of USP Fenopropfen Calcium RS, accurately weighed, to a 100-mL volumetric flask, add 0.5 mL of 0.5 N hydrochloric acid and 2 mL of acetone, and dissolve by shaking. Dilute with *Diluting solution* to volume, and mix.

**Assay preparation**—Transfer about 70 mg of Fenopropfen Calcium, accurately weighed, to a 100-mL volumetric flask, add 0.5 mL of 0.5 N hydrochloric acid and 2 mL of acetone, and dissolve by shaking. Dilute with *Diluting solution* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 272-nm detector and a 4.6-mm  $\times$  15-cm column that contains 5- $\mu$ m packing L7. The flow rate is about 2 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.5 for fenopropfen and 1.0 for gemfibrozil; the tailing factor for the fenopropfen peak is not more than 2; and the resolution, *R*, between the fenopropfen peak and the gemfibrozil peak is not less than 8. Chromatograph the *Standard prepara-*

*tion*, and record the peak responses as directed for *Procedure*: the column efficiency determined from the fenopropfen peak is not less than 3000 theoretical plates; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of (C<sub>15</sub>H<sub>13</sub>O<sub>3</sub>)<sub>2</sub>Ca in the portion of Fenopropfen Calcium taken by the formula:

$$100C(r_U/r_S)$$

in which *C* is the concentration, in mg per mL, of anhydrous fenopropfen calcium in the *Standard preparation*, as determined from the concentration of USP Fenopropfen Calcium RS, corrected for moisture content by a titrimetric water determination; and *r<sub>U</sub>* and *r<sub>S</sub>* are the fenopropfen peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Fenopropfen Calcium Capsules

» Fenopropfen Calcium Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of fenopropfen (C<sub>15</sub>H<sub>14</sub>O<sub>3</sub>).

**Packaging and storage**—Preserve in well-closed containers.

#### USP Reference standards (11)—

USP Fenopropfen Calcium RS

USP Fenopropfen Sodium RS

#### Identification—

**A:** Transfer a portion of Capsule contents, equivalent to about 85 mg of fenopropfen, to a 125-mL separator containing 5 mL of acetone and 2 mL of 6 N hydrochloric acid. Swirl to dissolve, add 15 mL of water, and extract with three 15-mL portions of chloroform, draining each chloroform extract through a layer of about 2 g of anhydrous sodium sulfate, supported on glass wool and previously washed with chloroform, into a 50-mL volumetric flask. Rinse the sodium sulfate filter with about 2 mL of chloroform, collect the rinsing with the combined chloroform extracts, dilute with chloroform to volume, and mix. Transfer this solution to a suitable flask, and evaporate on a water bath with the aid of a current of air to dryness: the IR absorption spectrum of a film of the liquid residue thus obtained between sodium chloride plates exhibits maxima only at the same wavelengths as that of a similar preparation of USP Fenopropfen Calcium RS.

**B:** Place an amount of Capsule contents, equivalent to about 300 mg of fenopropfen, in a suitable container, and dissolve in 10 mL of acetone. Filter the solution through paper, and collect the filtrate in a crucible. Carefully evaporate to dryness, and ignite the crucible and its contents. Dissolve the residue in 10 mL of 1 N hydrochloric acid, transfer the solution to a beaker, add 2 drops of methyl red TS, neutralize with 6 N ammonium hydroxide, and add 3 N hydrochloric acid dropwise until the solution is acid to the indicator. Upon the addition of ammonium oxalate TS, a white precipitate is formed. The residue so obtained is insoluble in acetic acid but dissolves in hydrochloric acid.

#### Dissolution (711)—

**Medium:** pH 7.0 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*); 1000 mL.

**Apparatus 1:** 10-mesh basket; 100 rpm.

**Time:** 60 minutes.

**Procedure**—Filter 20 mL of the solution under test, and transfer 5.0 mL of the filtrate to a 25-mL volumetric flask. Dilute with *Dissolution Medium* to volume, and mix. Determine the absorbances of this solution and a Standard solution prepared from USP Fenopropfen Sodium RS, in the same medium having a known concentration of about 60 µg per mL, at the wavelength of maximum absorbance at about 270 nm, using *Dissolution Medium* as the blank. Calculate the amount of C<sub>15</sub>H<sub>14</sub>O<sub>3</sub> dissolved, in mg, by the formula:

$$(242.28 / 264.26)(5C)(A_U / A_S)$$

in which 242.28 is the molecular weight of fenopropfen; 264.26 is the molecular weight of anhydrous fenopropfen sodium; C is the concentration of anhydrous fenopropfen sodium in the Standard solution, as determined from the concentration of USP Fenopropfen Sodium RS corrected for moisture content by a titrimetric water determination; and A<sub>U</sub> and A<sub>S</sub> are the absorbances of the solutions obtained from the substance under test and the USP Reference Standard, respectively.

**Tolerances**—Not less than 75% (Q) of the labeled amount of C<sub>15</sub>H<sub>14</sub>O<sub>3</sub> is dissolved in 60 minutes.

**Uniformity of dosage units** (905): meet the requirements.

#### Assay—

*Mobile phase, Diluting solution, Resolution solution, Standard preparation, and Chromatographic system*—Proceed as directed in the Assay under *Fenopropfen Calcium*.

**Assay preparation**—Weigh the contents of not fewer than 20 Capsules, and calculate the average weight per Capsule. Mix the combined contents of the Capsules, and transfer an accurately weighed portion, equivalent to about 150 mg of fenopropfen, to a 250-mL volumetric flask. Add about 200 mL of *Diluting solution*, and sonicate for about 15 minutes. Allow to cool, dilute with *Diluting solution* to volume, mix, and pass through a suitable filter, discarding the first 10 mL of the filtrate. Use the clear filtrate as the *Assay preparation*.

**Procedure**—Proceed as directed in the Assay under *Fenopropfen Calcium*. Calculate the quantity, in mg, of fenopropfen (C<sub>15</sub>H<sub>14</sub>O<sub>3</sub>) in the portion of Capsules taken by the formula:

$$(484.55 / 522.61)(1000C)(r_U / r_S)$$

in which 484.55 is two times the molecular weight of fenopropfen; 522.61 is the molecular weight of fenopropfen calcium; and the other terms are as defined therein.

## Fenopropfen Calcium Tablets

» Fenopropfen Calcium Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of fenopropfen (C<sub>15</sub>H<sub>14</sub>O<sub>3</sub>).

**Packaging and storage**—Preserve in well-closed containers.

#### USP Reference standards (11)—

USP Fenopropfen Calcium RS

USP Fenopropfen Sodium RS

**Identification**—An amount of finely powdered Tablets responds to the *Identification* tests under *Fenopropfen Calcium Capsules*.

#### Dissolution (711)—

**Medium:** pH 7.0 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*); 1000 mL.

**Apparatus 1:** 10-mesh basket; 100 rpm.

**Time:** 60 minutes.

**Procedure**—Filter 20 mL of the solution under test, and transfer 10.0 mL of the filtrate to a 100-mL volumetric flask. Dilute with *Dissolution Medium* to volume, and mix. Determine the absorbances of this solution and a Standard solution prepared from USP Fenopropfen Sodium RS, in the same medium having a known concentration of about 60 µg per mL at the wavelength of maximum absorbance at about 270 nm, using *Dissolution Medium* as the blank. Calculate the amount of C<sub>15</sub>H<sub>14</sub>O<sub>3</sub> dissolved, in mg, by the formula:

$$(242.28 / 264.26)(10C)(A_U / A_S)$$

in which 242.28 is the molecular weight of fenopropfen; 264.26 is the molecular weight of anhydrous fenopropfen sodium; C is the concentration of anhydrous fenopropfen sodium in the Standard solution, as determined from the concentration of USP Fenopropfen Sodium RS corrected for moisture content by a titrimetric water determination; and A<sub>U</sub> and A<sub>S</sub> are the absorbances of the solutions obtained from the substance under test and the USP Reference Standard, respectively.

**Tolerances**—Not less than 75% (Q) of the labeled amount of C<sub>15</sub>H<sub>14</sub>O<sub>3</sub> is dissolved in 60 minutes.

**Uniformity of dosage units** (905): meet the requirements.

#### Assay—

*Mobile phase, Diluting solution, Resolution solution, Standard preparation, and Chromatographic system*—Proceed as directed in the Assay under *Fenopropfen Calcium*.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 6000 mg of fenopropfen, to a 250-mL volumetric flask, add 50 mL of 0.5 N hydrochloric acid, and sonicate for 10 minutes, shaking the solution occasionally. Dilute with acetone to volume, sonicate for 10 minutes, and stir for an additional 30 minutes. Transfer 5.0 mL of this solution to a 200-mL volumetric flask, dilute with *Diluting solution* to volume, and mix. Pass a portion of this solution through a suitable filter having a 0.5-µm or finer porosity, discarding the first 8 mL of the filtrate, and use the clear filtrate as the *Assay preparation*.

**Procedure**—Proceed as directed in the Assay under *Fenopropfen Calcium*. Calculate the quantity, in mg, of fenopropfen (C<sub>15</sub>H<sub>14</sub>O<sub>3</sub>) in the portion of Tablets taken by the formula:

$$(484.55 / 522.61)(10,000C)(r_U / r_S)$$

in which 484.55 is two times the molecular weight of fenopropfen; 522.61 is the molecular weight of fenopropfen calcium; and the other terms are as defined therein.

## Fentanyl

C<sub>22</sub>H<sub>28</sub>N<sub>2</sub>O

Propanamide, N-phenyl-N-[1-(2-phenylethyl)-4-piperidinyl];

336.47

*N*-(1-Phenethylpiperidin-4-yl)-*N*-phenylpropionamide  
[437-38-7].

### DEFINITION

Fentanyl contains NLT 98.0% and NMT 102.0% of the labeled amount of  $C_{22}H_{28}N_2O$ , calculated on the dried basis.

**[CAUTION]**—Great care should be taken to prevent inhaling particles of Fentanyl and exposing the skin to it.]

### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### • PROCEDURE

**Solution A:** Add 3 mL of triethylamine to about 950 mL of water in a 1000-mL volumetric flask. Adjust with perchloric acid to a pH of  $2.62 \pm 0.02$ , and dilute with water to volume.

**Solution B:** Acetonitrile

**Diluent:** *Solution A* and *Solution B* (9:1)

**Mobile phase:** See *Table 1*.

**Table 1**

Time (min)	Solution A (%)	Solution B (%)
0	90	10
2	90	10
3.5	85	15
5.1	82	18
7.6	72	28
11.5	63	37
15	40	60
19	40	60
20	90	10
25	90	10

**System suitability stock solution:** 0.4 mg/mL of USP Fentanyl Related Compound A RS, and about 0.1 mg/mL each of USP Fentanyl Related Compound B RS, USP Fentanyl Related Compound D RS, USP Fentanyl Related Compound E RS, and USP Fentanyl Related Compound G RS, prepared by dissolving in a suitable volumetric flask 50% filled with acetonitrile and diluting with water to volume

**Standard stock solution:** 1 mg/mL of USP Fentanyl RS prepared by dissolving in a suitable volumetric flask 40% filled with acetonitrile and diluting with water to volume

**Standard solution:** 0.1 mg/mL of USP Fentanyl RS from the *Standard stock solution* in *Diluent*

**System suitability solution:** 0.3 µg/mL each of USP Fentanyl Related Compound B RS, USP Fentanyl Related Compound D RS, USP Fentanyl Related Compound G RS, and USP Fentanyl Related Compound E RS; 1.3 µg/mL of USP Fentanyl Related Compound A RS; and 100 µg/mL of USP Fentanyl RS, prepared by diluting an appropriate amount of *System suitability stock solution* and *Standard stock solution* in *Diluent*

**Sample stock solution:** Transfer 100 mg of Fentanyl to a 100-mL volumetric flask. Add 25 mL of acetonitrile, dissolve by shaking, and dilute with *Diluent* to volume.

**Sample solution:** 0.1 mg/mL of Fentanyl from the *Sample stock solution* in *Diluent*

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 206 nm

**Column:** 4.6-mm × 15-cm; 3.5-µm packing L7

**Column temperature:** 35°

**Flow rate:** 1 mL/min

**Injection size:** 30 µL

**System suitability**

**Sample:** *System suitability solution*

**Suitability requirements**

**Tailing factor:** NLT 0.5 and NMT 2.0 for fentanyl and all fentanyl related compound peaks

**Resolution:** NLT 1.2 between fentanyl and fentanyl related compound E peaks

**Relative standard deviation:** NMT 0.7% for fentanyl and NMT 10% for all fentanyl related compounds

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of fentanyl ( $C_{22}H_{28}N_2O$ ) in the portion of Fentanyl taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of fentanyl from the *Sample solution*

$r_S$  = peak response of fentanyl from the *Standard solution*

$C_S$  = concentration of fentanyl in the *Standard solution*

$C_U$  = concentration of Fentanyl in the *Sample solution*

**Acceptance criteria:** 98.0%–102.0% on the dried basis

### IMPURITIES

• **RESIDUE ON IGNITION** (281): NMT 0.5%

• **HEAVY METALS**, *Method II* (231): NMT 20 ppm

#### • ORGANIC IMPURITIES

**Solution A, Solution B, Diluent, System suitability solution, Sample stock solution, and Chromatographic system:** Proceed as directed in the *Assay*.

**Standard stock solution:** 1.2 µg/mL in *Diluent* prepared by dissolving 0.1 mg/mL of USP Fentanyl Related Compound E RS in a suitable volumetric flask 50% filled with acetonitrile and then diluting with water to volume. Dilute an aliquot of this solution with *Diluent* to achieve the desired concentration.

**Standard solution:** 0.024 µg/mL of USP Fentanyl Related Compound E RS from the *Standard stock solution* in *Diluent*

**Sample solution:** 250 µg/mL of Fentanyl from the *Sample stock solution* in *Diluent*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each individual impurity in the portion of Fentanyl taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response of each individual impurity from the *Sample solution*

$r_S$  = peak response of fentanyl related compound E from the *Standard solution*

$C_S$  = concentration of USP Fentanyl Related Compound E RS in the *Standard solution* (µg/mL)

$C_U$  = concentration of Fentanyl in the *Sample solution* (µg/mL)

$F$  = relative response factor of the fentanyl related compounds (see *Table 2*)

**Acceptance criteria:** See *Table 2*.

[NOTE—Identify fentanyl related compound C and fentanyl related compound F by using the relative retention times provided in *Table 2*. Identify the other impurity peaks in the sample by comparing them to those in the *System suitability solution*.]

Table 2

Name	Relative Retention Time <sup>a</sup>	Relative Response Factor <sup>b</sup>	Acceptance Criteria, NMT (%)
Fentanyl related compound B <sup>c</sup>	0.28	0.67	0.015
Fentanyl related compound C <sup>d</sup>	0.56	0.67	0.25
Fentanyl related compound D <sup>e</sup>	0.86	0.97	0.015
Fentanyl related compound G <sup>f</sup>	0.89	0.82	0.25
Fentanyl related compound F <sup>g</sup>	0.92	0.75	0.25
Fentanyl related compound E <sup>h</sup>	0.98	1.0	0.015
Fentanyl	1.00	—	—
Fentanyl related compound A <sup>i</sup>	1.26	0.55	0.25
Individual unspecified impurities	—	—	0.10
Total impurities	—	—	0.5

<sup>a</sup> The relative retention time is calculated based on fentanyl.

<sup>b</sup> The relative response factor (RRF) is calculated based on fentanyl related compound E.

<sup>c</sup> 4-Anilinopiperidine.

<sup>d</sup> N-Phenyl-N-(4-piperidyl)propanamide.

<sup>e</sup> N-Phenyl-1-(phenylmethyl)-4-piperidinamine.

<sup>f</sup> N-Phenyl-N-[1-(2-phenylethyl)-4-piperidyl]acetanilide hydrochloride, or acetyl fentanyl.

<sup>g</sup> N-(1-Benzyl-4-piperidyl)propionanilide.

<sup>h</sup> N-Phenyl-1-(2-phenylethyl)-4-piperidinamine.

<sup>i</sup> (2-Bromoethyl)benzene.

(Organic Impurities postponed indefinitely)

### SPECIFIC TESTS

- **Loss on Drying** (731): Dry a sample in a vacuum at 60° for 2 h: it loses NMT 0.5% of its weight.

### ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tightly closed, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.
- **USP Reference Standards** (11)
  - USP Fentanyl RS
  - USP Fentanyl Related Compound A RS
  - USP Fentanyl Related Compound B RS
  - USP Fentanyl Related Compound C RS
  - USP Fentanyl Related Compound D RS
  - USP Fentanyl Related Compound E RS
  - USP Fentanyl Related Compound F RS
  - USP Fentanyl Related Compound G RS

## Fentanyl Citrate

$C_{22}H_{28}N_2O \cdot C_6H_8O_7$  528.59

Propanamide, N-phenyl-N-[1-(2-phenylethyl)-4-piperidyl]-, 2-hydroxy-1,2,3-propanetricarboxylate (1:1).

N-(1-Phenethyl-4-piperidyl)propionanilide citrate (1:1) [990-73-8].

» Fentanyl Citrate contains not less than 98.0 percent and not more than 102.0 percent of  $C_{22}H_{28}N_2O \cdot C_6H_8O_7$ , calculated on the dried basis.

[Caution—Great care should be taken to prevent inhaling particles of Fentanyl Citrate and exposing the skin to it.]

**Packaging and storage**—Preserve in well-closed, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

**USP Reference standards** (11)—

USP Fentanyl Citrate RS

**Identification**—

**A:** Infrared Absorption (197K).

**B:** Ultraviolet Absorption (197U)—

Solution: 500 µg per mL.

Medium: dilute hydrochloric acid in methanol (1 in 10).

**Loss on drying** (731)—Dry it in vacuum at 60° for 2 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.5%.

**Heavy metals, Method II** (231): 0.002%.

**Ordinary impurities** (466)—

Test solution: a mixture of chloroform and methanol (4:1).

Standard solution: a mixture of chloroform and methanol (4:1) except to eliminate the 0.01 mg per mL solution and add a 0.02 mg per mL solution.

Procedure—Use a thin-layer chromatographic plate coated with chromatographic silica gel with a calcium sulfate binder.

Eluant: a mixture of chloroform, methanol, and formic acid (85:10:5).

Visualization: 3.

**Assay**—Dissolve about 500 mg of Fentanyl Citrate, accurately weighed, in 30 mL of glacial acetic acid. Add 3 drops of *p*-naphtholbenzein TS, and titrate with 0.05 N perchloric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.05 N perchloric acid is equivalent to 26.43 mg of  $C_{22}H_{28}N_2O \cdot C_6H_8O_7$ .

## Fentanyl Citrate Injection

» Fentanyl Citrate Injection is a sterile solution of Fentanyl Citrate in Water for Injection. It contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled amount of fentanyl ( $C_{22}H_{28}N_2O$ ), present as the citrate.

**Packaging and storage**—Preserve in single-dose containers, preferably of Type I glass, protected from light.

**USP Reference standards** (11)—

USP Endotoxin RS

USP Fentanyl Citrate RS

**Identification**—The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

**Bacterial endotoxins** (85)—It contains not more than 50.0 USP Endotoxin Units per mg.

**pH** (791): between 4.0 and 7.5.

**Other requirements**—It meets the requirements under Injections (1).

**Assay—**

**Mobile phase**—Prepare a filtered and degassed mixture containing 4 volumes of ammonium acetate solution (1 in 100) and 6 volumes of a mixture of methanol, acetonitrile, and glacial acetic acid (400:200:0.6). Adjust this solution to a pH of  $6.6 \pm 0.1$  by the dropwise addition of glacial acetic acid, and make adjustments if necessary (see *System Suitability* under *Chromatography* <621>), to obtain a retention time of about 5 minutes for the fentanyl peak.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Fentanyl Citrate RS in water, and quantitatively dilute with water to obtain a solution having a known concentration of about 80 µg per mL.

**Assay preparation**—If necessary, dilute the Injection with water so that each mL contains the equivalent of about 50 µg of fentanyl.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak response as directed for *Procedure*: the tailing factor for the fentanyl peak is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 25 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in µg, of fentanyl ( $C_{22}H_{28}N_3O$ ) in each mL of the Injection taken by the formula:

$$(336.48 / 528.59)CD(r_U / r_S)$$

in which 336.48 and 528.59 are the molecular weights of fentanyl and fentanyl citrate, respectively; C is the concentration, in µg per mL, of USP Fentanyl Citrate RS in the *Standard preparation*; D is the dilution factor used to obtain the *Assay preparation*; and  $r_U$  and  $r_S$  are the peak responses for the fentanyl peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

---

**Ferric Subsulfate Solution**

---

$Fe_4(OH)_2(SO_4)_5$  737.71

Basic ferric sulfate solution.

Monse's Solution [1310-45-8].

» Ferric Subsulfate Solution contains, in each 100 mL, basic ferric sulfate equivalent to not less than 20 g and not more than 22 g of iron (Fe). Ferric Subsulfate Solution may be prepared as follows. Add 55 mL of Sulfuric Acid to 800 mL of water in a porcelain dish and heat to nearly 100°, then add 75 mL of nitric acid, and mix. Divide 1045 g of Ferrous Sulfate, coarsely powdered, into 4 portions, and add these portions one at a time to the hot liquid, stirring after each addition until effervescence ceases. If, after the Ferrous Sulfate has dissolved, the solution has a black color, add nitric acid, a few drops at a time, with heating and stirring, until red fumes cease to be evolved. Boil the solution until it assumes a red color and is free from nitrate, as indicated by the test for *Limit of nitrate* below, maintaining the volume at about 1000 mL by the addition of water as needed. Cool, and add enough water to make the solution measure

1000 mL. Filter, if necessary, until the Solution is clear.

**Packaging and storage**—Preserve in tight, light-resistant containers, and store at temperatures above 22°.

**Labeling**—The label indicates that crystallization may occur if the Solution is exposed to temperatures below 22°, and that warming will redissolve the crystals. Label it to indicate that it is intended for topical and vaginal use only.

**Identification—**

**A:** A 1 in 20 dilution of the Solution in water yields a brownish-red precipitate with ammonia TS.

**B:** A 1 in 20 dilution of the Solution in water yields a blue precipitate with potassium ferrocyanide TS.

**C:** A 1 in 20 dilution of the Solution in water yields a white precipitate with barium chloride TS that is insoluble in hydrochloric acid.

**Limit of nitrate**—Add a clear crystal of ferrous sulfate to a cooled mixture of equal volumes of sulfuric acid and a 1 in 10 dilution of the Solution in water: the crystal does not become brown, nor does a brownish-black color develop around it.

**Limit of ferrous salts**—Add a few drops of freshly prepared potassium ferricyanide TS to 2 mL of 1 in 20 dilution of the solution in water: a brown color is produced and the solution remains free from even a transient green or greenish-blue color.

**Assay**—Transfer 10.0 mL of the Solution to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a glass-stoppered conical flask, and add 5 mL of hydrochloric acid and 3 g of potassium iodide. Insert the stopper into the flask, and allow the mixture to stand for 15 minutes. Add 15 mL of water, and titrate the liberated iodine with 0.1 N sodium thiosulfate VS, using starch TS as the indicator. Each mL of 0.1 N sodium thiosulfate is equivalent to 5.585 mg of iron (Fe).

---

**Ferric Sulfate**

---

$Fe_2(SO_4)_3 \cdot xH_2O$  (anhydrous) 399.88

Ferric persulfate.

Ferric sesquisulfate.

Ferric tersulfate [10028-22-5].

Hydrate [142906-29-4].

» Ferric Sulfate is hydrated  $Fe_2(SO_4)_3$ . It contains not less than 73.0 percent and not more than 80.0 percent of  $Fe_2(SO_4)_3$ .

**Packaging and storage**—Preserve in tight, light-resistant containers, and store at controlled room temperature.

**Labeling**—Label it to indicate that it is intended for use in compounding topical and periodontal dosage forms only.

**Identification**—Dissolve 0.5 g in a mixture of 50 mL of water and 3 mL of hydrochloric acid: this solution meets the requirements for the *Ferric Salts* test under *Iron* <191>.

**Limit of insoluble matter**—Transfer 10 g in a covered beaker, and dissolve in a mixture of 100 mL of water and 5 mL of sulfuric acid. Heat to boiling, and warm on a steam bath for 1 hour. Filter the hot solution through a tared sintered-glass crucible of fine porosity. Wash the beaker and the filter with hot water, dry the crucible at 105°, cool in a desiccator, and weigh: not more than 2 mg of insoluble matter is found (0.02%).

**Limit of chloride**—Dissolve 1 g by warming with a mixture of 10 mL of water and 1 mL of nitric acid, add 4 mL of additional nitric acid, and dilute with water to 50 mL. To 25 mL of this solution add 1 mL of phosphoric acid and 1 mL of silver nitrate TS. Any turbidity does not exceed that

produced in a control containing 0.01 mg of chloride ion (Cl), 1 mL of nitric acid, 1 mL of phosphoric acid, and 1 mL of silver nitrate TS (0.002%).

**Limit of ferrous iron**—Dissolve 4 g by warming with 50 mL of dilute sulfuric acid (1 in 10), cool, and titrate with 0.1 N potassium permanganate: not more than 0.16 mL is required to produce a permanent pink color (0.02% as  $\text{Fe}^{++}$ ).

**Limit of copper and zinc**—[NOTE—If the reagents used in the tests for *Copper* and *Zinc* contain excessive amounts of copper and zinc, then they should first be purified by extracting with *Dithizone Extraction Solution* (see *Lead* (251)).]

**Copper**—Dissolve 1.2 g in 100 mL of water. To 10 mL of this test solution add 50 mL of a solution containing 5 g of ammonium tartrate and 5 mL of ammonium hydroxide. Add 10 mL of *Standard Dithizone Solution* (see *Lead* (251)), shake for 2 minutes, draw off the dithizone layer, and compare the pink color with that in a control containing 6  $\mu\text{g}$  of copper ion (Cu) and treated exactly as the 10-mL portion of test solution. If the color in the test solution is less than that in the control, then less than 0.005% of Cu and of Zn is found and the test for *Zinc* is not necessary. If the color in the test solution is more than that in the control, add 15 mL of dilute hydrochloric acid (1 in 250), and shake for 2 minutes. Draw off the dithizone solution, and shake with a second 15 mL of dilute hydrochloric acid (1 in 250) for 2 minutes. [NOTE—Draw off the dithizone, combine the two acid extracts, and reserve for the test for *Zinc*.] Any pink color in the dithizone solution is not darker than that in the control solution treated exactly as the test solution (0.005%).

**Zinc**—To the combined acid extracts saved from the test for *Copper*, add sufficient 0.5 M sodium acetate to bring the pH to between 5.0 and 5.5, and then add 1 mL of 0.1 N sodium thiosulfate. Add 10 mL of *Standard Dithizone Solution* (see *Lead* (251)), shake for 2 minutes, and allow the layers to separate. Draw off the dithizone layer, and discard the water layer. Any pink color in the dithizone layer is not greater than that in a control prepared by adding 0.006 mg of zinc ion (Zn) to the combined acid extracts from the control used in the test for *Copper* (0.005%).

**Limit of nitrate**—Dissolve 10 g in 100 mL of dilute sulfuric acid (1 in 100), heat to boiling, and pour, slowly, into a mixture of 140 mL of water and 50 mL of ammonium hydroxide. Pass through a folded filter while still hot, wash the filter with hot water until the volume of filtrate is 300 mL, mix, and cool. To 15 mL of the diluted filtrate add 1 mL of sodium chloride solution (1 in 200), 0.10 mL of indigo carmine TS, and 15 mL of sulfuric acid. The blue color is not completely discharged at the end of 5 minutes (0.01%).

**Substances not precipitated by ammonia**—Evaporate to dryness 30 mL of the diluted filtrate obtained in the test for *Limit of nitrate*, and ignite gently: the weight of residue does not exceed 1 mg (0.1%).

**Assay**—Transfer about 700 mg of Ferric Sulfate, accurately weighed, to a glass-stoppered conical flask. Add a mixture of 50 mL of water and 3 mL of hydrochloric acid, and swirl to dissolve. Add 3 g of potassium iodide, insert the stopper into the flask, and allow to stand in the dark for 30 minutes. Then add 100 mL of water, and titrate the liberated iodine with 0.1 N sodium thiosulfate VS, adding starch TS as the endpoint is approached. Each mL of 0.1 N sodium thiosulfate is equivalent to 19.994 mg of ferric sulfate [ $\text{Fe}_2(\text{SO}_4)_3$ ].

## Ferrous Fumarate

$\text{C}_4\text{H}_2\text{FeO}_4$  169.90  
2-Butenedioic acid, (E)-, iron(2+) salt;  
Iron(2+) fumarate [141-01-5].

### DEFINITION

Ferrous Fumarate contains NLT 97.0% and NMT 101.0% of ferrous fumarate ( $\text{C}_4\text{H}_2\text{FeO}_4$ ), calculated on the dried basis.

### IDENTIFICATION

#### A. INFRARED ABSORPTION

**Sample:** To 1.5 g of Ferrous Fumarate, add 25 mL of dilute hydrochloric acid (1 in 2). Dilute with water to 50 mL, heat to dissolve, then cool, and filter on a fine-pore size, sintered-glass crucible. Wash the precipitate with dilute hydrochloric acid (3 in 100), saving the filtrate for *Identification* test B, and dry the precipitate at 105°.

**Acceptance criteria:** The IR absorption of a potassium bromide dispersion of the dried precipitate exhibits maxima only at the same wavelengths as that of a similar preparation of USP Fumaric Acid RS.

- B. IDENTIFICATION TESTS—GENERAL, Iron (191):** A portion of the filtrate obtained in *Identification* test A meets the requirements.

### ASSAY

#### PROCEDURE

**Sample:** 500 mg of Ferrous Fumarate

**Blank:** Proceed as directed in the *Analysis* without the *Sample*.

**Titrimetric system**

(See *Titrimetry* (541).)

**Mode:** Direct titration

**Titrant:** 0.1 N ceric sulfate VS

**Endpoint detection:** Visual

**Analysis:** Transfer the *Sample* to a 500-mL conical flask, and add 25 mL of dilute hydrochloric acid (2 in 5). Heat to boiling, and add, dropwise, a solution of 112 mg/mL of stannous chloride in dilute hydrochloric acid (3 in 10) until the yellow color disappears, then add 2 drops in excess. Cool the solution in an ice bath to room temperature, add 10 mL of 50 mg/mL of mercuric chloride solution, and allow to stand for 5 min. Add 200 mL of water, 25 mL of dilute sulfuric acid (1 in 2), and 4 mL of phosphoric acid. Then add 2 drops of orthophenanthroline TS, and titrate with *Titrant*. Perform a *Blank* determination.

Calculate the percentage of ferrous fumarate ( $\text{C}_4\text{H}_2\text{FeO}_4$ ) in the *Sample* taken:

$$\text{Result} = \{(V_S - V_B) \times N \times F / W\} \times 100$$

$V_S$  = *Titrant* volume consumed by the *Sample* (mL)

$V_B$  = *Titrant* volume consumed by the *Blank* (mL)

$N$  = *Titrant* normality (mEq/mL)

$F$  = equivalency factor, 169.9 mg/mEq

$W$  = *Sample* weight (mg)

**Acceptance criteria:** 97.0%–101.0% on the dried basis

### IMPURITIES

#### SULFATE

**Sample solution:** Transfer 1.0 g of Ferrous Fumarate to a 250-mL beaker, add 100 mL of water, and heat on a steam bath, adding hydrochloric acid dropwise until completely dissolved. [NOTE—About 2 mL of the acid will be required.] Filter the solution if necessary, and dilute the filtrate with water to 100 mL. Heat the filtrate

to boiling, add 10 mL of barium chloride TS, warm on a steam bath for 2 h, cover, and allow to stand for 16 h. [NOTE—If crystals of ferrous fumarate form, warm the solution on the steam bath to dissolve them.]

**Analysis:** Pass the *Sample solution* through ashless filter paper, wash the residue with hot water until, with the addition of ammonium sulfide TS, a black precipitate is no longer formed in the filtrate. Transfer the paper containing the residue to a tared crucible. Char the paper, without burning, and ignite the crucible and its contents at 600° to constant weight.

**Acceptance criteria:** NMT 0.2%: Each mg of residue is equivalent to 0.412 mg of sulfate (SO<sub>4</sub>).

• **ARSENIC, Method I (211)**

**Test preparation:** To 2.0 g in 10 mL of water add 10 mL of sulfuric acid. Warm to precipitate the fumaric acid completely, cool, add 30 mL of water, and filter into a 100-mL volumetric flask. Wash the precipitate with water, adding the washings to the flask, then add water to volume, and mix. Transfer 50.0 mL of this solution into the arsine generator flask, and dilute with water to 55 mL.

**Analysis:** Proceed as directed in the chapter, except omit the addition of 20 mL of 7 N sulfuric acid specified for the *Procedure*.

**Acceptance criteria:** NMT 3 ppm

• **LIMIT OF FERRIC IRON**

**Sample:** 2 g of Ferrous Fumarate

**Blank:** Proceed as directed in the *Analysis* without the *Sample*.

**Titrimetric system**

(See *Titrimetry* (541).)

**Mode:** Direct titration

**Titrant:** 0.1 N sodium thiosulfate VS

**Endpoint detection:** Visual

**Analysis**

**Analysis:** Transfer the *Sample* to a glass-stoppered, 250-mL conical flask, add 25 mL of water and 4 mL of hydrochloric acid, and heat on a hot plate until solution is complete. Insert the stopper in the flask, and cool to room temperature. Add 3 g of potassium iodide, insert the stopper in the flask, swirl to mix, and allow to stand in the dark for 5 min. Remove the stopper, add 75 mL of water, and titrate with the *Titrant*, adding 3 mL of starch TS as the endpoint is approached. Perform a *Blank* determination.

Calculate the percentage of ferric iron in the portion of Ferrous Fumarate taken:

$$\text{Result} = \{[(V_S - V_B) \times N \times F/W] \times 100\}$$

$V_S$  = *Titrant* volume consumed by the *Sample* (mL)

$V_B$  = *Titrant* volume consumed by the *Blank* (mL)

$N$  = *Titrant* normality (mEq/mL)

$F$  = equivalency factor, 55.85 mg/mEq

$W$  = *Sample* weight (mg)

**Acceptance criteria:** NMT 2.0%

• **LIMIT OF LEAD**

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glassware before use, use water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin. Select all reagents to have as low a content of lead as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glassware before use by soaking in warm nitric acid (1 in 2) for 30 min and by rinsing with deionized water.]

**Ascorbic acid–sodium iodide solution:** 100 mg/mL of ascorbic acid and 192.5 mg/mL of sodium iodide

**Trioctylphosphine oxide solution:** 50 mg/mL of trioctylphosphine oxide in 4-methyl-2-pentanone

**[CAUTION—]**This solution causes irritation. Avoid contact with eyes, skin, and clothing. Take special precautions in disposing of unused portions of solutions to which this reagent is added.]

**Standard solution:** Transfer 5.0 mL of *Lead Nitrate Stock Solution*, prepared as directed in *Heavy Metals* (231), to a 100-mL volumetric flask. Dilute with water to volume, and mix. Transfer 2.0 mL of the resulting solution to a 50-mL beaker. To this beaker add 6 mL of nitric acid and 10 mL of perchloric acid, and evaporate in a hood to dryness. **[CAUTION—]**Use perchloric acid in a well-ventilated fume hood with proper precautions.] Cool, dissolve the residues in 10 mL of 9 N hydrochloric acid, and transfer with the aid of about 10 mL of water to a 50-mL volumetric flask. Add 20 mL of *Ascorbic acid–sodium iodide solution* and 5.0 mL of *Trioctylphosphine oxide solution*, shake for 30 s, and allow to separate. Add water to bring the organic solvent layer into the neck of the flask, shake again, and allow to separate. The organic solvent layer is the *Standard solution*, and it contains 2.0 µg/mL of lead.

**Sample solution:** Transfer 1.0 g of Ferrous Fumarate to a 50-mL beaker, and add 6 mL of nitric acid and 10 mL of perchloric acid. **[CAUTION—]**Use perchloric acid in a well-ventilated fume hood with proper precautions.] Cover with a ribbed watch glass, and heat in a hood until completely dry. Cool, dissolve the residue in 10 mL of 9 N hydrochloric acid, and transfer with the aid of about 10 mL of water to a 50-mL volumetric flask. Add 20 mL of *Ascorbic acid–sodium iodide solution* and 5.0 mL of *Trioctylphosphine oxide solution*, shake for 30 s, and allow to separate. Add water to bring the organic solvent layer into the neck of the flask, shake again, and allow to separate. The organic layer is the *Sample solution*.

**Blank:** To a 50-mL beaker add 6 mL of nitric acid and 10 mL of perchloric acid, and evaporate in a hood to dryness. **[CAUTION—]**Use perchloric acid in a well-ventilated fume hood with proper precautions.] Cool, dissolve the residue in 10 mL of 9 N hydrochloric acid, and transfer with the aid of about 10 mL of water to a 50-mL volumetric flask. Add 20 mL of *Ascorbic acid–sodium iodide solution* and 5.0 mL of *Trioctylphosphine oxide solution*, shake for 30 s, and allow to separate. Add water to bring the organic solvent layer into the neck of the flask, shake again, and allow to separate. The organic layer is the *Blank*, and it contains 0 µg/mL of lead.

**Instrumental conditions**

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** Atomic absorption spectrophotometry

**Analytical wavelength:** 283.3 nm

**Lamp:** Lead hollow-cathode

**Flame:** Air–acetylene

**System suitability**

**Samples:** *Standard solution* and *Blank*

**Suitability requirements:** The absorbance of the *Standard solution* and the absorbance of the *Blank* are significantly different.

**Analysis**

**Samples:** *Standard solution*, *Sample solution*, and *Blank*. Concomitantly determine the absorbances of the *Blank*, *Standard solution*, and the *Sample solution*. Use the *Blank* to set the instrument to zero.

**Acceptance criteria:** NMT 10 ppm: The absorbance of the *Sample solution* does not exceed that of the *Standard solution*.

• **MERCURY**

[NOTE—Carry out this test in subdued light, because mercuric dithizonate is light sensitive.]

**Hydroxylamine hydrochloride solution, Standard mercury solution, Dithizone extraction solution, and Diluted dithizone extraction solution:** Prepare as directed in *Mercury* (261), *Method I*.

**Control solution:** Mix 3.0 mL of *Standard mercury solution*, 30 mL of dilute nitric acid (1 in 10), 5 mL of 250 mg/mL of sodium citrate solution, and 1 mL of *Hydroxylamine hydrochloride solution*.

**Test preparation:** Dissolve 1 g of Ferrous Fumarate in 30 mL of dilute nitric acid (1 in 10) with the aid of heat, on a steam bath. Cool quickly by immersing in an ice bath, and pass through a fine-porosity filter that previously has been washed with dilute nitric acid (1 in 10) and water. To the filtrate add 20 mL of 250 mg/mL of sodium citrate solution and 1 mL of *Hydroxylamine hydrochloride* solution.

**Analysis:** Adjust the *Control solution* to a pH of 1.8 with ammonium hydroxide, and the *Sample solution* to a pH of 1.8 with sulfuric acid. Separately transfer the solutions to separators. Treat the *Sample solution* and the *Control solution* in parallel as follows.

Extract with two 5-mL portions of *Dithizone extraction solution* and 5 mL of chloroform, pooling the chloroform extracts in a second separator. Add 10 mL of hydrochloric acid (1 in 2), shake, allow the layers to separate, and discard the chloroform layer. Wash the acid extract with 3 mL of chloroform, and discard the washing. Add 0.1 mL of 20 mg/mL edetate disodium solution and 2 mL of 6 N acetic acid, mix, and add slowly 5 mL of ammonium hydroxide. Close the separator, cool it under cold running water, and dry its outer surface. Remove the stopper, and pour the contents into a beaker. Adjust the *Sample solution* and the *Control solution* to a pH of 1.8 in the same manner as before, and return the solutions to their respective separators. Add 5.0 mL of *Diluted dithizone extraction solution*, shake vigorously, and allow the layers to separate. Using *Diluted dithizone extraction solution* as a color blank, compare the colors developed in the chloroform layers of the *Sample solution* and the *Control solution*.

**Acceptance criteria:** NMT 3 µg/g: The color developed by the *Sample solution* is not more intense than that developed by the *Control solution*.

### SPECIFIC TESTS

- **LOSS ON DRYING** (731): Dry a sample at 105° for 16 h: it loses NMT 1.5% of its weight.

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** (11)  
USP Fumaric Acid RS

## Ferrous Fumarate Tablets

### DEFINITION

Ferrous Fumarate Tablets contain NLT 95.0% and NMT 110.0% of the labeled amount of ferrous fumarate ( $C_4H_2FeO_4$ ).

### IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Iron** (191)

**Sample solution:** To a portion of powdered Tablets, equivalent to 1 g of ferrous fumarate, add 25 mL of dilute hydrochloric acid (1 in 2), mix, and add 25 mL of water. Boil the solution for a few min, cool, and filter.

**Acceptance criteria:** The filtrate meets the requirements.

### ASSAY

- **PROCEDURE**

**Sample:** A portion of the powder from NLT 20 finely powdered Tablets equivalent to 500 mg of ferrous fumarate

**Blank:** Proceed as in the *Analysis* without the *Sample*.

**Titrimetric system**

(See *Titrimetry* (541).)

**Mode:** Indirect titration

**Titrant:** 0.1 N sodium thiosulfate VS

**Indicator:** Starch TS

**Endpoint detection:** Visual

**Analysis:** Transfer the *Sample* to a 250-mL beaker. Add 25 mL of water, 25 mL of nitric acid, and 7.5 mL of perchloric acid. Cover with a ribbed watch glass, and heat to the production of strong fumes. Cool, rinse the watch glass and the sides of the beaker with water, and evaporate in a hood to near-dryness. Wash down the watch glass and the sides of the beaker with 2 mL of hydrochloric acid and then with a small volume of water. Warm slightly, if necessary, to dissolve the residue. Transfer to a glass-stoppered, 250-mL conical flask. Repeat the washing with 2 mL of hydrochloric acid, and complete the transfer to the flask, using NMT 20–25 mL of water for the transfer. Add 4 g of potassium iodide to the flask, insert the stopper, and allow to stand in the dark for 5 min. Add 75 mL of water and titrate with *Titrant*, adding 3 mL of starch TS as the endpoint is approached. Perform a blank determination. Calculate the percentage of the labeled amount of ferrous fumarate ( $C_4H_2FeO_4$ ) in the portion of Tablets taken:

$$\text{Result} = \{[(V_S - V_B) \times N \times F]/W\} \times 100$$

$V_S$  = *Titrant* volume consumed by the *Sample* (mL)  
 $V_B$  = *Titrant* volume consumed by the *Blank* (mL)  
 $N$  = actual normality of the *Titrant* (mEq/mL)  
 $F$  = equivalency factor, 169.9 mg/mEq  
 $W$  = nominal weight of ferrous fumarate in the *Sample* taken (mg)

**Acceptance criteria:** 95.0%–110.0%

### PERFORMANCE TESTS

- **DISSOLUTION** (711)

**Medium:** 0.1 N hydrochloric acid in 0.5% sodium lauryl sulfate; 900 mL

**Apparatus 2:** 75 rpm

**Time:** 45 min

**Standard solution:** Solution having a known concentration of iron in the *Medium*

**Sample solution:** Filtered portion of the solution under test, suitably diluted with the *Medium* if necessary

**Instrumental conditions**

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** Atomic absorption spectrophotometry

**Analytical wavelength:** 248.3 nm

**Lamp:** Iron hollow-cathode

**Flame:** Air–acetylene

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
 Determine the concentration of iron (Fe) in the *Sample solution* in comparison with a *Standard solution*.

Calculate the percentage of the labeled amount of ferrous fumarate ( $C_4H_2FeO_4$ ) dissolved:

$$\text{Result} = (M_r/A_r) \times (C \times D \times V/L) \times 100$$

$M_r$  = molecular weight of ferrous fumarate, 169.9  
 $A_r$  = atomic weight of iron, 55.85  
 $C$  = measured concentration of iron in the *Sample solution* (mg/mL)  
 $D$  = dilution factor for the *Sample solution*  
 $V$  = volume of *Medium*, 900 mL  
 $L$  = label amount of ferrous fumarate (mg/Tablet)

**Tolerances:** NLT 75% (Q) of the labeled amount of ferrous fumarate is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Label the Tablets in terms of ferrous fumarate ( $C_4H_2FeO_4$ ) and in terms of elemental iron.

## Ferrous Fumarate and Docusate Sodium Extended-Release Tablets

» Ferrous Fumarate and Docusate Sodium Extended-Release Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ferrous fumarate ( $C_4H_2FeO_4$ ) and not less than 90.0 percent and not more than 115.0 percent of the labeled amount of docusate sodium ( $C_{20}H_{37}NaO_7S$ ).

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—Label the Tablets in terms of the content of ferrous fumarate ( $C_4H_2FeO_4$ ) and in terms of the content of elemental iron.

**USP Reference standards** (11)—

USP Docusate Sodium RS

**Dissolution** (711)—

Medium: 0.1 N hydrochloric acid; 900 mL.

Apparatus 2: 50 rpm.

Times: 1 and 3 hours.

Determine the amount of Fe (II) dissolved, on filtered portions of the solution under test, employing the method described under *Assay for ferrous fumarate* with the following modification.

**Standard solution**—Transfer the appropriate amount of *Iron stock solution* to a volumetric flask, and dilute with 0.1 N hydrochloric acid in such a way that the final concentration is similar to that expected in the solution under test.

**Tolerances**—The percentages of the labeled amount of Fe (II) dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
1	between 40% and 75%
3	not less than 80%

**Uniformity of dosage units** (905): meet the requirements with respect to iron.

**Assay for ferrous fumarate**—

**6 N Hydrochloric acid**—Slowly add 5 mL of hydrochloric acid to 5 mL of water, and mix.

**Diluting solution**—Add 1 mL of 6 N Hydrochloric acid to 59 mL of water, and mix.

**Phosphoric acid solution**—Dilute 20 mL of phosphoric acid with *Diluting solution* to 200 mL, and mix.

**Iron stock solution**—Transfer about 350 mg of ferrous ammonium sulfate hexahydrate, accurately weighed, to a 1000-mL volumetric flask, dissolve in *Diluting solution*, dilute with *Diluting solution* to volume, and mix to obtain a solution having a known concentration of about 50 µg per mL.

**Standard preparations**—To separate 100-mL volumetric flasks transfer 2.0, 4.0, 6.0, 8.0, and 10.0 mL of *Iron stock solution*. To each flask add 6.0 mL of *Phosphoric acid solution*, dilute with *Diluting solution* to volume, and mix. The *Standard preparations* so obtained contain about 1.0, 2.0, 3.0, 4.0, and 5.0 µg of iron per mL, respectively.

**Blank solution**—Transfer 6.0 mL of *Phosphoric acid solution* to a 100-mL volumetric flask, dilute with *Diluting solution* to volume, and mix.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 1.5 g of ferrous fumarate, to a 1000-mL volumetric flask, add 110 mL of 6 N Hydrochloric acid, and boil for 30 minutes. Cool, dilute with water

to volume, mix, and filter. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with *Diluting solution* to volume, and mix. Transfer 8.0 mL of this solution to a 100-mL volumetric flask, add 6.0 mL of *Phosphoric acid solution*, dilute with *Diluting solution* to volume, and mix to obtain a solution having a known concentration of about 4 µg of iron per mL.

**Procedure**—Concomitantly determine the absorbances of the *Standard preparations* and the *Assay preparation* at the iron emission line at 248.3 nm with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-scattering* (851)) equipped with an iron hollow-cathode lamp and an air-acetylene flame, using the *Blank solution* as the blank. Plot the absorbances of the *Standard preparations* versus their concentrations, in µg per mL, of iron, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, in µg per mL, of iron in the *Assay preparation*. Calculate the average quantity, in mg, of ferrous fumarate ( $C_4H_2FeO_4$ ) in each Tablet taken by the formula:

$$(TC/D)(169.90/55.85)$$

in which *T* is the labeled quantity, in mg, of ferrous fumarate in each Tablet; *C* is the concentration, in µg per mL, of iron in the *Assay preparation*; *D* is the concentration, in µg per mL, of ferrous fumarate in the *Assay preparation*, based on the labeled quantity per Tablet and the extent of dilution; and 169.90 and 55.85 are the molecular weight of ferrous fumarate and the atomic weight of iron, respectively.

**Assay for docusate sodium**—

**Calcium acetate solution**—Dissolve 4 g of calcium acetate in 2000 mL of water.

**Diluting solution**—Mix 450 mL of acetonitrile and 550 mL of *Calcium acetate solution*.

**Mobile phase**—Add 2 mL of phosphoric acid to 1000 mL of *Diluting solution*, and mix. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)). Filter, and degas.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Docusate Sodium RS in *Diluting solution* to obtain a solution having a known concentration of about 1 mg per mL.

**Sodium benzoate solution**—Dissolve an accurately weighed quantity of sodium benzoate in *Diluting solution*, and dilute quantitatively and stepwise with the same solvent to obtain a solution having a known concentration of about 8 µg per mL.

**Resolution solution**—Dissolve a suitable quantity of USP Docusate Sodium RS in *Sodium benzoate solution* to obtain a solution containing about 1 mg per mL of docusate sodium.

**Assay preparation**—Transfer a number of Tablets, equivalent to about 2 g of docusate sodium, to a 2000-mL volumetric flask. Add about 1500 mL of *Diluting solution*, and sonicate with frequent shaking until the Tablets are completely disintegrated. Cool, dilute with *Diluting solution* to volume, and mix. Centrifuge, and use the clear supernatant. If the supernatant is not clear, pass through a membrane filter.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 214-nm detector and a 4.6-mm × 30-cm column that contains 3-µm packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Resolution solution* and the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between sodium benzoate and docusate sodium is not less than 7.0; the tailing factor is not less than 0.9 and not more than 3.5; the column efficiency is not less than 1000 theoretical plates; and the relative standard deviation for six replicate injections of the *Standard preparation* is not more than 2.0%. The relative retention times are 1.0 for docusate sodium and 0.25 for sodium benzoate.

**Procedure**—Separately inject equal volumes (about 25  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the average quantity, in mg, of docusate sodium ( $C_{20}H_{37}NaO_7S$ ) in each of the Tablets taken by the formula:

$$(2000C/N)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Docusate Sodium RS in the *Standard preparation*; *N* is the number of Tablets taken; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Ferrous Gluconate

$C_{12}H_{22}FeO_{14} \cdot 2H_2O$  482.17  
D-Gluconic acid, iron(2+) salt (2:1), dihydrate;  
Iron(2+) gluconate (1:2) dihydrate [12389-15-0].  
Anhydrous 446.15 [299-29-6].

### DEFINITION

Ferrous Gluconate contains NLT 97.0% and NMT 102.0% of ferrous gluconate ( $C_{12}H_{22}FeO_{14}$ ), calculated on the dried basis.

### IDENTIFICATION

#### A. THIN-LAYER CHROMATOGRAPHY

**Standard solution:** 10 mg/mL of USP Potassium Gluconate RS

**Sample solution:** 10 mg/mL of Ferrous Gluconate, heating in a water bath at 60°, if necessary, to dissolve

#### Chromatographic system

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

**Mode:** TLC

**Adsorbent:** 0.25-mm layer of chromatographic silica gel

**Application volume:** 5  $\mu$ L

**Developing solvent system:** Alcohol, ethyl acetate, ammonium hydroxide, and water (50:10:10:30)

**Spray reagent:** Dissolve 2.5 g of ammonium molybdate in 50 mL of 2 N sulfuric acid in a 100-mL volumetric flask, add 1.0 g of ceric sulfate, swirl to dissolve, and dilute with 2 N sulfuric acid to volume.

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, and dry at 110° for 20 min. Allow to cool, and spray with *Spray reagent*. Heat the plate at 110° for about 10 min.

**Acceptance criteria:** The principal spot of the *Sample solution* corresponds in color, size, and  $R_f$  value to that of the *Standard solution*.

#### B. FERROUS ION

**Sample solution:** 5 mg/mL in water

**Analysis:** Add potassium ferricyanide TS to the *Sample solution*.

**Acceptance criteria:** The solution yields a dark blue precipitate.

### ASSAY

#### PROCEDURE

**Sample:** 1.5 g of Ferrous Gluconate

**Blank:** Proceed as directed in the *Analysis* without the *Sample*.

### Titrimetric system

(See *Titrimetry* <541>.)

**Mode:** Direct titration

**Titrant:** 0.1 N ceric sulfate VS

**Endpoint detection:** Visual

**Analysis:** Dissolve the *Sample* in a mixture of 75 mL of water and 15 mL of 2 N sulfuric acid in a 300-mL conical flask. Add 250 mg of zinc dust, close the flask with a stopper containing a Bunsen valve, and allow to stand at room temperature for 20 min or until the solution becomes colorless. Pass the solution through a filtering crucible containing a thin layer of zinc dust, and wash the crucible and contents with 10 mL of 2 N sulfuric acid, followed by 10 mL of water. [NOTE—Prepare and use the filtering crucible in a well-ventilated hood.]

Add orthophenanthroline TS, and immediately titrate the filtrate in the suction flask with *Titrant*. Perform a *Blank* determination.

Calculate the percentage of ferrous gluconate ( $C_{12}H_{22}FeO_{14}$ ) in the *Sample* taken:

$$\text{Result} = \{[(V_S - V_B) \times N \times F] / W\} \times 100$$

$V_S$  = *Titrant* volume consumed by the *Sample* (mL)

$V_B$  = *Titrant* volume consumed by the *Blank* (mL)

$N$  = *Titrant* normality (mEq/mL)

$F$  = equivalency factor, 446.2 mg/mEq

$W$  = *Sample* weight (mg)

**Acceptance criteria:** 97.0%–102.0% on the dried basis

### IMPURITIES

#### CHLORIDE AND SULFATE, Chloride <221>

**Standard solution:** 1.0 mL of 0.020 N hydrochloric acid

**Sample:** 1.0 g

**Acceptance criteria:** NMT 0.07%

#### CHLORIDE AND SULFATE, Sulfate <221>

**Standard solution:** 1.0 mL of 0.020 N sulfuric acid

**Sample:** 1.0 g

**Acceptance criteria:** NMT 0.1%

#### MERCURY <261>

NMT 3 ppm

#### ARSENIC, Method I <211>

**Test preparation:** Transfer 1.0 g of Ferrous Gluconate to a 100-mL round-bottom flask fitted with a 24/40 standard-taper joint. Add 40 mL of 9 N sulfuric acid and 2 mL of potassium bromide solution (3 in 10). Immediately connect to a suitable distillation apparatus that has a reservoir with a water jacket, cooled with circulating ice water, and heat to dissolve the Ferrous Gluconate. Distill, collect 25 mL of distillate, and transfer the distillate to the arsine generator flask. Wash the condenser and reservoir several times with small portions of water, add the washings to the distillate in the generator flask, add bromine TS until the solution is slightly yellow, and dilute with water to 35 mL. Proceed as directed in the chapter.

**Acceptance criteria:** NMT 3 ppm

#### LIMIT OF LEAD

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glassware before use, use water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin before use. Select all reagents to have as low a content of lead as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glassware before use by soaking in warm 8 N nitric acid for 30 min and by rinsing with deionized water.]

**Ascorbic acid–sodium iodide solution:** 100 mg/mL of ascorbic acid and 192.5 mg/mL of sodium iodide

**Triocetylphosphine oxide solution:** 50 mg/mL of triocetylphosphine oxide in 4-methyl-2-pentanone.

[CAUTION—This solution causes irritation. Avoid contact with eyes, skin, and clothing. Take special precautions in disposing of unused portions of solutions to which this reagent is added.]

**Standard solution:** Transfer 5.0 mL of *Lead Nitrate Stock Solution*, prepared as directed in the test for *Heavy Metals* (231), to a 100-mL volumetric flask, and dilute with water to volume. Transfer 2.0 mL of the resulting solution to a 50-mL volumetric flask, add 10 mL of 9 N hydrochloric acid and 10 mL of water. Add 20 mL of *Ascorbic acid–sodium iodide solution* and 5.0 mL of *Trioctylphosphine oxide solution*, shake for 30 s, and allow to separate. Add water to bring the organic solvent layer into the neck of the flask, shake again, and allow to separate. The organic layer is the *Standard solution*, and it contains 2 µg/mL of lead.

**Sample solution:** To a 50-mL volumetric flask add 1.0 g of Ferrous Gluconate, 10 mL of 9 N hydrochloric acid, 10 mL of water, 20 mL of *Ascorbic acid–sodium iodide solution*, and 5.0 mL of *Trioctylphosphine oxide solution*. Shake for 30 s, and allow to separate. Add water to bring the organic solvent layer into the neck of the flask, shake again, and allow to separate. The organic layer is the *Sample solution*.

**Blank:** To a 50-mL volumetric flask add 10 mL of 9 N hydrochloric acid, 10 mL of water, 20 mL of *Ascorbic acid–sodium iodide solution*, and 5.0 mL of *Trioctylphosphine oxide solution*. Shake for 30 s, and allow to separate. Add water to bring the organic solvent layer into the neck of the flask, shake again, and allow to separate. The organic layer is the *Blank*, and it contains 0 µg/mL of lead.

#### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** Atomic absorption spectrophotometry

**Analytical wavelength:** 283.3 nm

**Lamp:** Lead hollow-cathode

**Flame:** Air–acetylene

#### System suitability

**Samples:** *Standard solution* and *Blank*

**Suitability requirements:** The absorbance of the *Standard solution* and the absorbance of the *Blank* are significantly different.

#### Analysis

**Samples:** *Standard solution*, *Sample solution*, and *Blank*. Concomitantly determine the absorbances of the *Blank*, *Standard solution*, and *Sample solution*. Use the *Blank* to set the instrument to zero.

**Acceptance criteria:** The absorbance of the *Sample solution* does not exceed that of the *Standard solution* (NMT 10 ppm).

#### • LIMIT OF FERRIC IRON

**Sample:** 5 g of Ferrous Gluconate

**Blank:** Proceed as directed in the *Analysis* without the *Sample*.

#### Titrimetric system

(See *Titrimetry* (541).)

**Mode:** Direct titration

**Titrant:** 0.1 N sodium thiosulfate VS

**Endpoint detection:** Visual

**Analysis:** Dissolve the *Sample* in a mixture of 100 mL of water and 10 mL of hydrochloric acid, and add 3 g of potassium iodide. Shake, and allow to stand in the dark for 5 min. Titrate any liberated iodine with the *Titrant*, adding 3 mL of starch TS as the endpoint is approached. Perform a *Blank* determination.

Calculate the percentage of ferric iron in the portion of Ferrous Gluconate taken:

$$\text{Result} = \{[(V_S - V_B) \times N \times F]/W\} \times 100$$

$V_S$  = *Titrant volume consumed by the Sample* (mL)

$V_B$  = *Titrant volume consumed by the Blank* (mL)

$N$  = *Titrant normality* (mEq/mL)

$F$  = *equivalency factor*, 55.85 mg/mEq

$W$  = *Sample weight* (mg)

**Acceptance criteria:** NMT 2.0%

#### • OXALIC ACID

**Sample:** 1.0 g

**Analysis:** Dissolve the *Sample* in 10 mL of water, add 2 mL of hydrochloric acid, and transfer to a separator. Extract successively with 50 mL and 20 mL of ether. Combine the ether extracts, add 10 mL of water, and evaporate the ether on a steam bath. Add 1 drop of 6 N acetic acid and 1 mL of a 50 mg/mL solution of calcium acetate.

**Acceptance criteria:** No turbidity is produced within 5 min.

#### • REDUCING SUGARS

**Sample:** 500 mg

**Analysis:** Dissolve the *Sample* in 10 mL of water, warm, and render alkaline with 1 mL of 6 N ammonium hydroxide. Pass hydrogen sulfide gas into the solution to precipitate the iron, and allow the solution to stand for 30 min to coagulate the precipitate. Filter, and wash the precipitate with two successive 5-mL portions of water. Acidify the combined filtrate and washings with hydrochloric acid, and add 2 mL of 3 N hydrochloric acid in excess. Boil the solution until the vapors no longer darken lead acetate paper, and continue to boil, if necessary, until it has been concentrated to 10 mL. Cool, add 5 mL of sodium carbonate TS and 20 mL of water, filter, and adjust the volume of the filtrate to 100 mL. To 5 mL of the filtrate add 2 mL of alkaline cupric tartrate TS, and boil for 1 min.

**Acceptance criteria:** No red precipitate is formed within 1 min.

#### SPECIFIC TESTS

• **LOSS ON DRYING** (731): Dry a sample at 105° for 16 h: it loses 6.5%–10.0% of its weight.

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers.

• **USP REFERENCE STANDARDS** (11)

USP Potassium Gluconate RS

## Ferrous Gluconate Capsules

#### DEFINITION

Ferrous Gluconate Capsules contain NLT 93.0% and NMT 107.0% of the labeled amount of ferrous gluconate dihydrate ( $C_{12}H_{22}FeO_{14} \cdot 2H_2O$ ).

#### IDENTIFICATION

##### • A. THIN-LAYER CHROMATOGRAPHY

**Standard solution:** 10 mg/mL of USP Potassium Gluconate RS

**Sample solution:** A filtered solution in water, equivalent to 10 mg/mL of ferrous gluconate dihydrate from the contents of the Capsules

#### Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

**Mode:** TLC

**Adsorbent:** 0.25-mm layer of chromatographic silica gel

**Application volume:** 5 µL

**Developing solvent system:** Alcohol, ethyl acetate, ammonium hydroxide, and water (50:10:10:30)

**Spray reagent:** Dissolve 2.5 g of ammonium molybdate in 50 mL of 2 N sulfuric acid in a 100-mL volumetric flask. Add 1.0 g of ceric sulfate, swirl to dissolve, and dilute with 2 N sulfuric acid to volume.

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, and dry at 110° for 20 min. Allow to cool, and spray with *Spray reagent*. Heat the plate at 110° for about 10 min.

**Acceptance criteria:** The principal spot of the *Sample solution* corresponds in color, size, and  $R_f$  value to that of the *Standard solution*.

- B. FERROUS ION**

**Sample solution:** Equivalent to 5 mg/mL of ferrous gluconate dihydrate from a dilution of the *Sample solution* obtained in *Identification test A*

**Analysis:** Add potassium ferricyanide TS to the *Sample solution*.

**Acceptance criteria:** The solution yields a dark blue precipitate.

**ASSAY**

- PROCEDURE**

**Buffer:** Dissolve 3.0 g of sodium acetate in 50 mL of water. Add 2.0 mL of glacial acetic acid, dilute with water to 200 mL, and mix. This *Buffer* has a pH of 4.6.

**Color reagent solution:** Dissolve 400 mg of 2,2'-bipyridine in 100 mL of water, using heat if necessary, to dissolve. Cool, and filter.

**Standard stock solution:** 7.022 mg/mL of ferrous ammonium sulfate hexahydrate [ $\text{Fe}(\text{NH}_4)_2(\text{SO}_4)_2 \cdot 6\text{H}_2\text{O}$ ] in water, equivalent to 1000 µg/mL of iron (Fe)

**Standard solution:** 100 µg/mL of iron (Fe) in 0.1 N sulfuric acid from *Standard stock solution*

**Sample solution**

**For hard gelatin capsules:** Transfer, as completely as possible, the contents of NLT 20 Capsules to a suitable tared container. Mix and finely powder the combined contents, and transfer a weighed portion of the powder, equivalent to 430 mg of ferrous gluconate dihydrate, to a 500-mL volumetric flask. Add 300 mL of water, heating on a steam bath if necessary to dissolve. Cool, and dilute with water to volume.

**For soft gelatin capsules:** Place a number of Capsules, equivalent to 430 mg of ferrous gluconate dihydrate, in a 500-mL volumetric flask. Add 300 mL of water, heating on a steam bath to dissolve the Capsules. Cool, and dilute with water to volume.

**Instrumental conditions**

(See *Spectrophotometry and Light-Scattering* <851>.)

**Mode:** UV-Vis

**Analytical wavelength:** 522 nm

**Cell:** 1 cm

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Transfer 3.0 mL of the *Sample solution* to a 100-mL volumetric flask, and add, in the order named, 70 mL of *Buffer*, 10.0 mL of 100 mg/mL of sodium thiosulfate solution, and 5.0 mL of *Color reagent solution*, with mixing following each addition. Heat for 60 min on a steam bath, cool, dilute with *Buffer* to volume, and filter. Prepare reagent blanks for the *Standard solution* and the *Sample solution* by repeating the above procedure, omitting the addition of 5.0 mL of *Color reagent solution*.

Concomitantly determine the absorbances of the reacted solutions against the corresponding reagent blanks.

Calculate the percentage of the labeled amount of ferrous gluconate dihydrate ( $\text{C}_{12}\text{H}_{22}\text{FeO}_{14} \cdot 2\text{H}_2\text{O}$ ) in the portion of Capsules taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times (M_r/A_r) \times 100$$

$A_U$  = absorbance of the *Sample solution* corrected by the absorbance of its reagent blank

$A_S$  = absorbance of the *Standard solution* corrected by the absorbance of its reagent blank

$C_S$  = concentration of iron in the *Standard solution* (µg/mL)

$C_U$  = nominal concentration of ferrous gluconate dihydrate in the *Sample solution* (µg/mL)

$M_r$  = molecular weight of ferrous gluconate dihydrate, 482.17

$A_r$  = atomic weight of iron, 55.85

**Acceptance criteria:** 93.0%–107.0%

**PERFORMANCE TESTS**

- DISSOLUTION <711>**

**Medium:** 0.1 N hydrochloric acid; 900 mL

**Apparatus 1:** 100 rpm

**Time:** 45 min

**Standard solution:** Solution having a known concentration of iron in the *Medium*

**Sample solution:** Filtered portion of the solution under test, suitably diluted with the *Medium* if necessary

**Instrumental conditions**

(See *Spectrophotometry and Light-Scattering* <851>.)

**Mode:** Atomic absorption spectrophotometry

**Analytical wavelength:** 248.3 nm

**Lamp:** Iron hollow-cathode

**Flame:** Air-acetylene

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Determine the concentration of iron (Fe) in the *Sample solution* in comparison with a *Standard solution*.

Calculate the percentage of the labeled amount of ferrous gluconate dihydrate ( $\text{C}_{12}\text{H}_{22}\text{FeO}_{14} \cdot 2\text{H}_2\text{O}$ ) dissolved:

$$\text{Result} = (M_r/A_r) \times (C \times D \times V/L) \times 100$$

$M_r$  = molecular weight of ferrous gluconate dihydrate, 482.17

$A_r$  = atomic weight of iron, 55.85

$C$  = measured concentration of iron in the *Sample solution* (mg/mL)

$D$  = dilution factor for the *Sample solution*

$V$  = volume of *Medium*, 900 mL

$L$  = label amount of ferrous gluconate dihydrate (mg/Capsule)

**Tolerances:** NLT 75% (Q) of the labeled amount of ferrous gluconate dihydrate ( $\text{C}_{12}\text{H}_{22}\text{FeO}_{14} \cdot 2\text{H}_2\text{O}$ ) is dissolved.

- UNIFORMITY OF DOSAGE UNITS <905>:** Meet the requirements

**ADDITIONAL REQUIREMENTS**

- PACKAGING AND STORAGE:** Preserve in tight containers.
- LABELING:** Label the Capsules in terms of the content of ferrous gluconate dihydrate ( $\text{C}_{12}\text{H}_{22}\text{FeO}_{14} \cdot 2\text{H}_2\text{O}$ ) and in terms of the content of elemental iron.

## PERFORMANCE TESTS

### • DISSOLUTION <711>

**Medium:** Simulated gastric fluid TS; 900 mL

**Apparatus 2:** 150 rpm

**Time:** 80 min

**Standard solution:** Solution having a known concentration of iron in the *Medium*

**Sample solution:** Filtered portion of the solution under test, suitably diluted with the *Medium* if necessary

### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

**Mode:** Atomic absorption spectrophotometry

**Analytical wavelength:** 248.3 nm

**Lamp:** Iron hollow-cathode

**Flame:** Air–acetylene

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Determine the concentration of iron (Fe) in the *Sample solution* in comparison with a *Standard solution*.

Calculate the percentage of the labeled amount of ferrous gluconate dihydrate ( $C_{12}H_{22}FeO_{14} \cdot 2H_2O$ ) dissolved:

$$\text{Result} = (M_r/A_r) \times (C \times D \times V/L) \times 100$$

$M_r$  = molecular weight of ferrous gluconate dihydrate, 482.17  
 $A_r$  = atomic weight of iron, 55.85  
 $C$  = measured concentration of iron in the *Sample solution* (mg/mL)  
 $D$  = dilution factor for the *Sample solution*  
 $V$  = volume of *Medium*, 900 mL  
 $L$  = label amount of ferrous gluconate dihydrate (mg/Tablet)

**Tolerances:** NLT 80% (Q) of the labeled amount of ferrous gluconate dihydrate ( $C_{12}H_{22}FeO_{14} \cdot 2H_2O$ ) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS <905>**: Meet the requirements

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Label the Tablets in terms of the content of ferrous gluconate dihydrate ( $C_{12}H_{22}FeO_{14} \cdot 2H_2O$ ) and in terms of the content of elemental iron.
- **USP REFERENCE STANDARDS <11>**  
USP Potassium Gluconate RS

## Ferrous Sulfate

$FeSO_4 \cdot 7H_2O$	278.01
$FeSO_4$	151.91
Sulfuric acid, iron(2+) salt (1:1), heptahydrate; Iron(2+) sulfate (1:1) heptahydrate [7782-63-0]. Anhydrous [7720-78-7].	

## DEFINITION

Ferrous Sulfate contains an amount of anhydrous ferrous sulfate ( $FeSO_4$ ) equivalent to NLT 99.5% and NMT 104.5% of ferrous sulfate heptahydrate ( $FeSO_4 \cdot 7H_2O$ ).

## IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Iron, Ferrous Salts <191> and Sulfate <191>**: Meets the requirements

## ASSAY

### • PROCEDURE

**Sample:** 1 g of Ferrous Sulfate

**Blank:** Proceed as in the *Analysis* without the *Sample*.

### Titrimetric system

(See *Titrimetry* <541>.)

**Mode:** Direct titration

**Titrant:** 0.1 N ceric sulfate VS

**Endpoint detection:** Visual

**Analysis:** Dissolve the *Sample* in a mixture of 25 mL of 2 N sulfuric acid and 25 mL of freshly boiled and cooled water. Add orthophenanthroline TS, and immediately titrate with *Titrant*. Perform a blank determination. Calculate the percentage of ferrous sulfate heptahydrate ( $FeSO_4 \cdot 7H_2O$ ) in the *Sample* taken:

$$\text{Result} = \{(V_S - V_B) \times N \times F/W\} \times 100$$

$V_S$  = *Titrant* volume consumed by the *Sample* (mL)  
 $V_B$  = *Titrant* volume consumed by the *Blank* (mL)  
 $N$  = *Titrant* normality (mEq/mL)  
 $F$  = equivalency factor, 278.0 mg/mEq  
 $W$  = *Sample* weight (mg)

**Acceptance criteria:** 99.5%–104.5% of ferrous sulfate heptahydrate

## IMPURITIES

### • ARSENIC, Method I <211>

**Test preparation:** Transfer 1 g of Ferrous Sulfate to a round-bottomed, 100-mL flask fitted with a glass joint, and add 40 mL of sulfuric acid (1 in 4) and 2 mL of 300 mg/mL potassium bromide solution. Immediately connect the flask to a condenser having a matching glass joint and a reservoir with a water jacket that is cooled by ice water. Heat the flask gently over a low flame until the solid dissolves, then distill until 25 mL of distillate collects in the reservoir. Transfer this distillate to the arsine generator flask, and wash the condenser and the reservoir with several small portions of water, adding the washings to the generator flask. Swirl to mix, add bromine TS until the color of the solution is slightly yellow, and dilute with water to 35 mL.

**Acceptance criteria:** NMT 3 ppm

### • LEAD

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glassware before use, use water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin. Select all reagents to have as low a content of lead as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glassware before use by soaking in warm nitric acid (1 in 2) for 30 min and by rinsing with deionized water.]

**Ascorbic acid–sodium iodide solution:** 100 mg/mL of ascorbic acid and 192.5 mg/mL of sodium iodide

**Trioctylphosphine oxide solution:** 50 mg/mL of trioctylphosphine oxide in 4-methyl-2-pentanone

**[CAUTION—** This solution causes irritation. Avoid contact with eyes, skin, and clothing. Take special precautions in disposing of unused portions of solutions to which this reagent is added.)

**Standard solution:** Transfer 5.0 mL of *Lead Nitrate Stock Solution*, prepared as directed in *Heavy Metals* (231), to a 100-mL volumetric flask. Dilute with water to volume, and mix. Transfer 2.0 mL of the resulting solution to a 50-mL volumetric flask. Add 10 mL of 9 N hydrochloric acid and 10 mL of water. Add 20 mL of *Ascorbic*

acid-sodium iodide solution and 5.0 mL of Trioctylphosphine oxide solution, shake for 30 s, and allow to separate. Add water to bring the organic solvent layer into the neck of the flask, shake again, and allow to separate. The organic layer is the *Standard solution*, and it contains 2 µg/mL of lead.

**Sample solution:** To a 50-mL volumetric flask add 1.0 g of Ferrous Sulfate, 10 mL of 9 N hydrochloric acid, 10 mL of water, 20 mL of Ascorbic acid-sodium iodide solution, and 5.0 mL of Trioctylphosphine oxide solution. Shake for 30 s, and allow to separate. Add water to bring the organic solvent layer into the neck of the flask, shake again, and allow to separate. The organic layer is the *Sample solution*.

**Blank:** To a 50-mL volumetric flask add 10 mL of 9 N hydrochloric acid, 10 mL of water, 20 mL of Ascorbic acid-sodium iodide solution, and 5.0 mL of Trioctylphosphine oxide solution. Shake for 30 s, and allow to separate. Add water to bring the organic solvent layer into the neck of the flask, shake again, and allow to separate. The organic layer is the *Blank*, and it contains 0 µg/mL of lead.

#### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** Atomic absorption spectrophotometry

**Analytical wavelength:** 283.3 nm

**Lamp:** Lead hollow-cathode

**Flame:** Air-acetylene

#### System suitability

**Samples:** *Standard solution* and *Blank*

**Suitability requirements:** The absorbance of the *Standard solution* and the absorbance of the *Blank* are significantly different.

#### Analysis

**Samples:** *Standard solution*, *Sample solution*, and *Blank*. Concomitantly determine the absorbances of the *Blank*, *Standard solution*, and the *Sample solution*. Use the *Blank* to set the instrument to zero.

**Acceptance criteria:** The absorbance of the *Sample solution* does not exceed that of the *Standard solution* (NMT 10 ppm).

#### • MERCURY

[NOTE—Carry out this test in subdued light, because mercuric dithizonate is light sensitive.]

**Hydroxylamine hydrochloride solution, Standard mercury solution, Dithizone extraction solution, and Diluted dithizone extraction solution:** Prepare as directed in *Mercury* (261), *Method I*.

**Control solution:** Mix 3.0 mL of *Standard mercury solution*, 30 mL of dilute nitric acid (1 in 10), 5 mL of 250 mg/mL of sodium citrate solution, and 1 mL of *Hydroxylamine hydrochloride solution*.

**Test preparation:** Dissolve 1 g of Ferrous Sulfate in 30 mL of dilute nitric acid (1 in 10) with the aid of heat, on a steam bath. Cool quickly by immersing in an ice bath, and pass through a fine-porosity filter that previously has been washed with dilute nitric acid (1 in 10) and water. To the filtrate add 20 mL of 250 mg/mL sodium citrate solution and 1 mL of *Hydroxylamine hydrochloride solution*.

**Analysis:** Adjust the *Control solution* to a pH of 1.8 with ammonium hydroxide and the *Sample solution* to a pH of 1.8 with sulfuric acid. Separately transfer the solutions to separators. Treat the *Sample solution* and the *Control solution* in parallel as follows.

Extract with two 5-mL portions of *Dithizone extraction solution* and 5 mL of chloroform, pooling the chloroform extracts in a second separator. Add 10 mL of dilute hydrochloric acid (1 in 2), shake, allow the layers to separate, and discard the chloroform layer. Wash the acid extract with 3 mL of chloroform, and discard the washing. Add 0.1 mL of 20 mg/mL of edetate disodium solution and 2 mL of 6 N acetic acid, mix, and add slowly 5 mL of ammonium hydroxide. Close the separator, cool it under cold running water, and dry its

outer surface. Remove the stopper, and pour the contents into a beaker. Adjust the *Sample solution* and the *Control solution* to a pH of 1.8 in the same manner as before, and return the solutions to their respective separators. Add 5.0 mL of *Diluted dithizone extraction solution*, shake vigorously, and allow the layers to separate. Using *Diluted dithizone extraction solution* as a color blank, compare the colors developed in the chloroform layers of the *Sample solution* and the *Control solution*.

**Acceptance criteria:** The color developed by the *Sample solution* is not more intense than that developed by the *Control solution* (NMT 3 µg/g).

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Label it to indicate that it is not to be used if it is coated with brownish yellow basic ferric sulfate.

## Ferrous Sulfate Oral Solution

#### DEFINITION

Ferrous Sulfate Oral Solution contains NLT 94.0% and NMT 106.0% of the labeled amount of ferrous sulfate heptahydrate ( $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$ ).

#### IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Iron, Ferrous Salts (191) and Sulfate (191):** Meets the requirements

#### ASSAY

##### • PROCEDURE

**Sample:** A volume of Oral Solution equivalent to 625 mg of  $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$  accurately measured

**Blank:** Proceed as in the *Analysis* without the *Sample*.

##### Titrimetric system

(See *Titrimetry* (541).)

**Mode:** Direct titration

**Titrant:** 0.1 N ceric sulfate VS

**Indicator:** Orthophenanthroline TS

**Endpoint detection:** Visual

**Analysis:** Add 25 mL of 2 N sulfuric acid and 75 mL of freshly boiled and cooled water to the *Sample*, and shake well. Then add orthophenanthroline TS, and immediately titrate with *Titrant* until the color changes. Perform a blank determination.

Calculate the percentage of the labeled amount of ferrous sulfate heptahydrate ( $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$ ) in the *Sample* taken:

$$\text{Result} = \left\{ \left[ (V_S - V_B) \times N \times F \right] / W \right\} \times 100$$

$V_S$  = *Titrant* volume consumed by the *Sample* (mL)

$V_B$  = *Titrant* volume consumed by the *Blank* (mL)

$N$  = actual normality of the *Titrant* (mEq/mL)

$F$  = equivalency factor, 278.0 mg/mEq

$W$  = nominal amount of ferrous sulfate heptahydrate in the *Sample* taken (mg)

**Acceptance criteria:** 94.0%–106.0% of the labeled amount of ferrous sulfate heptahydrate ( $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$ )

#### SPECIFIC TESTS

- **pH (791):** 1.4–5.3

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **LABELING:** Label the Oral Solution in terms of the content of ferrous sulfate heptahydrate ( $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$ ) and in terms of the content of elemental iron.

## Ferrous Sulfate Syrup

### DEFINITION

Ferrous Sulfate Syrup contains, in each 100 mL, NLT 3.75 g and NMT 4.25 g of ferrous sulfate heptahydrate ( $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$ ), equivalent to NLT 0.75 g and NMT 0.85 g of elemental iron.

Ferrous Sulfate Syrup is prepared as follows.

Ferrous Sulfate	40 g
Citric Acid, hydrous	2.1 g
Peppermint Spirit	2 mL
Sucrose	825 g
Purified Water, a sufficient quantity to make	1000 mL

Dissolve the *Ferrous Sulfate*, *Citric Acid*, *Peppermint Spirit*, and 200 g of *Sucrose* in 450 mL of *Purified Water*, and filter the solution until clear. Dissolve the remainder of the *Sucrose* in the clear filtrate, and add *Purified Water* to make 1000 mL. Mix, and filter if necessary, through a pledget of cotton.

### IDENTIFICATION

#### • A. IDENTIFICATION TESTS—GENERAL, *Iron*, *Ferrous Salts* <191> and *Sulfate* <191>

**Sample solution:** Dilute 1 mL of Syrup with water to 100 mL.

**Acceptance criteria:** Meets the requirements

### ASSAY

#### • PROCEDURE

**Sample:** 25 mL of Syrup

**Blank:** Proceed as in the *Analysis* without the *Sample*.

#### Titrimetric system

(See *Titrimetry* <541>.)

**Mode:** Direct titration

**Titrant:** 0.1 N ceric sulfate VS

**Indicator:** Orthophenanthroline TS

**Endpoint detection:** Visual

**Analysis:** Add 15 mL of 2 N sulfuric acid and 100 mL of water to the *Sample*, and shake well. Add 3 drops of orthophenanthroline TS, and titrate with *Titrant* until the color changes. Perform a blank determination. Calculate the amount of ferrous sulfate heptahydrate ( $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$ ) in g per each 100 mL of Syrup:

$$\text{Result} = \{[(V_S - V_B) \times N \times F]/W\} \times 100$$

$V_S$  = *Titrant* volume consumed by the *Sample* (mL)

$V_B$  = *Titrant* volume consumed by the *Blank* (mL)

$N$  = actual normality of the *Titrant* (mEq/mL)

$F$  = equivalency factor, 0.278 g/mEq

$W$  = volume of Ferrous Sulfate Syrup for the *Sample* taken (mL)

**Acceptance criteria:** 3.75–4.25 g in each 100 mL

### ADDITIONAL REQUIREMENTS

#### • PACKAGING AND STORAGE: Preserve in tight containers.

#### • LABELING: Label the Syrup in terms of the content of ferrous sulfate heptahydrate ( $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$ ) and in terms of the content of elemental iron.

## Ferrous Sulfate Tablets

### DEFINITION

Ferrous Sulfate Tablets contain NLT 95.0% and NMT 110.0% of the labeled amount of ferrous sulfate heptahydrate ( $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$ ). [NOTE—An equivalent amount of Dried Ferrous Sulfate may be used in place of  $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$  in preparing Ferrous Sulfate Tablets.]

### IDENTIFICATION

#### • A. IDENTIFICATION TESTS—GENERAL, *Iron*, *Ferrous Salts* <191> and *Sulfate* <191>

**Sample solution:** Equivalent to 10 mg/mL of ferrous sulfate heptahydrate from powdered Tablets in water acidified with hydrochloric acid

**Acceptance criteria:** Meets the requirements

### ASSAY

#### • PROCEDURE

**Sample:** Equivalent to 500 mg of ferrous sulfate heptahydrate from finely powdered Tablets (NLT 20)

**Blank:** Proceed as in the *Analysis* without the *Sample*.

#### Titrimetric system

(See *Titrimetry* <541>.)

**Mode:** Direct titration

**Titrant:** 0.1 N ceric sulfate VS

**Indicator:** Orthophenanthroline TS

**Endpoint detection:** Visual

**Analysis:** In a beaker, dissolve the *Sample* in a mixture of 20 mL of 2 N sulfuric acid and 80 mL of freshly boiled and cooled water. Filter the solution rapidly as soon as all soluble ingredients in the Tablets are dissolved, and wash the container and the filter with small portions of a mixture of 20 mL of 2 N sulfuric acid and 80 mL of freshly boiled and cooled water.

Add orthophenanthroline TS, and immediately titrate the filtrate in the suction flask with *Titrant* until the color changes. Perform a blank determination.

Calculate the percentage of the labeled amount of ferrous sulfate heptahydrate ( $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$ ) in the *Sample* taken:

$$\text{Result} = \{[(V_S - V_B) \times N \times F]/W\} \times 100$$

$V_S$  = *Titrant* volume consumed by the *Sample* (mL)

$V_B$  = *Titrant* volume consumed by the *Blank* (mL)

$N$  = actual normality of the *Titrant* (mEq/mL)

$F$  = equivalency factor, 278.0 mg/mEq

$W$  = nominal weight of ferrous sulfate heptahydrate in the *Sample* taken (mg)

**Acceptance criteria:** 95.0%–110.0%

### PERFORMANCE TESTS

#### • DISSOLUTION <711>

**Medium:** 0.1 N hydrochloric acid; 900 mL

**Apparatus 2:** 50 rpm

**Time:** 45 min

**Standard solution:** Solution having a known concentration of iron in the *Medium*

**Sample solution:** Filtered portion of the solution under test, suitably diluted with the *Medium* if necessary

#### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

**Mode:** Atomic absorption spectrophotometry

**Analytical wavelength:** 248.3 nm

**Lamp:** Iron hollow-cathode

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Determine the concentration of iron (Fe) in the *Sample solution* in comparison with a *Standard solution*.

Calculate the percentage of the labeled amount of ferrous sulfate heptahydrate ( $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$ ) dissolved:

$$\text{Result} = (M_r/A_r) \times (C \times D \times V/L) \times 100$$

- $M_r$  = molecular weight of ferrous sulfate heptahydrate, 278.02  
 $A_r$  = atomic weight of iron, 55.85  
 $C$  = measured concentration of iron in the *Sample solution* (mg/mL)  
 $D$  = dilution factor for the *Sample solution*  
 $V$  = volume of *Medium*, 900 mL  
 $L$  = label claim (mg/Tablet)

**Tolerances:** NLT 75% (Q) of the labeled amount of ferrous sulfate heptahydrate ( $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$ ) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Label the Tablets in terms of ferrous sulfate heptahydrate ( $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$ ) and in terms of elemental iron.

### Dried Ferrous Sulfate

$\text{FeSO}_4 \cdot x\text{H}_2\text{O}$  151.91  
 Sulfuric acid, iron(2+) salt (1:1), hydrate;  
 Iron(2+) sulfate (1:1) hydrate [13463-43-9].  
 Anhydrous [7720-78-7].

#### DEFINITION

Dried Ferrous Sulfate contains NLT 86.0% and NMT 89.0% of anhydrous ferrous sulfate ( $\text{FeSO}_4$ ).

#### IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Iron, Ferrous Salts (191) and Sulfate (191):** Meets the requirements

#### ASSAY

##### PROCEDURE

**Sample:** 800 mg of Dried Ferrous Sulfate

**Blank:** Proceed as in the *Analysis* without the *Sample*.

##### Titrimetric system

(See *Titrimetry* (541).)

**Mode:** Direct titration

**Titrant:** 0.1 N ceric sulfate VS

**Endpoint detection:** Visual

**Analysis:** Dissolve the *Sample* in a mixture of 25 mL of 2 N sulfuric acid and 25 mL of freshly boiled and cooled water. Add orthophenanthroline TS, and immediately titrate with the *Titrant*. Perform a blank determination. Calculate the percentage of anhydrous ferrous sulfate ( $\text{FeSO}_4$ ) in the *Sample* taken:

$$\text{Result} = \{[(V_S - V_B) \times N \times F]/W\} \times 100$$

$V_S$  = *Titrant* volume consumed by the *Sample* (mL)

$V_B$  = *Titrant* volume consumed by the *Blank* (mL)

$N$  = *Titrant* normality (mEq/mL)

$F$  = equivalency factor, 151.9 mg/mEq

$W$  = *Sample* weight (mg)

**Acceptance criteria:** 86.0%–89.0%

#### IMPURITIES

- **ARSENIC, Method I (211)**

**Test preparation:** Transfer 1 g of Dried Ferrous Sulfate to a round-bottomed, 100-mL flask fitted with a glass joint, and add 40 mL of sulfuric acid (1 in 2) and 2 mL of 300 mg/mL of potassium bromide solution. Immediately connect the flask to a condenser having a matching glass joint and a reservoir with a water jacket that is cooled by ice water. Heat the flask gently over a low flame until the solid dissolves, then distill until 25 mL of distillate collects in the reservoir. Transfer this distillate to the arsine generator flask, and wash the condenser and the reservoir with several small portions of water, adding the washings to the generator flask. Swirl to

mix, add bromine TS until the color of the solution is slightly yellow, and dilute with water to 35 mL.

**Acceptance criteria:** NMT 3 ppm

##### LIMIT OF LEAD

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glassware before use, use water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin. Select all reagents to have as low a content of lead as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glassware before use by soaking in warm nitric acid (1 in 2) for 30 min and by rinsing with deionized water.]

**Ascorbic acid–sodium iodide solution:** 100 mg/mL of ascorbic acid and 192.5 mg/mL of sodium iodide

**Trioctylphosphine oxide solution:** 50 mg/mL of trioctylphosphine oxide in 4-methyl-2-pentanone

[**CAUTION**—This solution causes irritation. Avoid contact with eyes, skin, and clothing. Take special precautions in disposing of unused portions of solutions to which this reagent is added.]

**Standard solution:** Transfer 5.0 mL of *Lead Nitrate Stock Solution*, prepared as directed in *Heavy Metals* (231), to a 100-mL volumetric flask. Dilute with water to volume. Transfer 2.0 mL of the resulting solution to a 50-mL volumetric flask. Add 10 mL of 9 N hydrochloric acid and 10 mL of water. Add 20 mL of *Ascorbic acid–sodium iodide solution* and 5.0 mL of *Trioctylphosphine oxide solution*, shake for 30 s, and allow to separate. Add water to bring the organic solvent layer into the neck of the flask, shake again, and allow to separate. The organic layer is the *Standard solution*, and it contains 2 µg/mL of lead.

**Sample solution:** To a 50-mL volumetric flask add 1.0 g of Dried Ferrous Sulfate, 10 mL of 9 N hydrochloric acid, 10 mL of water, 20 mL of *Ascorbic acid–sodium iodide solution*, and 5.0 mL of *Trioctylphosphine oxide solution*. Shake for 30 s, and allow to separate. Add water to bring the organic solvent layer into the neck of the flask, shake again, and allow to separate. The organic layer is the *Sample solution*.

**Blank:** To a 50-mL volumetric flask add 10 mL of 9 N hydrochloric acid, 10 mL of water, 20 mL of *Ascorbic acid–sodium iodide solution*, and 5.0 mL of *Trioctylphosphine oxide solution*. Shake for 30 s, and allow to separate. Add water to bring the organic solvent layer into the neck of the flask, shake again, and allow to separate. The organic layer is the *Blank*, and it contains 0 µg/mL of lead.

##### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** Atomic absorption spectrophotometry

**Analytical wavelength:** 283.3 nm

**Lamp:** Lead hollow-cathode

**Flame:** Air–acetylene

##### System suitability

**Samples:** *Standard solution* and *Blank*

**Suitability requirements:** The absorbance of the *Standard solution* and the absorbance of the *Blank* are significantly different.

##### Analysis

**Samples:** *Standard solution*, *Sample solution*, and *Blank*. Concomitantly determine the absorbances of the *Blank*, *Standard solution*, and the *Sample solution*. Use the *Blank* to set the instrument to zero.

**Acceptance criteria:** The absorbance of the *Sample solution* does not exceed that of the *Standard solution* (NMT 10 ppm).

##### MERCURY

[NOTE—Carry out this test in subdued light, because mercuric dithizonate is light sensitive.]

**Hydroxylamine hydrochloride solution, Standard mercury solution, Dithizone extraction solution, and Diluted dithizone extraction solution:** Prepare as directed in *Mercury* (261), *Method I*.

**Control solution:** Mix 3.0 mL of *Standard mercury solution*, 30 mL of nitric acid (1 in 10), 5 mL of 250 mg/mL of sodium citrate solution, and 1 mL of *Hydroxylamine hydrochloride solution*.

**Test preparation:** Dissolve 1 g of Dried Ferrous Sulfate in 30 mL of nitric acid (1 in 10) with the aid of heat, on a steam bath. Cool quickly by immersing in an ice bath, and pass through a fine-porosity filter that previously has been washed with nitric acid (1 in 10) and water. To the filtrate, add 20 mL of 250 mg/mL of sodium citrate solution and 1 mL of *Hydroxylamine hydrochloride solution*.

**Analysis:** Adjust the *Control solution* to a pH of 1.8 with ammonium hydroxide and the *Sample solution* to a pH of 1.8 with sulfuric acid. Separately transfer the solutions to separators. Treat the *Sample solution* and the *Control solution* in parallel as follows.

Extract with two 5-mL portions of *Dithizone extraction solution* and 5 mL of chloroform, pooling the chloroform extracts in a second separator. Add 10 mL of hydrochloric acid (1 in 2), shake, allow the layers to separate, and discard the chloroform layer. Wash the acid extract with 3 mL of chloroform, and discard the washing. Add 0.1 mL of 20 mg/mL of edetate disodium solution and 2 mL of 6 N acetic acid, mix, and add slowly 5 mL of ammonium hydroxide. Close the separator, cool it under cold running water, and dry its outer surface. Remove the stopper, and pour the contents into a beaker. Adjust the *Sample solution* and the *Control solution* to a pH of 1.8 in the same manner as before, and return the solutions to their respective separators. Add 5.0 mL of *Diluted dithizone extraction solution*, shake vigorously, and allow the layers to separate. Using *Diluted dithizone extraction solution* as a color blank, compare the colors developed in the chloroform layers of the *Sample solution* and the *Control solution*.

**Acceptance criteria:** The color developed by the *Sample solution* is not more intense than that developed by the *Control solution* (NMT 3 ppm).

#### • INSOLUBLE SUBSTANCES

**Sample:** 2.0 g of Dried Ferrous Sulfate

**Analysis:** Dissolve the *Sample* in 20 mL of freshly boiled dilute sulfuric acid (1 in 100), heat to boiling, and digest in a covered beaker on a steam bath for 1 h. Filter through a tared filtering crucible, wash thoroughly, and dry at 105°.

**Acceptance criteria:** The weight of the insoluble residue does not exceed 1 mg (NMT 0.05%).

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

## Ferumoxides Injection

» Ferumoxides Injection is a sterile colloidal suspension of superparamagnetic iron oxide associated with dextran in Water for Injection. It contains not less than 95 percent and not more than 105 percent of the labeled amount of iron. It contains in each mL not less than 5.6 mg and not more than 9.1 mg of dextran. It contains in each mL not less than 0.25 mg and not more than 0.53 mg of citrate. It also contains mannitol. It contains no antimicrobial agents. Ferumoxides is a nonstoichiometric iron oxide magnetite of average formula  $\text{FeO}_{1.44}$ , with particles having a diameter between 100 and 250 nm.

**Packaging and storage**—Preserve in single-dose containers of Type I glass, and store at controlled room temperature. Avoid freezing.

**Labeling**—Label it to indicate that it is to be administered through a 5- $\mu\text{m}$  filter and that it is not to be used if there are indications that the package has been exposed to freezing temperatures.

#### USP Reference standards (11)—

USP Dextran T-10 RS

USP Dextrose RS

USP Endotoxin RS

**Identification**—Transfer about 1 mL of the Injection to a test tube, and add 2 drops of ammonium hydroxide: no precipitate is formed. Add 2 mL of hydrochloric acid, mix, and add 2 mL of ammonium hydroxide: a brown precipitate is formed.

**Specific gravity** (841): between 1.031 and 1.041.

**Bacterial endotoxins** (85)—It contains not more than 12.5 USP Endotoxin Units per mL.

**pH** (791): between 5.0 and 9.0.

#### Colloidal particle size—

**Apparatus**—Use a submicron laser light-scattering instrument.<sup>1</sup>

**Standards**—Use 90- and 270-nm NIST-traceable polystyrene monospheres.

**Standard dilutions**—Transfer 3 mL of 0.2- $\mu\text{m}$  filtered water to each of two clear acrylic cuvettes. Add a sufficient amount of the 90-nm monospheres to one of the cuvettes and a sufficient amount of the 270-nm monospheres to the other cuvette to make the dilutions slightly turbid, place in the *Apparatus*, and then measure the particle sizes: the particle size in the *Standards* is within 10% of the certified diameter.

**Procedure**—Transfer about 40  $\mu\text{L}$  of the Injection to a clear acrylic cuvette, and add 3 mL of 0.2- $\mu\text{m}$  filtered water. Cover, invert to mix (without shaking), place in the *Apparatus*, and measure the intensity-weighted effective diameter. [NOTE—Several minutes are necessary for the sample to reach equilibrium.] The intensity-weighted effective diameter is between 100 and 250 nm.

#### Magnetic susceptibility—

**Apparatus:** a calibrated magnetic susceptibility balance.

**Standard solutions**—Transfer 118.85 g of nickel chloride hexahydrate, accurately weighed, to a 500-mL volumetric flask, dilute with water to volume, and mix to obtain 1 M nickel chloride. Transfer 356.55 g of nickel chloride hexahydrate, accurately weighed, to a separate 500-mL volumetric flask, dilute with water to volume, and mix to obtain 3 M nickel chloride.

**Balance constant**—[NOTE—Each magnetic susceptibility balance has a *Balance constant*,  $K$ , that is determined each time the balance is moved to a new location. The *Balance constant* is referenced to the known magnetic susceptibility of nickel chloride hexahydrate.] Measure the length,  $L$ , in cm, of the large-bore susceptibility tube, from the bottom of the inside of the tube to the bottom of the black band. Tare the susceptibility tube on a balance, fill it with water to the bottom of the black band, and weigh again. Record the weight,  $W$ , in g, of the water in the tube, zero the susceptibility balance, and then place the tube containing water in the susceptibility balance. Zero the balance again. Rinse the tube with 1 M nickel chloride, and then fill the tube with fresh 1 M nickel chloride. Insert the tube into the susceptibility balance, and record the magnetic susceptibility,  $R$ , in

<sup>1</sup> Brookhaven Instruments 90Plus or equivalent.

cgs units, of 1 M nickel chloride. Calculate the *Balance constant*,  $K$ , by the formula:

$$(4.24 \times 10^{-6})(W \times 10^9)/RL$$

in which  $4.24 \times 10^{-6}$  is the magnetic susceptibility, in cgs units, of nickel chloride hexahydrate; and the other terms are as defined above.

**Tube constant**—[NOTE—For each susceptibility tube, a tube constant,  $C_T$ , is determined.] Measure the length of the tube,  $L$ , in cm, from the bottom of the inside of the tube to the bottom of the black band. Tare the tube on a balance, fill it with water to the bottom of the black band, and weigh again. Record the weight,  $W$ , in g, of the water in the tube. Calculate the tube constant,  $C_T$ , by the formula:

$$KL/(W \times 10^9)$$

in which  $K$  is the *Balance constant* as obtained above; and  $L$  and  $W$  are as defined above.

**Diluted sample**—Transfer about 0.2 g of the Injection, accurately weighed, to a 10-mL volumetric container, dilute with water to volume, mix, and accurately weigh the contents.

**Procedure**—[NOTE—Use the same susceptibility tube throughout the procedure.] Fill the susceptibility tube with water to the black band. Insert the tube into the susceptibility balance, and adjust to zero. Remove the tube from the balance, pour the water from the tube, rinse the tube with 1 M nickel chloride, and then fill the tube with fresh 1 M nickel chloride. Insert the tube into the balance, and record the magnetic susceptibility in cgs units. Similarly, measure the magnetic susceptibility of 3 M nickel chloride. The balance readings are within 5% of the expected values, which are  $(4.24 \times 10^{-6})/C_T$  for 1 M nickel chloride and  $(12.72 \times 10^{-6})/C_T$  for 3 M nickel chloride. Rinse the tube with well-mixed Injection, then fill the tube with the Injection to the black band, and weigh. Insert the tube into the susceptibility balance, and proceed as directed for the *Standard solutions*. Calculate the magnetic susceptibility, in cgs units, per g of iron in the Injection by the formula:

$$1000C_T RT/WI$$

in which  $C_T$  is the *Tube constant* as obtained above;  $R$  is the balance reading, in cgs units;  $T$  is the weight, in g, of the *Diluted sample*;  $W$  is the weight, in g, of the ferumoxides in the *Diluted sample*; and  $I$  is the concentration of iron, in mg per g, in the Injection, obtained by using specific gravity to convert the concentration of iron, in mg per mL, as determined in the *Assay for iron*, to mg per g. The magnetic susceptibility is not less than  $17,100 \times 10^{-6}$  in cgs units per g of iron.

**Osmolality** (785): between 325 and 365 mOsmol per kg.  
**Other requirements**—It meets the requirements for *Injections* (1) with the exception of *Foreign Matter* and *Particulate Matter*.

#### Assay for iron—

**Iron standard solution**—Use a NIST-traceable iron standard containing 1000 µg per mL (1000 ppm).

**Standard preparations**—Pipet 5.0, 10.0, 15.0, and 20.0 mL of the *Iron standard solution* into separate 1000-mL volumetric flasks, dilute each with water to volume, and mix to obtain solutions having known concentrations of 5 µg per mL, 10 µg per mL, 15 µg per mL, and 20 µg per mL, respectively.

**Assay preparation**—Accurately weigh 100 µL of the Injection, and transfer to a test tube. Add 2 mL of hydrochloric acid, and mix. [NOTE—The Injection dissolves to yield a medium yellow solution.] Add 2 mL of water, and then transfer the contents of the tube to a 100-mL volumetric flask, dilute with water to volume, and mix.

**Procedure**—Using an atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* (851)) equipped with an iron hollow-cathode lamp and an air-acetylene flame, set the instrument to zero with water, and measure the absorbance,  $A_{20}$ , of the *Standard preparation* containing 20 µg per mL at the iron emission line of 296.7 nm. Concomitantly determine the absorbances of the *Standard preparations*. Calculate the iron concentration, in µg per mL, of each *Standard preparation* by the formula:

$$20(A_S / A_{20})$$

in which  $A_S$  is the absorbance of the relevant *Standard preparation*. The reading for each *Standard preparation* is within 0.3 µg per mL of its nominal concentration. Measure the absorbance of the *Assay preparation*, and calculate the content of iron, in mg per mL, in the Injection by the formula:

$$2(A_U / A_{20})(S/W)$$

in which  $A_U$  is the absorbance of the *Assay preparation*;  $A_{20}$  is the absorbance of the *Standard preparation* containing 20 µg per mL;  $S$  is the specific gravity of the Injection; and  $W$  is the weight, in g, of the volume of Injection taken to prepare the *Assay preparation*.

#### Assay for dextran—

**Control preparation**—Transfer about 50 mg of USP Dextrose RS, accurately weighed, to a 1000-mL volumetric flask, dilute with water to volume, mix, and filter.

**Standard preparation**—Transfer about 50 mg of USP Dextran T-10 RS, accurately weighed, to a 1000-mL volumetric flask, dilute with water to volume, mix, and filter.

**Assay preparation**—Transfer 0.25 g of the Injection, accurately weighed, to a test tube, add about 0.25 mL of hydrochloric acid, then add about 9 mL of water, and mix. Remove the free iron from this solution by passing it through a cation-exchange column into a 25-mL volumetric flask. Rinse the column with about 9 mL of water, collecting the washings in the 25-mL volumetric flask, dilute with water to volume, and mix.

**Procedure**—To each of four test tubes, separately add 0.2 mL of the *Assay preparation*, the *Standard preparation*, the *Control preparation*, and water (to be used as the blank). Add 0.2 mL of a 5% phenol solution to each test tube. Mix each tube briefly on a vortex mixer, rapidly add 1.0 mL of sulfuric acid to each test tube, and again mix briefly on a vortex mixer. [Caution—Reaction is exothermic.] Cover the test tubes, and allow to stand at room temperature for at least 15 minutes. [NOTE—The resultant solution is orange-yellow in color and free of any solid material.] Mix each tube on a vortex mixer. Using a suitable spectrophotometer, determine the absorbances of the solutions from the *Standard preparation*, the *Control preparation*, and the *Assay preparation* against the blank at the wavelength of maximum absorbance at about 490 nm. Calculate the percent recovery of dextran in the *Control preparation* by the formula:

$$100(1.11)(C/C_D)(A_C / A_S)$$

in which 1.11 is a correction factor (to account for dextrose being a monomer of dextran);  $C$  is the concentration, in mg per mL, of USP Dextran T-10 RS in the *Standard preparation*;  $C_D$  is the concentration, in mg per mL, of USP Dextrose RS in the *Control preparation*; and  $A_C$  and  $A_S$  are the absorbances of the solutions from the *Control preparation* and the *Standard preparation*, respectively: not less than 90% to 110% is found. Calculate the quantity, in mg per mL, of dextran in the volume of Injection taken by the formula:

$$25S(C/W)(A_U / A_S)$$

in which  $S$  is the specific gravity of the Injection;  $C$  is the concentration, in mg per mL, of USP Dextran T-10 RS in the *Standard preparation*;  $W$  is the weight, in g, of the portion

of the Injection taken to prepare the *Assay preparation*; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

#### Assay for citrate—

**Mobile phase**—Prepare a filtered and degassed 0.0375 N sodium hydroxide solution. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard stock solution**—Transfer 0.7776 g of trisodium citrate dihydrate to a 100-mL volumetric flask, dilute with water to volume, filter, and refrigerate. This solution contains 5000 µg of citrate per mL (5000 ppm).

**Standard preparations**—Transfer 10 mL of *Standard stock solution* to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 1.0, 2.0, and 4.0 mL of this solution to separate 100-mL volumetric flasks, add 0.8 mL of hydrochloric acid to each flask, dilute with water to volume, and mix to obtain solutions having known concentrations of 5 µg per mL, 10 µg per mL, and 20 µg per mL.

**System suitability solution**—Use the filtered *Standard preparation* containing 5 µg per mL.

**Assay preparation**—Transfer about 0.5 mL of the Injection, accurately weighed, to a test tube, add 0.2 mL of hydrochloric acid and about 9 mL of water, and mix. Remove the free iron from this solution by passing the solution through a cation-exchange column<sup>2</sup> into a 25-mL volumetric flask. Rinse the column with about 9 mL of water, collecting the washings in the flask, dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph<sup>3</sup> is equipped with an ion detector with suppressed conductivity at 30 µS, a 4-mm × 25-cm separator column<sup>4</sup> that contains 15-µm packing L48, a 4-mm × 50-mm guard column,<sup>5</sup> and integrators. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 3.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparations* and the *Assay preparation* into the chromatograph, record the chromatograms for about 16 minutes, and measure the responses for the major peaks. Prepare a standard curve by plotting the conductivities of the *Standard preparations* versus their concentrations, in µg per mL. Determine the concentration,  $C$ , in µg per mL, of citrate in the *Assay preparation* by extrapolation from the standard curve. Calculate the quantity, in mg per mL, of citrate in the volume of Injection taken by the formula:

$$0.025C(S/W)$$

in which  $S$  is the specific gravity of the Injection; and  $W$  is the weight, in g, of the volume of Injection taken to prepare the *Assay preparation*.

## Ferumoxsil Oral Suspension

» Ferumoxsil Oral Suspension is an aqueous suspension of silicone-coated superparamagnetic iron oxide. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of iron (Fe). It contains a preservative and a thickening agent. It may contain suitable

<sup>2</sup> AG 50W-X8 (H+), available from Biorad.

<sup>3</sup> DX-500, available from Dionex Corporation or equivalent source.

<sup>4</sup> HPLC IonPac AS5 or equivalent

<sup>5</sup> HPLC IonPac AG5 or equivalent

colors, flavors, and sweetening agents. Ferumoxsil is poly[*N*-(2-aminoethyl)-3-aminopropyl]siloxane-coated nonstoichiometric magnetite [ $\text{FeO}_x(\text{C}_5\text{H}_{13}\text{N}_2\text{SiO}_2)_y$ ].

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

**Labeling**—Label it to indicate that it is to be well-shaken for 1 minute before use, and that it is not to be used if there are indications that the package has been exposed to freezing temperatures.

**Viscosity—Capillary Viscometer Methods** <911> and **Rotational Rheometer Methods** <912>: between 11 and 60 centipoises.

**Osmolarity** <785>: between 230 and 270 mOsmol per kg.

**Microbial enumeration tests** <61> and **Tests for specified microorganisms** <62>—It meets the requirements of the tests for absence of *Escherichia coli*. The total aerobic microbial count does not exceed 100 cfu per mL.

**pH** <791>: between 5.5 and 9.0.

#### Magnetic susceptibility—

**Apparatus, Standard solutions, Balance constant, and Tube constant**—Proceed as directed for *Magnetic susceptibility* under *Ferumoxides Injection*.

**Procedure**—Proceed as directed for *Magnetic susceptibility* under *Ferumoxides Injection* except to use undiluted Oral Suspension whenever Injection is indicated. Calculate the magnetic susceptibility, in cgs units, per g of iron in the Oral Suspension by the formula:

$$1000C_T/R/I$$

in which  $C_T$  is the *Tube constant*;  $R$  is the balance reading, in cgs units; and  $I$  is the concentration, in mg per g, of iron in the Oral Suspension, as determined in the *Assay for iron*. The magnetic susceptibility is not less than  $22,500 \times 10^{-6}$  in cgs units per g of iron.

**Settling**—Prepare a mixture of Oral Suspension and water (1:5). Mix by gentle inversion, and determine the absorbance at 500 nm in a suitable spectrophotometer, using water as the blank. Cover the cell, and allow to stand undisturbed for 4 hours at room temperature. Without mixing, determine the absorbance again. Calculate the percentage of iron remaining in solution after settling by the formula:

$$100(A_4 / A_0)$$

in which  $A_4$  is the absorbance of the solution after standing for 4 hours; and  $A_0$  is the initial absorbance of the solution: not less than 80% is found.

#### Uniformity of dosage units <905>—

FOR ORAL SUSPENSION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

#### Deliverable volume <698>—

FOR ORAL SUSPENSION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

#### Assay for iron—

**Iron standard solution and Standard preparations**—Proceed as directed in the *Assay for iron* under *Ferumoxides Injection*.

**Assay preparation**—Transfer about 5 g of well-mixed Oral Suspension, accurately weighed, to a 100-mL volumetric flask. Add 2 mL of nitric acid, and mix. Transfer the flask to a boiling water bath, and boil for 30 minutes to obtain a yellowish solution. Allow to cool to room temperature, dilute with water to volume, and mix.

**Procedure**—Proceed as directed in the *Assay for iron* under *Ferumoxides Injection*. Calculate the iron concentrations, in

µg per mL, of the three *Standard preparations* by the formula:

$$20(A_5 / A_{20})$$

in which  $A_5$  is the absorbance of the relevant *Standard preparation*; and  $A_{20}$  is the absorbance of the *Standard preparation* containing 20 µg per mL. The reading for each *Standard preparation*,  $A_5$ , is within 0.5 µg per mL of its nominal concentration. Measure the absorbance of the *Assay preparation*, and calculate the content of iron, in µg per mL, in the Oral Suspension by the formula:

$$2000(A_U / A_{20})(1.01/W)$$

in which  $A_U$  is the absorbance of the *Assay preparation*;  $A_{20}$  is the absorbance as defined above; 1.01 is the specific gravity of the Oral Suspension; and  $W$  is the weight, in g, of Oral Suspension taken to prepare the *Assay preparation*.

## Fexofenadine Hydrochloride

$C_{32}H_{39}NO_4 \cdot HCl$  538.12  
Benzeneacetic acid, 4-[1-hydroxy-4-[4-(hydroxydiphenylmethyl)-1-piperidinyl]butyl]- $\alpha,\alpha$ -dimethyl-, hydrochloride, ( $\pm$ );  
( $\pm$ )-*p*-[1-Hydroxy-4-[4-(hydroxydiphenylmethyl)piperidinyl]butyl]- $\alpha$ -methylhydratropic acid, hydrochloride [138452-21-8].

### DEFINITION

Fexofenadine Hydrochloride contains NLT 98.0% and NMT 102.0% of fexofenadine hydrochloride ( $C_{32}H_{39}NO_4 \cdot HCl$ ), calculated on the anhydrous basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION** <197K>
- **B.** The retention time of the fexofenadine peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **C.**  
**Analysis:** Examine the precipitate formed in *Other Components* for the *Content of Chloride* test.  
**Acceptance criteria:** A white precipitate is observed.

### ASSAY

#### • PROCEDURE

**Buffer:** 6.64 g/L of monobasic sodium phosphate and 0.84 g/L of sodium perchlorate in water. Adjust with phosphoric acid to a pH of 2.0.  
**Diluent:** Acetonitrile and *Buffer* (1:1)  
**Mobile phase:** Acetonitrile and *Buffer* (7:13). Add 3 mL/L of triethylamine.  
**Standard solution:** 0.06 mg/mL of USP Fexofenadine Hydrochloride RS and 0.005 mg/mL of USP Fexofenadine Related Compound A RS in *Mobile phase*  
**Sample stock solution:** 1.0 mg/mL of Fexofenadine Hydrochloride in *Diluent*  
**Sample solution:** 0.06 mg/mL of Fexofenadine Hydrochloride in *Mobile phase* from the *Sample stock solution*

### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 220 nm

**Column:** 4.6-mm  $\times$  25-cm; packing L11

**Flow rate:** 1.5 mL/min

**Injection volume:** 20 µL

### System suitability

**Sample:** *Standard solution*

### Suitability requirements

**Resolution:** NLT 10 between fexofenadine and fexofenadine related compound A

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0% for fexofenadine and NMT 3.0% for fexofenadine related compound A

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of fexofenadine hydrochloride ( $C_{32}H_{39}NO_4 \cdot HCl$ ) in the portion of Fexofenadine Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Fexofenadine

Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Fexofenadine Hydrochloride in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the anhydrous basis

### OTHER COMPONENTS

#### • CONTENT OF CHLORIDE

**Sample:** 300 mg of Fexofenadine Hydrochloride

**Blank:** Methanol

**Titrimetric system:**

(See *Titrimetry* <541>.)

**Mode:** Direct titration

**Titrant:** 0.1 N silver nitrate VS

**Endpoint detection:** Potentiometrically

**Analysis:** Dissolve the *Sample* in 50 mL of methanol.

Each mL of 0.1 N silver nitrate VS is equivalent to 3.545 mg of chloride.

**Acceptance criteria:** 6.45%–6.75% on the anhydrous basis

### IMPURITIES

• **RESIDUE ON IGNITION** <281>: NMT 0.1%

• **HEAVY METALS**, *Method II* <231>: NMT 20 ppm

• **LIMIT OF FEXOFENADINE RELATED COMPOUND B**

**Buffer:** Glacial acetic acid and water (2.3: 2000). Adjust with 6 N ammonium hydroxide to a pH of  $4.0 \pm 0.1$ .

**Mobile phase:** Acetonitrile and *Buffer* (20:80)

**System suitability solution:** Add 1.2 mg of USP Fexofenadine Related Compound B RS to a 5-mL volumetric flask. Dilute with *Mobile phase* to volume. Transfer 2.0 mL of the solution into a 100-mL volumetric flask. Add 25 mg of USP Fexofenadine Hydrochloride RS, and dilute with *Mobile phase* to volume.

**Standard solution:** 2.5 µg/mL of USP Fexofenadine Hydrochloride RS in *Mobile phase* from the *System suitability solution*

**Sample solution:** 0.25 mg/mL of Fexofenadine Hydrochloride in *Mobile phase*

### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 220 nm

**Column:** 4.6-mm × 25-cm; packing L45

**Flow rate:** 0.5 mL/min

**Injection volume:** 20 µL

**System suitability**

**Sample:** *System suitability solution*

[NOTE—The relative retention times for fexofenadine related compound B and fexofenadine are about 0.7 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 3.0 between fexofenadine and fexofenadine related compound B

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of fexofenadine related compound B in the portion of Fexofenadine Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response for fexofenadine related compound B from the *Sample solution*

$r_S$  = peak response for fexofenadine from the *Standard solution*

$C_S$  = concentration of USP Fexofenadine Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of fexofenadine in the *Sample solution* (mg/mL)

$F$  = relative response factor for fexofenadine related compound B relative to fexofenadine, 0.8

**Acceptance criteria:** NMT 0.2%

• **OTHER ORGANIC IMPURITIES**

**Buffer, Diluent, Mobile phase, Standard solution, Chromatographic system, and System suitability:** Proceed as directed in the *Assay*.

**Sample solution:** Use the *Sample stock solution* in the *Assay*.

**Reference solution:** Use the *Sample solution* in the *Assay*.

**Samples:** *Standard solution*, *Sample solution*, *Reference solution*, and *Mobile phase* (used as the blank)

Measure the peak areas, excluding the peaks corresponding to those from the *Mobile phase*.

Calculate the percentage of fexofenadine related compound A in the portion of Fexofenadine Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response for fexofenadine related compound A from the *Sample solution*

$r_S$  = peak response for fexofenadine related compound A from the *Standard solution*

$C_S$  = concentration of USP Fexofenadine Related Compound A RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of fexofenadine in the *Sample solution* (mg/mL)

Calculate the percentage of decarboxylated degradant [(±)-4-[1-hydroxy-4-[4-(hydroxydiphenylmethyl)-1-piperidinyl]-butyl]-isopropylbenzene], with a relative retention time of 3.2, in the portion of Fexofenadine Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response of the decarboxylated degradant from the *Sample solution*

$r_S$  = peak response of fexofenadine from the *Standard solution*

$C_S$  = concentration of USP Fexofenadine Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of fexofenadine in the *Sample solution* (mg/mL)

$F$  = relative response factor for the decarboxylated degradant relative to fexofenadine, 1.1

Calculate the percentage of other impurities in the portion of Fexofenadine Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response for any other impurity from the *Sample solution*

$r_S$  = peak response of fexofenadine from the *Reference solution*

$C_S$  = concentration of fexofenadine in the *Reference solution* (mg/mL)

$C_U$  = concentration of fexofenadine in the *Sample solution* (mg/mL)

**Acceptance criteria:** See *Table 1*.

**Table 1**

Name	Acceptance Criteria, NMT (%)
Fexofenadine related compound A <sup>a</sup>	0.2
Decarboxylated degradant <sup>b</sup>	0.15
Any other individual, unidentified impurity	0.1
Total impurities	0.5

<sup>a</sup> Benzeneacetic acid, 4-[1-oxy-4-[4-(hydroxydiphenylmethyl)-1-piperidinyl]butyl]-α,α-dimethyl.

<sup>b</sup> (±)-4-[1-Hydroxy-4-[4-(hydroxydiphenylmethyl)-1-piperidinyl]-butyl]-isopropylbenzene.

**SPECIFIC TESTS**

- **WATER DETERMINATION, Method 1c (921):** NMT 2.0% for the anhydrous form; 6.0%–10.0% for the hydrate form. [NOTE—"Hydrate" refers to a mixture of dihydrate and trihydrate forms of fexofenadine hydrochloride.]

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers, and store at controlled room temperature.
- **LABELING:** Where it is the hydrate form, the label so indicates.
- **USP REFERENCE STANDARDS (11)**
  - USP Fexofenadine Hydrochloride RS
  - USP Fexofenadine Related Compound A RS
  - Benzeneacetic acid, 4-[1-oxy-4-[4-(hydroxydiphenylmethyl)-1-piperidinyl]butyl]-α,α-dimethyl. C<sub>32</sub>H<sub>37</sub>NO<sub>4</sub> 499.65
  - USP Fexofenadine Related Compound B RS
  - 3-[1-Hydroxy-4-[4-(hydroxydiphenylmethyl)-1-piperidinyl]butyl]-α,α-dimethyl benzeneacetic acid hydrochloride. C<sub>32</sub>H<sub>39</sub>NO<sub>4</sub> · HCl 538.12

## Fexofenadine Hydrochloride Capsules

**DEFINITION**

Fexofenadine Hydrochloride Capsules contain NLT 93.0% and NMT 105.0% of the labeled amount of fexofenadine hydrochloride (C<sub>32</sub>H<sub>39</sub>NO<sub>4</sub> · HCl).

**IDENTIFICATION**

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

• **B. INFRARED ABSORPTION** (197K)

**Sample solution:** Empty an equivalent of 60 mg of fexofenadine hydrochloride, from the contents of several Capsules, into a suitable capped tube. Add 10 mL of a mixture of acetonitrile and methanol (10:1), and shake until the sample is dispersed. Allow to settle. Decant, filter, and collect the supernatant in a suitable beaker. Evaporate the solvent to near dryness by using a stream of nitrogen and with gentle heating from an appropriate source (steam, low-temperature hot plate). While still warm, add 5 mL of water and 5 drops of diluted hydrochloric acid, and stir to induce precipitation. Chill in an ice bath for about 30 min. Pass through a 10- to 15- $\mu$ m filtering crucible with fritted disk. Dry the precipitate in an air oven for 1 h at 105°.

**Acceptance criteria:** Meet the requirements

**ASSAY**

• **PROCEDURE**

**Buffer:** 6.64 g/L of monobasic sodium phosphate and 0.84 g/L of sodium perchlorate in water. Adjust with phosphoric acid to a pH of 2.0.

**Diluent:** Acetonitrile and *Buffer* (1:1)

**Mobile phase:** Acetonitrile and *Buffer* (7:13). Add 3 mL/L of triethylamine.

**Standard solution:** 0.06 mg/mL of USP Fexofenadine Hydrochloride RS and 0.005 mg/mL of USP Fexofenadine Related Compound A RS in *Mobile phase*

**Sample stock solution:** Remove, as completely as possible, the contents of NLT 20 Capsules, mix the combined contents, and finely powder by using a mortar and pestle. Transfer a portion of the powder, equivalent to about 50 mg of fexofenadine hydrochloride, to a 50-mL volumetric flask. Add 40 mL of *Diluent*, and shake by mechanical means for 60 min. Sonicate for about 2 min. Allow to cool to room temperature, and dilute with *Diluent* to volume.

**Sample solution:** Transfer 3.0 mL of the *Sample stock solution* to a 50-mL volumetric flask, and dilute with *Mobile phase* to volume.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 220 nm

**Column:** 4.6-mm  $\times$  25-cm; packing L11

**Flow rate:** 1.5 mL/min

**Injection volume:** 20  $\mu$ L

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Resolution:** NLT 10 between fexofenadine and fexofenadine related compound A

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0% and 3.0% for fexofenadine and fexofenadine related compound A, respectively

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of fexofenadine hydrochloride ( $C_{32}H_{39}NO_4 \cdot HCl$ ) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response of fexofenadine from the *Standard solution*

$C_S$  = concentration of USP Fexofenadine Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of fexofenadine hydrochloride in the *Sample solution* (mg/mL)

**Acceptance criteria:** 93.0%–105.0%

**PERFORMANCE TESTS**

• **DISSOLUTION** (711)

**Test 1**

**Medium:** Water; 900 mL

**Apparatus 2:** 50 rpm

**Time:** 15 and 45 min

**Buffer:** 1.0 g of monobasic sodium phosphate, 0.5 g of sodium perchlorate, and 0.3 mL of phosphoric acid in 300 mL of water

**Mobile phase:** Acetonitrile and *Buffer* (7:3)

**System suitability stock solution:** 0.44 mg/mL of USP Fexofenadine Related Compound A RS in water.

[NOTE—A small amount of glacial acetic acid, not to exceed 5% of the total volume, may be used if necessary to dissolve USP Fexofenadine Related Compound A RS.]

**System suitability solution:** Prepare a solution of USP Fexofenadine Hydrochloride RS in the *System suitability stock solution* containing 0.01 mg/mL of USP Fexofenadine Related Compound A RS and 0.06 mg/mL of USP Fexofenadine Hydrochloride RS.

**Standard solution:** 0.07 mg/mL of USP Fexofenadine Hydrochloride RS in water. [NOTE—A small amount of methanol, not to exceed 0.5% of the total volume, may be used if necessary to dissolve USP Fexofenadine Hydrochloride RS.]

**Sample solution:** Filtered portions of the solution under test

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 220 nm

**Column:** 4.6-mm  $\times$  10-cm; packing L1

**Flow rate:** 1 mL/min

**Injection volume:** 50  $\mu$ L

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

**Suitability requirements**

**Resolution:** NLT 2.0 between fexofenadine and fexofenadine related compound A, *System suitability solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of fexofenadine hydrochloride ( $C_{32}H_{39}NO_4 \cdot HCl$ ) dissolved.

**Tolerances:** NLT 50% (Q) of the labeled amount of fexofenadine hydrochloride ( $C_{32}H_{39}NO_4 \cdot HCl$ ) is dissolved in 15 min; NLT 75% (Q) of the labeled amount of fexofenadine hydrochloride ( $C_{32}H_{39}NO_4 \cdot HCl$ ) is dissolved in 45 min.

**Test 2:** If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.

**Medium, Apparatus, Buffer, Mobile phase, System suitability stock solution, System suitability solution, Chromatographic system, and Analysis:** Proceed as directed for *Test 1*.

**Time:** 45 min

**Tolerances:** NLT 75% (Q) of the labeled amount of fexofenadine hydrochloride ( $C_{32}H_{39}NO_4 \cdot HCl$ ) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

**IMPURITIES**

• **ORGANIC IMPURITIES**

**Buffer:** 6.64 mg/mL of monobasic sodium phosphate and 0.84 mg/mL of sodium perchlorate in water. Adjust with phosphoric acid to a pH of 2.0.

**Diluent:** Acetonitrile and *Buffer* (1:1)

**Mobile phase:** Acetonitrile and *Buffer* (7:13). Add 3 mL/L of triethylamine

**Standard solution:** 0.06 mg/mL of USP Fexofenadine Hydrochloride RS and 0.005 mg/mL of USP Fexofenadine Related Compound A RS in *Mobile phase*

**Sample solution:** Use the *Sample stock solution* as prepared in the *Assay*.

**Reference solution:** 0.06 mg/mL of fexofenadine hydrochloride in *Mobile phase* from the *Sample solution*

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 220 nm

**Column:** 4.6-mm × 25-cm; packing L11

**Flow rate:** 1.5 mL/min

**Injection volume:** 20 µL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Resolution:** NLT 10 between fexofenadine and fexofenadine related compound A

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0% and 3.0% for fexofenadine and fexofenadine related compound A, respectively

#### Analysis

**Samples:** *Standard solution*, *Sample solution*, and *Reference solution*

Calculate the percentage of fexofenadine related compound A in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response for fexofenadine related compound A from the *Sample solution*

$r_S$  = peak response for fexofenadine related compound A from the *Standard solution*

$C_S$  = concentration of USP Fexofenadine Related Compound A RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of fexofenadine in the *Sample solution* (mg/mL)

Calculate the percentage of decarboxylated degradant [(±)-4-[1-hydroxy-4-[4-(hydroxydiphenylmethyl)-1-piperidinyl]-butyl]-isopropylbenzene], with a relative retention time of 3.2, in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response of the decarboxylated degradant from the *Sample solution*

$r_S$  = peak response of fexofenadine from the *Standard solution*

$C_S$  = concentration of USP Fexofenadine Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of fexofenadine in the *Sample solution* (mg/mL)

$F$  = response factor for the decarboxylated degradant relative to fexofenadine, 1.1

Calculate the percentage of other impurities in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response for any other impurity from the *Sample solution*

$r_S$  = peak response of fexofenadine from the *Reference solution*

$C_S$  = concentration of fexofenadine in the *Reference solution* (mg/mL)

$C_U$  = nominal concentration of fexofenadine in the *Sample solution* (mg/mL)

**Acceptance criteria:** See *Table 1*.

**Table 1**

Name	Acceptance Criteria, NMT (%)
Fexofenadine related compound A <sup>a</sup>	0.4
Decarboxylated degradant <sup>b</sup>	0.2
Any other individual, unidentified impurity	0.2
Total impurities	0.5

<sup>a</sup> Benzeneacetic acid, 4-[1-oxy-4-[4-(hydroxydiphenylmethyl)-1-piperidinyl]butyl]-α,α-dimethyl.

<sup>b</sup> (±)-4-[1-Hydroxy-4-[4-(hydroxydiphenylmethyl)-1-piperidinyl]-butyl]-isopropylbenzene.

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at controlled room temperature.

• **LABELING:** When more than one *Dissolution* test is given, the labeling states the test used only if *Test 1* is not used.

#### • USP REFERENCE STANDARDS <11>

USP Fexofenadine Hydrochloride RS

USP Fexofenadine Related Compound A RS

Benzeneacetic acid, 4-[1-oxy-4-[4-(hydroxydiphenylmethyl)-1-piperidinyl]butyl]-α,α-dimethyl.

C<sub>32</sub>H<sub>37</sub>NO<sub>4</sub> 538.12

## Fexofenadine Hydrochloride Tablets

#### DEFINITION

Fexofenadine Hydrochloride Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of fexofenadine hydrochloride (C<sub>32</sub>H<sub>39</sub>NO<sub>4</sub> · HCl).

#### IDENTIFICATION

##### • A. INFRARED ABSORPTION <197K>

**Standard solution:** Transfer 60 mg of USP Fexofenadine Hydrochloride RS to a suitable capped tube and add 10 mL of a mixture of acetonitrile and methanol (10:1).

**Sample solution:** Transfer an equivalent to 60 mg of fexofenadine hydrochloride, from a sufficient number of weighed and finely powdered Tablets, to a suitable capped tube, and add 10 mL of a mixture of acetonitrile and methanol (10:1).

**Analysis:** Shake or mix the *Standard solution* and *Sample solution* on a vortex mixer for 1–2 min to disperse the sample. Allow the solution to stand for 10 min, or centrifuge for 2–3 min. Pass the liquid into a 50-mL beaker using a 0.45-µm polytetrafluoroethylene syringe filter. Evaporate the solvent until about 0.5 mL remains, using a stream of nitrogen with gentle heating (do not exceed 75°). Add 5 mL of water and 5 drops of dilute hydrochloric acid, and stir to induce precipitation. Chill in an ice bath for 30 min. Filter the solution through a 10- to 15-µm sintered-glass crucible. Dry the precipitate in an air oven for 1 h at 105° oven for 1 h at 105°. Prepare a bromide dispersion from the residue.

**Acceptance criteria:** The IR absorption spectrum of the potassium bromide dispersion of the residue from the sample exhibits maxima only at the same wavelengths as that of a potassium bromide dispersion from the Standard.

• **B.** The retention time of the major peak in the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY****• PROCEDURE**

**Solution A:** Glacial acetic acid and water (17:983). Dilute 100 mL of this solution with water to 1 L.

**Solution B:** Dilute 15 mL of a solution containing acetonitrile and triethylamine (1:1) with *Solution A* to 1 L. Adjust with phosphoric acid to a pH of 5.25.

**Diluent:** Acetonitrile and *Solution A* (3:1)

**Mobile phase:** Acetonitrile and *Solution B* (9:16)

**Standard stock solution:** 0.25 mg/mL of USP Fexofenadine Hydrochloride RS in *Diluent*

**Standard solution:** 0.015 mg/mL from the *Standard stock solution* in *Mobile phase*

**Sample stock solution:** Transfer a sufficient number of whole Tablets (NLT 10) to a suitable volumetric flask, add *Solution A* (equivalent to 20% of the total flask volume), and shake by mechanical means at a high speed for 30 min or until the Tablets are fully disintegrated and finely dispersed. Add acetonitrile (equivalent to 80% of the total flask volume), and shake by mechanical means for 60 min. Dilute with *Diluent* to volume. Pass a portion of this solution through a polytetrafluoroethylene filter having a 0.45- $\mu$ m or finer pore size, and use the filtrate. Dilute, if necessary, with *Diluent* to obtain a solution containing an equivalent to 1.2 mg/mL of fexofenadine hydrochloride.

**Sample solution:** 0.018 mg/mL from the *Sample stock solution* in *Mobile phase*

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 220 nm

**Column:** 4.6-mm  $\times$  25-cm; 5- $\mu$ m packing L11

**Column temperature:** 35°

**Flow rate:** 1.5 mL/min

**Injection size:** 20  $\mu$ L

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{32}H_{39}NO_4 \cdot HCl$  in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Fexofenadine Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of fexofenadine hydrochloride in the *Sample solution* (mg/mL)

**Acceptance criteria:** 95.0%–105.0%

**PERFORMANCE TESTS****• DISSOLUTION <711>****Test 1**

**Medium:** 0.001 N hydrochloric acid; 900 mL, deaerated

**Apparatus 2:** 50 rpm

**Time:** 10 and 30 min

Determine the percentages of the labeled amount of  $C_{32}H_{39}NO_4 \cdot HCl$  dissolved by using the following method.

**Solution A:** 1.0 g of monobasic sodium phosphate, 0.5 g of sodium perchlorate, and 0.3 mL of concentrated phosphoric acid in 300 mL of water

**Mobile phase:** Acetonitrile and *Solution A* (7:3)

**Standard solution:** USP Fexofenadine Hydrochloride RS in *Medium* to obtain a solution having a known concentration similar to that expected for the solution

under test. [NOTE—A small amount of methanol, not exceeding 0.5% of the total volume, can be used to dissolve fexofenadine hydrochloride.]

**System suitability solution:** 0.44 mg/mL of USP Fexofenadine Related Compound A RS in water. Transfer 1.0 mL of this solution into a vial, and add 40 mL of the *Standard solution*. [NOTE—A small amount of acetic acid, not exceeding 5% of the total volume, can be used to dissolve fexofenadine related compound A.]

**Sample solution:** Pass portions of the solution under test through a glass fiber filter having a 0.45- $\mu$ m pore size.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 220 nm

**Column:** 4.6-mm  $\times$  10-cm; packing L1

**Flow rate:** 1 mL/min

**Injection size:** 2–3  $\mu$ g column load of fexofenadine hydrochloride

**System suitability**

**Samples:** *Standard solution* and *System suitability solution*

**Suitability requirements**

**Resolution:** NLT 2.0 between fexofenadine and fexofenadine related compound A, *System suitability solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{32}H_{39}NO_4 \cdot HCl$  dissolved in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times D \times V \times 100$$

$r_U$  = peak area from the *Sample solution*

$r_S$  = peak area from the *Standard solution*

$C_S$  = concentration of USP Fexofenadine Hydrochloride RS in the *Standard solution* (mg/mL)

$L$  = Tablet label claim (mg)

$D$  = dilution factor of the *Sample solution*

$V$  = volume of *Medium*, 900 mL

**Tolerances:** NLT 60% (Q) of the labeled amount of  $C_{32}H_{39}NO_4 \cdot HCl$  is dissolved in 10 min; NLT 80% (Q) of the labeled amount of  $C_{32}H_{39}NO_4 \cdot HCl$  is dissolved in 30 min.

**Test 2**

If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.

**Medium:** 0.001 N hydrochloric acid; 900 mL

**Apparatus 2:** 50 rpm. Use paddles and shafts coated with Teflon.

**Time:** 30 min

Determine the percentages of the labeled amount of  $C_{32}H_{39}NO_4 \cdot HCl$  dissolved by using the following method.

**Solution A:** 7 mg/mL of ammonium acetate in water. Adjust with glacial acetic acid to a pH of  $4.0 \pm 0.05$ .

**Mobile phase:** Acetonitrile and *Solution A* (2:3)

**Standard solution 1:** Transfer 20 mg of USP Fexofenadine Hydrochloride RS to a 100-mL volumetric flask. Add 3.0 mL of methanol, and mix. Dilute with *Medium* to volume.

**Standard solution 2:** Transfer 15.0 mL of *Standard solution 1* to a 50-mL volumetric flask. Dilute with *Medium* to volume.

**Standard solution 3:** Transfer 7.5 mL of *Standard solution 1* to a 50-mL volumetric flask. Dilute with *Medium* to volume.

**Sample solution:** Pass portions of the solution under test through a suitable filter of 0.45- $\mu$ m pore size.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 259 nm

**Column:** 4.6-mm × 15-cm; packing L11

**Flow rate:** 1.5 mL/min

**Injection size:** 10 µL for *Standard solution 1* and 30 µL for *Standard solutions 2* and *3*

#### System suitability

**Sample:** Any of the *Standard solutions*

**Suitability requirements**

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solutions 1, 2, and 3* and the *Sample solution*

Calculate the percentage of  $C_{32}H_{39}NO_4 \cdot HCl$  dissolved in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_U$  = peak area from the *Sample solution*

$r_S$  = peak area from the *Standard solution*

$C_S$  = concentration of the appropriate *Standard solution* (mg/mL)

$V$  = volume of *Medium*, 900 mL

$L$  = Tablet label claim (mg)

**Tolerances:** NLT 75% (Q) of the labeled amount of  $C_{32}H_{39}NO_4 \cdot HCl$  is dissolved.

#### Test 3

If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 3*.

**Medium:** 0.001 N hydrochloric acid; 900 mL for Tablets labeled to contain 30 mg or 60 mg, and 1800 mL for Tablets labeled to contain 180 mg

**Apparatus 2:** 50 rpm

**Time:** 45 min

**Buffer solution:** 6.64 g/L of monobasic sodium phosphate monohydrate and 0.84 g/L of sodium perchlorate monohydrate in water. Add 4 mL/L of triethylamine. Adjust with phosphoric acid to a pH of  $2.3 \pm 0.1$ .

**Mobile phase:** *Buffer solution* and acetonitrile (65:35)

**Standard stock solution:** 0.5 mg/mL of USP Fexofenadine Hydrochloride RS in *Mobile phase*. This solution is stable for 3.5 months under refrigeration or for 18 days at room temperature.

**Standard solution:** Dilute the *Standard stock solution* with *Medium* to obtain a final concentration of 0.07 mg/mL of USP Fexofenadine Hydrochloride RS. This solution is stable for 8 days under refrigeration or for 24 h at room temperature.

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 220 nm

**Column:** 4.6-mm × 10-cm; 5-µm packing L1

**Column temperature:** 40°

**Flow rate:** 2.5 mL/min

**Injection size:** 20 µL

#### System suitability

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 2.0

**Column efficiency:** NLT 1000 theoretical plates

**Relative standard deviation:** NMT 2.0%

Calculate the percentage of fexofenadine hydrochloride dissolved in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$L$  = Tablet label claim (mg)

$V$  = volume of *Medium*, 900 or 1800 mL

**Tolerances:** NLT 75% (Q) of the labeled amount of fexofenadine hydrochloride is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

#### IMPURITIES

##### Organic Impurities

##### • PROCEDURE

**Solution A, Solution B, Diluent, Mobile phase, Standard stock solution, Sample stock solution, and Sample solution:** Prepare as directed in the *Assay*.

**Standard solution:** 0.015 mg/mL of fexofenadine hydrochloride and 0.0045 mg/mL of fexofenadine related compound A from *Quantitative limit solution* and the *Standard stock solution* in *Mobile phase*

**System suitability stock solution:** Dilute 4.0 mL of the *Standard stock solution* with *Mobile phase* to 100 mL.

**System suitability solution:** Dilute 6.0 mL of the *System suitability stock solution* with *Mobile phase* to 100 mL.

**Quantitative limit solution:** 0.05 mg/mL of USP Fexofenadine Related Compound A RS in *Diluent*

##### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 220 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L11

**Column temperature:** 35°

**Flow rate:** 1.5 mL/min

**Injection size:** 20 µL

#### System suitability

**Samples:** *Standard solution* and *System suitability solution*

[NOTE— For the relative retention times, see *Impurity Table 1*.]

##### Suitability requirements

**Resolution:** NLT 7 between fexofenadine and fexofenadine related compound A, *Standard solution*

**Tailing factor:** NMT 2.0, *Standard solution*

**Relative standard deviation:** NMT 6%, *System suitability solution*; NMT 2.0% and NMT 3.0% for fexofenadine and fexofenadine related compound A, *Standard solution*

#### Analysis

**Samples:** *Standard solution*, *Sample stock solution*, and *Sample solution*

Calculate the percentage of fexofenadine related compound A in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area of fexofenadine related compound A in the *Sample stock solution*

$r_S$  = peak area of fexofenadine related compound A in the *Standard solution*

$C_S$  = concentration of fexofenadine related compound A in the *Standard solution* (mg/mL)

$C_U$  = concentration of Fexofenadine hydrochloride in the *Sample stock solution*

Calculate the percentage of the decarboxylated degradant [(±)-4-[1-hydroxy-4-[4-(hydroxydiphenylmethyl)-1-piperidinyl]-butyl]-isopropylbenzene] in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak area of the decarboxylated degradant in the *Sample stock solution*

$r_S$  = peak area of fexofenadine in the *Standard solution*

$C_S$  = concentration of USP Fexofenadine Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of fexofenadine hydrochloride in the *Sample stock solution*  
 $F$  = relative response factor (see *Impurity Table 1*)  
 Calculate the percentage of any other impurities in the portion of Tablets taken:

$$\text{Result} = r_U / (F \times r_s + r_T) \times 100$$

$r_U$  = peak area for each individual unknown impurity in the *Sample stock solution*  
 $F$  = difference in concentration between the *Sample stock solution* and the *Sample solution*, 66.7  
 $r_s$  = peak area response for fexofenadine in the *Sample solution*  
 $r_T$  = sum of the peak areas of all unknown impurities in the *Sample stock solution*

[NOTE— Disregard any peak below 0.05%.]

#### Acceptance criteria

**Individual impurities:** See *Impurity Table 1*.

**Total impurities:** NMT 0.5%

**Impurity Table 1**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Fexofenadine related compound A	1.6	—	0.4
Decarboxylated degradant	6.7	1.1	0.15
Fexofenadine	1.0	—	—
Any individual other impurity	—	1.0	0.2

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at controlled room temperature.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS (11)**  
 USP Fexofenadine Hydrochloride RS  
 USP Fexofenadine Related Compound A RS  
 Benzeneacetic acid, 4-[1-oxy-4-[4-(hydroxydiphenylmethyl)-1-piperidinyl]butyl]- $\alpha,\alpha$ -dimethyl.  
 $C_{32}H_{37}NO_4$  499.65

## Fexofenadine Hydrochloride and Pseudoephedrine Hydrochloride Extended-Release Tablets

#### DEFINITION

Fexofenadine Hydrochloride and Pseudoephedrine Hydrochloride Extended-Release Tablets contain NLT 95.0% and NMT 105.0% of the labeled amounts of fexofenadine hydrochloride ( $C_{32}H_{39}NO_4 \cdot HCl$ ) and pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ).

#### IDENTIFICATION

- **A.** The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.
- **B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)**  
**Standard solution A:** 6 mg/mL of USP Fexofenadine Hydrochloride RS in methanol  
**Standard solution B:** 12 mg/mL of USP Pseudoephedrine Hydrochloride RS in methanol

**Sample solution:** Transfer the equivalent of 30 mg of fexofenadine hydrochloride and 60 mg of pseudoephedrine hydrochloride from finely powdered Tablets (NLT 4) into a suitable vessel, and add 5 mL of methanol. Cap the vessel, and shake vigorously for 2 min. Pass the resulting suspension through a suitable filter of 0.45- $\mu$ m pore size. Use the filtrate.

**Adsorbent:** 0.2-mm layer of high-performance thin-layer chromatographic silica gel mixture. Dry the plate at 105° for 1 h before use.

**Application volume:** 10  $\mu$ L

**Developing solvent system:** Toluene, dehydrated alcohol, and ammonium hydroxide (50:45:5)

**Analysis:** Proceed as directed, using the *Developing solvent system*. After removal of the plate, mark the solvent front, and allow the plate to air-dry. Heat the plate at 105° until the odor of ammonia disappears (about 5 min). Allow the plate to cool, and examine under UV light at 254 nm. [NOTE—The  $R_F$  values for fexofenadine and pseudoephedrine are 0.17 and 0.39, respectively.]

**Acceptance criteria:** The  $R_F$  value of fexofenadine hydrochloride in the *Sample solution* is comparable to that of fexofenadine hydrochloride in *Standard solution A*. The  $R_F$  value of pseudoephedrine hydrochloride in the *Sample solution* is comparable to that of pseudoephedrine hydrochloride in *Standard solution B*.

#### ASSAY

##### • PROCEDURE

**Solution A:** Dissolve 6.8 g of sodium acetate and 16.22 g of sodium 1-octanesulfonate in water and dilute with water to 1 L. Adjust with glacial acetic acid to a pH of 4.6.

**Mobile phase:** Methanol and *Solution A* (13:7)

**Diluent:** Methanol and *Solution A* (3:2)

**System suitability solution:** Transfer 40 mg of USP Pseudoephedrine Hydrochloride RS to a 50-mL volumetric flask. Add 5 mL of *tert*-butylhydroperoxide solution, and sonicate. Cover the flask opening with aluminum foil, and place the flask in an oven at 90° for 60 min. Remove from the oven, and allow to cool. Add 35 mL of *Mobile phase*, and cool to room temperature. Dilute with *Mobile phase* to volume. The degradation of pseudoephedrine hydrochloride by this process produces the related compound ephedrone.

**Related compounds stock solution:** Dissolve quantities of USP Fexofenadine Related Compound A RS and decarboxylated degradant<sup>1</sup> in a volume of methanol, and dilute with *Solution A* to obtain a ratio of methanol to *Solution A* of 3:2. Dilute with *Diluent* to obtain a solution having concentrations of 0.2 mg/mL for each component.

**Related compounds solution:** 0.02 mg/mL each of USP Fexofenadine Related Compound A RS and decarboxylated degradant from *Related compounds stock solution* diluted with *Mobile phase*

**Standard stock solution:** 0.4 mg/mL of fexofenadine hydrochloride and 0.8 mg/mL of pseudoephedrine hydrochloride from USP Fexofenadine Hydrochloride RS and USP Pseudoephedrine Hydrochloride RS, respectively, in *Mobile phase*

**Standard solution:** Dilute 6.0 mL of the *Standard stock solution* and 15.0 mL of the *Related compounds solution* with *Mobile phase* to 50 mL to obtain a solution having known concentrations of 0.096 mg/mL of pseudoephedrine hydrochloride, 0.048 mg/mL of fexofenadine hydrochloride, 0.006 mg/mL of fexofenadine related compound A, and 0.006 mg/mL of decarboxylated degradant.

**Sample stock solution:** Nominally equivalent to 1.2 mg/mL of fexofenadine hydrochloride and 2.4 mg/mL of pseudoephedrine hydrochloride. To prepare, transfer NLT 10 whole Tablets to a 500-mL volumetric flask.

<sup>1</sup> Available from USP as USP Fexofenadine Related Compound C AS, Cat# 1270446.

Add 300 mL of methanol, and shake by mechanical means at high speed for 60 min. Sonicate the flask for 60 min at 40°. Add 150 mL of *Solution A*, and sonicate for 60 min at 40°. Vent the flask, and vigorously shake the flask by hand at 15-min intervals during the mechanical shaking and sonication steps. Cool to room temperature, and dilute with *Solution A* to volume to obtain a final concentration. Pass a portion of this solution through a filter of 0.45- $\mu$ m or finer pore size, and use the filtrate.

**Sample solution:** 0.048 mg/mL and 0.096 mg/mL of fexofenadine hydrochloride and pseudoephedrine hydrochloride, respectively, from the *Sample stock solution* diluted with *Mobile phase*. [NOTE—Alternatively, centrifuge the *Sample stock solution* and use the supernatant to prepare the *Sample solution*. Filter the *Sample solution* before analysis.]

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 215 nm

**Column:** 4.6-mm  $\times$  5-cm; 5- $\mu$ m packing L6 connected in series to a 4.6-mm  $\times$  25-cm; 5- $\mu$ m packing L11

**Column temperature:** 35°

**Flow rate:** 1.5 mL/min

**Injection size:** 20  $\mu$ L

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for pseudoephedrine and ephedrone are 1.0 and 1.2, respectively (*System suitability solution*); and for fexofenadine, fexofenadine related compound A, and decarboxylated degradant are 1.0, 1.2, and 3.1, respectively (*Standard solution*).]

#### Suitability requirements

**Resolution:** NLT 1.5 between pseudoephedrine and ephedrone, *System suitability solution*; NLT 2.0 between fexofenadine and fexofenadine related compound A, *Standard solution*

**Relative standard deviation:** NMT 1.0% for replicate injections based on the pseudoephedrine peak, *System suitability solution*; NMT 1.0% for replicate injections based on the fexofenadine peak, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate separately the percentage of the labeled amount of fexofenadine hydrochloride ( $C_{32}H_{39}NO_4 \cdot HCl$ ) and pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ) in the Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of either fexofenadine or pseudoephedrine from the *Sample solution*  
 $r_S$  = peak response of either fexofenadine or pseudoephedrine from the *Standard solution*  
 $C_S$  = concentration of either USP Fexofenadine Hydrochloride RS or USP Pseudoephedrine Hydrochloride RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of either fexofenadine hydrochloride or pseudoephedrine hydrochloride in the *Sample solution* (mg/mL)

**Acceptance criteria:** 95.0%–105.0%

#### PERFORMANCE TESTS

##### • DISSOLUTION <711>

###### Test 1

**Medium:** 0.001 N hydrochloric acid; 900 mL

**Apparatus 2:** 50 rpm

###### Times

**Fexofenadine hydrochloride:** 15 and 45 min

**Pseudoephedrine hydrochloride:** 45 min; 3, 5, and 12 h

**Solution A:** 7.0 mg/mL of monobasic sodium phosphate monohydrate in water. Adjust with 85% phosphoric acid to a pH of  $2.00 \pm 0.05$ .

**Mobile phase:** Acetonitrile and *Solution A* (9:11)

**Standard solution:** Dissolve quantities of USP Fexofenadine Hydrochloride RS and USP Pseudoephedrine Hydrochloride RS in *Medium*, and dilute to obtain a solution containing known concentrations similar to those expected in the *Sample solution*. [NOTE—A small amount of methanol, NMT 0.5% of the total volume, can be used to dissolve the fexofenadine hydrochloride.]

**Sample solution:** Pass a portion of the solution under test through a suitable nylon filter of 0.45- $\mu$ m pore size.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.6-mm  $\times$  25-cm; packing L6

**Flow rate:** 1 mL/min

**Injection size:** 10  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

##### Suitability requirements

**Resolution:** NLT 3.0 between fexofenadine and pseudoephedrine

**Tailing factor:** NMT 1.5 for fexofenadine and pseudoephedrine

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentages of  $C_{32}H_{39}NO_4 \cdot HCl$  and  $C_{10}H_{15}NO \cdot HCl$  dissolved.

#### Tolerances

**Fexofenadine hydrochloride ( $C_{32}H_{39}NO_4 \cdot HCl$ ):** NLT 65% (Q) of the labeled amount is dissolved in 15 min and NLT 80% (Q) of the labeled amount is dissolved in 45 min.

**Pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ):** See *Table 1*.

**Table 1**

Time	Amount Dissolved
45 min	NMT 36%
3 h	45%–69%
5 h	61%–80%
12 h	NLT 80%

The percentages of the labeled amount of pseudoephedrine hydrochloride dissolved at the times specified conform to *Acceptance Table 2* in <711>.

**Test 2:** If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.

**Medium:** 0.001 N hydrochloric acid; 900 mL

**Apparatus 2:** 50 rpm

###### Times

**Fexofenadine hydrochloride:** 45 min

**Pseudoephedrine hydrochloride:** 30 min; 2, 4, and 12 h

**Solution A:** 2.7 mg/mL of monobasic potassium phosphate and 2.2 mg/mL of sodium 1-octanesulfonate in

water. Adjust with phosphoric acid to a pH of  $2.50 \pm 0.05$ .

**Mobile phase:** Methanol, acetonitrile, and *Solution A* (3:3:4)

**Fexofenadine standard stock solution:** Transfer 66 mg of USP Fexofenadine Hydrochloride RS to a 100-mL volumetric flask. Add 10 mL of methanol, and swirl until dissolved. Add 50 mL of *Medium*, and mix. Allow the solution to equilibrate to room temperature, and dilute with *Medium* to volume.

**Pseudoephedrine standard stock solution:** Transfer 66 mg of USP Pseudoephedrine Hydrochloride RS to a 100-mL volumetric flask. Add 10 mL of methanol, and swirl until dissolved. Add 50 mL of *Medium*, and mix. Allow the solution to equilibrate to room temperature, and dilute with *Medium* to volume.

**Standard solution:** 66 µg/mL of USP Fexofenadine Hydrochloride RS and 132 µg/mL of USP Pseudoephedrine Hydrochloride RS from a mixture of *Fexofenadine standard stock solution* and *Pseudoephedrine standard stock solution* diluted with *Medium*

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 215 nm

**Column:** 4.6-mm  $\times$  25-cm; 5-µm packing L7

**Flow rate:** 1.5 mL/min

**Injection size:** 10 µL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Resolution:** NLT 2.0 between fexofenadine and pseudoephedrine

**Tailing factor:** NMT 2.0 for fexofenadine and NMT 2.5 for pseudoephedrine

**Relative standard deviation:** NMT 2.0% for both peaks

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentages of  $C_{32}H_{39}NO_4 \cdot HCl$  and  $C_{10}H_{15}NO \cdot HCl$  dissolved.

#### Tolerances

**Fexofenadine hydrochloride ( $C_{32}H_{39}NO_4 \cdot HCl$ ):** NLT 80% (Q) of the labeled amount is dissolved in 45 min.

**Pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ):** See *Table 2*.

**Table 2**

Time	Amount Dissolved
30 min	NMT 35%
2 h	38%–58%
4 h	56%–76%
12 h	NLT 80%

The percentages of the labeled amount of pseudoephedrine hydrochloride dissolved at the times specified conform to *Acceptance Table 2* in <711>.

**Test 3:** If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 3*.

**Medium:** 0.001 N hydrochloric acid; 900 mL

**Apparatus 2:** 50 rpm

#### Times

**Fexofenadine hydrochloride:** 30 min

**Pseudoephedrine hydrochloride:** 0.5, 2, 4, and 12 h

**Buffer solution:** 6.64 g/L of monobasic sodium phosphate in water. Adjust with phosphoric acid to a pH of  $2.50 \pm 0.05$ .

**Mobile phase:** *Buffer solution* and acetonitrile (3:2)

**Standard solution:** [NOTE—A small amount of methanol, not exceeding 0.5% of the final total volume, can be used to dissolve fexofenadine hydrochloride.] Prepare a solution in *Medium* containing known concentrations of USP Fexofenadine Hydrochloride RS and USP Pseudoephedrine Hydrochloride RS similar to those expected in the solution under test.

**Sample solution:** Pass a portion of the solution under test through a suitable PVDF or nylon filter of 0.45-µm pore size.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.6-mm  $\times$  25-cm; packing L1

**Flow rate:** 2.5 mL/min

**Injection size:** 10 µL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** NMT 2.0 for fexofenadine and pseudoephedrine

**Relative standard deviation:** NMT 2.0% for both peaks

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentages of  $C_{32}H_{39}NO_4 \cdot HCl$  and  $C_{10}H_{15}NO \cdot HCl$  dissolved.

#### Tolerances

**Fexofenadine hydrochloride ( $C_{32}H_{39}NO_4 \cdot HCl$ ):** NLT 80% (Q) of the labeled amount is dissolved in 30 min.

**Pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ):** See *Table 3*.

**Table 3**

Time (h)	Amount Dissolved
0.5	13%–33%
2	35%–55%
4	50%–70%
12	NLT 80%

The percentages of the labeled amount of pseudoephedrine hydrochloride dissolved at the times specified conform to *Acceptance Table 2* in <711>.

**Test 4:** For products labeled with a dosing interval of 24 h. If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 4*.

**Medium:** 0.001 N hydrochloric acid; 900 mL

**Apparatus 2:** 50 rpm

#### Times

**Fexofenadine hydrochloride:** 30 min

**Pseudoephedrine hydrochloride:** 3, 7, and 23 h

Determine the percentages of the labeled amounts of fexofenadine hydrochloride and of pseudoephedrine hydrochloride dissolved by using the chromatographic procedure described in *Test 1*.

#### Tolerances

**Fexofenadine hydrochloride ( $C_{32}H_{39}NO_4 \cdot HCl$ ):** NLT 80% (Q) of the labeled amount is dissolved in 30 min.

**Pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ):** See *Table 4*.

**Table 4**

Time (h)	Amount Dissolved
3	10%–30%
7	35%–65%
23	NLT 80%

The percentages of the labeled amount of pseudoephedrine hydrochloride dissolved at the times specified conform to *Acceptance Table 2* in (711).

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

### IMPURITIES

[NOTE—On the basis of knowledge of the product, perform either: (a) *Organic Impurities, Procedure 1* or (b) *Organic Impurities, Procedure 2, Organic Impurities, Procedure 3, and Organic Impurities, Procedure 4.*]

#### • ORGANIC IMPURITIES, PROCEDURE 1

**Solution A, Mobile phase, Diluent, System suitability solution, Related compounds stock solution, Related compounds solution, Standard stock solution, Standard solution, and Chromatographic system:** Proceed as directed in the Assay.

**Sample solution:** Use the *Sample stock solution*, prepared as directed in the Assay.

**Reference solution:** Use the *Sample solution*, prepared as directed in the Assay.

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for pseudoephedrine and ephedrone are 1.0 and 1.2, respectively (*System suitability solution*); and for fexofenadine, fexofenadine related compound A, and decarboxylated degradant are 1.0, 1.2, and 3.1, respectively (*Standard solution*).]

#### Suitability requirements

**Resolution:** NLT 1.7 between pseudoephedrine and ephedrone, *System suitability solution*; NLT 2.0 between fexofenadine and fexofenadine related compound A, *Standard solution*

**Relative standard deviation:** NMT 1.0% for replicate injections based on the pseudoephedrine peak, *System suitability solution*; NMT 1.0% for replicate injections based on the fexofenadine peak and NMT 3.0% based on the individual peaks for fexofenadine related compound A and decarboxylated degradant, *Standard solution*

#### Analysis

**Samples:** *Sample solution* and *Reference solution*

Calculate the percentage of fexofenadine related compound A and decarboxylated degradant in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = individual peak area response of either fexofenadine related compound A or decarboxylated degradant from the *Sample solution*

$r_S$  = peak area response of fexofenadine related compound A or decarboxylated degradant from the *Standard solution*

$C_S$  = concentration of either USP Fexofenadine Related Compound A RS or decarboxylated degradant in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of fexofenadine hydrochloride in the *Sample solution* (mg/mL)

Calculate the percentage of ephedrone in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak height response of ephedrone from the *Sample solution*

$r_S$  = peak height response of pseudoephedrine from the *Standard solution*

$C_S$  = concentration of USP Pseudoephedrine Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of pseudoephedrine hydrochloride in the *Sample solution* (mg/mL)

$F$  = relative response factor for ephedrone, 0.394  
Calculate the percentage of any other impurities in the portion of Tablets taken:

$$\text{Result} = r_U/(F \times r_S + r_T) \times 100$$

$r_U$  = individual peak area response of an individual unknown impurity from the *Sample solution*

$F$  = difference in concentration between the *Sample solution* and the *Reference solution*, 25

$r_S$  = peak area response of fexofenadine hydrochloride from the *Reference solution*

$r_T$  = sum of the peak area responses of all unknown impurities from the *Sample solution*

[NOTE—Disregard any peak below 0.05%.]

**Acceptance criteria:** See *Table 5*.

**Table 5**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Pseudoephedrine	1.0	—
Ephedrone	1.2 <sup>a</sup>	0.2
Fexofenadine	1.0	—
Fexofenadine related compound A	1.2 <sup>b</sup>	0.4
Decarboxylated degradant <sup>c</sup>	3.1 <sup>b</sup>	0.2
Tertiary dehydrated impurity <sup>d</sup>	1.8	0.2
Any other individual impurity	—	0.2
Total impurities	—	0.8

<sup>a</sup> Relative to pseudoephedrine.

<sup>b</sup> Relative to fexofenadine.

<sup>c</sup> (±)-4-(1-Hydroxy-4-[4-(hydroxydiphenylmethyl)-1-piperidinyl]-butyl]-isopropylbenzene.

<sup>d</sup> 4-[4-(Diphenylmethylene)-1-piperidinyl]-1-hydroxybutyl]-2,2-dimethyl phenyl acetic acid.

#### • ORGANIC IMPURITIES, PROCEDURE 2

**Solution A:** Dissolve 2.7 g of monobasic potassium phosphate and 2.2 g of sodium 1-octanesulfonate in 1000 mL of water. Adjust with phosphoric acid to a pH of  $2.50 \pm 0.05$ .

**Mobile phase:** Methanol and *Solution A* (3:2)

**Standard stock solution:** 0.18 mg/mL USP Fexofenadine Hydrochloride RS in *Mobile phase*

**Standard solution:** 0.0108 mg/mL of USP Fexofenadine Hydrochloride RS in *Mobile phase*, prepared from the *Standard stock solution*

**Sensitivity solution:** 0.54 µg/mL of USP Fexofenadine Hydrochloride RS in *Mobile phase*, prepared from the *Standard solution*

**Sample solution:** Weigh and finely powder 9 Tablets, and quantitatively transfer the ground powder to a 500-mL volumetric flask, with the aid of 200 mL of *Mobile phase*. Sonicate for 10 min, and add an additional 100 mL of *Mobile phase*. Shake by mechanical means for 30 min, and dilute with *Mobile phase* to volume. Pass a portion of the solution through a polypropylene or polysulfone membrane filter of 0.45-µm pore size, and discard at least the first 10 mL of the filtrate.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 215 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L1

**Flow rate:** 1 mL/min

**Injection size:** 20 µL

[NOTE—The run time is six times the retention time of fexofenadine.]

USP Finasteride RS

**Identification**—**A:** *Infrared Absorption* <197M>.**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.**Specific rotation** <781S>: between −56.0° and −60.0°, determined at 405 nm.*Test solution:* 10 mg per mL, in methanol.**Water, Method I** <921>: not more than 0.3%.**Residue on ignition** <281>: not more than 0.1%.**Heavy metals, Method II** <231>: 0.001%.**Chromatographic purity**—*Mobile phase*—Prepare a filtered and degassed mixture of water, tetrahydrofuran, and acetonitrile (8:1:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).*Diluting solution*—Prepare a solution of water and acetonitrile (1:1).*Standard solution*—Dissolve an accurately weighed quantity of USP Finasteride RS in *Diluting solution*, and dilute quantitatively, and stepwise if necessary, with *Diluting solution* to obtain a solution having a known concentration of about 1.0 mg per mL.*Test solution*—Transfer about 100 mg of Finasteride, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Diluting solution* to volume, and mix.*Chromatographic system* (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 30-cm column that contains 4-μm packing L1. The flow rate is about 1.5 mL per minute. The column temperature is maintained at 60°. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 10,000 theoretical plates; and the tailing factor is not more than 1.3.*Procedure*—Inject a volume (about 15 μL) of the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Finasteride taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the peak response for each impurity, and  $r_s$  is the sum of the responses of all peaks: not more than 0.5%

of any individual impurity is found; and not more than 1.0% of total impurities is found.

#### Assay—

**Mobile phase**—Prepare a filtered and degassed mixture of water and tetrahydrofuran (4:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Diluting solution**—Prepare a solution of water and acetonitrile (1:1).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Finasteride RS in *Diluting solution*, and dilute quantitatively, and stepwise if necessary, with *Diluting solution* to obtain a solution having a known concentration of about 200 µg per mL.

**Assay preparation**—Transfer about 20 mg of Finasteride, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Diluting solution* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 215-nm detector and a 3.0-mm × 3.0-cm column that contains 3-µm packing L7. The flow rate is about 3 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 1800 theoretical plates; the tailing factor is not more than 1.3; and the relative standard deviation for replicate injections is not more than 1.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{23}H_{36}N_2O_2$  in the portion of Finasteride taken by the formula:

$$100C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Finasteride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Finasteride Tablets

» Finasteride Tablets contain not less than 95.0 percent and not more than 105.0 percent of finasteride ( $C_{23}H_{36}N_2O_2$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers, and store at controlled room temperature.

#### USP Reference standards <11>—

USP Finasteride RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

#### Dissolution <711>—

**Medium**: water; 900 mL.

**Apparatus 2**: 50 rpm.

FOR PRODUCTS LABELED AS 5-MG TABLETS—

**Time**: 45 minutes.

Determine the amount of  $C_{23}H_{36}N_2O_2$  dissolved by employing the following method.

**Mobile phase**—Prepare a filtered and degassed mixture of acetonitrile and water (29:21). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Diluting solution**—Prepare a solution of acetonitrile and water (7:3).

**Standard solution**—Dissolve an accurately weighed quantity of USP Finasteride RS in *Diluting solution*, and dilute

quantitatively, and stepwise if necessary, with *Diluting solution* to obtain a solution having a known concentration approximately equivalent to the sample under test.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 5-cm column that contains packing L1. The column temperature is maintained at 45°. The flow rate is about 2 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the capacity factor,  $k'$ , is not less than 2.0; the column efficiency is greater than 1000 theoretical plates; the tailing factor is less than 2; and the relative standard deviation for replicate injections is less than 2.0%.

**Procedure**—Separately inject equal volumes (about 200 µL) of the solution under test and the *Standard solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity of  $C_{23}H_{36}N_2O_2$  dissolved.

**Tolerances**—Not less than 75% ( $Q$ ) of the labeled amount of  $C_{23}H_{36}N_2O_2$  is dissolved in 45 minutes.

FOR PRODUCTS LABELED AS 1-MG TABLETS—

**Time**: 30 minutes.

**Mobile phase**—Prepare a degassed mixture of acetonitrile and water (11:9). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Diluting solution**—Prepare a solution of water and acetonitrile (7:3).

**Standard solution**—Dissolve an accurately weighed quantity of USP Finasteride RS in *Diluting solution*, to obtain a solution having a known concentration of 0.1 mg per mL. Dilute this solution quantitatively, and stepwise if necessary, in 0.5% sodium lauryl sulfate to obtain a solution containing 0.001 mg of finasteride per mL.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L11. The column temperature is maintained at 45°. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 5000 theoretical plates; the tailing factor is not more than 2; and the relative standard deviation for replicate injections is not more than 2%.

**Procedure**—Separately inject equal volumes (about 100 µL) of the solution under test and the *Standard solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity of finasteride ( $C_{23}H_{36}N_2O_2$ ) dissolved.

**Tolerances**—Not less than 80% ( $Q$ ) of the labeled amount of  $C_{23}H_{36}N_2O_2$  is dissolved in 30 minutes.

**Uniformity of dosage units** <905>: meet the requirements.

#### Assay—

**Mobile phase**—Prepare a filtered and degassed mixture of 2.5 mM phosphoric acid and acetonitrile (1:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Diluting solution**—Prepare a solution of acetonitrile and water (7:3).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Finasteride RS in *Diluting solution*, and dilute quantitatively, and stepwise if necessary, with *Diluting solution* to obtain a solution having a known concentration of about 100 µg per mL.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an amount of powder equivalent to about 10 mg of finasteride, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Diluting solution* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 240-nm detector

and a 4.6-mm × 10.0-cm column that contains packing L1. The column temperature is maintained at 45°. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the capacity factor,  $k'$ , is not less than 2.0; the column efficiency is not less than 1000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of finasteride ( $C_{23}H_{36}N_2O_2$ ) in the portion of Tablets taken by the formula:

$$100C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Finasteride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Flavoxate Hydrochloride

$C_{24}H_{25}NO_4 \cdot HCl$  427.92  
4*H*-1-Benzopyran-8-carboxylic acid, 3-methyl-4-oxo-2-phenyl-, 2-(1-piperidinyl)ethyl ester, hydrochloride; 2-Piperidinoethyl 3-methyl-4-oxo-2-phenyl-4*H*-1-benzopyran-8-carboxylate hydrochloride [3717-88-2].

### DEFINITION

Flavoxate Hydrochloride contains NLT 98.0% and NMT 102.0% of  $C_{24}H_{25}NO_4 \cdot HCl$ , calculated on the dried basis.

### IDENTIFICATION

- A. INFRARED ABSORPTION** (197K)
- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- C. IDENTIFICATION TESTS—GENERAL, Chloride** (191): A solution of 10 mg/mL meets the requirements of the silver nitrate precipitate.

### ASSAY

#### PROCEDURE

**Solution A:** Mixture of 1.0 g of sodium hexanesulfonate in 650 mL of water, 1 mL of triethylamine, and 1.0 mL of phosphoric acid

**Mobile phase:** Add 350 mL of acetonitrile to *Solution A*.

**Standard solution:** 50 µg/mL of USP Flavoxate Hydrochloride RS in *Mobile phase*

**Sample solution:** 50 µg/mL of Flavoxate Hydrochloride in *Mobile phase*

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 293 nm

**Column:** 4.6-mm × 15-cm; 5-µm packing L1

**Flow rate:** 1 mL/min

**Injection size:** 20 µL

#### System suitability

**Sample:** *Standard solution*

[NOTE—The retention time of flavoxate is about 4.3 min.]

#### Suitability requirements

**Column efficiency:** NLT 3000 theoretical plates

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{24}H_{25}NO_4 \cdot HCl$  in the portion of Flavoxate Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Flavoxate Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of Flavoxate Hydrochloride in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the dried basis

### IMPURITIES

#### Inorganic Impurities

• **RESIDUE ON IGNITION** (281): NMT 0.1%

• **HEAVY METALS**, *Method II* (231): NMT 10 ppm

#### Organic Impurities

##### PROCEDURE

**Solution A:** 0.05% (v/v) trifluoroacetic acid in water

**Solution B:** Acetonitrile

**Mobile phase:** See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	68	32
15	68	32
25	20	80
35	20	80
36	68	32
41	68	32

**Diluent:** Methanol and 0.02% trifluoroacetic acid (1:1)

**Standard stock solution 1:** 2 mg/mL of USP Flavoxate Hydrochloride RS in *Diluent*

**Standard stock solution 2:** 0.05 mg/mL of USP Flavoxate Related Compound A RS in *Diluent*

**Standard stock solution 3:** 0.05 mg/mL of USP Flavoxate Related Compound B RS in methanol

**Standard stock solution 4:** 0.05 mg/mL of USP Flavoxate Related Compound C RS prepared as follows: Dissolve USP Flavoxate Related Compound C RS first in methanol using 10% of final volume, then fill 10% of final volume with 0.02% trifluoroacetic acid. Dilute with *Diluent* to volume.

**Standard solution:** 1 mg/mL of USP Flavoxate Hydrochloride RS and 5 µg/mL each of USP Flavoxate Related Compound A RS, USP Flavoxate Related Compound B RS, and USP Flavoxate Related Compound C RS in *Diluent* from *Standard stock solutions* 1, 2, 3, and 4, respectively

**Sample solution:** 1 mg/mL of Flavoxate Hydrochloride in *Diluent*

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 240 nm

**Column:** 4.6-mm × 15-cm; 5-µm packing L1

**Column temperature:** 30°

**Flow rate:** 0.8 mL/min

**Injection size:** 10 µL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Resolution:** NLT 2.0 between the flavoxate related compound B and flavoxate related compound C peaks

**Tailing factor:** NMT 1.5 for the flavoxate related compounds A, B, and C peaks

**Relative standard deviation:** NMT 2.0% for the flavoxate peak

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of flavoxate related compounds A, B, and C in the portion of Flavoxate Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response of each individual impurity from the *Sample solution*

$r_S$  = peak response of flavoxate from the *Standard solution*

$C_S$  = concentration of USP Flavoxate Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Flavoxate Hydrochloride in the *Sample solution* (mg/mL)

$F$  = relative response factor (see *Impurity Table 1*)

Calculate the percentage of any other unspecified degradation product in the portion of Flavoxate Hydrochloride taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response of each unspecified impurity from the *Sample solution*

$r_T$  = sum of responses of all peaks from the *Sample solution*

#### Acceptance criteria

**Individual impurities:** See *Impurity Table 1*.

**Total impurities:** 1.0%

**Impurity Table 1**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Flavoxate	1.0	—	—
Flavoxate related compound A <sup>a</sup> *	2.8	1.6	0.3
Flavoxate related compound B <sup>b</sup> *	3.5	1.5	0.1
Flavoxate related compound C <sup>c</sup> *	3.7	1.4	0.1
Any single unspecified degradation product	—	1.0	0.1

<sup>a</sup> 3-Methylflavone-8-carboxylic acid.

<sup>b</sup> 3-Methylflavone-8-carboxylic acid methyl ester.

<sup>c</sup> 3-Methylflavone-8-carboxylic acid ethyl ester.

\* For identification and system suitability purposes only.

#### SPECIFIC TESTS

- **LOSS ON DRYING** (731): Dry a sample at 105° to constant weight: it loses NMT 0.5% of its weight.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light; and store at room temperature.
- **USP REFERENCE STANDARDS** (11)
  - USP Flavoxate Hydrochloride RS
  - USP Flavoxate Related Compound A RS
    - 3-Methylflavone-8-carboxylic acid.
    - $C_{17}H_{12}O_4$  280.27
  - USP Flavoxate Related Compound B RS
    - 3-Methylflavone-8-carboxylic acid methyl ester.
    - $C_{18}H_{14}O_4$  294.30
  - USP Flavoxate Related Compound C RS
    - 3-Methylflavone-8-carboxylic acid ethyl ester.
    - $C_{19}H_{16}O_4$  308.33

## Flavoxate Hydrochloride Tablets

» Flavoxate Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of  $C_{24}H_{25}NO_4 \cdot HCl$ , based on the label claim.

**Packaging and storage**—Preserve in well-closed containers, protected from light.

#### USP Reference standards (11)—

USP Flavoxate Hydrochloride RS

USP Flavoxate Related Compound A RS

3-Methylflavone-8-carboxylic acid.

$C_{17}H_{12}O_4$  280.27

#### Identification—

**A:** *Infrared Absorption* (197K)—

*Test specimen*—Grind at least 4 Tablets into a fine powder. Use an amount of powder equivalent to about 100 mg of flavoxate hydrochloride. Add 30 mL of methanol, and stir for about 10 minutes. Pass through a Whatman #1 filter paper, and collect the filtrate. Evaporate the methanol to dryness on a steam bath with the help of nitrogen gas. Dry the residue in vacuum at 60° for about 30 minutes. Mix 1 to 2 mg of dried residue with 200 mg of potassium bromide, and grind thoroughly for 10 to 15 minutes.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to the major peak in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

#### Dissolution (711)—

*Medium:* 0.1 N hydrochloric acid; 900 mL, deaerated.

*Apparatus 1:* 100 rpm.

*Time:* 30 minutes.

*Standard solution*—Transfer an accurately weighed quantity of USP Flavoxate Hydrochloride RS to a suitable volumetric flask, dissolve in a small amount of methanol (not more than 2% of the final volume), and dilute with *Medium* to volume to obtain a solution having a known concentration of about 0.11 mg per mL.

*Test solution*—Pass a portion of the solution under test through a suitable filter having a porosity of 45  $\mu m$ .

*Procedure*—Determine the amount of  $C_{24}H_{25}NO_4 \cdot HCl$  dissolved by employing UV absorption at the wavelength of maximum absorbance at about 294 nm, in portions of the *Test solution* in comparison with the *Standard solution*, using a cell with a path length of 0.2 cm and using *Medium* as the blank. Calculate the percentage of  $C_{24}H_{25}NO_4 \cdot HCl$  dissolved by the formula:

$$\frac{A_U \times C_S \times 900 \times 100}{A_S \times L}$$

in which  $A_U$  and  $A_S$  are the absorbances obtained from the *Test solution* and the *Standard solution*, respectively;  $C_S$  is the concentration, in mg per mL, of the *Standard solution*; 900 is the volume, in mL, of *Medium*; 100 is the conversion factor to percentage; and  $L$  is the Tablet label claim, in mg.

*Tolerances*—Not less than 70% (Q) of the labeled amount of  $C_{24}H_{25}NO_4 \cdot HCl$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

#### Related compounds—

*Mobile phase*—Prepare as directed in the *Assay*.

*Standard stock solution*—Dissolve an accurately weighed quantity of USP Flavoxate Hydrochloride RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with

*Mobile phase* to obtain a solution having a known concentration of about 0.1 mg per mL.

*USP Flavoxate Related Compound A RS stock solution*—Dissolve an accurately weighed quantity of USP Flavoxate Related Compound A RS in acetonitrile to obtain a solution having a known concentration of about 0.3 mg per mL.

*Standard solution*—Quantitatively dilute suitable volumes of *Standard stock solution* and *USP Flavoxate Related Compound A RS stock solution* with *Mobile phase* to obtain a solution having a final known concentration of about 0.001 mg per mL of flavoxate hydrochloride and about 0.003 mg per mL of flavoxate related compound A.

*Test solution*—Filter the *Assay stock preparation*, prepared as directed in the *Assay*, through a 0.45- $\mu$ m filter (polyvinylidene fluoride [PVDF] or equivalent). Use the filtrate.

*Chromatographic system* (see *Chromatography* <621>)—Prepare as directed in the *Assay*. Chromatograph the *Standard solution*, and record the peak areas as directed for *Procedure*: the resolution,  $R$ , between flavoxate hydrochloride and flavoxate hydrochloride related compound A is not less than 10.0; the column efficiency is not less than 3000 plate counts; the tailing factor is not more than 2.0 for flavoxate hydrochloride; and the relative standard deviation for five replicate injections is not more than 2.0% for both peaks.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, and record the chromatograms. Measure the peak areas of all the peaks in the *Test solution*. Identify the peaks using the relative retention times as given in *Table 1*.

Table 1

Component Name	Relative Retention Time	Relative Response Factor	Limit (%)
Flavoxate hydrochloride	1.0	—	—
Flavoxate related compound A*	2.5	1.5	0.3
Any individual unspecified degradation product	—	1.0	0.1
Total impurities	—	—	1.0

\*3-Methylflavone-8-carboxylic acid.

Calculate the percentage of each impurity relative to flavoxate hydrochloride in the portion of Tablets taken by the formula:

$$100(C_S / C_U)(r_i / r_S)(1/F)$$

in which  $C_S$  is the concentration, in mg per mL, of flavoxate hydrochloride in the *Standard solution*;  $C_U$  is the nominal concentration, in mg per mL, of flavoxate hydrochloride, based on label claim, in the *Test solution*;  $r_i$  is the peak response of each individual impurity;  $r_S$  is the response of the flavoxate hydrochloride peak obtained from the *Standard solution*; and  $F$  is the relative response factor for each of the impurities relative to flavoxate hydrochloride, as shown in *Table 1*.

#### Assay—

*Mobile phase*—Dissolve 1.0 g of sodium hexanesulfonate, 1.0 mL of triethylamine, and 1.0 mL of phosphoric acid in 650 mL of water. Filter and degas. To the filtrate, add 350 mL of acetonitrile. Mix well. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Flavoxate Hydrochloride RS, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.05 mg per mL.

*Assay stock preparation*—Weigh and finely powder not fewer than 20 Tablets. Weigh accurately a portion of the powder, equivalent to about 100 mg of flavoxate hydrochloride based on label claim, and transfer to a 100-mL volumetric flask. Add about 80% volume of *Mobile phase*. Sonicate for 10 minutes, and stir for 15 minutes. Dilute with *Mobile phase* to volume.

*Assay preparation*—Dilute the *Assay stock preparation* quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution with a nominal concentration of about 0.05 mg per mL of flavoxate hydrochloride, based on label claim. Filter the solution through a 0.45- $\mu$ m filter (polyvinylidene fluoride [PVDF] or equivalent). Use the filtrate.

*Chromatographic system* (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 293-nm detector and a 4.6-mm  $\times$  15-cm column that contains 5- $\mu$ m packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 3000; the tailing factor is not more than 2.0; and the relative standard deviation for five replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the flavoxate hydrochloride peak whose retention time is about 4.0 minutes. Calculate the percentage of the label claim of flavoxate hydrochloride ( $C_{24}H_{25}NO_4 \cdot HCl$ ) in the portion of the Tablets taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which  $C_S$  is the concentration, in mg per mL, of flavoxate hydrochloride in the *Standard preparation*;  $C_U$  is the nominal concentration of flavoxate hydrochloride in the *Assay preparation*, based on the label claim; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Flecainide Acetate

$C_{17}H_{20}F_6N_2O_3 \cdot C_2H_4O_2$  474.39

Benzamide, *N*-(2-piperidinylmethyl)-2,5-bis(2,2,2-trifluoroethoxy)-, monoacetate.

*N*-(2-Piperidinylmethyl)-2,5-bis(2,2,2-trifluoroethoxy)benzamide monoacetate [54143-56-5].

» Flecainide Acetate contains not less than 98.0 percent and not more than 101.0 percent of  $C_{17}H_{20}F_6N_2O_3 \cdot C_2H_4O_2$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

#### USP Reference standards <11>—

USP Flecainide Acetate RS

USP Flecainide Related Compound A RS

3-[2,5-Bis(2,2,2-trifluoroethoxy)phenyl]-1,5,6,7,8,8a-hexahydroimidazo-[1,5a]pyridine hydrochloride.

$C_{17}H_{18}F_6N_2O_2 \cdot HCl$  432.8

**Clarity of solution**—Prepare a test solution by placing 250 mg of it in a test tube about 18 mm in diameter, adding 10 mL of water and 1 drop of glacial acetic acid, and

shaking to dissolve it. The solution is colorless and is not less clear than an equal volume of water in a similar test tube.

#### Identification—

**A:** Infrared Absorption (197K).

**B:** Ultraviolet Absorption (197U)—

*Solution:* 130 µg per mL.

*Medium:* alcohol.

Absorptivities at 298 nm, calculated on the dried basis, do not differ by more than 3.0%.

**Melting range** (741): between 146° and 152°, but the range between beginning and end of melting does not exceed 3°.

**Loss on drying** (731)—Dry it in a vacuum at a pressure not exceeding 5 mm of mercury at 60° for 2 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.2%.

**Heavy metals, Method II** (231): not more than 0.002%.

#### Chromatographic purity—

**Mobile phase**—Prepare a mixture of water, acetonitrile, glacial acetic acid, and 1.0 N tetrabutylammonium hydroxide in methanol (710:290:10:5). Adjust with ammonium hydroxide to a pH of 5.8 ± 0.05. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Diluent**—Prepare a mixture of water and acetonitrile (71:29).

**Standard solution**—Prepare a solution of USP Flecainide Acetate RS and USP Flecainide Related Compound A RS in *Diluent* having known concentrations of about 0.1 mg of each per mL.

**Test solution**—Transfer about 250 mg of Flecainide Acetate, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column containing 5-µm packing L7. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the responses as directed for *Procedure*: the relative retention times are 1.0 for flecainide and about 1.7 for flecainide related compound A; the resolution, *R*, between flecainide and flecainide related compound A is not less than 2; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for all the peaks. Calculate the percentage of flecainide related compound A in the portion of Flecainide Acetate taken by the formula:

$$2500(C_A / W_U)(r_{UA} / r_{SA})$$

in which  $C_A$  is the concentration, in mg per mL, of USP Flecainide Related Compound A RS in the *Standard solution*;  $W_U$  is the weight, in mg, of Flecainide Acetate taken to prepare the *Test solution*; and  $r_{UA}$  and  $r_{SA}$  are the flecainide related compound A peak responses obtained from the *Test solution* and the *Standard solution*, respectively. Not more than 0.5% is found. Calculate the percentage of any other impurity in the portion of Flecainide Acetate taken by the formula:

$$2500(C_F / W_U)(r_i / r_F)$$

in which  $C_F$  is the concentration, in mg per mL, of USP Flecainide Acetate RS in the *Standard solution*;  $W_U$  is the weight, in mg, of Flecainide Acetate taken to prepare the *Test solution*;  $r_i$  is the peak response for any individual impurity observed in the chromatogram obtained from the *Test solution*; and  $r_F$  is the flecainide peak response obtained from

the *Standard solution*. Not more than 0.5% is found, and the sum of all impurities found is not greater than 2.0%.

**Content of acetate**—Dissolve about 600 mg of Flecainide Acetate, accurately weighed, in about 100 mL of dimethylformamide, and stir by mechanical means until dissolved. Titrate with 0.1 N tetrabutylammonium hydroxide VS, determining the endpoint potentiometrically (see *Titrimetry* (541)). Perform a blank determination and make any necessary correction. Each mL of 0.1 N tetrabutylammonium hydroxide is equivalent to 6.005 mg of  $C_{21}H_{20}F_6N_2O_3$ : between 12.4% and 12.8%, calculated on the dried basis, is found.

**Assay**—Dissolve about 600 mg of Flecainide Acetate, accurately weighed, in about 20 mL of glacial acetic acid, and stir by mechanical means until dissolved. Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically (see *Titrimetry* (541)). Perform a blank determination and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 47.44 mg of  $C_{17}H_{20}F_6N_2O_3 \cdot C_2H_4O_2$ .

## Flecainide Acetate Oral Suspension

### DEFINITION

Flecainide Acetate Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of flecainide acetate ( $C_{17}H_{20}F_6N_2O_3 \cdot C_2H_4O_2$ ).

Prepare Flecainide Acetate Oral Suspension 20 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)):

Flecainide Acetate	2 g
Vehicle: a mixture of Vehicle for Oral Solution (regular or sugar-free), NF, and Vehicle for Oral Suspension, NF (1:1), a sufficient quantity to make	100 mL

Calculate the required quantity of each ingredient for the total amount to be prepared. If using tablets, place the required number in a suitable mortar, and comminute to a fine powder with a pestle, or use *Flecainide Acetate* powder. Add the *Vehicle* in small portions, and triturate to make a smooth paste. Add increasing volumes of the *Vehicle* to make a flecainide acetate liquid that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough of the liquid *Vehicle* to bring to final volume, and mix well.

### ASSAY

#### • PROCEDURE

**Mobile phase:** Acetonitrile and 0.06% phosphoric acid solution (40:60)

**Standard stock solution:** 1.0 mg/mL of USP Flecainide Acetate RS in *Mobile phase*

**Standard solution:** Transfer 2 mL of *Standard stock solution* to a 10-mL volumetric flask, and dilute with *Mobile phase* to volume to obtain a solution containing about 200 µg/mL of flecainide acetate.

**Sample solution:** Agitate the container of Oral Suspension for 30 min on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at −70° until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix with a vortex mixer for 30 s. Pipet 1.0 mL of the sample into a 100-mL volumetric flask, and dilute with *Mobile phase* to volume to obtain a solution having a nominal concentration of about 200 µg/mL.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 280 nm

**Column:** 4.6-mm × 25-cm; 5-μm packing L1

**Column temperature:** 40°

**Flow rate:** 1.0 mL/min

**Injection size:** 20 μL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Relative standard deviation:** NMT 2.0% for replicate injections

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of flecainide acetate ( $C_{17}H_{20}F_6N_2O_3 \cdot C_2H_4O_2$ ) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = nominal concentration of flecainide acetate in the *Standard solution* (μg/mL)

$C_U$  = nominal concentration of flecainide acetate in the *Sample solution* (μg/mL)

**Acceptance criteria:** 90.0%–110.0%

**SPECIFIC TESTS**

- **PH** (791): 3.8–4.8

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at controlled room temperature or controlled cold temperature.
- **LABELING:** Label it to indicate that it is to be well-shaken before use, protected from light, and to state the *Beyond-Use Date*.
- **BEYOND-USE DATE:** NMT 60 days after the date on which it was compounded when stored at controlled room temperature or when stored at controlled cold temperature
- **USP REFERENCE STANDARDS** (11)  
USP Flecainide Acetate RS

## Flecainide Acetate Tablets

» Flecainide Acetate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of flecainide acetate ( $C_{17}H_{20}F_6N_2O_3 \cdot C_2H_4O_2$ ).

**Packaging and storage**—Preserve in well-closed containers, protected from light.

**USP Reference standards** (11)—

USP Flecainide Acetate RS

USP Flecainide Related Compound A RS

3-[2,5-Bis(2,2-trifluoroethoxy)phenyl]-1,5,6,7,8,8a-hexahydroimidazo-[1,5a]pyridine hydrochloride.

$C_{17}H_{18}F_6N_2O_2 \cdot HCl$  432.8

**Identification, Ultraviolet Absorption** (197U)—

**Spectral range:** 250 to 400 nm.

**Solution:** Use the test solution obtained in the test for *Uniformity of dosage units*.

**Dissolution** (711)—

**Medium:** 0.075 N hydrochloric acid; 900 mL.

**Apparatus 2:** 50 rpm.

**Time:** 30 minutes for Tablets each containing 50 mg of flecainide acetate, or 60 minutes for 100-, 150-, or 200-mg Tablets.

**Procedure**—Determine the amount of  $C_{17}H_{20}F_6N_2O_3 \cdot C_2H_4O_2$  dissolved from UV absorbances at the wavelength

of maximum absorbance at about 296 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Flecainide Acetate RS in the same *Medium*.

**Tolerances**—Not less than 70% (Q) of the labeled amount of  $C_{17}H_{20}F_6N_2O_3 \cdot C_2H_4O_2$  is dissolved from 50-mg Tablets in 30 minutes; or from 100-, 150-, or 200-mg Tablets in 60 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Procedure for content uniformity**—Transfer 1 Tablet to a volumetric flask of such capacity that the concentration of flecainide acetate should be in the range of 0.1 to 1 mg per mL, dilute with lactic acid solution (2 mg per mL) to volume, mix, and sonicate for about 30 minutes, shaking at about 10-minute intervals. Allow to cool, and pass a portion of this stock solution through a glass-fiber filter. If necessary, quantitatively dilute an accurately measured volume of the clear filtrate with the lactic acid solution (2 mg per mL) to obtain a test solution having a concentration of about 0.1 mg of flecainide acetate per mL. Dissolve an accurately weighed quantity of USP Flecainide Acetate RS in the lactic acid solution (2 mg per mL), sonicating if necessary to achieve dissolution, to obtain a Standard solution having a known concentration of about 0.1 mg per mL. Concomitantly determine the absorbances of both solutions at the wavelength of maximum absorbance at about 296 nm, with a spectrophotometer, using the lactic acid solution (2 mg per mL) as the blank. Calculate the quantity, in mg, of  $C_{17}H_{20}F_6N_2O_3 \cdot C_2H_4O_2$  in the Tablet taken by the formula:

$$(CT / D)(A_U / A_S)$$

in which C is the concentration, in mg per mL, of USP Flecainide Acetate RS in the Standard solution; T is the labeled quantity, in mg of flecainide acetate per Tablet; D is the concentration, in mg per mL, of flecainide acetate in the test solution on the basis of the labeled quantity per Tablet and the extent of dilution; and  $A_U$  and  $A_S$  are the absorbances of the test solution and the Standard solution, respectively.

**Assay**—

**Mobile phase**—Prepare a mixture of water, acetonitrile, glacial acetic acid, and 1.0 N tetrabutylammonium hydroxide in methanol (710:290:10:5). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Diluent**—Prepare a mixture of water and lactic acid (980:20).

**Standard preparation**—Quantitatively dissolve an accurately weighed quantity of USP Flecainide Acetate RS in *Diluent* to obtain a solution having a known concentration of about 2 mg per mL.

**Resolution solution**—Prepare a solution in *Diluent* containing about 2 mg of USP Flecainide Acetate RS and 0.8 mg of USP Flecainide Related Compound A RS per mL.

**Assay preparation**—Transfer not fewer than 20 Tablets, accurately counted, to a volumetric flask of such capacity that the concentration of flecainide acetate is about 2 mg per mL after dilution to volume as directed below. Fill the flask to about 90% of its capacity with *Diluent*, and sonicate for about 30 minutes, swirling periodically. Allow to cool, dilute with *Diluent* to volume, and mix. Pass a portion of this solution through a filter having a of 0.5-μm or finer porosity, discarding the first 2 mL of the filtrate.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column that contains 5-μm packing L7. The flow rate is about 2 mL per minute. Chromatograph the *Resolution solution*, and record the responses as directed for *Procedure*: the relative retention times are 1.0 for flecainide and about 1.5 for flecainide related compound A; and the resolution, R, between flecainide and the flecainide re-

lated compound A is not less than 2.0. Chromatograph the *Standard preparation*, and record the responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 1.5%.

*Procedure*—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of flecainide acetate ( $C_{17}H_{20}F_6N_2O_3 \cdot C_2H_4O_2$ ) in each Tablet taken by the formula:

$$(CT / D)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Flecainide Acetate RS in the *Standard preparation*; T is the labeled quantity, in mg, of flecainide acetate per Tablet; D is the concentration, in mg per mL, of flecainide acetate in the *Assay preparation* on the basis of the labeled quantity per Tablet and the extent of dilution; and  $r_U$  and  $r_S$  are the flecainide peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Floxuridine

$C_9H_{11}FN_2O_5$  246.19  
Uridine, 2'-deoxy-5-fluoro-  
2'-Deoxy-5-fluorouridine [50-91-9].

» Floxuridine contains not less than 98.5 percent and not more than 101.0 percent of  $C_9H_{11}FN_2O_5$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

**Labeling**—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected for further processing during the preparation of injectable dosage forms.

**USP Reference standards** (11)—  
USP Floxuridine RS

### Identification—

**A:** Infrared Absorption (197M).

**B:** Ultraviolet Absorption (197U)—

*Solution:* 20  $\mu$ g per mL.

*Medium:* 0.1 N potassium hydroxide.

Absorptivities at 268 nm, calculated on the dried basis, do not differ by more than 3.0%.

**C:** Dissolve about 200 mg in 10 mL of water, and add a few drops of bromine TS: the bromine color is discharged.  
**Melting range**, *Class I* (741): between 145° and 153°, but the range between beginning and end of melting does not exceed 2°.

**Specific rotation** (781S): between +36° and +39°.

*Test solution:* 10 mg per mL, in water.

**Loss on drying** (731)—Dry it in vacuum over silica gel at 60° for 4 hours: it loses not more than 0.2% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Limit of fluoride ions**—[NOTE—Use plasticware throughout this test.]

*pH 5.25 Buffer*—Dissolve 110 g of sodium chloride and 1 g of sodium citrate in 700 mL of water in a 2000-mL volu-

metric flask. Cautiously add 150 g of sodium hydroxide, and dissolve with shaking. Cool to room temperature, and, while stirring, cautiously add 450 mL of glacial acetic acid to the cooled solution. Cool, add 600 mL of isopropyl alcohol, dilute with water to volume, and mix: the pH of this solution is between 5.0 and 5.5.

*Standard stock solution*—Transfer 221 mg of sodium fluoride, previously dried at 150° for 4 hours, to a 100-mL volumetric flask, add about 20 mL of water, and mix to dissolve. Add 1.0 mL of sodium hydroxide solution (1 in 2500), dilute with water to volume, and mix. Each mL of this solution contains 1 mg of fluoride ions. Store in a tightly closed, plastic container.

*Standard solutions*—Dilute portions of the *Standard stock solution* quantitatively and stepwise with *pH 5.25 Buffer* to obtain 100-mL solutions having concentrations of 1, 3, 5, and 10  $\mu$ g per mL.

*Test solution*—Transfer 1.0 g of Floxuridine to a 100-mL volumetric flask, dissolve in and dilute with *pH 5.25 Buffer* to volume, and mix.

*Procedure*—Concomitantly measure the potential (see *Titrimetry* (541)), in mV, of the *Standard solutions* and the *Test solution*, with a pH meter capable of a minimum reproducibility of  $\pm 0.2$  mV, equipped with a glass-sleeved calomel-fluoride specific-ion electrode system. [NOTE—When taking measurements, immerse the electrodes in the solution, which has been transferred to a 150-mL beaker containing a polytetrafluoroethylene-coated stirring bar. Allow to stir on a magnetic stirrer having an insulated top until equilibrium is attained (1 to 2 minutes), and record the potential. Rinse and dry the electrodes between measurements, taking care to avoid damaging the crystal of the specific-ion electrode.] Plot the logarithm of the fluoride-ion concentrations, in  $\mu$ g per mL, of the *Standard solutions* versus potential, in mV. From the measured potential of the *Test solution* and the standard curve, determine the concentration, in  $\mu$ g per mL, of fluoride ions in the *Test solution*: not more than 0.05% is found.

**Heavy metals**, *Method II* (231): 0.002%.

**Other requirements**—Where the label states that Floxuridine is sterile, it meets the requirements for *Sterile Solids* under *Injections* (1) and for *Pyrogen* under *Floxuridine for Injection*. Where the label states that Floxuridine must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Pyrogen* under *Floxuridine for Injection*.

**Assay**—Dissolve about 800 mg of Floxuridine, accurately weighed, in 80 mL of dimethylformamide, and titrate with 0.1 N tetrabutylammonium hydroxide VS, determining the endpoint potentiometrically using a calomel-glass electrode system. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N tetrabutylammonium hydroxide is equivalent to 24.62 mg of  $C_9H_{11}FN_2O_5$ .

## Floxuridine for Injection

» Floxuridine for Injection is lyophilized Floxuridine suitable for intraarterial infusion. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_9H_{11}FN_2O_5$ .

**Packaging and storage**—Preserve in *Containers for Injections* as described under *Injections* (1), protected from light. Store containers of constituted Floxuridine for Injection under refrigeration for not more than 2 weeks.

**USP Reference standards** (11)—

USP Floxuridine RS

**Constituted solution**—It meets the requirements for *Constituted Solutions under Injections* (1).**Identification**—**A:** *Ultraviolet Absorption* (197U)—*Solution*—Use *Assay preparation*.**B:** It responds to *Identification test C* under *Floxuridine*.**Pyrogen**—It meets the requirements of the *Pyrogen Test* (151), the test dose being 0.50 mL per kg of a solution prepared by dilution of Floxuridine for Injection with Sodium Chloride Injection to a concentration of 100 mg per mL.**Uniformity of dosage units** (905): meets the requirements.**pH** (791): between 4.0 and 5.5, in a solution (1 in 50).**Other requirements**—It meets the requirements under *Injections* (1).**Assay**—Transfer about 100 mg of Floxuridine for Injection, accurately weighed, to a 250-mL volumetric flask, dissolve in and dilute with potassium hydroxide solution (1 in 180) to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with potassium hydroxide solution (1 in 180) to volume, and mix. Concomitantly determine the absorbances of this solution and a Standard solution of USP Floxuridine RS, in the same medium having a known concentration of about 20 µg per mL, in 1-cm cells at the wavelength of maximum absorbance at about 268 nm, with a suitable spectrophotometer, using potassium hydroxide solution (1 in 180) as the blank. Calculate the quantity, in mg, of  $C_9H_{11}FN_2O_5$  in the portion of Floxuridine for Injection taken by the formula:

$$5C(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Floxuridine RS in the Standard solution; and  $A_U$  and  $A_S$  are the absorbances of the solution from Floxuridine for Injection and the Standard solution, respectively.

---

**Fluconazole**

---

$C_{13}H_{12}F_2N_6O$  306.27  
 1*H*-1,2,4-Triazole-1-ethanol, 1-(2,4-difluorophenyl)-1-(1*H*-1,2,4-triazol-1-ylmethyl)-;  
 2,4-Difluoro-1',1'-bis(1*H*-1,2,4-triazol-1-ylmethyl)benzyl alcohol [86386-73-4].

**DEFINITION**Fluconazole contains NLT 98.0% and NMT 102.0% of  $C_{13}H_{12}F_2N_6O$ , calculated on the dried basis.**IDENTIFICATION**• **A. INFRARED ABSORPTION** (197K)• **B. ULTRAVIOLET ABSORPTION** (197U)*Sample solution:* 200 µg/mL*Medium:* Alcohol**ASSAY**• **PROCEDURE***Sample solution:* Dissolve 200 mg of Fluconazole in 100 mL of glacial acetic acid.*Analysis:* Titrate with 0.1 N perchloric acid VS, using a suitable anhydrous electrode system. Perform a blank determination, and make any necessary correction. EachmL of 0.1 N perchloric acid is equivalent to 15.31 mg of fluconazole ( $C_{13}H_{12}F_2N_6O$ ).**Acceptance criteria:** 98.0%–102.0% on the dried basis**IMPURITIES**[NOTE—On the basis of information regarding the manufacturing process, perform either: (a) *Organic Impurities, Procedure 1* or (b) *Organic Impurities, Procedure 2* and *Organic Impurities, Procedure 3*.]• **ORGANIC IMPURITIES, PROCEDURE 1****Mobile phase:** Acetonitrile and water (20:80)**Standard solution:** 10 µg/mL each of USP Fluconazole RS, USP Fluconazole Related Compound A RS, USP Fluconazole Related Compound B RS, and USP Fluconazole Related Compound C RS, dissolved in acetonitrile, and then diluted in *Mobile phase***Sample solution:** 3 mg/mL of Fluconazole in *Mobile phase***Chromatographic system**(See *Chromatography* (621), *System Suitability*.)**Mode:** LC**Detector:** UV 260 nm**Column:** 4.6-mm × 15-cm; 3.5-µm packing L1**Column temperature:** 40°**Flow rate:** 0.5 mL/min**Injection size:** 20 µL**System suitability****Sample:** *Standard solution*

[NOTE—The retention times for fluconazole related compound A, fluconazole related compound B, fluconazole related compound C, and fluconazole are about 4.9, 8.0, 8.5, and 9.9 min, respectively.]

**Suitability requirements****Resolution:** NLT 1.5 between fluconazole related compound B and fluconazole related compound C  
**Relative standard deviation:** NMT 5.0% for each peak**Analysis****Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of fluconazole related compound A, fluconazole related compound B, and fluconazole related compound C in the portion of Fluconazole taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 $r_U$  = peak response of fluconazole related compound A, fluconazole related compound B, or fluconazole related compound C from the *Sample solution* $r_S$  = average peak response of fluconazole related compound A, fluconazole related compound B, and fluconazole related compound C for replicate injections of the *Standard solution* $C_S$  = concentration of USP Fluconazole Related Compound A RS, USP Fluconazole Related Compound B RS, and USP Fluconazole Related Compound C RS in the *Standard solution* (mg/mL) $C_U$  = concentration of Fluconazole in the *Sample solution* (mg/mL)

Calculate the percentage of any other impurities in the portion of Fluconazole taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 $r_U$  = peak response of any other impurity from the *Sample solution* $r_S$  = average peak response of fluconazole for replicate injections of the *Standard solution* $C_S$  = concentration of USP Fluconazole RS in the *Standard solution* (mg/mL) $C_U$  = concentration of Fluconazole in the *Sample solution* (mg/mL)

Acceptance criteria: See Table 1.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)

• **ORGANIC IMPURITIES, PROCEDURE 3**

**Standard solution A:** 1 mg/mL of USP Fluconazole RS in methanol (2.0%)

**Standard solution B:** 0.1 mg/mL of USP Fluconazole RS from *Standard solution A* in methanol (0.2%)

**Standard solution C:** 0.05 mg/mL of USP Fluconazole RS from *Standard solution A* in methanol (0.1%)

**Sample solution:** 50 mg/mL of Fluconazole in methanol

**Chromatographic system**

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

**Mode:** TLC

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture

**Application volume:** 10 µL

**Developing solvent system:** Chloroform, methanol, and ammonium hydroxide (80:20:1)

**Spray reagent A:** 1.7 mg/mL of silver nitrate in water

**Spray reagent B (potassium iodoplatinate solution):** 375 mg of chloroplatinic acid in 5 mL of 1 N hydrochloric acid. Dissolve 5 g of potassium iodide in 50 mL of water, and store in a light-resistant container. Prepare a mixture of water, potassium iodide solution, and chloroplatinic acid solution (20:9:1).

**Analysis**

**Samples:** *Standard solution A*, *Standard solution B*, *Standard solution C*, and *Sample solution*

Spray the dry plate with *Spray reagent A*, and expose the plate to 365-nm UV light for 10–20 min. Dry the plate for 20 min between 80° and 90°, then spray the plate with *Spray reagent B*. Allow the plate to dry. Examine the plate and compare the intensities of any secondary spots observed in the *Sample solution* with those of the principal spots in the *Standard solutions*.

**Acceptance criteria:** No spot from the *Sample solution* with an  $R_f$  value between 0.10–0.25 and 0.27–0.41 is larger or more intense than that from *Standard solution B* (0.2%).

• **RESIDUE ON IGNITION** <281>: NMT 0.1%

**Sample:** 0.5 g

• **IRON** <241>

**Sample solution:** Transfer 0.5 g of the sample into a test tube. Dissolve in 5 mL of alcohol, and add 5 mL of distilled water.

**Acceptance criteria:** NMT 20 ppm

**SPECIFIC TESTS**

• **LOSS ON DRYING** <731>: Dry a sample at 105° for 3 h: it loses NMT 0.5% of its weight.

• **CLARITY AND COLOR OF SOLUTION**

**Sample solution:** Dissolve a sample in methanol to obtain a 5-in-100 solution (w/v).

**Acceptance criteria:** The solution is clear and colorless.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store below 30°.
- **LABELING:** If a procedure for *Organic Impurities* other than *Procedure 1* is used, then the labeling states with which *Organic Impurities* procedure(s) the article complies.
- **USP REFERENCE STANDARDS** (11)
  - USP Desacetyl Diltiazem Hydrochloride RS  
 $C_{20}H_{24}N_2O_3S \cdot HCl$  408.95
  - USP Fluconazole RS
  - USP Fluconazole Related Compound A RS  
2-[2-Fluoro-4-(1*H*-1,2,4-triazol-1-yl)phenyl]-1,3-bis(1*H*-1,2,4-triazol-1-yl)-propan-2-ol.
  - USP Fluconazole Related Compound B RS

  - USP Fluconazole Related Compound C RS  
1,1'-(1,3-Phenylene)di(1*H*-1,2,4-triazole).

## Fluconazole Injection

**DEFINITION**

Fluconazole Injection is a sterile solution of Fluconazole in a suitable vehicle. It contains NLT 90.0% and NMT 110.0% of the labeled amount of fluconazole ( $C_{13}H_{12}F_2N_6O$ ).

**IDENTIFICATION**

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY**

• **PROCEDURE**

**Buffer:** 0.82 g/L of sodium acetate in water. Adjust with 1 N acetic acid solution to a pH of 5.0.

**Diluent:** Methanol and *Buffer* (20:80)

**Solution A:** Methanol and *Buffer* (5:95)

**Solution B:** Acetonitrile and methanol (60:40)

**Mobile phase:** See *Table 1*.

**Table 1**

Time (min)	Solution A (%)	Solution B (%)
0	80	20
9	80	20
15	15	85
18	80	20
25	80	20

**System suitability solution:** 0.04 mg/mL each of benzyl alcohol and USP Fluconazole RS in *Diluent*

**Standard solution:** 0.2 mg/mL of USP Fluconazole RS in *Diluent*

**Sample solution:** Equivalent to 0.2 mg/mL of fluconazole from Injection in *Diluent*

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 261 nm

**Column:** 4.0-mm × 10-cm; 3-μm packing L1

**Flow rate:** 1 mL/min

**Injection size:** 100 μL

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for benzyl alcohol and fluconazole are about 0.8 and 1.0, respectively, from the *System suitability solution*.]

**Suitability requirements**

**Resolution:** NLT 1.8 between benzyl alcohol and fluconazole, *System suitability solution*

**Column efficiency:** NLT 4000 theoretical plates for the fluconazole peak, *System suitability solution*

**Tailing factor:** NMT 1.5 for the fluconazole peak, *System suitability solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of fluconazole ( $C_{13}H_{12}F_2N_6O$ ) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of fluconazole in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

**IMPURITIES**

**Organic Impurities**

[NOTE—On the basis of the synthetic route, perform either (a) *Procedure 1* and *Procedure 2*, or (b) *Procedure 3*, or (c) *Procedure 4*. *Procedure 3* is recommended if bis-triazole ketone and epoxyfluconazole (see *Table 4*) are potential impurities. *Procedure 4* is recommended if fluconazole bromohydrine and epoxyfluconazole (see *Table 5*) are potential impurities.]

• **PROCEDURE 1: FOR NONPOLAR IMPURITIES**

**Buffer and Diluent:** Prepare as directed in the *Assay*.

**Solution A:** Methanol and *Buffer* (5:95)

**Solution B:** Acetonitrile and methanol (60:40)

**Mobile phase:** See *Table 2*.

**Table 2**

Time (min)	Solution A (%)	Solution B (%)
0	77	23
5	77	23
30	40	60
43	77	23
50	77	23

**System suitability solution:** 2.4 and 20 μg/mL, respectively of 1,4-benzoquinone and USP Fluconazole RS in *Diluent*

**Standard solution:** 2 μg/mL of USP Fluconazole RS in *Diluent*

**Diluted standard solution:** 0.2 μg/mL of USP Fluconazole RS in *Diluent* from the *Standard solution*

**Sample solution:** Equivalent to 1.0 mg/mL of fluconazole from Injection in *Diluent*

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 261 nm

**Column:** 4.0-mm × 10-cm; 3-μm packing L1

**Flow rate:** 1 mL/min

**Injection size:** 100 μL

**System suitability**

**Samples:** *System suitability solution*, *Standard solution*, and *Diluted standard solution*

[NOTE— The relative retention times for 1,4-benzoquinone and fluconazole are about 0.5 and 1.0, respectively, *System suitability solution*.]

**Suitability requirements**

**Resolution:** NLT 5.0 between 1,4-benzoquinone and fluconazole, *System suitability solution*

**Column efficiency:** NLT 2500 theoretical plates for the fluconazole peak, *System suitability solution*

**Tailing factor:** NMT 1.5 for the fluconazole peak, *System suitability solution*

**Relative standard deviation:** NMT 5.0%, *Standard solution*

**Ratio of average peak area:** Between 8.0 and 12.0 for the ratio of the fluconazole peak from the *Standard solution* to that of the *Diluted standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

[NOTE—For the following calculations, do not include peaks eluting before fluconazole and do not include impurities at relative retention times of 2.00–2.12 and 3.14–3.26. The disregarded impurities at the specified relative retention times are process impurities monitored in the drug substance. Furthermore, disregard any peak due to an excipient or any peak less than 0.02%. This test is for determination of the late-eluting peaks, and hence the early-eluting peaks are not quantitated using this procedure.]

Calculate the percentage of the single largest unknown nonpolar impurity in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of the largest impurity from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of fluconazole in the *Standard solution* (mg/mL)

$C_U$  = concentration of fluconazole, based on the label claim and the extent of dilution, in the *Sample solution* (mg/mL)

Calculate the percentage of unknown nonpolar impurities in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = sum of the peak areas of the unknown peaks from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$C_U$  = concentration of fluconazole, based on the label claim and the extent of dilution, in the *Sample solution* (mg/mL)

**Acceptance criteria**

**Largest unknown nonpolar impurity:** NMT 0.1%

**Total unknown nonpolar impurities:** NMT 0.5%

• **PROCEDURE 2: FOR POLAR IMPURITIES**

**Buffer, Diluent, Mobile phase, System suitability solution, and Chromatographic system:** Proceed as directed in the Assay.

**Standard solution:** 2 µg/mL of USP Fluconazole RS in *Diluent*

**Diluted standard solution:** 0.2 µg/mL of USP Fluconazole RS in *Diluent* from the *Standard solution*

**Sample solution:** Equivalent to 0.2 mg/mL of fluconazole from Injection in *Diluent*

**System suitability**

**Samples:** *System suitability solution*, *Standard solution*, and *Diluted standard solution*

[NOTE—The relative retention times for benzyl alcohol and fluconazole are about 0.8 and 1.0, respectively, *System suitability solution*.]

**Suitability requirements**

**Resolution:** NLT 1.8 between benzyl alcohol and fluconazole, *System suitability solution*

**Column efficiency:** NLT 4000 theoretical plates for the fluconazole peak, *System suitability solution*

**Tailing factor:** NMT 1.5 for the fluconazole peak, *System suitability solution*

**Relative standard deviation:** NMT 5.0%, *Standard solution*

**Ratio of average peak area:** Between 8.0 and 12.0 for the ratio of the fluconazole peak from the *Standard solution* to that of the *Diluted standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

[NOTE—The relative retention times of known related compounds versus fluconazole are included in Table 3.]

Calculate the percentage of the single largest unknown polar impurity in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of the largest impurity from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of fluconazole in the *Standard solution* (mg/mL)

$C_U$  = concentration of fluconazole, based on the label claim and the extent of dilution, in the *Sample solution* (mg/mL)

Calculate the quantity, as a percentage, of the unknown polar impurities in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = total peak area response of all the unknown peaks from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of fluconazole in the *Standard solution* (mg/mL)

$C_U$  = concentration of fluconazole, based on the label claim and the extent of dilution, in the *Sample solution* (mg/mL)

**Acceptance criteria**

**Largest unknown polar impurity:** NMT 0.1%

**Total unknown polar impurities:** NMT 0.5%

**Total unknown polar and nonpolar impurities:** NMT 1.0% (sum of results from Procedure 1 and Procedure 2)

[NOTE—Disregard any peak due to an excipient or any peak less than 0.03%.]

**Table 3**

Name	Relative Retention Time
Hydroxymethylfurfural (if dextrose is present) <sup>a</sup>	0.22–0.28
Aminofluconazole quaternary salt <sup>b</sup>	0.30–0.36
Unidentified impurity (if dextrose is present) <sup>c</sup>	0.37–0.43
Fluconazole isomer <sup>d</sup>	0.47–0.59

Cyclohexanone <sup>f</sup>	0.77–0.83
Fluconazole	1.0

<sup>a</sup> 5-Hydroxymethylfurfural.

<sup>b</sup> 4-Amino-1-(2-(2,4-difluorophenyl)-2-hydroxy-3-(1H-1,2,4-triazol-1-yl)propyl)-4H-1,2,4-triazolium bromide.

<sup>c</sup> Dextrose-related compound.

<sup>d</sup> 2-(2,4-Difluorophenyl)-1-(1H-1,2,4-triazol-1-yl)-3-(4H-1,2,4-triazol-4-yl)propan-2-ol.

<sup>e</sup> 2-(2,4-Difluorophenyl)-3-(1H-1,2,4-triazol-1-yl)propane-1,2-diol.

<sup>f</sup> A process impurity associated with drug product packaged in bags.

[NOTE—Disregard aminofluconazole quaternary salt, fluconazole isomer, and fluconazole diol impurities from *Ta*-

ble 3 in the following calculation because these are process impurities that are monitored in the drug substance.]

• **PROCEDURE 3**

**Buffer:** 0.63 g/L of ammonium formate in water

**Mobile phase:** Acetonitrile and *Buffer* (14:86)

**Standard solution:** 2 mg/mL of USP Fluconazole RS in *Buffer*. [NOTE—Use approximately 14% of the total volume as acetonitrile, and sonicate if necessary to facilitate dissolution.]

**Sensitivity solution:** 1 µg/mL of USP Fluconazole RS in *Mobile phase* from the *Standard solution*

**Sample solution:** Equivalent to 2 mg/mL of fluconazole in 0.9% aqueous solution of sodium chloride

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 260 nm

**Column:** 4.6-mm × 15-cm; 3.5-µm packing L1

**Column temperature:** 30°

**Flow rate:** 1 mL/min

**Injection size:** 20 µL

**System suitability**

**Samples:** *Standard solution* and *Sensitivity solution*

[NOTE—The retention time for fluconazole is between 12 and 14 min.]

**Suitability requirements**

**Signal-to-noise ratio:** NLT 10, *Sensitivity solution*

**Column efficiency:** NLT 3000 theoretical plates, *Standard solution*

**Tailing factor:** NMT 2.0, *Standard solution*

**Relative standard deviation:** NMT 2%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_S$  = peak response of fluconazole from the *Standard solution*

$C_S$  = concentration of fluconazole in the *Standard solution* (mg/mL)

$C_U$  = concentration of fluconazole, based on the label claim, in the *Sample solution* (mg/mL)

**Acceptance criteria**

**Individual impurities:** See *Table 4*.

**Total impurities:** NMT 0.5%

**Table 4**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Bistriazole ketone <sup>a</sup>	0.13	0.2
Fluconazole isomer <sup>b</sup>	0.5	0.2
Fluconazole	1.0	—
Epoxyfluconazole <sup>c</sup>	2.6	0.2
Any other individual impurity	—	0.2

<sup>a</sup> 1,3-Bis(1*H*-1,2,4-triazol-1-yl)propan-2-one.

<sup>b</sup> 2-(2,4-Difluorophenyl)-1-(1*H*-1,2,4-triazol-1-yl)-3-(4*H*-1,2,4-triazol-4-yl)propan-2-ol.

<sup>c</sup> 1-[2-(2,4-Difluorophenyl)-2,3-epoxypropyl]-1*H*-1,2,4-triazole.

**Procedure 4**

**Buffer:** 13.4 g/L of dibasic sodium phosphate heptahydrate in water. Adjust with phosphoric acid to a pH of 7.0.

**Mobile phase:** Acetonitrile and *Buffer* (26:74)

**Standard solution:** 2 mg/mL of USP Fluconazole RS in *Mobile phase*

**Sample solution:** Equivalent to 2 mg/mL of fluconazole in 0.9% aqueous solution of sodium chloride

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

Calculate the percentage of each impurity in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_S$  = peak response of fluconazole from the *Standard solution*

$C_S$  = concentration of fluconazole in the *Standard solution* (mg/mL)

$C_U$  = concentration of fluconazole, based on the label claim, in the *Sample solution* (mg/mL)

**Acceptance criteria**

**Individual impurities:** See *Table 5*.

**Total impurities:** NMT 0.5%

**Table 5**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Amino fluconazole quaternary salt <sup>a</sup>	0.57	0.74	0.1
Fluconazole isomer <sup>b</sup>	0.68	0.93	0.1
Fluconazole diol <sup>c</sup>	0.91	1.3	0.1
Fluconazole	1.0	1.0	—
Fluconazole bromohydrine <sup>d</sup>	2.58	1.1	0.1
Epoxyfluconazole <sup>e</sup>	2.59	0.90	0.1
Any other individual impurity	—	1.0	0.1

<sup>a</sup> 4-Amino-1-(2-(2,4-difluorophenyl)-2-hydroxy-3-(1*H*-1,2,4-triazol-1-yl)propyl)-4*H*-1,2,4-triazol-1-ium bromide.

<sup>b</sup> 2-(2,4-Difluorophenyl)-1-(1*H*-1,2,4-triazol-1-yl)-3-(4*H*-1,2,4-triazol-4-yl)propan-2-ol.

<sup>c</sup> 2-(2,4-Difluorophenyl)-3-(1*H*-1,2,4-triazol-1-yl)propane-1,2-diol.

<sup>d</sup> 1-Bromo-2-(2,4-difluorophenyl)-3-(1*H*-1,2,4-triazol-1-yl)propan-2-ol.

<sup>e</sup> 1-[2-(2,4-Difluorophenyl)-2,3-epoxypropyl]-1*H*-1,2,4-triazole.

**SPECIFIC TESTS**

• **STERILITY TESTS** <71>: Meets the requirements

• **BACTERIAL ENDOTOXINS TEST** (85): NMT 0.416 USP Endotoxin Unit/mg of fluconazole

• **OTHER REQUIREMENTS:** Meets the requirements under *Injections* <1>

**ADDITIONAL REQUIREMENTS**

• **PACKAGING AND STORAGE:** Store at controlled room temperature.

• **LABELING:** Label to indicate the vehicle used. If a test for *Organic Impurities* other than *Procedure 1* and *Procedure 2* is used, then the labeling states with which *Organic Impurities* test the article complies.

• **USP REFERENCE STANDARDS** <11>

USP Endotoxin RS  
USP Fluconazole RS

## Fluconazole Tablets

### DEFINITION

Fluconazole Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of fluconazole ( $C_{13}H_{12}F_2N_6O$ ).

### IDENTIFICATION

- The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

• **PROCEDURE**

**Buffer:** 0.01 M anhydrous sodium acetate solution. Adjust with glacial acetic acid to a pH of 5.0.

**Mobile phase:** Methanol, acetonitrile, and *Buffer* (20:10:70)

**Standard stock solution:** 1.0 mg/mL of USP Fluconazole RS dissolved in water, and diluted with *Mobile phase* to volume. Sonicate the solution, if necessary. [NOTE—The target ratio is about 5% water to 95% *Mobile phase*.]

**Standard solution:** 0.2 mg/mL of USP Fluconazole RS in *Mobile phase* prepared from the *Standard stock solution*

**Sample solution:** Weigh NLT 5 Tablets, and disperse in a suitable quantity of water. Sonicate the solution, if necessary. Add a sufficient quantity of *Mobile phase*, sonicate for 5 min, and shake for 30 min. Dilute with *Mobile phase* to volume to obtain a concentration between about 1 and 4 mg/mL, and mix. [NOTE—The target ratio is about 5% water to 95% *Mobile phase*.] Centrifuge a suitable portion of the mixture. Filter and quantitatively dilute a portion of the supernatant with *Mobile phase* to obtain a solution of about 0.2 mg/mL of fluconazole.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 261 nm

**Column:** 3.9-mm × 150-mm; 4-μm packing L1

**Flow rate:** 1 mL/min

**Injection size:** 20 μL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Column efficiency:** NLT 1100 theoretical plates

**Tailing factor:** NMT 3.0

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of the labeled amount of fluconazole ( $C_{13}H_{12}F_2N_6O$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Fluconazole RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of fluconazole in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

### PERFORMANCE TESTS

• **DISSOLUTION** <711>

**Test 1**

**Medium:** Water; 500 mL (900 mL for Tablets labeled to contain more than 100 mg)

**Apparatus 2:** 50 rpm

**Time:** 45 min

**Buffer, Mobile phase, and System suitability:** Proceed as directed in the *Assay*.

**Standard solution:** 2 mg/mL of USP Fluconazole RS in *Medium*. Sonicate the solution to facilitate dissolution, if necessary. Quantitatively dilute a portion of this solution with *Medium* to obtain a final concentration similar to the one expected in the *Sample solution*.

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45-μm pore size.

**Chromatographic system and System suitability:** Proceed as directed in the *Assay*, making any necessary modifications.

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of the labeled amount of fluconazole ( $C_{13}H_{12}F_2N_6O$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Fluconazole RS in the *Standard solution* (mg/mL)

$L$  = label claim (mg/Tablet)

$V$  = volume of *Medium*, 500 or 900 mL

**Tolerances:** NLT 75% (Q) of the labeled amount of  $C_{13}H_{12}F_2N_6O$  is dissolved.

**Test 2:** If the product complies with this test, the labeling indicates that it meets *Dissolution Test 2*.

**Medium:** Water; 900 mL (for all Tablet strengths)

**Apparatus 2:** 50 rpm

**Time:** 45 min

**Mobile phase:** Water and acetonitrile (4:1)

**Standard stock solution:** 1.1 mg/mL of USP Fluconazole RS in methanol

**Standard solution:** Dilute the *Standard stock solution* with *Medium* to obtain a final concentration of ( $L/900$ ) mg/mL, where  $L$  is the Tablet label claim in mg.

**Sample solution:** Pass a portion of the solution under test through a suitable filter.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 260 nm

**Column:** 4.6-mm × 15-cm; 5-μm packing L1

**Column temperature:** 40°

**Flow rate:** 1.5 mL/min

**Injection size:** 50 μL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Column efficiency:** NLT 1000 theoretical plates

**Tailing factor:** NMT 1.5

**Relative standard deviation:** NMT 2.0%

Calculate the percentage of the labeled amount of fluconazole ( $C_{13}H_{12}F_2N_6O$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$L$  = label claim (mg/Tablet)

$V$  = volume of *Medium*, 900 mL

**Tolerances:** NLT 75% (Q) of the labeled amount of fluconazole is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** <905>: Meet the requirements

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at controlled room temperature.

- **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS** (11)  
USP Fluconazole RS

## Flucytosine

$C_4H_4FN_3O$  129.09  
Cytosine, 5-fluoro-  
5-Fluorocytosine [2022-85-7].

» Flucytosine contains not less than 98.5 percent and not more than 101.0 percent of  $C_4H_4FN_3O$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Flucytosine RS  
USP Fluorouracil RS

**Identification**—

**A:** *Ultraviolet Absorption* (197U)—

*Solution:* 8 µg per mL.

*Medium:* dilute hydrochloric acid (1 in 100).

Absorptivities at 285 nm, calculated on the dried basis, do not differ by more than 2.0%.

**B:** The  $R_f$  value of the principal spot in the specimen chromatogram in the test for *Fluorouracil* corresponds to that obtained with the solution of USP Flucytosine RS.

**Loss on drying** (731)—Dry it at 105° for 4 hours: it loses not more than 1.5% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals, Method II** (231): 0.002%.

**Fluoride ions**—[NOTE—All glassware and/or plasticware used in this test should be scrupulously clean and even free from trace amounts of fluoride. The use of plasticware to contain the solutions while the potential is measured is recommended.]

**Buffer solution**—To 110 g of sodium chloride in a 2-L volumetric flask add 1 g of sodium citrate and 700 mL of water, and dissolve with shaking. Carefully add 150 g of sodium hydroxide, and dissolve with shaking. Cool to room temperature, and while stirring, cautiously add 450 mL of glacial acetic acid. Cool to room temperature, add 600 mL of isopropyl alcohol, dilute with water to volume, and mix. The pH of this solution is between 5.0 and 5.5.

**Standard stock solution**—Accurately weigh 2.211 g of sodium fluoride, previously dried at 150° for 4 hours, into a 1-L volumetric flask, and dissolve in about 200 mL of water. Add 1.0 mL of sodium hydroxide solution (1 in 250), dilute with water to volume, and mix. Each mL of this solution contains 1 mg of fluoride ion. Store the solution in a closed plastic container.

**Standard preparations**—Dilute a portion of *Standard stock solution* quantitatively and stepwise with *Buffer solution* to obtain a *Standard preparation* having a fluoride concentration of 1 µg per mL. Prepare the final dilution in a 100-mL volumetric flask. In the same manner, prepare additional *Standard preparations* having fluoride concentrations of 3 µg per mL, 5 µg per mL, and 10 µg per mL, respectively.

**Test preparation**—Place 1 g of Flucytosine, accurately weighed, in a 100-mL volumetric flask, and dissolve in and dilute with *Buffer solution* to volume.

**Procedure**—Concomitantly measure the potential (see *Titrimetry* (541)), in mV, of the *Standard preparations* and the *Test preparation*, with a suitable pH meter equipped with a fluoride-specific ion electrode and a glass-sleeved calomel reference electrode that has been modified in the following manner. Mix 70 mL of freshly prepared saturated potassium chloride solution with 30 mL of isopropyl alcohol, fill the electrode with the clear supernatant, and allow the electrode to remain in the mixture for not less than 2 hours prior to use, or preferably overnight.

When taking the measurements, transfer the solution to a 150-mL beaker, and immerse the electrodes. Insert a polytetrafluoroethylene-coated stirring bar into the beaker, place the beaker on a magnetic stirrer having an insulated top, and allow to stir until equilibrium is attained (about 1 to 2 minutes). Rinse and dry the electrodes between measurements, taking care not to scratch the crystal in the specific ion electrode.

Measure the potential of each *Standard preparation*, and plot the fluoride concentration, in mg per 100 mL, versus the potential, in mV, on semilogarithmic paper. Measure the potential of the *Test preparation*, and determine from the standard curve the fluoride concentration, in mg per 100 mL. Calculate the percentage of fluoride in the portion of Flucytosine taken by the formula:

$$C / 10$$

in which C is the fluoride concentration, in mg per 100 mL, from the standard curve: not more than 0.05% of fluoride is found.

**Fluorouracil**—Dissolve 250 mg in 10 mL of a mixture of glacial acetic acid and water (4:1). Apply 20 µL of this solution to a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.5-mm layer of chromatographic silica gel mixture. To the same plate apply 20 µL, in 10-µL increments, of a 0.025 mg per mL solution of USP Fluorouracil RS in a mixture of glacial acetic acid and water (4:1). Develop the chromatogram in a mixture of chloroform and glacial acetic acid (13:7) until the solvent front has moved not less than 14 cm from the origin. Remove the plate from the developing chamber, and allow the solvent to evaporate. Locate the spots on the plate by observing under short-wavelength UV radiation: any spot from the solution under test is not greater in size and intensity than the spot at the respective  $R_f$  produced by the *Standard solution*, corresponding to not more than 0.1% of fluorouracil.

**Assay**—Place about 400 mg of Flucytosine, accurately weighed, in a 250-mL beaker, add 150 mL of a mixture of 2 volumes of glacial acetic acid and 1 volume of acetic anhydride, and dissolve, warming gently if necessary. Titrate potentiometrically with 0.1 N perchloric acid VS, using a calomel-glass electrode system. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 12.91 mg of  $C_4H_4FN_3O$ .

## Flucytosine Capsules

» Flucytosine Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of flucytosine ( $C_4H_4FN_3O$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Flucytosine RS

**Identification—**

**A:** The UV absorption spectrum of the solution from the Capsule contents obtained in the Assay exhibits maximum absorption at the same wavelength as that of the Standard solution, and the two spectra are similar between 260 nm and 350 nm.

**B:** Shake a portion of the contents of Capsules, equivalent to about 500 mg of flucytosine, with 10 mL of water. Filter, and to 2 mL of the filtrate add 1 mL of sodium pentacyanoaminoferate reagent [prepared by dissolving 100 mg of sodium (tri)pentacyanoaminoferate in 20 mL of sodium carbonate solution (1 in 100)] and 1 mL of 3 percent hydrogen peroxide: on standing, a darker green is produced than that produced by a blank.

**Dissolution** (711)—

*Medium:* water; 900 mL.

*Apparatus 2:* 75 rpm.

*Time:* 60 minutes.

**Procedure—**Determine the amount of  $C_4H_4FN_3O$  dissolved by employing UV absorption at the wavelength of maximum absorbance at about 276 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Flucytosine RS in the same *Medium*.

**Tolerances—**Not less than 80% (Q) of the labeled amount of  $C_4H_4FN_3O$  is dissolved in 60 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay—**Weigh the contents of not fewer than 20 Capsules, and determine the average weight per Capsule. Mix the combined contents, and transfer an accurately weighed portion of the powder, equivalent to about 250 mg of flucytosine, to a 250-mL volumetric flask. Add about 50 mL of 0.1 N hydrochloric acid, shake by mechanical means for 30 minutes, then add 0.1 N hydrochloric acid to volume, mix, and filter, discarding the first 20 mL of the filtrate. Dilute 10 mL of the clear filtrate with 0.1 N hydrochloric acid to 250 mL. Dilute 10.0 mL of this solution with 0.1 N hydrochloric acid to 50 mL. Dissolve an accurately weighed quantity of USP Flucytosine RS in 0.1 N hydrochloric acid, and dilute quantitatively and stepwise with the same solvent to obtain a Standard solution having a known concentration of about 8 µg per mL. Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 285 nm, with a suitable spectrophotometer, using 0.1 N hydrochloric acid as the blank. Calculate the quantity, in mg, of flucytosine ( $C_4H_4FN_3O$ ) in the portion of Capsule contents taken by the formula:

$$31.25C(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Flucytosine RS in the Standard solution; and  $A_U$  and  $A_S$  are the absorbances of the solution from the Capsule contents and the Standard solution, respectively.

**Flucytosine Oral Suspension****DEFINITION**

Flucytosine Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of flucytosine ( $C_4H_4FN_3O$ ). Prepare Flucytosine Oral Suspension 10 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Flucytosine	1.0 g
Vehicle: a 1:1 mixture of Vehicle for Oral Solution (regular or sugar-free), NF, and Vehicle for Oral Suspension, NF, a sufficient quantity to make	100 mL

Empty the contents of the required number of capsules into a suitable mortar, or add *Flucytosine* powder to the mortar. Add 10 mL of *Vehicle*, and mix to a uniform paste. Add *Vehicle* in small portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough *Vehicle* to bring to final volume, and mix well.

**ASSAY****• PROCEDURE**

**Solution A:** 1 g of ammonium acetate and 1 mL of diisopropylamine in 1 L of water. Adjust with glacial acetic acid to a pH of 7.5.

**Mobile phase:** Methanol and *Solution A* (50:50). Filter, and degas.

**Standard solution:** 50 µg/mL of USP Flucytosine RS in *Mobile phase*

**Sample solution:** Agitate the container of Oral Suspension for 30 min on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at  $-70^\circ$  until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix on a vortex mixer for 30 s. Pipet 0.5 mL of the sample into a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 280 nm

**Column:** 4.6-mm × 200-mm; 5-µm packing L3

**Flow rate:** 1 mL/min

**Injection volume:** 20 µL

**System suitability**

**Sample:** *Standard solution*

[NOTE—The retention time for flucytosine is about 3 min.]

**Suitability requirements**

**Relative standard deviation:** NMT 1.0% for replicate injections

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of flucytosine ( $C_4H_4FN_3O$ ) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of flucytosine in the *Standard solution* ( $\mu\text{g/mL}$ )

$C_U$  = nominal concentration of flucytosine in the *Sample solution* ( $\mu\text{g/mL}$ )

**Acceptance criteria:** 90.0%–110.0%

#### SPECIFIC TESTS

- **PH** (791): 4.0–5.0

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store in a cold place.
- **LABELING:** Label it to state that it is to be well shaken, and to state the *Beyond-Use Date*.
- **BEYOND-USE DATE:** NMT 60 days after the date on which it was compounded
- **USP REFERENCE STANDARDS** (11)  
USP Flucytosine RS

## Fludarabine Phosphate

$\text{C}_{10}\text{H}_{13}\text{FN}_5\text{O}_7\text{P}$  365.21  
9H-Purin-6-amine, 2-fluoro-9-(5-O-phosphono- $\beta$ -D-arabinofuranosyl)-;  
9- $\beta$ -D-Arabinofuranosyl-2-fluoroadenine 5'-(dihydrogen phosphate) [75607-67-9].

#### DEFINITION

Fludarabine Phosphate contains NLT 98.0% and NMT 102.0% of fludarabine phosphate ( $\text{C}_{10}\text{H}_{13}\text{FN}_5\text{O}_7\text{P}$ ), calculated on the anhydrous, solvent-free basis.

[**CAUTION**—Fludarabine Phosphate is potentially cytotoxic. Great care should be taken to prevent inhaling particles and exposing the skin to it.]

#### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)

#### ASSAY

##### PROCEDURE

**Solution A:** 10 mM of monobasic potassium phosphate

**Mobile phase:** Methanol and *Solution A* (6:94)

**Standard solution:** 0.02 mg/mL of USP Fludarabine Phosphate RS in *Mobile phase*

**Sample solution:** 0.02 mg/mL of Fludarabine Phosphate in *Mobile phase*

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 260 nm

**Column:** 4.6-mm  $\times$  15-cm; 5- $\mu\text{m}$  packing L1

**Flow rate:** 1.0 mL/min

**Injection volume:** 10  $\mu\text{L}$

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Relative standard deviation:** NMT 1.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of fludarabine phosphate ( $\text{C}_{10}\text{H}_{13}\text{FN}_5\text{O}_7\text{P}$ ) in the portion of Fludarabine Phosphate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Fludarabine Phosphate RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Fludarabine Phosphate in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the anhydrous, solvent-free basis

#### IMPURITIES

##### CHLORIDE

**Standard stock solution:** 82.4  $\mu\text{g/mL}$  of sodium chloride in water

**Standard solution:** Transfer 2.0 mL of *Standard stock solution* to a test tube, add 13.0 mL of water, and mix.

**Sample solution:** Transfer 50.0 mg of Fludarabine Phosphate to a test tube, add 15 mL of water to dissolve, and heat gently if necessary.

**Analysis:** Add 1.0 mL of nitric acid to the *Standard solution* and *Sample solution*, and place each in separate, colorless test tubes containing 1.0 mL of silver nitrate TS.

**Acceptance criteria:** NMT 0.2%; the *Sample solution* shows less turbidity than the *Standard solution*.

##### LIMIT OF FREE PHOSPHATE

**Standard solution:** 7.16  $\mu\text{g/mL}$  of potassium dihydrogen phosphate in water. Transfer 2.0 mL of this solution to a test tube.

**Sample solution:** 10 mg of Fludarabine Phosphate in 2.0 mL of water in a test tube, heating gently

**Blank:** 2.0 mL of water in a test tube

**Reagent solution:** Mix 4 g of finely powdered ammonium molybdate and 0.1 g of finely powdered ammonium vanadate in a 150-mL beaker. Add 70 mL of water, and grind the particles using a glass rod. A clear solution is obtained within a few min. Add 20 mL of nitric acid, adjust to room temperature, and dilute with water to 100 mL.

**Analysis:** To each of the test tubes containing the *Standard solution*, *Sample solution*, and *Blank*, add 2.0 mL of *Reagent solution*.

**Acceptance criteria:** NMT 0.1%; the color of the *Standard solution* must be more intense than that of the *Blank*. Viewed downward in diffuse daylight against a white background, the yellow coloration of the *Sample solution* must not be more intense than that of the *Standard solution*.

##### LIMIT OF SODIUM

**Standard stock solution:** 2.54 mg/mL of sodium chloride in water. Sodium chloride is previously dried at 105° for 2 h.

**Standard solution:** 1  $\mu\text{g/mL}$  of sodium chloride in water, from *Standard stock solution*

**Sample solution:** 0.5 mg/mL of Fludarabine Phosphate in water

**Instrumental conditions**

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** Flame photometry

**Analytical wavelength:** Sodium emission line at 589.0 nm

**Blank:** Water

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

**Acceptance criteria:** NMT 0.2%; the emission response of the *Sample solution* is NMT that of the *Standard solution*.

- **HEAVY METALS, Method I** (231): NMT 20 ppm

##### ORGANIC IMPURITIES PROCEDURE 1: EARLY-ELUTING IMPURITIES

**Mobile phase, Standard solution, and Chromatographic system:** Proceed as directed in the *Assay*.

**System suitability solution:** 10 mg of Fludarabine Phosphate in 10 mL of 0.1 N hydrochloric acid. Heat the solution at 80° in a water bath for 15 min.

**Sensitivity solution:** 0.5 µg/mL of USP Fludarabine Phosphate RS in *Mobile phase*, from the *Standard solution*

**Sample solution:** 1 mg/mL of Fludarabine Phosphate in *Mobile phase*

**System suitability**

**Samples:** *Standard solution*, *System suitability solution*, and *Sensitivity solution*

**Suitability requirements**

**Resolution:** NLT 2.0 between the iso-ara-guanine monophosphate and isoguanine peaks, *System suitability solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

**Signal-to-noise ratio:** NLT 10, *Sensitivity solution*

**Analysis**

**Sample:** *Sample solution*

Calculate the percentage of each early-eluting impurity in the portion of Fludarabine Phosphate taken:

$$\text{Result} = (r_U/r_S) \times (1/F_1) \times 100$$

$r_U$  = peak response of each individual impurity from the *Sample solution*

$r_S$  = peak response of fludarabine phosphate from the *Sample solution*

$F_1$  = relative response factor for each individual impurity (see *Table 1*)

**Acceptance criteria:** See *Table 1*.

**Table 1**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Iso-ara-guanine-monophosphate	0.26	0.25	0.8
Iso-guanine	0.34	0.40	0.2
3',5'-Diphosphate analog	0.42	0.53	0.4
Any individual unspecified impurity	<1.0	1.0	0.1
Fludarabine phosphate	1.0	—	—

• **ORGANIC IMPURITIES PROCEDURE 2: LATE-ELUTING IMPURITIES**

**Solvent A:** 10 mM monobasic potassium phosphate

**Mobile phase:** Methanol and *Solvent A* (1:4)

**Standard solution and Chromatographic system:** Proceed as directed in the *Assay*.

**Sensitivity solution and Sample solution:** Prepare as directed in *Organic Impurities Procedure 1: Early-Eluting Impurities*.

**System suitability**

**Samples:** *Standard solution* and *Sensitivity solution*

**Suitability requirements**

**Tailing factor:** NMT 2.0, *Standard solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

**Signal-to-noise ratio:** NLT 10, *Sensitivity solution*

**Analysis**

**Sample:** *Sample solution*

Calculate the percentage of each late-eluting impurity in the portion of Fludarabine Phosphate taken:

$$\text{Result} = (r_U/r_S) \times (1/F_2) \times 100$$

$r_U$  = peak response of each individual impurity from the *Sample solution*

$r_S$  = peak response of fludarabine phosphate from the *Sample solution*

$F_2$  = relative response factor for each individual impurity (see *Table 2*)

**Acceptance criteria:** See *Table 2*.

**Table 2**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Fludarabine phosphate	1.0	—	—

- **USP REFERENCE STANDARDS** <11>  
USP Fludarabine Phosphate RS

**Fludarabine Phosphate Injection****DEFINITION**

Fludarabine Phosphate Injection is a sterile solution of Fludarabine Phosphate in Water for Injection. It contains NLT 95.0% and NMT 105.0% of the labeled amount of fludarabine phosphate ( $C_{10}H_{13}FN_5O_7P$ ).

[**CAUTION**—Fludarabine Phosphate is potentially cytotoxic. Great care should be taken to prevent inhaling particles and exposing the skin to it.]

**IDENTIFICATION**

- **A. ULTRAVIOLET ABSORPTION** <197U>  
**Solution:** 27 µg/mL in 0.1 M hydrochloric acid
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

**ASSAY**• **PROCEDURE**

**Solution A:** 6.9 g/L of monobasic sodium phosphate monohydrate in water (50 mM). Adjust with 1.0 N sodium hydroxide to a pH of  $4.5 \pm 0.2$ .

**Mobile phase:** Methanol and *Solution A* (3:47)

**Standard solution:** 0.1 mg/mL of USP Fludarabine Phosphate RS in *Solution A*

**Sample solution:** Equivalent to 0.1 mg/mL of fludarabine phosphate from Injection diluted with *Solution A*

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 260 nm

**Column:** 4.6-mm  $\times$  25-cm; 5-µm packing L1

**Flow rate:** 1 mL/min

**Injection size:** 20 µL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 1.8

**Relative standard deviation:** NMT 1%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of Fludarabine Phosphate ( $C_{10}H_{13}FN_5O_7P$ ) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Fludarabine Phosphate RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of fludarabine phosphate in the *Sample solution* (mg/mL)

**Acceptance criteria:** 95.0%–105.0%

**IMPURITIES****Organic Impurities**

- **PROCEDURE 1: EARLY-ELUTING IMPURITIES (IMPURITIES ELUTING BEFORE FLUDARABINE)**

**Solution A:** 10 mM monobasic potassium phosphate in water

**Mobile phase:** *Solution A* and methanol (47:3)

**System suitability solution:** 1 mg/mL of fludarabine phosphate in 0.1 N hydrochloric acid. Heat the solution at  $80^\circ$  in a water bath for 15 min.

**Standard solution:** 0.02 mg/mL of USP Fludarabine Phosphate RS in *Mobile phase*

**Quantitative limit solution:** 0.5 µg/mL of USP Fludarabine Phosphate RS in *Mobile phase* from the *Standard solution*

**Sample solution:** Equivalent to 1 mg/mL of fludarabine phosphate from Injection diluted with *Mobile phase*

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 260 nm

**Column:** 4.6-mm  $\times$  15-cm; 5-µm packing L1

**Flow rate:** 1 mL/min

**Injection size:** 10 µL

**System suitability**

**Samples:** *Standard solution*, *System suitability solution*, and *Quantitative limit solution*

**Suitability requirements**

**Resolution:** NLT 2.0 between the iso-ara-guanine monophosphate and isoguanine peaks, *System suitability solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

**Signal-to-noise ratio:** NLT 10, *Quantitative limit solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each early-eluting impurity in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (1/F) \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_S$  = peak response of fludarabine phosphate from the *Sample solution*

F = relative response factor (see *Impurity Table 1*)

**Acceptance criteria** See *Impurity Table 1*.

Impurity Table 1

## Fludarabine Phosphate for Injection

**DEFINITION**

Fludarabine Phosphate for Injection contains NLT 95.0% and NMT 105.0% of the labeled amount of fludarabine phosphate ( $C_{10}H_{13}FN_5O_7P$ ).

[**CAUTION**—Fludarabine Phosphate is potentially cytotoxic. Great care should be taken to prevent inhaling particles and exposing the skin to it.]

**IDENTIFICATION**

- **A. ULTRAVIOLET ABSORPTION (197U)**  
**Sample solution:** 27 μg/mL in 0.1 M hydrochloric acid  
**Acceptance criteria:** Meets the requirements
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

**ASSAY**

• **PROCEDURE**

**Solution A:** 10 mM of monobasic potassium phosphate  
**Mobile phase:** Methanol and *Solution A* (6:94)

**Standard solution:** 0.02 mg/mL of USP Fludarabine Phosphate RS in *Mobile phase*

**Sample stock solution:** 1 mg/mL of fludarabine phosphate in *Mobile phase* prepared as follows. Inject 2.0 mL of *Mobile phase* into each of five vials of Fludarabine Phosphate for Injection. Transfer the contents of the vials into a 250-mL volumetric flask, using *Mobile phase* rinses. Dilute with *Mobile phase* to volume.

**Sample solution:** 0.02 mg/mL of fludarabine phosphate in *Mobile phase*, from *Sample stock solution*

**Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** UV 260 nm**Column:** 4.6-mm × 15-cm; 5-μm packing L1**Flow rate:** 1.0 mL/min**Injection volume:** 10 μL**System suitability****Sample:** *Standard solution***Suitability requirements****Relative standard deviation:** NMT 2.0%**Analysis****Samples:** *Standard solution* and *Sample solution*Calculate the percentage of the labeled amount of fludarabine phosphate (C<sub>10</sub>H<sub>13</sub>FN<sub>5</sub>O<sub>7</sub>P) in the portion of Fludarabine Phosphate for Injection taken:

- **CONSTITUTED SOLUTION:** At the time of use, it meets the requirements for *Injections (1)*, *Constituted Solutions*.

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve as described in *Injections (1)*, *Containers for Sterile Solids*, between 2° and 30°, or at controlled room temperature.
- **USP REFERENCE STANDARDS (11)**  
USP Endotoxin RS  
USP Fludarabine Phosphate RS

## Fludrocortisone Acetate

$C_{23}H_{31}FO_6$  422.49

Pregn-4-ene-3,20-dione, 21-(acetyloxy)-9-fluoro-11,17-dihydroxy-, (11 $\beta$ )-.

9-Fluoro-11 $\beta$ ,17,21-trihydroxypregn-4-ene-3,20-dione 21-acetate [514-36-3].

» Fludrocortisone Acetate contains not less than 97.0 percent and not more than 103.0 percent of  $C_{23}H_{31}FO_6$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers, protected from light.

**USP Reference standards (11)**—

USP Fludrocortisone Acetate RS

**Identification, Infrared Absorption (197M).**

**Specific rotation (781S):** between +126° and +138°.

*Test solution:* 5 mg per mL, in acetone.

**Loss on drying (731)**—Dry it in vacuum at 100° for 2 hours over magnesium perchlorate: it loses not more than 3.0% of its weight.

**Residue on ignition (281):** not more than 0.1%.

**Chromatographic purity**—Dissolve about 100 mg of it in a mixture of 5 mL of chloroform and 1 mL of acetone in a 10-mL volumetric flask, and dilute with chloroform to volume. Dilute 1 mL of this solution with chloroform to 100 mL. Apply 10  $\mu$ L, in 5- $\mu$ L increments, of the test solution and of its dilution to a line parallel to and about 2.5 cm

from the bottom of a thin-layer chromatographic plate (see *Chromatography (621)*) coated with a 0.25-mm layer of chromatographic silica gel mixture. Develop the plate in a suitable chamber containing a mixture of chloroform, methanol, and water (85:14:1) until the solvent front has moved about 15 cm. Remove the plate, air-dry, and examine under short-wavelength UV light: no spot in the chromatogram of the more concentrated test solution, other than the principal spot, is larger or more intense than the spot from the diluted test solution (1.0%).

### Assay—

**Standard preparation**—Dissolve about 25 mg of USP Fludrocortisone Acetate RS, accurately weighed, in chloroform to make 250 mL, and mix. Pipet 10 mL of this solution into a 50-mL volumetric flask, add chloroform to volume, and mix.

**Assay preparation**—Prepare as directed under *Standard preparation*, using Fludrocortisone Acetate instead of the USP Reference Standard.

**Procedure**—Pipet 10 mL of the *Assay preparation* and the *Standard preparation*, respectively, into separate 25-mL volumetric flasks, and pipet 10 mL of chloroform into a third flask to provide a blank. Treat each flask as follows. Add 1.0 mL of a solution prepared by dissolving 50 mg of blue tetrazolium in 10 mL of methanol, and mix. Add 1.0 mL of a mixture of 1 volume of tetramethylammonium hydroxide TS and 4 volumes of methanol, mix, and allow to stand for 10 minutes. Dilute with a 1 in 100 solution of hydrochloric acid in methanol to volume. Concomitantly determine the absorbances of the solutions from the *Assay preparation* and the *Standard preparation* in 1-cm cells at about 525 nm, with a suitable spectrophotometer, against the reagent blank. Calculate the quantity, in mg, of  $C_{23}H_{31}FO_6$  in the portion of Fludrocortisone Acetate taken by the formula:

$$1.25C(A_U / A_S)$$

in which C is the concentration, in  $\mu$ g per mL, of USP Fludrocortisone Acetate RS in the *Standard preparation*; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

## Fludrocortisone Acetate Tablets

» Fludrocortisone Acetate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of fludrocortisone acetate ( $C_{23}H_{31}FO_6$ ).

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards (11)**—

USP Fludrocortisone Acetate RS

USP Norethindrone RS

**Identification**—Transfer a portion of powdered Tablets, equivalent to about 1 mg of fludrocortisone acetate, to a glass-stoppered, 15-mL centrifuge tube, add 10 mL of acetone, and shake by mechanical means for 3 minutes. Centrifuge the mixture, and apply 20  $\mu$ L, in 5- $\mu$ L increments, of the clear solution and 20  $\mu$ L of a solution of USP Fludrocortisone Acetate RS in acetone, containing about 100  $\mu$ g per mL, at points along a line about 2.5 cm from the bottom of a thin-layer chromatographic plate (see *Chromatography (621)*) coated with a 0.25-mm layer of chromatographic silica gel mixture. Develop the plate in a suitable chamber containing a mixture of chloroform, methanol, and water (85:14:1) until the solvent front has moved about 15 cm. Remove the plate, air-dry, and examine under short-wavelength UV light: the  $R_f$  value of the principal spot in the

chromatogram of the test solution corresponds to that obtained with the Standard solution.

**Dissolution** (711)—[NOTE—Use low-actinic glassware throughout this procedure for all solutions. Withdraw dissolution samples with glass syringes, and filter them through membrane filters that have been checked for absorptive loss.]

*Medium:* 0.01 N hydrochloric acid; 500 mL.

*Apparatus 2:* 75 rpm.

*Time:* 30 minutes.

Determine the amount of  $C_{23}H_{31}FO_6$  dissolved, employing the following method.

*Mobile phase*—Prepare a filtered and degassed mixture of acetonitrile and water (45:55). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard solution*—Transfer about 25 mg of USP Fludrocortisone Acetate RS, accurately weighed, to a 1000-mL volumetric flask. Add 50 mL of acetonitrile, and sonicate for 5 minutes to dissolve. Dilute with 0.01 N hydrochloric acid to volume to obtain a known concentration of fludrocortisone acetate similar to that expected in the solution under test.

*Chromatographic system* (see *Chromatography* (621))—The chromatograph is equipped with a 245-nm detector and a 4.6-mm  $\times$  15-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 1000 theoretical plates, the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 100  $\mu$ L) of a filtered portion of the solution under test and the *Standard solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity of  $C_{23}H_{31}FO_6$  dissolved based on the peak responses obtained from the solution under test and the *Standard solution*.

*Tolerances*—Not less than 80% (Q) of the labeled amount of  $C_{23}H_{31}FO_6$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

*Procedure for content uniformity*—

*Mobile solvent*—Prepare as directed in the Assay.

*Internal standard solution*—Prepare a solution of USP Nor-ethindrone RS in acetonitrile having a concentration of about 10  $\mu$ g per mL.

*Standard preparation*—Dissolve a suitable quantity of USP Fludrocortisone Acetate RS, accurately weighed, in *Internal standard solution* to obtain a solution having a known concentration of about 0.20 mg per mL. Add 5.0 mL of this solution to 10.0 mL of water contained in a low-actinic 50-mL volumetric flask. Dilute with *Internal standard solution* to volume to obtain a solution having a known concentration of about 20  $\mu$ g of fludrocortisone acetate per mL.

*Test preparation*—Add 1.0 mL of water to 1 Tablet in a 10-mL centrifuge tube, and mix on a vortex-type mixer for 1 minute or until disintegration is complete. Add 4.0 mL of *Internal standard solution*, mix on a vortex-type mixer for 1 minute, then shake by mechanical means for not less than 40 minutes. Centrifuge at 3600 rpm for 20 minutes, or until a clear supernatant is obtained. Use the clear supernatant.

*Procedure*—Proceed as directed for *Procedure* in the Assay. Calculate the quantity, in mg, of  $C_{23}H_{31}FO_6$  in the Tablet taken by the formula:

$$(T / D)C(R_U / R_S)$$

in which  $C$ ,  $R_U$ , and  $R_S$  are as defined in the Assay;  $T$  is the labeled quantity, in mg, of fludrocortisone acetate in the

Tablet; and  $D$  is the concentration, in  $\mu$ g per mL, of fludrocortisone acetate in the *Test preparation*, based on the labeled quantity per Tablet and the extent of dilution.

**Assay**—

*Mobile solvent*—Prepare a suitable, degassed acetonitrile solution, 40% to 45% (v/v), such that the resolution factor,  $R$ , between fludrocortisone acetate and the internal standard is not less than 2.5.

*Internal standard solution*—Prepare a solution of USP Nor-ethindrone RS in acetonitrile having a concentration of about 75  $\mu$ g per mL.

*Standard preparation*—Dissolve a suitable quantity of USP Fludrocortisone Acetate RS, accurately weighed, in *Internal standard solution* to obtain a solution having a known concentration of about 0.50 mg per mL. Pipet 5 mL of this solution into a 25-mL volumetric flask containing 5.0 mL of water. Dilute with *Internal standard solution* to volume to obtain a solution having a known concentration of about 0.1 mg of fludrocortisone acetate per mL.

*Assay preparation*—Weigh and finely powder not fewer than 35 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 2.5 mg of fludrocortisone acetate, to a low-actinic, glass-stoppered, 50-mL centrifuge tube. Add 5.0 mL of water, and mix for 1 minute. Add 20.0 mL of *Internal standard solution*, mix by mechanical means for 40 minutes, then centrifuge for 15 minutes or until a clear supernatant is obtained. Use the clear supernatant.

*Procedure*—Introduce equal volumes (about 20  $\mu$ L) of the *Assay preparation* and the *Standard preparation* into a high-pressure liquid chromatograph (see *Chromatography* (621)) operated at room temperature, by means of a suitable microsyringe or sampling valve, adjusting the specimen size and other operating parameters such that the peak obtained with the *Standard preparation* is about 0.7 full scale. Typically, the apparatus is fitted with a 3.9-mm  $\times$  30-cm stainless steel column packed with packing L1, and equipped with an UV detector capable of monitoring absorption at 254 nm and a suitable recorder. In a suitable chromatogram, the coefficient of variation for five replicate injections of the *Standard preparation* is not more than 3.0% and the resolution factor,  $R$ , is not less than 2.5 between the two peaks. Measure the height of the peaks, at identical retention times, obtained with the *Assay preparation* and the *Standard preparation*, and calculate the quantity, in mg, of fludrocortisone acetate ( $C_{23}H_{31}FO_6$ ) in the portion of Tablets taken by the formula:

$$25C(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Fludrocortisone Acetate RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the ratios of the peak heights of the fludrocortisone acetate peak to the internal standard peak from the *Assay preparation* and the *Standard preparation*, respectively.

## Flumazenil

$C_{15}H_{14}FN_3O_3$  303.29

4*H*-imidazo[1,5-*a*][1,4]benzodiazepine-3-carboxylic acid, 8-fluoro-5,6-dihydro-5-methyl-6-oxo-, ethyl ester.

Ethyl 8-fluoro-5,6-dihydro-5-methyl-6-oxo-4*H*-imidazo[1,5-*a*][1,4]benzodiazepine-3-carboxylate [78755-81-4].

» Flumazenil contains not less than 98.0 percent and not more than 102.0 percent of  $C_{15}H_{14}FN_3O_3$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

**USP Reference standards** (11)—

USP Flumazenil RS

USP Flumazenil Related Compound B RS

Ethyl 8-hydroxy-5,6-dihydro-5-methyl-6-oxo-4H-imidazo-[1,5-a][1,4]benzodiazepine-3-carboxylate.  
 $C_{15}H_{15}N_3O_4$  301.30

USP Flumazenil Related Compound C RS

N,N-Dimethylformamide diethyl acetal.

**Identification**—

**A:** *Infrared Absorption* (197K).

**B:** The retention time of the major peak for flumazenil in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Melting range**, *Class Ia* (741): between 198° and 202°.

**Bacterial endotoxins** (85)—It contains not more than 25.0 USP Endotoxin Units per mg of flumazenil.

**Loss on drying** (731)—Dry it at 105° for 3 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals**, *Method II* (231): 0.002%.

**Related compounds**—

TEST 1—

*Ninhydrin solution*—Dissolve 0.5 g of ninhydrin in 90 mL of alcohol, and add 10 mL of glacial acetic acid.

*Diluent*—Prepare a mixture of alcohol and chloroform (1:1).

*Adsorbent*: 0.25-mm layer of chromatographic silica gel mixture (see *Chromatography* (621)).

*Test solution*—Transfer about 250 mg of Flumazenil, accurately weighed, to a 5-mL volumetric flask. Dissolve in and dilute with *Diluent* to volume, and mix.

*Standard solution 1*—Prepare a solution of USP Flumazenil RS and USP Flumazenil Related Compound C RS in *Diluent* having known concentrations of about 0.5 mg per mL and about 0.6 µL per mL, respectively.

*Standard solution 2*—Dilute 2.0 mL of *Standard solution 1* with *Diluent* to 10.0 mL.

*Application volume*: 10 µL.

*Developing solvent system*: a mixture of chloroform, glacial acetic acid, alcohol, and water (75:15:7.5:2.5).

*Procedure*—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* (621). Dry the plate for 10 minutes in a current of cold air, and view under short-wavelength UV light. Spray the plate with *Ninhydrin solution*, and heat at 105° for 15 minutes. The  $R_f$  values of analytes are as follows.

Compound	$R_f$	Detection
Flumazenil	about 0.8	UV
Flumazenil related compound C	about 0.04	Ninhydrin

Any spot at an  $R_f$  value corresponding to flumazenil related compound C in the chromatogram obtained from the *Test solution* is not more intense than the corresponding spot in the chromatogram obtained from *Standard solution 2*: not more than 0.2% is found.

TEST 2—

*Diluted phosphoric acid*, pH 2.0, *Mobile phase*, *System suitability solution*, and *Chromatographic system*—Proceed as directed in the *Assay*.

*Standard solution*—Dilute the *Standard preparation* quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 1 µg per mL.

*Test solution*—Use the *Assay preparation*.

*Procedure*—Separately inject equal volumes (about 5 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms for at least three times the retention time of the flumazenil peak, and measure the areas for the major peaks. Calculate the percentage of any impurity in the portion of Flumazenil taken by the formula:

$$100(C_S / C_U)(r_i / r_S)(1/F)$$

in which  $C_S$  and  $C_U$  are the concentrations, in mg per mL, of flumazenil in the *Standard solution* and the *Test solution*, respectively;  $r_i$  is the peak area for any impurity in the *Test solution*;  $r_S$  is the peak area for flumazenil in the *Standard solution*; and  $F$  is the relative response factor for each of the known impurities relative to flumazenil. [NOTE— $F$  values are given for all the impurities, along with the corresponding limits, in the *Table* below.]

Compound Name	Relative Retention Time	Relative Response Factor	Limit (%)
Flumazenil related compound A	about 0.4	1.1	0.2
7-Fluoro-4-methyl-3,4-dihydro-2,5H-1,4-benzodiazepine-2,5-dione	about 0.5	1.5	0.2
Ethyl 5,6-dihydro-5-methyl-6-oxo-4H-imidazo-[1,5-a][1,4]benzodiazepine-3-carboxylate	about 0.7	1.3	0.2
Flumazenil related compound B	about 0.8	1.1	0.2
Flumazenil	1.0	—	—
Ethyl 8-chloro-5,6-dihydro-5-methyl-6-oxo-4H-imidazo-[1,5-a][1,4]benzodiazepine-3-carboxylate	about 2.2	1.1	0.2
Any individual unknown impurity	—	1.0	0.1
Total	—	—	0.5

**Assay—**

*Diluted phosphoric acid, pH 2.0*—Adjust 800 mL of water with phosphoric acid to a pH of  $2.0 \pm 0.05$ .

*Mobile phase*—Prepare a filtered and degassed mixture of *Diluted phosphoric acid, pH 2.0*, methanol, and tetrahydrofuran (80:13:7). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*System suitability solution*—Dissolve appropriate quantities of USP Flumazenil RS and USP Flumazenil Related Compound B RS in *Mobile phase*, and dilute, stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 6.4 µg per mL of each compound.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Flumazenil RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 1.0 mg per mL of flumazenil.

*Assay preparation*—Transfer about 25.0 mg of Flumazenil, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph 5 µL of the *System suitability solution*, and record the peak responses: the relative retention times are about 0.8 for flumazenil related compound B and 1.0 for flumazenil; the resolution, *R*, between flumazenil related compound B and flumazenil is not less than 4.0; the column efficiency is not less than 1500 theoretical plates for the flumazenil peak; and the tailing factor is not more than 1.5 for the flumazenil peak. Chromatograph 5 µL of the *Standard preparation*, and record the peak responses: the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 5 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the flumazenil peaks. Calculate the percentage of  $C_{15}H_{14}FN_3O_3$  in the portion of Flumazenil taken by the formula:

$$100(C_s/C_u)(r_u/r_s)$$

in which  $C_s$  and  $C_u$  are the concentrations, in mg per mL, of flumazenil in the *Standard preparation* and the *Assay preparation*, respectively; and  $r_u$  and  $r_s$  are the peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Flumazenil Injection

» Flumazenil Injection is a sterile solution of Flumazenil. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of flumazenil ( $C_{15}H_{14}FN_3O_3$ ).

**Packaging and storage**—Preserve in tight, single-dose containers, preferably of Type I glass, and store at controlled room temperature.

### USP Reference standards (11)—

USP Flumazenil RS

USP Flumazenil Related Compound A RS

8-Fluoro-5,6-dihydro-5-methyl-6-oxo-4H-imidazol-[1,5-a][1,4]benzodiazepine-3-carboxylic acid.

$C_{13}H_{10}FN_3O_3$  275.24

USP Flumazenil Related Compound B RS

Ethyl 8-hydroxy-5,6-dihydro-5-methyl-6-oxo-4H-imidazol-[1,5-a][1,4]benzodiazepine-3-carboxylate.

$C_{15}H_{15}N_3O_4$  301.30

**Identification—**

**A:** *Thin-Layer Chromatographic Identification Test* (201)—

*Adsorbent*: 0.25-mm layer of chromatographic silica gel mixture containing a fluorescent indicator.

*Test solution*—Dilute, if necessary, a volume of injection with water to obtain a solution containing 0.1 mg of Flumazenil per mL.

*Standard solution*—Prepare a solution in methanol, and dilute, step wise if necessary, with water to obtain a solution containing about 0.1 mg of USP Flumazenil RS per mL in a mixture of water and methanol (9:1).

*Developing solvent system*: a mixture of ethyl acetate and methanol (9:1).

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Bacterial endotoxins** (85): not more than 100 USP Endotoxin Units per mg of flumazenil.

**pH** (791): between 3.4 and 4.6.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Related compounds—**

*Diluent, Mobile phase, System suitability solution, and Chromatographic system*—Proceed as directed in the *Assay*.

*Standard solution*—Use the *Standard preparation* as directed in the *Assay*.

*Test solution*—Use the *Assay preparation*.

*Procedure*—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Injection taken by the formula:

$$100(V/D)(F)(C/L)(r_i/r_s)$$
